Prolog language, syntax and meaning of Prolog programs, Lists, operators, arithmetic. Using structures: Example programs, controlling backtracking, input and output. more built-in procedures, programming, style and technique, operations on data structures. Advanced tree representations, basic problem-solving strategies, depth-first search strategy, breadth-first search strategy.

VII. Learning outcome

Ability to understand and apply principles of AI in solving simple problems to enable them to get insight into working of AI based systems.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Definitions of intelligence and artificial intelligence. Disciplines important to AI. History of development of AI.	2
2.	Different types of AI. Acting humanly, Turing test. AI systems in everyday life. Applications of AI.	2
3.	Classical AI, concept of expert system, conflict resolution, multiple rules, forward chaining, backward chaining.	3
4.	Advantages and disadvantages of expert system. Fuzzy logic and fuzzy rules. Fuzzy expert systems.	3
5.	Problem solving using AI, search techniques, breadth first search, depth first search	4
6.	Depth limited search, bidirectional search, heuristic search, problems and examples.	4
7.	Knowledge representation, frames, methods and demons, correlations, decision trees, fuzzy trees.	3
8.	Philosophy of AI, Penrose's pitfall, weak AI, strong AI, rational AI, brain prosthesis experiment,	2
9.	Chinese room problem, emergence of consciousness, technological singularity, Turing test.	3
10.	Modern AI, biological brain, basic neuron model, perceptrons and learning, self-organizing neural network,	3
11.	N-tuple network, evolutionary computing, genetic algorithms,	2
12.	Agent methods, agents for problem solving, software agents,	2
13.	Multi agents, hardware agents.	1
	Total	**31**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Prolog language, syntax and meaning of Prolog programs, Lists, operators, arithmetic.	4
2.	Using structures: Example programs, controlling backtracking, input and output. more built-in procedures, programming, style and technique, operations on data structures.	5
3.	Advanced tree representations, basic problem-solving strategies, depth-first search strategy, breadth-first search strategy.	5
	Total	**14**

I. Course Title : Neuro-Fuzzy Application in Engineering

II. Course Code : CSE 503

III. Credit Hours : 2+1

IV. Aim of the course

To learn the basic concept of neural network models and fuzzy logic based models and apply fuzzy reasoning and fuzzy inference to solve various agricultural engineering problems

V. Theory

Unit I

Basic concepts of neural networks and fuzzy logic, differences between conventional computing and neuro-fuzzy computing, characteristics of neuro-fuzzy computing.

Unit II

Fuzzy set theory: Basic definitions, terminology, formulation and parameters of membership functions. Basic operations of fuzzy sets: Complement, intersection, vision, T-norm and T- conorm. Fuzzy reasoning and fuzzy Inference: Relations, rules, reasoning, Inference systems, and modeling. Applications of fuzzy reasoning and modelling in engineering problems.

Unit III

Fundamental concepts of artificial neural networks: Model of a neuron, activation functions, neural processing. Network architectures, learning methods. Neural network models: Feed forward neural networks, back propagation algorithm, applications of feed forward networks, recurrent networks, hopfield networks, hebbian learning, self organizing networks, unsupervised learning, competitive learning.

Unit IV

Neuro–fuzzy modelling: Neuro-fuzzy inference systems, neuro-fuzzy control.

Unit V

Applications of neuro-fuzzy computing: Time series analysis and modelling, remote sensing, environmental modelling.

VI. Practical

Training algorithms of artificial neural networks: Basic models, learning rules, single layer and multi-layer feed-forward and feedback networks, supervised and unsupervised methods of training, recurrent networks, modular networks. Fuzzy systems: Fuzzy sets, operations on fuzzy sets, fuzzy relations, measures, fuzzy logic, fuzzy logic controller, integrated hybrid systems. Adaptive neuro-fuzzy inference systems, coactive neuro-fuzzy modelling, classification and regression trees, data clustering algorithms like k-means, fuzzy c-means, mountain and subtractive clustering, rule based structure identification, neuro-fuzzy control, case studies. Use of available software for fuzzy logic and neural networks.

VII. Learning outcome

The students will be able to have the basic concept of neural network models and fuzzy logic-based models and will be in a position to apply fuzzy reasoning and fuzzy inference for various problems of agricultural engineering. They will also learn to develop different types of neural network models.

I. Course Title : Soft Computing Techniques in Engineering

II. Course Code : CSE 504

III. Credit Hours : 2+1

IV. Aim of the course

To learn the basic concepts of soft computing techniques like neural networks, genetic algorithms and fuzzy systems and apply these techniques for real time problem solving.

V. Theory

Unit I

Introduction to control techniques, need of intelligent control. Architecture for intelligent control. Symbolic reasoning system, rule based systems, the artificial intelligence approach. Knowledge representation and expert systems. Data pre-processing: Scaling, Fourier transformation, principle component analysis and wavelet transformations.

Unit II

Concept of artificial neural networks (ANN) and basic mathematical model, network structures, activation function, back propagation, network size and pruning McCulloch-Pitts neuron model, simple perceptron, adaline and madaline neural networks, feed-forward multi-layer perceptron. Learning and training the neural network. Networks: Hopfield network, self-organizing network and recurrent network. Neural network based controller. Case studies: Identification and control of linear and nonlinear dynamic systems.

Unit III

Genetic algorithm (GA): Basic concept and detail algorithmic steps, adjustment of free parameters. Solution of typical control problems using GA. Concept of other search techniques like tabu search and ant-colony search for solving optimization problems.

Unit IV

Introduction to crisp sets and fuzzy sets, basic fuzzy set operation and approximate reasoning. Introduction to Fuzzy logic modelling and control of a system. Fuzzification, inference and defuzzification. Fuzzy knowledge and rule bases.

Unit V

Fuzzy modeling and control schemes for nonlinear systems. Self-organizing fuzzy logic control. Implementation of fuzzy logic controller. Stability analysis of fuzzy control systems. Intelligent control for SISO/MIMO nonlinear systems. Model based multivariable fuzzy controller.

VI. Practical

To work on data transformations, brief review on statistical criteria for termination of epochs, deciding the input output and hidden layers and neutrons for ANN problems, working on different algorithms of ANN to different problems in agricultural engineering, working with different fuzzy relations, propositions, implications and inferences, working with defuzzification techniques and fuzzy logic controllers, concept of coding, selection, crossover, mutation and application of genetic programming for global optimization, use of available software for application of soft computing techniques.

VII. Learning outcome

To enable students to apply modern engineering techniques which are useful for solving nonlinear and complex functions and to develop application of different soft computing techniques like genetic algorithms, fuzzy logic, neural networks and their combination to real world problems.

VIII. Lecture Schedule

I. Course Title : Digital Image Processing

II. Course Code : CSE 506

III. Credit Hours : 2+1

IV. Aim of the course

To give an overview of digital image processing including visual perception, image formation, spatial transformations, image enhancement, color image representation and processing, edge detection, image segmentation and morphological image processing.

V. Theory

Unit I

Digital image fundamentals, elements of visual perception, light and the electromagnetic spectrum, image sensing and acquisition, image sampling and quantization, basic relationships between pixels, linear and nonlinear operations.

Unit II

Image enhancement in the spatial domain, basic gray level transformations, histogram processing, basics of spatial filtering, smoothing spatial filters, sharpening spatial filters.

Unit III

Color image processing, color fundamentals, color models, pseudo color image processing, basics of full-color image processing, color transformations, smoothing and sharpening, color segmentation.

Unit IV

Image segmentation, detection of discontinuities, edge linking and boundary detection, thresholding, region-based segmentation, segmentation by morphological watersheds.

Unit V

Morphological image processing, dilation and erosion, opening and closing, extensions to gray-scale images.

VI. Practical

To write program to read and display digital image, image processing program using point processing method, program for image arithmetic operations, program for image logical operations, program for histogram calculation and equalization, program for geometric transformation of image, understand various image noise models and to write programs for image restoration and to remove noise using spatial filters. Brief outline of image processing tools.

VII. Learning outcome

This course introduces digital image processing. It focuses on the theory and algorithms underlying a range of tasks including acquisition, formation, enhancement, segmentation and representation.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction and Fundamentals, Motivation and Perspective, Applications, Components of Image Processing System,	3
2.	Element of Visual Perception, A Simple Image Model	1
3.	Sampling and Quantization.	2
4.	Light and the electromagnetic spectrum, image sensing and acquisition	2
5.	Basic relationships between pixels, linear and nonlinear operations	2
6.	Image Enhancement in Spatial Domain	2
7.	Introduction; Basic Gray Level Functions	2
8.	Histogram Specification	2
9.	Basics of spatial filtering, smoothing spatial filters, sharpening spatial filters	2
10.	Color image processing, color fundamentals	1
11.	Color models, pseudo color image processing	1
12.	Color transformations, smoothing and sharpening, color segmentation.	2
13.	Image segmentation, detection of discontinuities	1

S.No.	Topic	No. of Lectures
14.	Edge linking and boundary detection, thresholding, region-based segmentation	2
15.	Segmentation by morphological watersheds	1
16.	Morphological image processing, dilation and erosion	2
17.	Opening and closing, extensions to gray-scale images	2
	Total	**30**

IX. List of Practical

S.No.	Topic	No. of Practicals
1.	Display digital image, image processing program using point processing method, program for image arithmetic operations	3
2.	Program for image arithmetic operations, image logical operations, histogram calculation and equalization	4
3.	Program for geometric transformation of image, understand various image noise models	4
4.	Programs for image restoration and to remove noise using spatial filters	4

Department of Civil Engineering

I. Course Title : Dimensional Analysis and Similitude

II. Course Code : CE 501

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint the students with importance of analysis of dimensions and similitude principles in structuring mathematical/simulation models of various processes under different constraint variables.

V. Theory

Unit I

Introduction, Dimensions, Dimensional homogeneity, Non-dimensional parameter, Methods of dimensional analysis: Rayleigh's method, Buckingham-Pi theorem, Choice of variables, Model analysis, Examples on various applications, Dimensional analysis and Intermediate Asymptotic.

Unit II

Model studies, Model classification, Dimensionless numbers: Reynolds model, Froude's model, Euler's Model, Webber's model, Mach model, Scale effects, Distorted models, Model laws.

Unit III

Similitude: Types of similarities (geometric-kinematic and dynamic similarity), force ratios, similarity laws. Model analysis: Physical models. Similarity methods for nonlinear problem types of models, Scale effect. Numerical problems on Reynolds's and Froude's Model.

Unit IV

Use and scope of mathematical modeling, Principles of model formulation, Role and importance of steady-state and dynamic simulation, Classification of models, Model building, Modeling difficulties, Degree-of-freedom analysis, Selection of design variables.

VI. Learning outcome

The students will be able to analyze complex problems using dimensional analysis and to develop rules for experiments with scale models and provide basis for analyses and calculations, including simplifications and assumptions made, when formulating mathematical models.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction, Dimensions, Dimensional homogeneity, Non-dimensional parameter	2

S.No.	Topic	No. of Lectures
2.	Methods of dimensional analysis: Rayleigh's method, Buckingham-Pi theorem, Choice of variables	3
3.	Model analysis, Examples on various applications, Dimensional analysis and Intermediate Asymptotic	2
4.	Model studies, Model classification, Dimensionless numbers: Reynolds model	3
5.	Froude's model, Euler's Model, Webber's model, Mach model, Scale effects	3
6.	Distorted models, Model laws.	2
7.	Similitude: Types of similarities (geometric-kinematic and dynamic similarity), force ratios, similarity laws	3
8.	Model analysis: Physical models. Similarity methods for nonlinear problem types of models, Scale effect	3
9.	Numerical problems on Reynolds's and Froude's Model	3
10.	Use and scope of mathematical modeling, Principles of model formulation	2
11.	Role and importance of steady-state and dynamic simulation	2
12.	Classification of models, Model building, Modeling difficulties	2
13.	Degree-of-freedom analysis, Selection of design variables	2
	Total	**32**

I. Course Title : Water Quality and Pollution Control

II. Course Code : CE 502

III. Credit Hours : 2+1

IV. Aim of the course

To acquire in-depth knowledge of water quality parameters, water quality standards, source of water pollution and multiple use of water.

V. Theory

Unit I

Physical and chemical properties of water, suspended and dissolved solids, EC and pH, major ions. Water quality (Physical, Chemical and Bacteriological) investigation, Sampling design, Samplers and automatic samplers. Data collection platforms, Field kits, Water quality data storage, analysis and inference, Software packages. Water quality indices. Water quality for irrigation. Salinity and permeability problem, saline water irrigation root zone salinity, interaction of irrigation and drainage.

Unit II

Sources and types of pollution, organic and inorganic pollutants. BOD–DO relationships, impacts on water resources. NPS pollution and its control, Eutrophication control. Water treatment technologies, Constructed wetlands.

Unit III

Multiple uses of water. Reuse of water in agriculture. Low cost waste water treatment technologies Economic and social dimensions. Packaged treatment units, soil-based water treatment methods, reverse osmosis and desalination in water reclamation.

Unit IV

Principles of water quality, water quality classification, water quality standards, water quality indices, TMDL Concepts. Water quality models. Soil crop and other practices for use of poor quality water.

VI. Practical

Determination of pH, total solids, dissolved and suspended solids, chlorides, sulphates, turbidity, dissolved oxygen, hardness. Preparation of water quality map of watershed in GIS environment. Visit of water polluted site of nearby area.

VII. Learning outcome

The students will be able to understand water quality standards which are quite important for drinking and irrigation purposes. They will also be exposed to source and type of pollution along with multiple uses of water.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Physical and chemical properties of water, suspended and dissolved solids, EC and pH, major ions. Water quality (Physical, Chemical and Bacteriological) investigation	3
2.	Sampling design, Samplers and automatic samplers. Data collection platforms, Field kits, Water quality data storage, analysis and inference	3
3.	Software packages. Water quality indices. Water quality for irrigation	2
4.	Salinity and permeability problem, saline water irrigation root zone salinity, interaction of irrigation and drainage	3
5.	Sources and types of pollution, organic and inorganic pollutants. BOD–DO relationships, impacts on water resources	3
6.	NPS pollution and its control, Eutrophication control. Water treatment technologies, Constructed wetlands	3
7.	Multiple uses of water. Reuse of water in agriculture. Low cost waste water treatment technologies	3
8.	Economic and social dimensions. Packaged treatment units, soil-based water treatment methods, reverse osmosis and desalination in water reclamation	3
9.	Principles of water quality, water quality classification	3
10.	water quality standards, water quality indices	2
11.	TMDL Concepts. Water quality models	2
12.	Soil crop and other practices for use of poor quality water	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Determination of pH, total solids, dissolved and suspended solids	4
2.	Determination of chlorides, sulphates, turbidity	3

S.No.	Topic	No. of Practicals
3.	dissolved oxygen, hardness	4
4.	Preparation of water quality map of watershed in GIS environment	4
5.	Visit of water polluted site of nearby area	1

I. Course Title : Experimental Stress Analysis

II. Course Code : CE 510

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with importance of analysis of stress, analysis of strain, stress-strain relationship under different constraint conditions in 2-D plane as well as 3-D plane.

V. Theory

Unit I

Strain and stress – strain relationship. Generalized Hook's Law. Strain Gauges-Mechanical, optical, electrical, acoustical and pneumatic etc and their use.

Unit II

Different types of electrical resistance strain gauges. Semi-conductor strain gauges. Rosette analysis. Strain gauge circuits. Strain measurements at high temperatures.

Unit III

Two dimensional and three dimensional photo-elastic method of strain analysis. Bifringent coatings and scattered light in photo-elasticity.

Unit IV

Brittle coating methods. Moiré's method of strain analysis. Grid method of strain analysis. Photo elastic strain gauges.

VI. Learning outcome

The students will be able to analyze stress, strain and their interrelationships when they are subjected to different end conditions in two dimensional and three dimensional planes and provide basis for analyses and calculations, including simplifications and assumptions made, when formulating for stress and strain.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Strain and stress – strain relationship. Generalized Hook's Law	3
2.	Strain Gauges- Mechanical, optical, electrical, acoustical and pneumatic etc.	3
3.	Use of different strain gauges. Types of electrical strain gauges.	3
4.	Semi-conductor gauges. Rosette analysis. Strain gauge circuits.	32
5.	Strain measurements at high temperatures.	2
6.	Two dimensional photo-elastic method of strain analysis.	3
7.	Three dimensional photo-elastic method of strain analysis.	3
8.	Bifringent coatings and scattered light in photo-elasticity.	3
9.	Brittle coating methods	3
10.	Moir's method of strain analysis.	2
11.	Grid method of strain analysis. Photo elastic strain gauges.	2
	Total	**32**

VIII. List of Practicals

S.No.	Topic	No. of Practicals
1.	Cementing of an electrical resistance strain gage on a structural member	1
2.	To find the gage factor for a resistance type strain gage.	1
3.	To measure strain at centre of bream when loaded at greater points by making use of two strain gages one at top surface and 2nd at bottom both along longitudinal direction and fixing both in first and second arm of the bridge.	3
4.	To measure the modulus of elasticity of the beam making use of four strain gages, two on top and two on bottom, one on longitudinal and one in transversal direction on each face of the beam.	3
5.	Deter mine the tension produced in a circular shaft by using strain gages cemented perpendicular to each other.	1
6.	Determine the bending moment produced in a circular shaft by using a rectangular shaft.	1
7.	To align the circular polariscope.	1
8.	Study the plane polariscope and circular polariscope with different light field arrangements.	1
9.	Study of Moiré fringe apparatus and its applications in analysis of structures.	2
10.	Calibrate the photoelastic material by use of rectangular beam under pure bending.	2
	Total	**16**

Department of Mechanical Engineering

I. Course Title : Mechatronics and Robotics in Agriculture
II. Course Code : ME 501
III. Credit Hours : 2+0

IV. Aim of the course

To introduce the fundamentals of mechatronics and the concepts behind designing mechatronic systems and their subsystems and its application in automation in agriculture.

V. Theory

Unit I

Introduction to mechatronics: Basic definitions, key elements of mechatronics, historical perspective, the development of the automobile as a mechatronic system. Mechatronic design approach, functions of mechatronic systems, ways of integration, information processing systems, concurrent design procedure for mechatronic systems.

Unit II

System interfacing, instrumentation, and control systems.Input/output signals of a mechatronic system, signal conditioning, microprocessor control, microprocessor numerical control, microprocessor input/output control.

Unit III

Microprocessor based controllers and microelectronics: Introduction to microelectronics, digital logic, overview of control computers, microprocessors and microcontrollers, programmable logic controllers, digital communications.

Unit IV

Technologies of robot: Sub systems, transmission system (Mechanics), power generation and storage system, sensors, electronics, algorithms and software. Servo motor drives types and applications. Stepper motor and its concept. Industrial robots: Classification and sub systems. Defining work space area.

Unit V

Application of robots in agriculture: Harvesting and picking, weed control, autonomous mowing, pruning, seeding, spraying and thinning, phenotyping, sorting and packing. Utility platforms. Use of different agrobots in agriculture.

VI. Learning outcome

Ability to understand agricultural machinery that is built on concepts of mechatronics and ability to use robotic machinery in agriculture.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to Mechatronics: Basic definitions, key elements of mechatronics,	2
2.	Historical perspective, the development of the automobile as a mechatronic system	1
3.	Mechatronic design approach, functions of mechatronic systems, ways of integration, information processing systems, concurrent design procedure for mechatronic systems.	3
4.	System interfacing, Instrumentation, and control systems	2
5.	Input/output signals of a mechatronic system, signal conditioning	2
6.	Microprocessor control, microprocessor numerical control, microprocessor input/output control	2
7.	Microprocessor based controllers and microelectronics	2
8.	Introduction to microelectronics, digital logic, overview of control computers	2
9.	Microprocessors and microcontrollers, programmable logic controllers, digital communications.	3
10.	Technologies of robot: Sub systems, transmission system (Mechanics), power generation and storage system	2
11.	sensors, electronics, algorithms and software. Servo motor drives types and applications	2
12.	Stepper motor and its concept. Industrial robots: Classification and sub systems. Defining work space area.	2
13.	Application of robots in agriculture: Harvesting and picking, weed control	2
14.	autonomous mowing, pruning, seeding, spraying and thinning	2
15.	phenotyping, sorting and packing. Utility platforms. Use of different agrobots in agriculture.	3
	Total	**32**

I. Course Title : Refrigeration Systems

II. Course Code : ME 502

III. Credit Hours : 2+1

IV. Aim of the course

To acquire the skills required to model, analyse and design different refrigeration processes and components.

V. Theory

Unit I

Reversed Carnot cycle, Carnot, Brayton and aircraft refrigeration systems.

Unit II

Vapour compression refrigeration systems: Use of p-h chart, effect of pressure changes on COP, sub cooling of condensate on COP and capacity, super heating, single stage, multi-stage and cascade systems.

Unit III

Vapour absorption systems: Theory of mixtures, temperature-concentration and enthalpy concentration diagrams, adiabatic mixing of two systems, diabatic mixing, throttling process, ammonia water and water lithium-bromide systems.

Unit IV

Thermoelectric refrigeration systems: Advantages, comparison with vapour compression system. Vortex tube refrigeration system and its thermodynamic analysis. Ultra low temperature refrigeration. Ejection refrigeration. Water refrigeration: Centrifugal and steam jet refrigeration systems, characteristics of steam jet refrigeration system, effect of boiler efficiency on overall COP, actual steam jet system, two-fluid jet refrigeration.

VI. Practical

Numerical on air refrigeration cycle, Study of vapour compression refrigeration systems, Determination of the coefficient of performance of the refrigeration system, Study of vapour absorption (electrolux) refrigeration systems, Study and application of P-V, T-s and P-h chart in refrigeration, Study and performance testing of domestic refrigerator, Study of domestic water cooler, Study of actual and theoretical COP of Cascade Refrigeration System, Visit to cold storage plants.

VII. Learning outcome

After studying this course, students shall be able to analyse air and vapour compression refrigeration cycle, and perform thermodynamic analysis of absorption, steam jet, thermoelectric and vortex tube refrigeration systems.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Reversed Carnot cycle, Carnot cycle	2
2.	Brayton refrigeration systems	2
3.	Aircraft refrigeration systems	4
4.	Vapour compression refrigeration systems, Single stage vapour compression refrigeration, Use of p-h chart	3
5.	Effect of pressure changes on COP, sub cooling of condensate on COP and capacity, super heating	2
6.	Multi-stage vapour compression refrigeration systems	3
7.	Cascade vapour compression refrigeration systems	2
8.	Vapour absorption systems: Theory of mixtures, temperature-concentration and enthalpy concentration diagrams, adiabatic mixing of two systems, diabatic mixing, throttling process,	3
9.	Ammonia water vapour absorption systems.	1
10.	Water lithium-bromide vapour absorption systems.	1
11.	Thermoelectric refrigeration systems: Advantages, comparison with vapour compression system.	1
12.	Vortex tube refrigeration system and its thermodynamic analysis.	1
13.	Ultra low temperature refrigeration.	3
14.	Water refrigeration, Centrifugal refrigeration	1
15.	Ejection refrigeration, Steam jet refrigeration systems, characteristics of steam jet refrigeration system, effect of boiler	

S.No.	Topic	No. of Lectures
	efficiency on overall COP, actual steam jet system, two-fluid jet refrigeration.	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Numerical on air refrigeration cycle	2
2.	Study of vapour compression refrigeration systems	1
3.	Determination of the coefficient of performance of the refrigeration system	1
4.	Study of vapour absorption (electrolux) refrigeration systems	2
5.	Study and application of P-V, T-s and P-h chart in refrigeration	3
6.	Study and performance testing of domestic refrigerator,	2
7.	Study of domestic water cooler	1
8.	Study of actual and theoretical COP of Cascade Refrigeration System	2
9.	Visit to cold storage plants.	2

I. Course Title : Mechanism Analysis and Synthesis

II. Course Code : ME 503

III. Credit Hours : 2+1

IV. Aim of the course

The objective of the course is to understand the analysis and synthesis of mechanisms and to learn the graphical and analytical techniques commonly used in the synthesis of mechanisms.

V. Theory

Unit I

Kinematics of mechanisms, analysis and synthesis, mobility, systematic of mechanisms, deriving other mechanisms from linkages, Relative motion, instantaneous center method, Kennedy's theorem. Graphical and analytical methods of kinematic analysis.

Unit II

Computer - Aided analysis of mechanisms. Synthesis of linkages for path generation, function generation, Graphical techniques. Relative pole method and method of inversion. Analytical kinematics synthesis of linkages, Freudenstein's method, Loop closure equations based on complex variable approach,

Unit III

Gears and their motion-Analysis and Synthesis of epicyclic gear trains.

Unit IV

Cams-follower system; standard follower motions and combinations, importance of follower acceleration in cam system dynamics, terms related to cam design - their importance. Cam synthesis - graphical cam profile layout for a desired follower motion. Analytical determination of cam profile co-ordinates for disc cam operating common types of follower.

VI. Practical

Graphical solutions of mechanisms relating to velocity and acceleration. Problems on computer-aided analysis and synthesis of mechanisms. Analysis and design problems of gear trains, cam profile design.

VII. Learning outcome

The Student will be able to design mechanisms for better accuracy and productivity. The student will Get familiar with design process of the mechanisms for functional requirements.

VIII. Lecture Schedule

S.No.	Topics	No. of Lectures
1.	Introduction & basic concepts.	2
2.	Kinematics of mechanisms, analysis and synthesis, mobility, systematic of mechanisms, deriving other mechanisms from linkages	3
3.	Determination of velocity and acceleration using graphical method and analytical methods (relative velocity and acceleration, instantaneous centers), Kennedy's theorem. Graphical and analytical methods of kinematic analysis	4
4.	Computer - Aided analysis of mechanisms. Synthesis of linkages for path generation, function generation, Graphical techniques. Relative pole method and method of inversion	3
5.	Analytical kinematics synthesis of linkages, Freudenstein's method, Loop closure equations based on complex variable approach	5
6.	Introduction to spur, helical, spiral, bevel and worm gears, law of gearing, nomenclature, velocity of sliding between two teeth in mesh.	3
7.	Gears and their motion-Analysis and Synthesis of epicyclic gear trains	4
8.	Cams-follower system; standard follower motions and combinations, importance of follower acceleration in cam system dynamics, terms related to cam design	4
9.	Cam synthesis - graphical cam profile layout for a desired follower motion. Analytical determination of cam profile co-ordinates for disc cam operating common types of follower.	4
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Graphical solutions of mechanisms relating to velocity and acceleration (4 different mechanisms to be studied)	4
2.	Problems on computer-aided analysis and synthesis of mechanisms	4

S.No.	Topic	No. of Practicals
3.	Analysis and design problems of gear trains	5
4.	Cam profile design	3
	Total	**16**

I. Course Title : Vibrations

II. Course Code : ME 504

III. Credit Hours : 3+0

IV. Aim of the course

To enable the students to design vibration control sytem,and balancing of rotating and reciprocating masses.

V. Theory

Unit I

Vibration motion and its terminology. Undamped free vibrations, equations of motion- natural frequency. Energy method, Rayleigh method; effective mass principle of Virtual work. Equivalent spring stiffness in parallel and in series. Harmonic analysis and Fourier Series

Unit II

Damping - viscous, solid, coulomb equivalent dampers. Viscosity damped free vibrations, Logarithmic decrement. Forced vibrations with harmonic excitation and rotating unbalance. Energy dissipated by damping

Unit III

Forced vibration with damping, Vibration isolation and force and motion transmissibility. Two degree of freedom systems. Principal modes of vibration, co-ordinate coupling. Vibration absorbers

Unit IV

Free vibration equation of motion for multi-degree of freedom systems. Influence coefficients and Maxwell's reciprocal theorem, stiffness coefficients. Numerical methods for finding natural frequencies for multi-degree of freedom systems.

Unit V

Vibration of lumped parameter systems and continuous systems. Lagrange equations. Vibration measuring instruments, Vibrometers, velocity pickups, Accelerometer and frequency measuring instruments. Applications of vibrations. Vibration control, balancing of rotating and reciprocating machines, design of vibration isolators.

VI. Learning outcome

The student will be able to understand the concept of vibrations, analyze the mathematical modeling of the multidegree freedom systems and able to design vibration isolators.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Vibration motion and its terminology.	2
2.	Undamped free vibrations, equations of motion- natural frequency.	2
3.	Energy method, Rayleigh method; effective mass principle of Virtual work.	2
4.	Equivalent spring stiffness in parallel and in series.	1
5.	Harmonic analysis and Fourier Series.	2
6.	Damping - viscous, solid, coulomb equivalent dampers.	3
7.	Viscosity damped free vibrations, Logarithmic decrement	3
8.	Forced vibrations with harmonic excitation and rotating unbalance	2
9.	Energy dissipated by damping. Forced vibration with damping,	3
10.	Vibration isolation and force and motion transmissibility.	2
11.	Two degree of freedom systems. Principal modes of vibration co-ordinate coupling	3
12.	Vibration absorbers,	2
13.	Free vibration equation of motion for multi-degree of freedom systems.	2

I. Course Title : Fatigue Design

II. Course Code : ME 507

III. Credit Hours : 2+1

IV. Aim of the course

The course provides an understanding on fatigue design considerations of mechanical components. The causes of fatigue in brittle and ductile materials are taught with focus on crack initiation, propagation and fracture.

V. Theory

Unit I

Theories of failure, maximum normal stress, maximum shear stress and distortion energy theory, failure of ductile materials, failure of brittle materials.

Unit II

Stress concentration and its evaluation, stress concentration of ductile and brittle materials under static loading and under dynamic loading, determining geometric stress concentration factors, designing to avoid stress concentration.

Unit III

Fatigue of machine components, mechanism of fatigue failure, fatigue failure models and their considerations in design of machine elements, fatigue loads. Fatigue testing and presentation of fatigue data. Influence of stress conditions on fatigue strength/endurance limit of metals. Low and high cycle fatigue

Unit IV

Cumulative fatigue damage. Designing for finite and infinite life. Improving fatigue resistance of machine elements. Stress corrosion. Corrosion fatigue.

Practical Fatigue tests on testing machine(s) for specimens of different materials having different discontinuities/stress raisers and various surface conditions. Determination of correlation between fatigue limit and ultimate strength of material. Problems in fatigue design of common machine component.

VI. Learning outcome

The students is able to understand technical aspects and principles of fatigue design. The student can design the engineering product having good durability and long fatigue life

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Introduction to cyclic loading and Fatigue Design	1
2	Types of Loads and Stresses, Different theories of Failure like maximum normal stress, maximum shear stress and distortion energy theory etc.	3
3	Determining stress concentration based on geometric stress concentration factors, Design considerations to avoid stress concentration of ductile and brittle materials.	3
4	Mechanical failure. Macroscopic failure modes, Behavior of brittle and ductile materials in fatigue and stress concentration. Fracture in brittle and ductile materials, characteristics of fracture surfaces, inter-granular and intra-granular failure.	4
5	Cleavage and micro-ductility, growth of fatigue cracks, The ductile/brittle fracture transition, temperature for notched and unnotched components. Fracture at elevated temperature.	3
6	Fatigue of machine components, mechanism of fatigue failure. Low and high cycle with examples mean stress R ratio, strain and load control. S-N curves.	4
7.	Goodman's rule and Miners rule. Micro-mechanisms of fatigue damage, fatigue limits and initiation and propagation control, leading to a consideration of factors enhancing fatigue resistance.	3

S.No.	Topic	No. of Lectures
8.	Fatigue loads and mathematical models. Fatigue testing and presentation of fatigue data, Influence of stress conditions on fatigue strength/endurance limit of metals.	3
9.	Total life and damage tolerant approaches to life prediction. Fatigue failure models and their considerations in design of machine elements. Cumulative fatigue damage and Designing for finite and infinite life	2
10.	Methods to improve fatigue resistance of machine elements. Improvement of fatigue strength by chemical/metallurgical processes such as nitriding, flame hardening, case carburizing. Fatigue strength enhancement by mechanical work, cold rolling, peening, shot peening.	3
11.	Environmental Assisted Cracking: Stress corrosion cracking, Hydrogen embrittlement, Corrosion fatigue. Creep: Creep curves, Mechanisms of creep, Stress rapture test, Life prediction, High temperature alloys.	3
	Total	**32**

VIII. List of Practicals

S.No.	Topic	No. of Practicals
1.	Load measurement using Load indicator, Load Cells	1
2.	Strain measurement using Strain Gauge	1
3.	Stress measurement using strain rosette	1
4.	Determination of Fatigue strength measurement of S45C or alike material under same loading condition for different stress concentrations factors (like holes, notches, sharp corners for at least 5 different samples). Comparison to be listed.	5
5.	Study to improvement Fatigue Design based on at least 5 different processes like flame hardening, case carburizing, nitriding, shot peening, peening etc or alike processes.	5
6.	Determination of correlation between fatigue limit and ultimate strength of commercially available S45C material for three different samples	3
	Total	**16**

I. Course Title : Computer Aided Design

II. Course Code : ME 515

III. Credit Hours : 2+1

IV. Aim of the course

The **course** provides an understanding on computer aided design. It provides in depth knowledge about 2-d drawing, 3-D Modeling and finite element analysis for optimum product design.

V. Theory

Unit I

Introduction to computer aided design, scope of computer aided machine design, design process and design environments. Geometric modeling and interactive graphic, engineering analysis, design review and automated drafting, modeling, viewing,

Unit II

3-D solid modeling, boundary representation, constructive solid geometry, feature based modeling. Computer aided analysis and synthesis of common mechanical components, a bar, a beam and a shaft, comparison with analytical results.

Unit III

Application of numerical methods and optimization techniques to machine design problems, Computer aided selection of standard mechanical components. Introduction to FEM. FEA using two dimensional and three dimensional elements; plain strain and plain stress problems, finite element mesh, automatic meshing techniques, limitations of FEM.

Practical Computer aided design problems for machine components, use of standard software, CAD models for other applications. Development of FEM models for analysis of a bar, beam and a shaft. Practice in using an FEM software on other real life problems like spanners, connecting rods.

VI. Learning outcome

The students can design a product having better accuracy, less errors, increased productivity and shorter lead times with the help of CAD.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Introduction to Engineering Design, design steps and computer aided design.	2
2	Software and workstation selection for CAD. Design process with and without CAD	3
3	Input and output devices, Display devices; GKS, IGES and STEP; Modeling and viewing, Application areas of CAD.	3
4	Wireframe model, solid modeling, Boundary Representation (B-rep), Constructive Solid Geometry (CSG).	3
5	Mass, volumetric properties calculations; surface modeling, concepts of hidden-line removal and shading: Mechanical Assembly Kinematics analysis and simulation	3
6	Parametric Modeling Technique. Non-parametric and parametric representation of curves.	2
7	Parametric representation of Hermite Cubic, Beizer and B-spline curves; Surface and its analysis. Representation of Analytical and synthetic surfaces.	2
8	Numerical methods and optimization techniques to engineering design problems	3
9	Overview of FEM, Advantages and applications, recent advance in FEM, FEA software Basic principles and general procedure of FEM	3
10	Analyzing simple machine elements and comparing with analytical results of simple machine elements like bar, beam and a shaft.	4

S.No.	Topic	No. of Lectures
11	Simple Project. Mathematical modelling and design calculations of machines.	4
	Total	**32**

VIII. List of Practicals

S.No.	Topic	No. of Practicals
1.	Introduction to 2-D drawing. Use of any relevant software	2
2.	Study of drawings in First angle and third angle projections	1
3.	2-D assembly drawing and generation of BOM	1
4.	3-D Modeling. GKS, IGES and STEP; Modeling and viewing. Use of relevant software	3
5.	Assembly Design	2
6.	Introduction to FEA software. Mesh generation (Nodes and elements). Use of any other relevant software for FEA	3
7.	Practice on Boundary conditions like loads and constraints.	2
8.	Study of static and dynamic loading conditions. Study of Machine elements like bars, beams and shafts or other machine elements.	2
	Total	**16**

Department of Maths, Statistics and Physics

I. Course Title : Finite Element Methods

II. Course Code : MATH 501

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction. Historical background, Stress equilibrium, boundary condition,stress strain relation, potential energy and equilibrium. Rayleigh-Ritz method. Galerkin method.

Unit II

coordinates and shape functions, potential energy approach,element stiffness matrix,Galerkin approach, assembly of global stiffness matrix. The finite element equation, boundary conditions.

Unit III

Trusses: Two dimensional problems, modeling by constant strain triangle, two dimensional iso-parametric elements, the four-node quadrilateral.

Unit IV

Scalar field problems, steady state heat transfer, torsion, potential flow, seepage and fluid flow index, dynamic analysis, principles.

V. Practical

Use of simple FEM software for FEM software for understanding, principles of FEM. Working out simple problems using LISA or any simple software with understanding of operation. Solving one dimensional problem. Solution to planar and spatial trusses, solving simple two-dimensional problems, Axisymmetric problems, solution of problems with two dimensional iso-parametric elements,solving simple beams and frames, three dimensional problems, solution to heat transfer problems and flow problems.

Learning outcome

Ability to formulate problems based on use of FEM and solve them using software tools.

VI. Lecture Schedule

S.No.	Topic	No.of Lectures
1.	Introduction. Historical background, Stress equilibrium, boundary condition	4
2.	Stress strain relation, potential energy and equilibrium, Rayleigh-Ritz method, Galerkin method.	4

I. Course Title : Numerical Methods for Engineers

II. Course Code : MATH 502

III. Credit Hours : 2+1

IV. Aim of the course

To expose students to various numerical methods for solving algebraic equations, ordinary and partial differential equations.

V. Theory

Unit I

Solution of Algebraic Equations: Solution of non-linear and transcendental equations in one or more than one variable using bisection, false position, iteration, Newton Raphson, Secant methods. Solution of linear simultaneous equations: Matrix inversion, Gauss elimination, Gauss Jordan, LU decomposition methods, ill-conditioned systems.

Unit II

Solution of Ordinary Differential Equations: Initial Value Problem, Taylor series method, Picard's method, Euler method, Modified Euler method, RK class and predictor corrector class methods. Stiff ODE's and Gear's methods. Boundary Value Problem, Shooting methods, finite difference method. Use of Method of weighted residuals and orthogonal collocation and Galerkin technique to solve BVP in ODEs

Unit III

Eigen values and Eigen vectors: Maximum and minimum eigenvalue by Power spectral and Inverse Power Method, all eigenvalues by Fadeev-Leverrier method. Introduction to diagonalization and QR Factorization.Approximation Theory.

Unit IV

Finite difference formulae: Forward and backward differences, Richardson's extrapolation, interpolation formulae, polynomial forms, linear interpolation, Lagrange interpolation polynomial, Newton interpolation polynomial.

Unit V

Solution of Partial Differential Equations: Classification of PDEs(Parabolic, elliptical and hyperbolic equation), Elliptical equations, standard five pointsformula, diagonal five-point formula. Solution of Laplace equation by Liebman's iteration method.Poisson's equation and its applications.Solution of parabolic equations by Bender–Schmidt method, Bender-Schmidt recurrence equation, Crank-Nicholson difference method.

VI. Practical

Use of EXCEL Sheet and MATLAB: Application of EXCEL Sheet and MATLAB to solve the Engineering problems

VII. Learning outcome

Ability to solve algebraic equations, ordinary and partial differential equations coming across in Agricultural Engineering problems using various numerical methods, ability to use latest software's towards numerical problems.

VIII. Lecture Schedule

I. Course Title : Numerical Analysis

II. Course Code : Math 506

III. Credit Hours : 2+1

IV. Aim of the course

To provide understanding and application of basic numerical techniques for evaluation and approximation of roots of polynomials, solution of differential equations, numerical differentiation and integration.

V. Theory

Unit I

Computational errors, absolute and relative errors, difference operators, divided differences, interpolating polynomials using finite differences, Hermite interpolation, piecewise and spline interpolation, bivariate interpolation.

Unit II

Numerical solution of algebraic and transcendental equations by bisection, secant and Newton-Raphson's Methods, solution of polynomial equations by Birge-Vieta's, Bairstow's and Graffe's root squaring methods.

Unit III

Numerical differentiation based on interpolation, finite differences and undetermined coefficients. Numerical integration using methods based on interpolation and undetermined coefficients.

Unit IV

Numerical solution of ordinary differential equations of first order and first degree by Runge -Kutta method and predictor-corrector methods. Solution of linear system of equations, Gaussian elimination method, pivoting and scaling, factorization method, iterative techniques, inverse of a matrix, computation of eigen values and eigen vectors.

VI. Practical

Tutorials on: divided differences, Hermite and spline interpolation, bivariate interpolation, roots of algebraic and transcendental equations by Newton-Raphson's method, bisection method, Birge-Vieta's method, Bairstow's and Graffe's root squaring methods for polynomial equations, numerical evaluation of derivatives and integral, Runge-Kutta and predictor- corrector methods, Gaussian elimination method, factorization method, iterative techniques, inverse of a matrix, eigen values and eigen vectors.

VII. Learning outcome

To understand basic numerical methods and apply them to solve higher engineering problems.

VIII. Lecture Schedule

I. Course Title : Numerical Methods for Ordinary and Partial Differential Equations

II. Course Code : Math 507

III. Credit Hours : 2+1

IV. Aim of the course

To provide understanding and application of basic numerical techniques for evaluation and approximation of ordinary and partial differential equations.

V. Theory

Unit I

Interpolation, Approximation, least square and uniform approximation.

Unit II

Numerical differentiation and integration, Numerical solution of ordinary differential equations by single step and multi-step methods

Unit III

Various difference schemes for solutions of partial differential equations of parabolic, elliptic and hyperbolic types

Unit IV

Solution of differential equations by finite element methods

VI. Practical

Tutorials on: evaluation of derivatives and integrals by numerical methods, single step and multistep methods for solution of ordinary differential equations, solution of parabolic, hyperbolic and elliptic equations by finite difference methods. Finite element methods

VII. Learning outcome

To understand basic numerical techniques and apply them to solve ordinary and partial differential equations.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Interpolation	3
2.	Approximation	3
3.	Least square approximation	2
4.	Uniform approximation	2
5.	Numerical differentiation	3
6.	Numerical integration	3
7.	Numerical solution of ordinary differential equations by single step method	3
8.	Numerical solution of ordinary differential equations by multi-step method	3
9.	Various difference schemes for solutions of partial differential equations of parabolic type	2
10.	Various difference schemes for solutions of partial differential equations of elliptic type	2
11.	Various difference schemes for solutions of partial differential equations of hyperbolic type	2
12.	Solution of differential equations by finite element methods	4
	Total	**32**

IX. List of Practical

S.No.	Topic	No. of Practicals
1.	Evaluation of derivatives by numerical methods	2
2.	Evaluation of integrals by numerical methods	2
3.	Single step method for solution of ordinary differential equation	2
4.	Multistep method for solution of ordinary differential equation	2
5.	Solution of parabolic equations by finite difference method	2
6.	Solution of hyperbolic equations by finite difference methods	2
7.	Solution of elliptic equations by finite difference methods	2
8.	Finite Element methods	2
	Total	**16**

I. Course Title : Statistical Methods for Research Workers

II. Course Code : STAT 501

III. Credit Hours : 2+1

IV. Aim of the course

To expose students to various statistical techniques for analysis of data and interpretation of results.

V. Theory

Unit I

Probability and probability distributions. Principle of least squares. Linear and non-linear regression. Multiple regression. Correlation analysis. Selection of variables. Validation of models. Sampling techniques. Determination of sample size. Sampling distribution of mean and proportion.

Unit II

Hypothesis testing. Concept of p-value. Student's t-test. Large sample tests. Confidence intervals. ANOVA and testing of hypothesis in regression analysis. Analysis of variance for one way and two way classification (with equal cell frequency).Transformation ofdata.

Unit III

Advantages and disadvantages of nonparametric statistical tests. Scales of measurements. Run-test. Sign test. Median test. Wilcoxon-Mann Whitney test. Chi-square test. Kruskal-Walli's one way and Friedman's two way ANOVA by ranks. Kendall's Coefficient of concordance.

VI. Practical

Fitting of distributions. Sample and sampling distributions. Correlation analysis. Regression analysis (Multivariate, quadratic, exponential, power function, selection of variables, validation of models, ANOVA and testing of hypothesis). Tests of significance (Z-test, t-test, F-test and Chi-square test). Analysis of variance. Non-parametric tests.

VII. Learning outcome

The students will be able to understand different techniques for analyzing the data of their research work.

VIII. Lecture Schedule

S.No.	Topics	No. of Lectures
1.	Elementary statistics	
2.	Probability theory	2
3.	Probability distributions (Binomial, Poisson and Normal)	3
4.	Sampling techniques, Determination of sample size	2
5.	Sampling distribution of mean and Proportion	1
6.	Hypothesis testing concept of p-value	1
7.	Large sample (mean, proportion)	1
8.	Student's t-test (Single mean, Difference of mean for independent samples and paired observations) and F-test	3
9.	Analysis of variance (one way and two way), Transformation of data	2
10.	Correlation analysis and testing (Bivariate, Rank, Intra-class, Partial, Fisher's Z-transformation)	2
11.	Multiple linear regression and model validation	2
12.	Testing of coefficient of determination and regression coefficient	2
13.	Selection of variables in regression (forward substitution method and step-wise regression)	1
14.	Non-Linear regression (Quadratic, exponential and Power)	2
15.	Introduction to Non-parametric and scales of measurements	1
16.	Chi-square test (Goodness of fit, Independence of attributes, homogeneity of variances)	2
17.	One Sample test (Sign test, Median test, Run rest,)	2
18.	Two sample test (Wilcoxon Sign test, Mann Whitney test, Chi square test for two independent samples)	1
19.	K-Sample (Kruskal-Walli's test and Friedman's two way ANOVA)	2
20.	Kendall's coefficient of concordance	1
	Total	**33**

IX. List of Practicals

S.No.	Topics	No. of Practicals
1.	Elementary statistics	1
2.	Probability distributions (Binomial, Poisson and Normal)	1
3.	Sampling techniques, Determination of sample size, Sampling distribution of mean and Proportion	1
4.	Large sample (mean, proportion)	1
5.	Student's t-test (Single mean, Difference of mean for independent samples and paired observations) and F-test	1
6.	Analysis of variance (one way and two way), Transformation of data	2
7.	Correlation analysis and testing (Bivariate, Rank, Intra-class, Partial, Fisher's Z-transformation)	1
8.	Multiple linear regression and model validation	1
9.	Testing of coefficient of determination and regression coefficient	
10.	Selection of variables in regression (Forward substitution method and step-wise regression)	1
11.	Non-Linear regression (Quadratic, exponential and Power)	2
12.	Introduction to Non-parametric and scales of measurements	
13.	Chi-square test (Goodness of fit, Independence of attributes, homogeneity of variances)	2
14.	One Sample test:Sign test, Median test, Run rest, Two sample test: Wilcoxon Sign test, Mann Whitney test, X^2 test for two independent samples	1

S.No.	Topic	No. of Practicals
15.	K-Sample: Kruskal-Walli's test and Friedman's two way ANOVA, Kendall's coefficient of concordance	1
	Total	**16**

I. Course Title : Experimental Designs

II. Course Code : Stat 502

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint and equip the students with the basic principles of theory of designs and analysis of experiments.

V. Theory

Unit I

Basic principles of experimental designs. Uniformity trials. Completely randomized design, randomized block design and latin square designs. Multiple comparison tests.

Unit II

Missing plot techniques. Analysis of covariance. Factorial experiments:2^2, $2^3$and 3^2. Split plot design. Strip plot design. Factorial in split plot design.

Unit III

Crossover designs. Balanced incomplete block design. Response surface designs. Groups of experiments.

VI. Practical

Uniformity trials. Completely randomized design. Randomized block and latin square designs. Missing plot and analysis of covariance Split plot designs. Factorial in split plot design. Strip plot designs. Cross over and balanced incomplete block designs. Groups of experiments.

VII. Learning outcome

The students will be able to plan and design the experiments for their research.

They will also be exposed to statistical software for the analyzing the data pertaining to designs of this course.

VIII. Lecture Schedule

S.No.	Topics	No. of Lectures
1.	Basic principles of experimental designs,	1
2.	Completely randomized design	1
3.	Randomized block design	1
4.	Latin square design	1
5.	Multiple comparison tests	1

ANNEXURE I

List of BSMA Committee Members for Agricultural Engineering

Name and designation	Address	Specialization
1. **Dr J K Singh** Dean (Retd),	G.B. Pant University of Agriculture and Technology, Pantnagar	Chairman
2. **Dr Jaskarn Singh Mahal** Director of Extension Education Former Dean	College of Agricultural Engg. and Technology),	Convener
3. **Dr T B S Rajput** Emeritus Scientist	Indian Agricultural Research Institute, New Delhi	Member
4. **Dr A K Mehta** Professor & Head	College of Technology and Engineering, MPUAT, Udaipur	Member
5. **Dr S K Jha** Principal Scientist	Division of Post-Harvest Technology, New Delhi	Member
6. **Dr D Manohar Jesudas** Professor & Head	Department of Agricultural Machinery & Research Centre, TNAU, Coimbatore	Member
7. **Dr P K Singh** Professor	Department of Soil and Water Engineering, MPUAT, Udaipur	Member
8. **Dr Atul Mohod** Head, Department of Agricultural Engineering	Dr B.S. Konkan Krishi Vidyapeeth, Dapoli	Member

ANNEXURE II

Acknowledgements
(Food Technology)

The teaching and processing of food on commercial scale is of much recent origin and the number of teaching institutions and of research are countable on fingers. Like, dairy processing, food processing technology also started on the same pattern about two decades back. Indian Council of Agricultural Research recommended a 4 year undergraduate programme through its Dean's committee in year 2016 for different agriculture and allied fields. On completion of the exercise of Deans committee the next step of improving and developing Masters and Doctoral program by constituting Broad Subject Matter Area (BSMA) Committees for revision and uniformity in curricula and regulations. The narration in this manuscript is the outcome of BSMA on Food Technology meetings held at various locations and feedback from various institutions and invited specialists from other institutions and the industry.

During the course of this exercise, two meeting and two workshops were held at different institutions of the country with a view to obtain the status as well as the experiences of the faculty across the institutions and then deliberate on them with all enabling the committee to synthesize and make suitable recommendations to be used while framing the course titles and contents and decide the teaching weightage in terms of credits. Subsequently, the formation of course contents were assigned to a specialist group from amongst the committee members. These groups took the assignments to their respective places for completion. Such assignments were first presented in the next meeting/workshop for discussion and further moderations in view of some additional inputs received from other scientists. In this way the whole exercise took place for master's as well as Doctoral courses. Though, the work was vast but with due diligence and vigil by all of us, the matter reached to the desired stage of satisfactory completion. For all to happen, a word of gratefulness and gratitude to all need complements individually as well as combinedly.

First of all the Committee is beholden to Dr Trilochan Mohapatra, Secretary, DARE and Director General, ICAR, for reposing faith in the Committee and giving opportunity and guidance to examine, revise, and update the post graduate and doctoral curricula to build quality human resources and to fortify academic standards in our vitally important agriculture sector. The Committee is deeply indebted to Dr N.S. Rathore, and to his predecessor Dr R.C. Agrawal, Deputy Director General (Edn.), ICAR, New Delhi for their indulgence and guidance. Sincere gratitude to Dr G. Venkateshwarlu, Assistant Director General (EQR) for his humble and precise approach to support in numerous ways, along with Dr K.L. Khurana, Retired Principal Scientist, Education Division, Indian Council of Agricultural Research New Delhi to work as a bridge between the BSMA and ICAR.

Due recognition and gratefulness is to Dr Arvind Kumar Hon'ble Vice Chancellor, Rani Laxmibai Central Agricultural University, Jhansi who provided initial guideline as a Chairman of the core group and continued directives during the process of developing the syllabus.

The Committee would like to place on record its gratitude to all the Vice-Chancellors/ Director of Institutes, Deans and other stakeholders for their tremendous support in completing this challenging task.

Committee express deep sense of gratitude towards Dr S.Patil, Hon'ble Vice Chancellor, Indira Gandhi Krishi Vishwavidyalaya, Raipur, Dr N.C.Patel, Hon'ble Vice Chancellor, Anand Agricultural University, Anand; Dr, Partha Pratim Chakraborty, Director, Indian Institute of Technology, Kharagpur and Dr Chindi Vasudeva, Hon'ble Vice Chancellor of National Institute of Food Technology and Entrepreneurship Management, Kundali, Sonipat for kind permission to conduct meeting/workshop in their institute primarily and later providing institutional support to the members and hospitality. Valuable introductory remarks and permission for participation to the faculty of their faculty is also greatly acknowledged.

The committee express its indebtedness to Dr D C Joshi former Dean, College of Food Processing Technology and Bio Energy (CFPTBE), Anand Agricultural University, Anand, Dr R F Suthar, Dean, CFPTBE, Dr J.B. Prajapti, Dean, SMC Dairy Science College, Dr A.R. Sawate Assoc. Dean and Principal of College of Food Technology Vasantrao Naik Marathwada Krishi Vidyapeeth, Parbhani, Dr Raj Bala Grewal Director, Centre of Food Science and Technology, Choudhary Charan Singh Hissar Agricultural Uuniversity, Hisaar, Dr Poonam Aggarwal Sachdev, Professor, Department of Food Science & Technology, Panjab Agricultural University, Ludhiyana and Dr H. Pandey, Prof & Head Food Process Technology, CFPTBE, AAU, Anand.

Very special thanks to Dr A.K.Sharma, Professor and Head Food Process Engineering, AAU, Anand and Dr Narayan Singh Thakur, Professor (PHT), Department of Food Science and Technology, College of Horticulture, Dr YS Parmar University of Horticulture & Forestry, Solan for their whole hearted support and efforts in preparing the syllabus.

Thanks, are also expressed to the participants of industry at different locations and sharing the training and skill needs of human resource for the future food processing industry.

Our heart core feelings to all the staff of Education Division ICAR and staff of different institutes who supported in organization of meetings/workshop and development of course for their support like a fraternity.

Food Technology
– Processing Technology

Preamble

The efficient use of resources is the growing concern for all involved in food production, processing, distribution and retailing. The unique features of the raw materials of the food processing industries such as seasonality, perishability and variability in conjunction with sophistication required for processing to maintain high quality standards, necessitates special attention towards focused availability of qualified technical manpower, effective technologies and efficient machinery. The food industries in the country need modernization to face the challenges of the globalization. Government of India is also paying special attention to this important sector and associated stakeholders. Efficient utilization of resources will definitely help in manufacturing of nutritious and healthy food but also help in fostering economic development and therefore, improving livelihoods by promoting access to domestic, regional and international markets.

Over the years significant growth in processing technology have resulted in development of various value-added processed food products of very high quality and improvement in existing manufacturing processes. This motivated the BSMA committee for Food Science and Technology to enrich the content and syllabus of the MTech and PhD programmes in the area of Food Processing Technology. This will hopefully produce competent food technologists to handle resources from farm-to-factory-to-consumers and cater the various sectors of food processing industries.

The content and course are developed by keeping in mind the development and advancement in food technology globally. New techniques and advancement in food processing technology and new packaging techniques are introduced. Moreover, a new course is introduced named as Industrial Manufacturing of food and beverage which gives exposure to understand raw material quality, processing and production of food and beverage on industrial scale. Many new courses are introduced, viz. Frozen and Concentrated Foods, Aseptic Processing and Packaging, Traditional Foods, Technologies of Convenience Foods, Food Powders and Premixes, Food Business Management. A new subject Global Food Laws and Regulations is introduced which helps the food industry to export the food product to the world as per their specifications and regulations. New courses like Novel Technologies for Food Processing and Shelf Life Extension, Food Manufacturing Technology, Formulation of Standards of Food Products, Packaging and Labeling are introduced in PhD programme through which the students will develop and formulate new product, new technology and helps in developing the regulations of different food products.

The proposed curricula and quality measures should render Food Technology as an intellectually more stimulating discipline and an economically rewarding profession to attract talent and investment.

M.Tech. in Processing Technology

Major Courses

Course Code	Course Title	Credit Hours
FPT 501	Emerging Technologies in Food Processing*	2+1
FPT 502	Emerging Technologies in Food Packaging*	2+1
FPT 503	Industrial Manufacturing of Food and Beverages*	2+1
FPT 504	Food Material and Product Properties	2+1
FPT 505	Cocoa and Chocolate Processing Technologies	2+1
FPT 506	Spices, Herbs and Condiments	2+0
FPT 507	Meat, Poultry, Fish and Egg Processing	2+1
FPT 508	Nutraceuticals and Specialty Foods	2+1
FPT 509	Frozen and Concentrated Foods	1+1
FPT 510	Aseptic Processing and Packaging	2+1
FPT 511	Traditional Foods	2+1
FPT 512	Technologies of Convenience Foods	2+1
FPT 513	Food Powders and Premixes	2+1
FPT 514	Food Ingredients and Additives	2+1
FPT 515	Flavour Chemistry and Technology	2+1
FPT 516	Bioprocessing and Separation Technology	2+1
FPT 517	Enzymes in Food Processing	2+1
FPT 518	Food Process Automation and Modelling	2+0
FPT 519	Zero Waste Processing	2+0
FPT 520	Special Problem/ Summer Internship	0+2

*Compulsory Rest of the courses will be decided by the students advisory committee keeping the minimum limits set for award of degree.

Minor Courses

Course Code	Course Title	Credit Hours
FPE 502	Engineering Properties of Food Materials	3(2+1)
FPE 504	Bioprocessing and Down Stream Engineering	3(2+1)
FPE 506	Numerical Technique and Stimulation	2(1+1)
FPE 508	Food Safety and Storage Engineering	3(2+1)
FSQ 503	Advanced Food Chemistry	3(2+1)
FSQ 504	Global Food Laws and Regulations	2(2+0)
FSQ 506	Process and Products Monitoring for Quality Assurance	2(2+0)
FSQ 508	Management of Food By-products and Waste	3(2+1)

Supporting Courses

Course Code	Course Title	Credit Hours
BSH 501	Research Methodology	2+0
BSH 502	Food Informatics	1+1
FBM 501	Post-Harvest Management	2+1
FBM 502	Food Business Management	2+0
FBM 503	Food Processing Entrepreneurship and Start up	0+1
FPE 505	Energy Management and Auditing in Food Industry	2+1
FSQ 521	Food Safety Management Systems and Certification	2+1
FSQ 523	Quality Concepts and Chain Traceability	2+0
FPE 510	Operation Research	2+1

Common Courses

S. No.	Course Title	Credit Hours
1.	Library and Information Services	1
2.	Technical Writing and Communications Skills	1
3.	Intellectual Property and its Management in Agriculture	1
4.	Basic Concepts in Laboratory Techniques	1
5.	Agricultural Research, Research Ethics and Rural Development Programmes	1

These courses are available in the form of e-courses/MOOCs. The students may be allowed to register these courses/similar courses on these aspects, if available online on SWAYAM or any other platform. If a student has already completed any of these courses during UG, he/she may be permitted to register for other related courses with the prior approval of the HoD/BoS.

1	Seminar	1+0

Course Contents
M.Tech. in Processing Technology

I. **Course Title** : **Emerging Technologies in Food Processing**
II. **Course Code** : **FPT 501**
III. **Credit Hours** : **2+1**

IV. **Theory**

Unit I

Membrane Technology: Pressure activated membrane processes: MF, UF, NF and RO and their industrial application. Membrane distillation. Supercritical fluid extraction: Concept, property of super critical fluids SCF, extraction methods, application in food processing.

Unit II

Microwave and radio frequency processing: Advantages, mechanism of heat generation, application in food processing: microwave blanching, sterilization and finish drying. Hurdle technology: Concept and Principle, Preservation techniques as hurdles and their principles, hurdle tech foods.

Unit III

High Pressure processing: Concept, equipment for HPP treatment, mechanism of microbial and enzyme inactivation and its application in food processing, effect on food constituents.
Ultrasonic processing: Properties of ultrasonic, types of equipment, application of ultrasonic as processing technique.

Unit IV

Newer techniques in food processing: principle and application of High intensity light, pulse electric field, ohmic heating, IR heating, inductive heating, cold plasma, and pulsed X-rays in food processing and preservation, Cryo-processing of foods Nanotechnology: Principles and applications in foods.

V. **Practical**

- To evaluate the characteristics of treated water using RO system
- To study production and characteristics of treated water using, microfiltration, UF, NF and RO system
- To study the effect of ultrafiltration process on fruit juices quality
- To study suitability and production of fruit juices using ultrafiltration
- To study the effect of microfiltration process on milk quality
- To study super critical fluid extraction system and to carry out extraction of bioactive compound from selected samples
- To carry out extraction of lycopene from tomato using SCFE system
- To study microwave system and to evaluate the effect of different power on drying characteristics of selected vegetable products

- To study microwave blanching of vegetable and determination of blanching efficacy
- To study the ultrasonicator and evaluate the effect of ultrasonication on micro-organism in sample
- To study the ultrasonicator and to evaluate the effect of ultrasonication on extracted juice yield from fruit pomace
- To evaluate the different pre-treatment on oil yield from oil seed cake
- To prepare nano emulsion and study of their characteristics
- To study ohmic heating system and to study the processing of fruit pup using ohmic heating system
- To visit food industries utilizing advance food processing techniques
- To study the effect of different drying techniques/ hybrid drying techniques on fruits and vegetables.

I. Course Title : Emerging Technologies in Food Packaging

II. Course Code : FPT 502

III. Credit Hours : 2+1

IV. Theory

Unit I

Active and intelligent packaging: Active Packaging Techniques and intelligent Packaging Techniques, current use of novel Packaging Techniques, consumers and novel Packaging Oxygen, ethylene and other scavengers: Oxygen scavenging technology, selecting right types of oxygen scavenger, ethylene scavenging technology, carbon dioxide and other scavengers.

Antimicrobial food packaging: Antimicrobial agents, constructing antimicrobial packaging systems, factors affecting the effectiveness of antimicrobial packaging.

Unit II

Non-migratory bioactive polymers (NMBP): Advantages of NMBP, Inherently bioactive synthetic polymers: types and application, Polymers with immobilized bioactive compounds and their applications.

Time Temperature labels and indicators (TTIs): Defining and classifying TTIs, Requirements for TTIs, development of TTIs, Maximizing the effectiveness of TTIs, Application of TTIs- to monitor shelf-life, and optimization of distribution and stock rotation, leakage indicators, oxygen indicators, micro indicators etc.

Freshness indicator in packaging: Compounds indicating the quality of packaged food products, freshness indicators, pathogen indicators, other methods for spoilage detection.

Self-heating/rehydrating packages.

Unit III

Packaging-flavour interaction: Factors affecting flavor absorption, role of food matrix, role of differing packaging materials, flavour modification and sensory quality, Study of packaging materials compatibility with foods.

Developments in modified atmosphere packaging (MAP): Permeability properties of polymer packaging, measurement of permeability – water and gases. Selection criteria of packaging films, Novel MAP gas, testing novel MAP applications, applying high oxygen MAP.

Recycling packaging materials: Recyclability of packaging plastics, improving the recyclability of plastics packaging, testing safety and quality of recycled materials, uses of recycled plastics in packaging.

Unit IV

Green plastics for food packaging: Problems of plastic packaging wastes, range of biopolymers, developing novel biodegradable materials.

Edible Films and Coatings: Properties, types, sources, applications, advantages, disadvantages, theories of plasticization, challenges and opportunities.

PFS machine, seal and closures.

Safety and legislative aspects of packaging: Regulatory considerations, plastic, metal, paper and glass packaging.

V. Practical

- Determination of WVTR in different packaging materials
- Determination of GTR in different packaging materials.
- Study of different ethylene scavengers and their analysis
- Study of different oxygen scavengers systems and their analysis
- Application of anti-microbial packaging for moisture sensitive foods
- Evaluation of chemical residue migration from package to food
- Application of MAP packaging in selected foods
- Study of TTI label, leakage indictors etc.
- Determination of oxidative changes in packaged foods
- Comparative evaluation of flexible and rigid packages for fragile foods
- Packaging of foods under inert atmosphere.
- To study textural characteristics of selected fruit/ vegetable under MAP storage
- Shelf life evaluation and mode up of packaged food product.
- Determination of oil and grease resistant test for packaging films
- Determination of respiration rate in fresh fruits and vegetables
- Determination of shelf life of fresh fruits and vegetables by using edible coating and films.
- Effect of edible coating and films on respiration behaviour, chemical, physical and sensory characteristics of fresh fruits and vegetables.
- Visit to food packaging material manufacturing industry

I. Course Title : Industrial Manufacturing of Food and Beverages
II. Course Code : FPT 503
III. Credit Hours : 2+1

IV. Theory

Unit I

Grain products: Industrial manufacturing of grain based products: formulation, processes, machinery and material balance of baked, rolled, shredded, puffed, flaked, roasted products.
Extrusion technology: Importance and applications of extrusion in food processing; Pre and post extrusion treatments; Manufacturing process of extruded products; Change of functional properties of food components during extrusion. Breakfast cereals, RTE/RTC foods, instant premixes, functional foods.

Unit II

Fruit and vegetable products: Industrial manufacturing of fruit and vegetable based products: formulation, processes, machinery and material balance of minimally processed, Retorted products, IMF, high moisture stable foods, IQF; Machines and equipment for batch and continuous processing of fruit and vegetable products.

Unit III

Chocolates and candies: Coating or enrobing of chocolate (including pan-coating); Maintenance, safety and hygiene of bakery plants.
Fats and oils processing: Technology of refined oil, winterized oil, hydrogenated fat, texturized fat, by-products of fat/oil processing industries – oil seed protein isolates; Quality standards of fats and fatty foods; Antioxidants and its mechanism of application.

Unit IV

Beverages: Production technology of beer and wine
Non-alcoholic beverages: Carbonated beverages: carbonation equipment, -ingredients-preparation of syrups-Filling system-packaging-containers and closures. Non-carbonated beverage: Coffee bean preparation-processing-brewing-decaffeination- instant coffee, Tea types-black, green, Fruit juices and beverages,. Flash pasteurization, Aseptic Packaging of beverages Tea/coffee and cocoa beverages, Grain based and malted beverages.
Packaged drinking water: types, manufacturing processes, quality evaluation and raw and processed water, methods of water treatment, BIS quality standards of bottled water; mineral water, natural spring water, flavoured water, carbonated water.

V. Practical

- Preparation of cereals based fried snack foods
- Preparation of cereal, pulses based ready-to-eat snack food by extrusion cooking their quality evaluation
- Preparation of cereal grain based puffed products
- Development of instant food premixes
- Preparation of cereal and legume based roasted snack
- Preparation of flaked rice product

- To study the effect of roasting time and temperature on quality of pop-corn
- Determination of shelf-life and packaging requirements of snack food products
- Preparation of fruits/vegetable based ready to serve beverages and quality evaluation
- Heat classification of milk powders.
- Determination of degree of browning-chemical/physical methods.
- Determination of quality of packaged drinking water.
- Preparation of wine and beer
- Preparation of soy milk.
- Determination of quality of canned food.

I. Course Title : Food Material and Product Properties

II. Course Code : FPT 504

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: Biomaterials and their properties in relation to processing and product development.

Physico-chemical characteristics: Shape, sphericity, size, volume, microstructure, density, porosity, surface area, coefficients of friction and angle of repose and influence of constituents on processing.

Unit II

Mechanical and rheological properties: Flow behaviour of granular and powdered food materials, rheological models, creep phenomenon, stress – strain - time effects and relationships, and techniques of model fitting, Elastic vs. textural characteristics and textural profile analysis of food products.

Unit III

Thermal, electrical and optical properties: Specific heat, thermal conductivity, phase transition, thermodynamics-basic principles and laws, Thermodynamic properties of moist air, kinetics of water absorption, heat capacity, thermal diffusivity, electrical resistance and conductance, dielectric constant, reflectivity, transmittivity and absorptivity of incident rays.

Food microstructure: Methods and systems for food microstructure, determination of light microscopy, transmission electron microscopy, scanning electron microscopy, other instrumentation and techniques, image analysis: image acquisition, image processing, measurement analysis.

Unit IV

Functional properties: Dextrinization, Gelatinisation, Crystallisation, gelation, foaming, coagulation, denaturation and syneresis, foaming, emulsification.
Sensory attributes: Sensory properties and correlation with objective indices, microstructure and its relation to texture from their mechanical models and its examination.
Sorption behaviour of food: sorption isotherm, modelling.

V. Practical

- To determine physical dimension and shape for suitability of processing and packaging of food materials
- To determine bulk, true density and porosity of samples
- To determine the angle of repose using rough and smooth surface
- Analysis of powder characteristics using powder flow analyser.
- To determine the mixing and strength characteristics of wheat flour using faringograph/ mixograph/ mixolab
- To determine the amylolytic activity using falling number of wheat flour
- Development of stress and strain curve and to study viscosity of Newtonian and non-Newtonian fluid
- Effect of temperature on viscosity profile of a food sample
- Texture profile analysis of foods samples.
- Effect of temperature on textural profile of food
- Determination of thermal properties of foods using DSC.
- To estimate dielectric constant of foods
- Organoleptic evaluation of food materials
- TEM and SEM, image analysis and image processing techniques
- To determine water activity of food
- To determine colour value of food, viz. Lab, whiteness index, yellow index, browning index

I. Course Title : Cocoa and Chocolate Processing Technologies
II. Course Code : FPT 505
III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: Cocoa, Occurrence, chemistry of the cocoa bean, analysis of cocoa beans, processing of raw bean, changes taking place during fermentation of cocoa bean

Cocoa processing: processing of cocoa bean- Cleaning, roasting, alkalization, cracking and fanning; Nib grinding for cocoa liquor, cocoa butter and cocoa powder; processing of roast bean; chemical changes during various stages of processing

Unit II

Chocolates: Types, ingredients, chemistry of chocolate manufacture, Mixing, Refining, Conching, Tempering, moulding etc. to obtain chocolate slabs, chocolate bars. Dark, milk and white chocolate and their manufacturing processes

Unit III

Enrobed and other confectionary products: Compound Coatings & Candy Bars, Tempering technology, Chocolate hollow figures, Chocolate shells, Enrobing technology, Manufacture of candy bars, Presentation and application of vegetable fats. Production of chocolate mass

Unit IV

Packaging, quality and storage of chocolates.

V. Practical

- Anatomical structure of cocoa beans
- Effect of fermentation on cocoa beans
- Roasting of cocoa beans
- Effect of roasting on cocoa beans
- Effect of packaging on quality of cocoa beans
- Production of cocoa liquor
- Production of cocoa butter
- Effect of crunching on chocolate
- Effect of tempering on chocolate
- Fat expulsion during chocolate storage
- Production of milk chocolate
- Production of dark chocolate
- Effect of packaging on quality of chocolate
- Effect of storage temperature on chocolate quality

VI. Suggested Reading

- Minifie, BW, 1999. *Chocolate, Cocoa and Confectionery Technology*. Springer Science & Business Media.

I. Course Title : Spices, Herbs and Condiments

II. Course Code : FPT 506

III. Credit Hours : 2+0

IV. Theory

Unit I

Introduction: Status and scope of spice processing industries in India; Spices, Herbs and seasonings: sources, production, selection criteria, classification on the basis of origin, physical characteristic.

Major spices: Post-Harvest Technology composition, processed products of following spices (1) Ginger (2) Chilli (3) Turmeric (4) Onion and garlic (5) Pepper (6) Cardamom

Unit II

Minor spices, herbs and leafy vegetables: All spice, Annie seed, sweet Basil, Caraway seed, Cassia, Cinnamon, Clove, Coriander, cumin, Dill seed, nutmeg, mint, Rose merry, saffron, sage

Processing technology of Spices: Chemical composition, processing methods, equipment's used; recent developments in processing

Unit III

Processing effect on spice quality: Effect of processing on spice quality, contamination of spices with micro-organisms and insects

Unit IV

Spice Essential Oils: methods of extraction, isolation, and encapsulation,
Spice Oleoresins: method of extraction, isolation, separation equipment
Spices quality evaluation: Criteria for assessment of spice quality

V. Suggested Reading

- Reineccius G. 2005. *Flavour Chemistry and Technology*. CRC Press.
- Heath HB, 1986. *Flavour chemistry and Technology*. AVI Publ.
- Piggott JR, Paterson A. 1994. *Understanding Natural Flavours*. Springer US

I. Course Title : Meat, Poultry, Fish and Egg Processing

II. Course Code : FPT 507

III. Credit Hours : 2+1

IV. Theory

Unit I

Meat Industry: Meat and meat products in India-an Industrial profile. Meat production and trade practices. Prospects and problems in production of fresh meat in India, Research and Development activities on meat, fish and poultry products. Gross and microstructure of muscle. Mechanism of muscle contraction and relaxation: Organization of skeletal muscle from gross structure to molecular level. Muscle Communication (sarcolemma, sarcoplasmic reticulum, Innervation). Muscle metabolism. Different types of connective tissues and their relevance to properties of meat. Myofilament proteins and their major functions. Nervous tissue, nerves and the nature of stimuli, membrane potential in nerve and muscle, Events that occur during relaxation and contraction.

Unit II

Cattle and beef, sheep and mutton, pig and pork and their fabrication: Breeds, Pre-slaughter care, ante and post mortem, slaughter, handling of offal (edible and inedible). Cuts of beef, pork and mutton.

Meat inspection and grading: Application and Enforcement of inspection laws, elements of inspection (sanitation, antemortem inspection, post-mortem inspection, condemnation, product inspection, laboratory inspection, labelling). Identification of inspected products, product inspection, types of grades, factors used to establish quality grades, conformation, fleshing and finish.

Unit III

Properties of fresh meat: Perception of tenderness, Factors effecting tenderness, connective tissue, collagen, sarcomere contractile state, Myofibrillar tenderness, marbling. Methods to improve tenderness (Electrical stimulation, aging, Meat colour, Pigments associated with colour, Chemical state of pigments, methods to improve meat colour. Water holding capacity (Net charge effect and stearic effect) Molecular Techniques in meat products, cultured meat etc.

Poultry meat: Kind of poultry, processing of poultry. Special poultry products, Breaded poultry, Smoked turkey, packagedprecooked chicken, Freeze dried poultry meat.

Egg and egg processing: Egg quality, egg preservation, egg powder production

Unit IV

Meat analogues and restructured meat products: Textured plant proteins, processes for preparation of meat analogues and restructured meat products.

Fish processing and fish products: Chemical/Nutritional composition of Fish, Fish in human diet: protein, carbohydrates, lipids, vitamins etc. Selection of raw material for processing of streaking and filleting of fish; production of fish paste, fish oils, sauce, fish protein concentrates. Irradiation of fish and fisheries products, packaging of fish products, quality control and quality assurance. Allergens, toxins and infectious diseases from meat, poultry and fish products.

V. Practicals

- To study the effect of low and high oxygen atmosphere on meat colour.
- To study the chemistry of myoglobin as it relates to the colour of the molecule.
- To understand and compare the action of two meat tenderizing enzymes by applying the technique of electrophoresis.
- To study the structure of the muscle under compound microscope.
- Perform the slaughtering of the poultry birds.
- Identification of different internal organs of poultry birds and their utilization for product preparation.
- Dressing of Fish.
- Determination of total volatile acids in fish,
- Determination of buffering capacity of fish muscle.
- Rapid estimation of hypoxanthine concentration in chill stored fish.
- Determination of glycine in fish muscle.
- Determination of protein fractions in fresh fish.
- Cut out test for canned fishery products.
- Determination of glycogen in fish muscle.
- Industrial visit to meat industry.

I. Course Title : Nutraceuticals and Specialty Foods

II. Course Code : FPT 508

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: Defining nutraceuticals and functional foods. Nature, type and scope of nutraceutical and functional foods. Nutraceutical and functional food applications and their health benefits. Nutraceutical compounds and their classification based on chemical and biochemical nature, Innovations in Functional Food Industry for Health and Wellness, Development of biomarkers to indicate efficacy of functional ingredients.

Nutraceuticals and Functional foods: Nutraceuticals/ food components for specific disease such as cancer, heart disease, diabetes, obesity, anti-aging, arthritis, Prebiotics and probiotics; Omega 3 and omega 6 fatty acids, Isoflavones, phenolic compounds, catechins, lycopene, glucosinolates.

Unit II

Specialty Foods: Design of food for infants, children and old age.

Functional Beverage: Selection of ingredients, health benefits and production.

Extraction and delivery system: Non-thermal techniques, bioprocessing techniques, dehydration techniques, effect on bioactive ingredients. Delivery system and controlled release of nutraceuticals

Unit III

Packaging, Storage, labelling: Packaging requirements, storage and storage kinetics on quality of nutraceuticals, interactions of various environmental factors.

Marketing and safety aspects: Marketing and safety and regulatory issues for functional foods and nutraceuticals.

Unit IV

Nutrigenomics: concept of personalized medicine. Use of nanotechnology in functional food industry.

Biological functionality of cruciferous vegetables, tropical, subtropical and temperate fruits, herbs and spices.

V. Practical

- Determination of antioxidant activity of given food sample by different techniques, viz. DPPH, FRAP, ABTS, FRAP.
- Determination of total phenolic content of given food sample.
- Estimation of dietary fibres of given food sample.
- Estimation of lycopene in tomato.
- Estimation of carotenoids of given food sample.
- Determination of total flavonoid content of given food sample
- Effect of heat processing on ascorbic acid
- Determination of vitamins A.

- Estimation of pectic substances in plant sample
- Determination of beta carotene of given food sample.
- To determine gas chromatography for bioactive components analysis.
- To study the effect of drying on bioactive components of food sample
- To study the packaging requirement of functional foods.
- Determination and qualifications of some nutraceutical and functional food compounds by HPLC
- Estimation of â- glucan
- To study the storage kinetics of nutraceutical.
- Estimation of soluble/insoluble fibres of given food sample.

I. Course Title : Frozen and Concentrated Foods

II. Course Code : FPT 509

III. Credit Hours : 1+1

IV. Theory

Unit I

Freezing: Glass transitions in frozen foods and biomaterials, Microbiology of frozen foods, Thermo-physical properties of frozen foods, Freezing loads and Freezing time calculation, Innovations in freezing process, freezing methods and equipment. Facilities for the Cold Chain: Cold store design and maintenance, Transportation and storage of of frozen foods, Retail display equipment and management.

Unit II

Quality and safety of frozen foods: Quality and safety of frozen meat and meat product, poultry and poultry products, eggs and egg products, fish and shellfish, and related products, frozen vegetables and fruits, frozen dairy products, frozen ready meals and confectioners.

Unit III

Packaging of frozen foods: Selection of packaging materials, Plastic and paper packaging of frozen foods, Shelf-life prediction of frozen foods.

Unit IV

Concentrated milk: Production and quality of evaporated and condensed milk.

Concentrated juice products: Production and quality of fruits and vegetable juice concentrate, puree and paste, tomato juice concentrates, mango pulp etc.

V. Practical

- Measure the glass transition temperature of food
- Calculate freezing load of food sample
- Calculate freezing time of a frozen foods
- Effect of cold chain on quality of fruits and vegetables
- Effect of cooling on egg quality
- Effect of chilling on meat quality
- Effect of freezing on meat quality
- Production of concentrated milk and check its quality
- Production of evaporated milk and check its quality
- Effect of clarification n juice quality
- Effect of juice concentration on juice concentrate
- Effect of cold and hot break on tomato pulp quality
- Production tomato puree and paste and check its quality

VI. Suggested Reading

I. Course Title : Aseptic Processing and Packaging

II. Course Code : FPT 510

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: present and future of aseptic processing, Advantages and disadvantages, processing of semi-solid and fluid and particulate foods.

Aseptic processing operations: pre-sterilization, loss of sterility, water-to-product and product-to-water separation, cleaning, control, CIP.

Unit II

Quality Assurance: Effect of aseptic processing on nutrients, microorganisms, in-process and post-process assurance, HACCP, regulatory aspects of processing and packaging, Shelf life modules.

Unit III

Sanitary design and Equipments requirements: Pumps, Heat exchangers, homogenizers, aseptic process and packaging system for retail and institutional packages.

Unit IV

Packaging of aseptic processed foods: Packaging materials characteristics, aseptic filling, sterilization of packaging materials, package design, aseptic packaging system, type of pack and equipments: Fill and seal, Form, fill and seal, Erect, fill and seal, Thermoform, fill, sealed, Blow mold, fill, seal; geometry, materials and size of retail and bulk package, seal and closures.

V. Practical

- Effect of aseptic processing on microbial quality of juice based beverage
- Effect of aseptic processing on vitamins in selected foods.
- Effect of aseptic processing on minerals in selected foods.
- Effect of aseptic processing on colour pigments in selected foods.
- Effect of aseptic processing on browning of milk
- Effect of aseptic processing on viscosity of milk
- Effect of aseptic processing on proteins in selected foods
- Effect of different chemical sterilant on microbial quality of packaging material
- To estimate chemical sterilant residue on packaging materials
- Estimation of package integrity and leakage
- Shelf life models and prediction.

VI. Suggested Reading

I. Course Title : Traditional Foods

II. Course Code : FPT 511

III. Credit Hours : 2+1

IV. Theory

Unit I

Present status of traditional food products, Globalization of traditional food products; Plans and policies of the Government and developmental agencies.
Overview of heat-desiccated, coagulated, fried, fermented traditional food products
Process technology for Indian bread (chapatti), paratha, stuffed paratha, panipoori
Process technology for Indian fried foods- poori, samosa, sev, fafda, chorafali, Jalebi
Process technology for fermented traditional food and its improvement- pickle, idli, khaman, nan, dahi, dhokla, Spiced buttermilk etc.
Process improvement in production of Indian sweets (Halwasan, kajukatli, carrothalwa, Rabdi, chocolate burfi, Chikki etc).
Process improvement in production of puffed cereals and grains by microwave technique

Unit II

New products based on fruits, vegetables and cereals
Application of membrane technology; microwave heating, steaming, extrusion for industrial production of traditional food products (Shrikhand, Dhokla, wadi, murukku/chakri, Patra, Khandvi)
Utilization and scope of legumes and grains in India for novel food products development like- flour, ready to eat products, flour mixes etc (puranpoli, Idlimix,Wada mix, Gotamix)
Process technology for convenience traditional food products (ready to eat and serve -Curried vegetables, pulses and legumes), chutneys, paste
Use of natural and permitted synthetic preservatives and new packaging systems for traditional food products.

Unit III

Techno-economic aspects for establishing commercial units for traditional products. Introduction to traditional foods of India, composition and nutritive values, microbial and biochemical diversity, quality and food safety challenges Processing& Preservation methods of Sweets & Desserts**:** Kulfi, Falooda, Kheer, khurchan, khoa/mawa, Rabri,jalebi, imarti, Gulab jamun, Peda, petha, rewdi, gajak, milk cake, balushahi, bal mithai, singoni, Ras-malayi,Gulqand, ghevar, rasgolla, chamcham, son halwa, son papri, several varieties of halwa, laddu, barfi & rasgolla.

Unit IV

Traditional fermented foods: Idli, dosa, Vada, khamman dhokla, Dahi (Curd), Srikhand.Processing & Preservation methods of Snacks**:** Gujiya, kachauri, samosa, mirchibada, kofta, potato chips, banana-chips, mathri, bhujiya, fried dhals, bhujia, shakarpara, pakora, vada.

Processing & Preservation methods of Baked Products: Biscuits, Toast, Candies, Cookies, Breads, Roti, Naan, Tandoori Roti, parantha, kulcha, puri, bhatura.

Processing & Preservation methods of Preserves & Beverages: Murabba, sharbat, pana, aampapad, sharbat,

Coconut water, milk (khas, rose), Alcoholic Beverages

Industrialization, Socioeconomic Conditions and Sustainability of Traditional Foods.

V. Practical

- To study the effect of different combination of salt and oil in quality of traditional fermented food product (pickle)
- To study the effect of different starter culture on taste and texture of idli
- To evaluate the shelf life of stuffed paratha under different storage conditions
- To study the effect of time and temperature on quality of fried food products (poori/ panipoori etc.
- To study effect of sugar and Artificial sweeteners in the preparation of kajukatli
- To study the microwave heating in drying of khaman/ dhokla
- To study the effect of cold extrusion on mixing of vermicelli
- To prepare instant carrot halwa mix
- To study the effect of different packaging material on shelf life of traditional Indian food products
- To study the effect of different natural food preservatives in traditional sweets
- Preparation of spiced buttermilk
- Preparation of puffed cereals and grains
- Preparation and quality evaluation of Instant Premixes (Puranmix)
- Preparation of quality evaluation of dried malted moth bean powder
- Preparation of Indian traditional confections (chikki)
- Visit to ethnic food industry (Instant mixes/Pickle making)

VI. Suggested Reading

- Steinkrus KH. 1995. *Handbook of Indigenous Fermented Foods*. CRC Press
- Wickramasinghe P. 2007. *The Food of India OM Book Service*
- Aneja RP, Mathur BN, Chandan RC and Banerjee AK. 2002. *Technology of Indian Milk Products*, India Year Book Publications
- Mangal R. 2013. *Fundamentals of Indian Cooking: Theory and Practice*

I. Course Title : Technologies of Convenience Foods

II. Course Code : FPT 512

III. Credit Hours : 2+1

IV. Theory

Unit I

Overview of grain-based snacks: whole grains – roasted, toasted, puffed, popped and flakes

Coated grains- salted, spiced and sweetened

Flour based snack– batter and dough-based products; *savoury* and *farsans*;formulated chips and wafers, papads.

Fruit and vegetable-based snacks: chips, wafers, papads etc.

Coated nuts – salted, spiced and sweetened products- *chikkis, fried groundnut pakora,*

Unit II

Technology of ready- to- eat baked food products, drying, toasting, roasting and flaking, coating, chipping

Extruded snack foods: Formulation and processing technology, flavouring and packaging

Unit III

Ready-to-cook food products- different puddings and curried, Vegetables, meat and meat food products etc. Technology of instant cooked rice, carrot and other cereals-based food products

Technology of ready to eat instant premixes based on cereals, pulses etc.

Technology for RTE puffed snack- sand puffing, hot air puffing, explosion puffing, gun puffing etc.

Unit IV

Equipment for frying, baking and drying, toasting, roasting and flaking, popping, blending, coating, chipping.

V. Practical

- Preparation of cereals based fried snack foods
- Preparation of legume based fried snack foods
- Preparation of cereal, pulses based ready-to-eat snack food by extrusion cooking and their quality evaluation
- Preparation of cereal grain based puffed products
- To study the effect of frying time and temperature on potato chips
- Development of instant food premixes
- Preparation of cereal and legume based roasted snack
- Preparation of flaked rice product
- To study the effect of roasting time and temperature on quality of pop-corn
- Determination of shelf-life and packaging requirements of snack food products
- Preparation of cereal and legume based roasted snack foods by vacuum frying
- Visit to industries manufacturing snack foods.

VI. Suggested Reading

I. Course Title : Food Powders and Premixes
II. Course Code : FPT 513
III. Credit Hours : 2+1
IV. Theory

Unit I

Food powder properties: Particle size, shape, particle size distribution, density, Crystalline and amorphous microstructure of powders, cohesive forces in powders, adhesive forces and surface energies, stickiness of powders, surface structure of powders, fluidity of powders, compressibility of powders, mixing property of powders, segregation of powder particles, flow and packing properties
Handling of food powders: Basic flow patterns in storage vessels, storage vessel design, mass-flow operation, the Jenike silo design method, the flow-no flow criterion, Powder conveying: Belt, screw, chain, pneumatic

Unit II

Size reduction and enlargement: Principles, equipment, criteria for selecting comminution process, aggregation and agglomeration, instantization
Encapsulation: Principles, methods of encapsulation, viz. spray drying, coacervation, extrusion, co-crystallization

Unit III

Powder Production: Spray, drum and freeze-drying process and equipments
Undesirable properties: Attrition, segregation, caking, dust explosion hazards, laboratory testing to assess explosion characteristics of dust clouds, safety from dust cloud explosion hazards
Food powder rehydration: Principles of powder rehydration- wettability and sink ability, dispersibility, solubility, improvement of rehydration properties
Surface composition of food powders: Microscopy and spectroscopy techniques for analysing the surface of food powder, factors affecting food powder surface composition, impact of powder surface composition on powder functionality.

Unit IV

Packaging and Storage: Packaging requirements, design of package, effect of environmental factors on quality of food powders, shelf life test and prediction
Food Premix: Formulation, processing and packaging of Vitamin premix, mineral premix, fibres premix for food supplements

V. Practical

- Estimation of bulk properties: bulk density, true density, porosity
- Estimation of reconstitution powder properties: wettability, dispersibility, solubility
- Effect of moisture on lump formation and caking
- Estimate flowability of food powders
- Estimate hygroscopicity of powder

- Estimate glass transition and sticky point temperature of food powder
- Effect of bulk properties on packaging
- Measurement of particle size using particle size analyser
- Measurement of surface properties of food powder using SEM
- Packaging of food powders
- Effect of storage on quality of food powders
- Production of various vitamin premix and its application
- Production of various mineral premix and its application

VI. Suggested Reading

I. Course Title : Food Ingredients and Additives

II. Course Code : FPT 514

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: Role of food ingredients and additives in food processing, functions, classification, intentional and unintentional food additives, toxicology and safety evaluation of food additives, beneficial effects of food additives, food additives generally recognized as safe (GRAS), tolerance levels and toxic levels in foods-LD 50 values of food additives.

Preservatives: General mechanism of action; basis of selection; classes; Chemical preservatives: characteristics, antimicrobial spectrum, mechanism of action, toxicology, regulations, application in food.

Unit II

Antioxidants: Characteristics, types/classes/groups, mechanism of action/ working of antioxidants, functions, sources, application in food, limits and toxic effects of synthetic antioxidants, synergistic effects of antioxidants, role of free radicals in human body, Natural antioxidants.

Flavouring agents: Flavour functions, selection; forms; sources; process of flavour creation; natural and synthetic flavouring; extractions methods; production process; application in food.

Emulsifiers and Stabilizers: Characteristics/ functional properties; functions; basis of selection; types; mechanism of emulsion formation; mechanisms of emulsion stabilization and destabilization; application in food.

Unit III

Hydrocolloids: Definition: function and functional properties: sources; application in food.

Sweeteners: Characteristics; classification/types; applications in food; Limits and toxicology of non-nutritive sweeteners.

Colouring agents: Properties; functions; classification; sources of natural and synthetic colours: extraction; applications in food, levels of use, misbranded colours, colour stabilization.

Unit IV

Starch, protein, and lipids, fibres and fructo-oligosaccharides: As functional ingredients; their isolation, modification, specifications, functional properties and applications in foods.

Humectants, clarifying agents, Stabilizers and thickeners, Bleaching and maturing agents, Humectants, Sequestrants/ chelating agents, Anti-caking agents, Buffering agents, Acidulants: definition; characteristics; sources; functions and their application in food processing.

V. Practical

- Determination of benzoic acid in food samples
- Estimation of sulphur dioxide in food samples
- Estimation of sorbic acid in cheese and yoghurt
- Determination of nitrate and nitrites in foods
- Detection and determination of aspartame by thin layer chromatography
- Liquid chromatographic determination of caffeine, benzoate and saccharin in soda beverage
- Identification of natural colours
- Isolation, identification and estimation of synthetic food colours
- TLC detection of antioxidants in fats and oils
- TLC detection of emulsifiers
- Detection of alginates in foods (chocolate, ice cream)
- GC determination of menthol in mentholated pan masala
- Isolation and modifications of protein, starch, lipids, fibres from the raw and processed food samples
- Estimation of various additives mentioned in unit IV

I. Course Title : Flavour Chemistry and Technology

II. Course Code : FPT 515

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: classification of food flavour, chemical compounds responsible for flavours, difficulties of flavour chemistry research. Anatomy of chemical senses. Chemical compounds classes and their flavour response. Flavour intensifiers: Flavour intensifiers and their effects, Chemistry and technology of various flavour intensifiers.

Flavour Extraction: Methods of flavour extraction, isolation, separation and equipments.

Unit II

Flavour development during biogenesis: Flavour Compounds from Carbohydrates and Proteins, Lipid oxidation. Flavour formulation: Creating and formulating flavour, Synthetic flavours, Blended flavouring, flavour, creation for new products, Delivery of flavours from food matrices.

Flavouring compounds during food processing: Volatile and non-volatile flavouring compounds, non-enzymatic browning reactions.

Unit III

Flavour analysis: Sensory evaluation, discrimination analysis, descriptive analysis, Instrumental analysis (Absorption Spectroscopy (W/VIS), chromatography, mass spectrometry)

Food Flavours in different food products: Principal components and properties, baked products, cheese, milk, meat, fish, wine, coffee, tea, chocolate, fruit and vegetable products and fermented foods

Unit IV

Flavour encapsulation and stabilization: Principles and techniques of flavour encapsulation, types of encapsulation, factors affecting stabilization of encapsulated flavour and their applications in food industry, Packaging and flavour compounds interaction, packaging and storage

V. Practical

- Qualitative identification of different flavouring compounds
- Extraction of essential oil/ flavouring compound of basil leave by hydro distillation
- Extraction of essential oil/ flavouring compound of basil leave by SCFE
- Comparison of the quality of flavouring component obtained by hydro distillation and SCFE
- Extraction of essential oil/ flavouring compound of ginger by SCFE
- Effect of storage conditions on flavouring compound of ginger
- Preparation of flavour emulsions and their stability
- To study effects of staling on food flavours and its adverse effects
- Separation, purification and identification of some flavouring compounds by GC/ MS.
- Sensory evaluation of different flavours
- To check effect of cooking on flavour of food sample
- To check effect of fermentation on food flavour
- To study sugar caramelization reaction for flavour development
- Development of blended food flavour-based products
- To study effects of storage conditions on food flavour
- Encapsulation of flavouring compounds
- To study effects of overdoses of flavours
- To study flavour development on roasting/ baking

I. Course Title : Bioprocessing and Separation Technology

II. Course Code : FPT 516

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction to various separation processes, Gas-Liquid, Gas–Solid, Liquid-Liquid, Liquid-Solid separation; Concept of phase equilibrium, Stage equilibrium, Stage efficiency, Equilibrium concentration; Single stage contact equilibrium, counter-current multiple contact stages, Concept of equilibrium line and operating line, Determination of optimum number of contact stages by analytical and graphical method; Rate of extraction, Rate of gas absorption, Individual and over all mass transfer coefficient; Calculation of tower height for gas absorption for both dilute and concentrated solution. Construction and working mechanism of different extraction equipments like single stage extraction, Multiple stage static bed system, Bollmann extractor, Hildebrandt extractor, Rotocell extractor.

Unit II

Various separation processes Solid Separation Process, Introduction, Concept of size, Shape, Cut-size, Sieving, Magnetic separation, Eddy-current separation, Wet separation, Ballistic separation, Colour separation, Wet Separation Process, liquid-solid and liquid- liquid separation by hydro cyclones, Surface velocity classifier, Elutriators, Impingement separator, Electrostatic precipitation, Distillation: Introduction, boiling point diagram, differential or simple distillation, Flash or equilibrium distillation, Continuous rectification with and without reflux, Reflux ratio, Optimum reflux ratio, Batch distillation, Application of distillation in food processing.

Unit III

Membrane Separation Technology: Introduction to micro-filtration, Ultrafiltration, Reverse osmosis, Electro dialyses, dialyses, physical characteristics of membrane separation, Factors affecting reverse osmosis process, Concentration polarization, Design of reverse osmosis and ultra-filtration systems, Operation layout of the modules, Electrodialysis, per vaporization, Fabrication of membranes, Application of membrane technology in food industry.

Unit IV

Powder Technology: Classification of powder, Separation of powder, Sieving, Air classification, Factors affecting air classification, Cyclone application, Air separation, Particle size distribution,

Supercritical Fluid Extraction: Introduction, Properties of SCF, Food application, Application of SCFE in analytical technique, Pharmaceutical application.

V. Practical

- Determination of contact equilibrium in counter current and multiple contact model systems.
- Determination of rate of extraction in gas-liquid, gas-solid, liquid-liquid and liquid-solid systems.
- Study of working mechanisms of different extraction equipments.
- Evaluation of physical separation techniques based on size, shape and densities, magnetic, eddy current, ballistic and colour separation,
- Use of air classification, hydyocyclones, electrostatic and distillation techniques for fractionation and separation, application studies on Microfiltration, Ultrafiltration, reverse osmosis and dialysis.

VI. Suggested Reading

- Smith PG. 2011. *Introduction to Food Process Engineering* Springer

I. Course Title : Enzymes in Food Processing

II. Course Code : FPT 517

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: General Characteristics of Enzymes, Classes and Nomenclature of Enzymes, Enzymatic Reactions, Factors affecting enzyme activity, Enzyme Kinetic, Enzyme Inhibition

Enzyme Production: Selection and sources of commercial Enzymes, Advantages of microbial enzymes, rDNA in enzyme engineering, Problems of scale up, Enzyme extraction and purification

Unit II

Immobilization: Techniques, Advantages and disadvantages, use of immobilized biocatalysts in food processing

Enzymes for protein modification (hydrolysates and bioactive peptides), Enzymes for Lipid modification

Enzymes in cereal processing: Application of enzymes in process of malting, brewing, milling, baking (fungal –amylase for bread making; maltogenic – amylases for anti-staling xylansandpentosanes as dough conditioners; lipases or dough conditioning; oxidases as replacers of chemical oxidants; synergistic effect of enzymes), production of high fructose corn syrup, glucose syrups

Unit III

Enzymes in fruit processing: Applications of enzyme in fruit juice clarification, removal of haziness and bitterness, Uses of enzymes in wine production

Enzymes in meat, fish and milk processing: Meat tenderization and flavour development, fish processing (De-skinning, collagen extraction etc.,) Egg processing, Cheese processing,

Unit IV

Flavour production: Role of enzymes (enzyme-aided extraction of plant materials for production of flavours, production of flavour enhancers such as nucleotides, MSG; flavours from hydrolysed vegetable/animal protein)

Enzymes in the processing of fats and oils: specificity, stability and application of lipases and related enzymes Role of enzymes in hydrolysis of triglycerides, interesterification and randomization. Enzyme allergy.

V. Practical

- To investigate some of the kinetic properties of invertase
- To study time course of the reaction catalysed by alkaline phosphatase.
- To investigate the thermal stability of horseradish peroxidase
- Quantitative estimation of endoglucanase
- Quantitative estimation of exoglucanase
- Quantitative estimation of â galactosidase
- Quantitative estimation of Pectinase
- Quantitative estimation of Protease
- Quantitative estimation of Lipase
- Immobilization of amylase by sodium alginate and comparative evaluation with native enzyme
- To immobilize yeast cells and demonstrate its biological activity by invertase assay
- To carry out amylase fermentation
- To carry out protease fermentation
- To carry out lipase fermentation

I. Course Title : Food Process Automation and Modelling

II. Course Code : FPT 518

III. Credit Hours : 2+0

IV. Theory

Unit I

Principles of modelling: Linear programming-concepts, graphical and algebraic solution; Simplex method; Duality theory; Post-optimality analysis; Sensitivity analysis; Transportation and assignment models; Computer applications to LP, queuing theory; Project scheduling and management by PERT-CPM; Integer programming; Non-linear programming; Simulation; Goal programming; Decision theory; Markov chains; Sequencing problem.

Food process modelling: The principles of modelling, kinetic modelling, the modelling of heat and mass transfer; introduction diffusion equation, the Navier-stokes equations, heat and mass transfer in porous media Luikov's equation. Modelling thermal processes: cooling and freezing, modelling product heat load during cooling & freezing. Modelling foods with complex shapes, numerical solution of the heat conduction equation with phase change. Modelling thermal processes: heating, introduction, processing of packed and solid foods, continuous heating and cooling processes, Modelling food quality and microbiological safety. Case Studies in Modelling, Control in Food Processes.

Unit II

Food process equipment design: Design considerations of agricultural and food processing equipment. Design of food processing equipment, Dryers, design of dryers. Determination of heat and air requirement for drying grains. Types of heat exchanger. Design of heat exchangers and evaporators. Design of material handling equipment like belt conveyor, screw conveyor, bucket elevator and pneumatic conveyors.

Digital image processing: digital representation of image, morphological image processing – dialation, erosion, opening and closing, line and edge detection, thresholding, segmentation, techniques for finding length, breadth, perimeter, surface area, eccentricity and surface roughness of solids. Machine Vision-Based Measurement Systems for Fruit and Vegetable Quality Control in Postharvest.

Genetic algorithm optimization: traditional optimization techniques and their limitations, non-traditional method, fitness function in biological evolution, computational procedure for optimization of independent parameters using Genetic algorithm.

Artificial neural network modelling: Developing predictive model between independent and dependent parameters by using Artificial neural network –Neural network architecture, weights and bias values of neurons, least square method for NN parameters optimization, matrix representation and computation of the values of NN parameters.

Unit III

Automation in different unit operations of food processing: Raw food material sorting, grading, size reduction, mixing and agitation, thermal processing, dehydration, packaging, CIP, quality control. Bottle Washing Machine Automation, Bottling Plant Drive System, Demineralization Plant Control System, Labelling Machine Control system, Charger level automation, Reverse Osmosis plant automation, Thermal plant automation, Dehydration and freezing plant automation.

I. Course Title : Zero Waste Processing

II. Course Code : FPT 519

III. Credit Hours : 2+0

IV. Theory

Unit I

Introduction: Food processing waste and by-product, ISO 14000 for environmental management system, biochemical and nutritional aspects of food processing by-products. Waste minimization: Chain management issues and good housekeeping Procedures, minimise energy use in food Processing, minimise water use in food processing.

Unit II

Food waste separation: microbiological risk management, Effects of postharvest changes in quality on the stability of plant co-products, Separation technologies for food wastewater treatment and product recovery.

Unit III

Co-product recovery techniques: Enzymatic extraction and fermentation for the recovery of food processing products, Supercritical fluid extraction and other technologies for extraction of high-value food processing co-products, Membrane and filtration technologies, recovery of nutraceuticals, micronutrients, functional ingredients, Natural dyes.

Unit IV

Waste management and co-product recovery: Meat, cereal, dairy, fish, fruit and vegetable, vegetable oil, plantation crops processing, waste management of food packaging. Food processing waste water treatment and gas production from solid food processing

Vol. 4

Food Technology
– Process Engineering

Preamble
(Food Process Engineering)

"Food Process Engineering" is a relatively young discipline covering not only factories, equipment and processes but also understanding the product and developing innovative products and packages to satisfy the consumer's needs and wishes. The complexity of the food product and hygienic food production with suitable packaging, compared to chemicals or textile, calls for increasing reliance on the computer in food process research and development. Simulation and modeling constitute an essential step in food process research and development. "Virtualization" becomes a legitimate approach in food engineering research for equipment, mechanization, integrated processing system and hygienic plant design. Further, recent technologies such as Internet of Things, Artificial Intelligence, Nanomaterials, 3D printing, 3D scanning, soft gripping, nondestructive and online/quick analyzing have been found useful for suitable equipment and machineries manufacturing for sustainable food production.

Over the years Food Process Engineering studies emerged as a scientific and industrial discipline describing equipment and means for proper plant operations and environment control considering engineering properties of materials, transport phenomenon, computer aided design, simulation, project engineering and management, post-harvest engineering, storage engineering, additives and preservatives, reaction kinetics, and so on, in ways that preserve value of food and prevent any illness. This was well realized by the 5th Deans' Committee while they chose to have 'Food Process Engineering' as one of the departments at College of Food Technology under Agricultural University setup in the country. Food Process Engineering has been an area of priority for the food industries, processing plants, plant designers, equipment and plant manufacturers, bulk material handling systems, cold storage, supply chain systems and manufacturers, mega kitchen equipment, analytical instruments, ingredient/chemical producers, consumers, retailers, manufacturers, national and international agencies and regulators. Further, need for mechanization of selected indigenous food products and automation has been felt.

To meet the compliances for efficient use of resources, related equipment, instrumentation, plant and building design, establishment and operation for sustainable food manufacturing; competent human resources at various levels such as process engineers, plant engineers, equipment engineers, service engineers, service in-charges, plant in-charge, auditors, designated officers, equipment and instrument handlers, safety officers etc. Development of trained human resource in this scientific and industrial sector is essential for the future growth of food processing and national – international trade from it.

All above requirement of the eco system in an around food sector motivated the BSMA Committee for Food Science and Technology to come up with a new stream of M.Tech. and Ph.D. programme in the area of Food Process Engineering.

Present M. Tech. Food Technology (Process Engineering) course frame work has its parity with national frame work with credit distribution among the different course types core and optional subject with due credits to seminar, research and industrial exposure. Present curriculum at UG level offers adequate introduction on the basic principles of engineering (fluid mechanics, heat transfer, and mass transfer), math, and science (biology, chemistry, and physics) with basics in food chemistry, microbiology, food processing operations, engineering design, analytical techniques, plant sanitation and HACCP. For advancement of knowledge and core competence courses on food engineering operations, engineering properties of food materials and transport phenomenon, computer aided design of food plant machinery and equipment, numerical techniques and simulation etc are kept as compulsory. The course content also offer opportunity to learn testing, inspection, statistical and quality aspect of material and food products for robust knowledge on associated equipment and risk assessment.

Here besides theory teaching practical hands on exposure is also a focus. Other core courses may be selected as per the resources and need analysis which are related to global regulatory and certification requirements, toxicology, food informatics etc. Future researchers as per their interest may find and opportunity to opt for a formal learning on research methodology and advanced food science. Course structure also provides scope for learning across the PG departments. Master students of food process engineering will also have option to study post-harvest management, food processing entrepreneurship and start up, global food laws and regulations, food safety management systems and certification, quality concepts and chain traceability etc.

PhD programme in Food Process Engineering is to assess and design food machinery and associated utilities, AI based automation and robotics, novel process, packaging systems, separation, concentration of required materials etc. So far limited work in this area is taking place in the country and that to under general food technology programmes. The major highlights of PhD programme are a formal course structure focused on the discipline of process engineering with an opportunity to sharpen the assessment, design of machinery, equipment and/or instrument for online/offline quick quality assessment at laboratory or field or in plant. The researchers will be exposed to advances in process engineering, process and equipment validation, food quality and safety assessment, toxicology and risk assessment etc along with food law making process nationally and at international front.

Thus, the M.Tech. programme is intended to offer the industry ready professionals for food processing sector on one hand while they would be given training so that they can ponder upon the industry problems to offer solution either through deep scientific research or problem-solving approach for quick industry solution and immediate response. The programme will also be good for who enjoy quality food production, processing, distribution and retailing or interested in strengthening their proficiency in design and assessment of production management systems.

The programme shall also open new vista for entrepreneurs who intend to diversify in Food Process Engineering aspects. While PhD programme is envisaged to begin a new era of food process engineering research. While proposing this programme it is believed that this programme will also cover research gap in the area and will provide primary data from the country to be used in best quality indigenous equipment and production system manufacturing with compliance to applicable international/ reputed standards and codes which has been lacking in the past. The committee also has taken care that course should also offer knowledge opportunity matching to contemporary global scenario in the field. The committee hopes that the course will meet the expectations of different stakeholders of the sector and learners.

Course Titles with Credit Load
M.Tech. in Process Engineering

Major Courses

Course Code	Course Title	Credit Hours
FPE 501	Emerging Food Engineering Operations*	2+1
FPE 502	Engineering Properties of Food Materials*	2+1
FPE 503	Transport Phenomenon*	2+1
FPE 504	Bio Processing and Down Stream Engineering	2+1
FPE 505	Energy Management and Auditing in Food Industry	2+1
FPE 506	Numerical Techniques and Simulation	1+1
FPE 507	Computer Aided Design of Food Plant Machinery and Equipment	1+2
FPE 508	Food Safety and Storage Engineering	2+1
FPE 509	Equipment, Machine and System Design for Indigenous Food Product	0+2
FPE 510	Operation Research	2+1
FPE 511	Process Control in Food Industries	2+1
FPE 512	Project Engineering and Management	2+1
FPE 513	Food Process Automation and Robotics	2+0
FPE 514	Water and Waste Management	2+1
FPE 515	Special problem/ Summer internship	0+2

*Compulsory Rest of the courses will be decided by the students advisory committee keeping the minimum limits set for award of degree.

Minor Courses

Course Code	Course Title	Credit Hours
FPT 502	Emerging Technologies in Food Packaging	2+0
FPT 503	Industrial Manufacturing of Food and Beverages	2+1
FPT 504	Food Material and Product Properties	2+1
FPT 510	Aseptic Processing and Packaging	2+1
FSQ 503	Advanced Food Chemistry	2+1
FSQ 504	Global Food Laws and Regulations	2+0
FSQ 506	Process and Products Monitoring for Quality Assurance	2+0
FSQ 508	Management of Food By-products and Waste	2+1

FPE 526	Seminar	1(0+1)

Course Contents
M.Tech. in Process Engineering

I. Course Title : Emerging Food Engineering Operations
II. Course Code : FPE 501
III. Credit Hours : 2+1
IV. Theory

Unit I

Ionizing and non-ionizing radiation processing system operations: types of radiations, generation, microwave assisted processing systems, IR assisted processing systems, radio frequency systems, O_3, UV and x-ray assisted processing systems, gamma irradiations systems, e-beam radiation systems and applications.

Unit II

Pulse electric field (PEF) generation system and applications, cold plasma generation systems and applications, high pressure processing systems and applications, ultrasonic processing systems and applications.

Unit III

Extrusion systems, batch and continuous ohmic heating systems and applications, inductive heating systems and applications, applications of nanotechnology.

Unit IV

Drying systems: superheated steam drying, refractance window drying, heat pump drying, freeze drying, spray drying, foam bed drying, microwave drying, instant pressure drop (DIC) drying and hybrid drying systems.

Unit V

Membrane processing systems: UF, MF, NF, reverse osmosis and vapour permeation, pervaporation, membrane distillation. Supercritical fluid extraction: concept, property of near critical fluids (NCF), extraction methods. Cryoprocessing-cryogens properties, systems and their different applications.

V. Practical

- To evaluate the characteristics of treated water and selected liquid foods using membrane systems (NF, UF, RO, etc)
- To study super critical fluid extraction system and application
- To study microwave system and microwave assisted food processing
- To study efficacy of hot water, steam, microwave, ultrasound blanching of selected fruits and vegetables
- To study the ultrasonicator and applications
- To study cryogenic processing applications
- To prepare Nano emulsion and study of their characteristics
- To study ohmic/inductive heating systems applications
- To study cold plasma applications

- To study gamma irradiation applications
- To study drying kinetics using different drying systems
- To study operations in 3 D printing
- Solving problems in food processing and case studies
- Visits of food industries utilizing advance food processing systems.

I. Course Title : Engineering Properties of Food Materials

II. Course Code : FPE 502

III. Credit Hours : 2+1

IV. Theory

Unit I

Physical characteristics of different food grains, fruits and vegetables; shape and size, volume and density, porosity, surface area, water activity. Thermal properties: Specific heat, thermal conductivity, thermal diffusivity, phase transition, methods of determination, steady state, transient heat flow. Electrical properties; Dielectric loss factor, loss tangent, temperature dependent electrical conductivity and dielectric constant, method of determination, energy absorption from high-frequency electric field.

Unit II

Magnetic properties: paramagnetism, ferromagnetism, diamagnetism, magnetization, applications for magnetic field forces, magnetic resonance; Electromagnetic properties: electric polarization, temperature dependency, frequency dependency, microwave, conversion of microwaves into heat, penetration depth of microwaves, applications; Optical properties: refraction, colorimetry, near infrared, ultraviolet, applications; Acoustical properties: sound, ultrasonic sound and applications; Radioactivity: types of radiation, radioactive decay, measurement of ionizing radiation, natural radioactivity, applications.

Unit III

Contact stresses between bodies, hertz problems, firmness and hardness, mechanical damage, dead load and impact damage, vibration damage, friction, effect of load, sliding velocity and surface roughness. Friction in agricultural materials, rolling resistance, angle of internal friction, angle of repose, flow of bulk granular materials, aero dynamics of agricultural products, drag coefficients, terminal velocity.

Unit IV

Rheological properties and classification of fluid foods: measurement methods and techniques; Mechanisms and relevant models; Effect of temperature; Compositional factors affecting flow behavior; Viscosity of food dispersions – dilute and semi-dilute systems, concentration effects.

Unit V

Rheology of semi-solid and solid food; Rheological characterization of foods in terms of stress-strain relationship; Viscoelasticity; Transient tests - Creep Compliance and Stress Relaxation; Mechanical models for viscoelastic foods: Maxwell, Kelvin, Burgers and generalized models and their application; Dynamic measurement of viscoelasticity.

Unit VI

Large deformations and failure in foods: fracture, rupture and other related phenomena; Relationship between instrumental and sensory data; Texture Profile Analysis; Instrumental measurements – Empirical and Fundamental methods; Rheometers and Texture Analyzers; Measurement of Extensional viscosity; Acoustic measurements on crunchy foods.

Unit VII

Food structuring: traditional food structuring and texture improvement, approaches to food structuring, extrusion and spinning, structuring fat products, structure and stability, gels, gelation mechanisms, mixed gels, the microstructure of gels, structure-property relations angels.

Unit VIII

Examining food microstructures: light microscopy transmission electron microscopy, scanning electron microscopy, other instrumentation and techniques, image analysis: image acquisition, image processing and analysis.

V. Practical

- Viscosity measurements of fruit juices and semisolid food products
- Comparative analysis of Newtonian and non-Newtonian fluids
- Development of stress and strain curve and to study viscosity of Newtonian and non-newtonian fluids
- Temperature dependent and shear dependent rheology
- Pasting analysis of food; Determination of thermal conductivity, specific heat and glass transition temperature using differential scanning colorimetry (DSC)
- Texture analysis of fruits and vegetable-based products
- Texture analysis of baked foods products (bread/ biscuit)
- Starch characterization using starch master; Dough rheology using doughlab or farinograph
- Determination of microstructures in selected foods using light microscopy
- TEM and SEM, image analysis and image processing techniques; Evaluation of phase transition in colloidal systems, evaluation of structure texture function relations
- Case studies on food properties and applications.

I. Course Title : Transport Phenomenon

II. Course Code : FPE 503

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction to transport phenomena – Molecular transport mechanism, transport properties and their proportionality constants in momentum, energy and mass transfer.

Unit II

Principles of Steady and unsteady state heat transfer and governing equations; transient heat transfer; Lumped system analysis; Estimation of Conductivity and other thermal properties of foods; overall heat transfer coefficient.

Unit III

Steady-state equations - Momentum transport equations for Newtonian and non-Newtonian fluids, continuity equation in different co-ordinates.

Unit IV

Equations of motion - Navier–Stokes equations and their application in viscous fluid flow between parallel plates and through pipes.

Unit V

Turbulent transport mechanism - Mathematical analysis; eddy viscosity and eddy diffusivity; velocity, temperature and concentration distribution; time smoothing equations. Inter-phase transport in isothermal system - friction factors for various geometries.

Unit VI

Mass transfer - Fick's law of diffusion, diffusion of gases and liquids through solids, equimodal diffusion, isothermal evaporation of water into air, mass transfer coefficients.

Unit VII

Dimensional analysis – Buckingham Pi-theorem and matrix method, application to transport phenomena, analysis among mass, heat and momentum transfer, Reynolds' analogy.

Unit VIII

Boundary layer concept - Theoretical and exact solutions for heat, mass and momentum transfer.

V. Practical

- Effects of water concentration and water vapor pressure on the water vapor permeability and diffusion of chitosan films
- Mass transfer description of the osmo dehydration
- Pretreatment efficiency in osmotic dehydration
- Structural effects of blanching and osmotic dehydration pretreatments on air drying kinetics of fruit tissues
- Thermal processing of particulate foods by steam injection (1. Heating rate index for diced vegetables 2. Convective surface heat transfer coefficient for steam)
- Relating food frying to daily oil abuse (1. Determination of surface heat transfer coefficients with metal balls 2. A practical approach for evaluating product moisture loss, oil uptake, and heat transfer)
- Heat and mass transfer during the frying process; Influence of liquid water transport on heat and mass transfer during deep-fat frying
- Numerical simulation of transient two-dimensional profiles of temperature, concentration, and flow of liquid food in a can during sterilization
- Case studies on transport phenomenon and its applications.

VI. Suggested Reading

I. Course Title : Bioprocessing and Down Stream Engineering

II. Course Code : FPE 504

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction: Interaction of biochemical engineering, biochemistry and microbiology, Reaction kinetics, kinetics of batch and continuous cultures, process variables, biocatalyst and enzyme kinetics, scope and present status in India in relation to food industry.

Unit II

Fermenter and bioreactors: Transport phenomenon in microbial systems, types of reactor, working principles, aeration and agitation, sterilization and sanitation, advances in continuous fermentation, developments in solid-state fermentation for food applications.

Unit III

Alcoholic beverages: Production of alcoholic beverages: raw materials, culture, fermentation technology of non-distilled beverages (beer and wine) and distilled alcoholic beverages (brandy, whiskey, vodka, rum, gin).

Unit IV

Single Cell Proteins: Single cell proteins production, substrates, factors effecting SCP production, composition, uses, economic parameters and constrains including safety aspects.

Unit V

Organic acids/acidulants: Raw materials, Starters and fermentation conditions, recovery and applications, Case studies production of acetic acid (vinegar), citric acid, lactic acid and gluconic acid.

Unit VI

Biocatalysts in food processing: Sources of enzymes, advantages of microbial enzymes, mechanism of enzyme function, Production and purification of enzymes, immobilization and applications of biocatalysts in food processing, enzyme biosensors.

Unit VII

Down-stream processing: Handling of materials in microbial systems, filtration, centrifugation, sedimentation, chromatography, membrane separation (UF and NF) and electrophoresis, separation and disintegration of cells for product recovery operations. Biological waste treatment and in-plant sanitation.

Unit VIII

Modeling, simulation and scale-up: Bioprocess modeling and simulation and its application in industrial fermentation, scale-up of fermentation processes, design and analysis of biological fermenter and bioreactors.

V. Practical

- Studying biochemical changes during handling of important food items
- Study of fermenter and fermentation process
- Study of bioprocess instrumentation and control system
- Study of bacterial growth in batch culture
- Production and maintenance of starter culture
- Production of enzyme, extraction and purification
- Production of SCP; Production of microbial pigments
- Production of amino acids
- Production of alcohol and alcoholic beverages
- Visit to brewery
- Visit to effluent treatment plant
- Bioprocess modeling and simulation
- Case Studies & Reports.

I. Course Title : Energy Management and Auditing in Food Industry

II. Course Code : FPE 505

III. Credit Hours : 2+1

IV. Theory

Unit I

General Aspects of Energy Management & Energy Audit: Energy scenario, basics of energy and its various forma, material and energy balance, monitoring and targeting and financial management.

Unit II

Energy Auditing Basics: ASHRAE definitions of energy audits, the audit process, pre-site and post-site work, audit report.

Unit III

Energy Accounting and Analysis: Energy Accounting and Analysis, The energy use index, Conditioned area, electricity costs, Thermal energy costs, Energy-using systems, Commercial energy use profiles, Identifying potential measures, Industrial audit Opportunities, Industrial Energy Use Profiles.

Unit IV

Energy economics: Simple payback, time value of money, job simulation experience, making decisions for alternate investments, depreciation, taxes and the tax credit, impact of fuel inflation on life cycle costing.

Unit V

Measurements, Survey instrumentation, and data Collection: General audit instrumentation; co2, temperature, pressure, fluid and fuel flow, combustion gas composition, electrical and light measurement, measuring building losses, application of IR thermograph, infrared radiation and its measurement, measuring electrical system performance.

Unit VI

Energy and Water Conservation Technologies Applied to Food Processing Facilities: Conservation in steam generation and consumption system, energy conservation in heat exchangers, conservation in compressed air system, conservation in power and electrical systems, waste-heat recovery and thermal energy storage in food processing facilities, building envelop audit, energy consumption and saving opportunities.

V. Practical

- Study and practice with energy assessment and auditing instruments

- Performance assessment of motors and variable speed drives
- Performance assessment of pump, fans and blowers
- Performance assessment of refrigeration system
- Performance assessment of heat exchangers
- Performance assessment of furnace
- Performance assessment of boilers
- Conservation possibilities in dairy processing facilities
- Conservation possibilities in grains and oilseeds milling plants
- Conservation possibilities in sugar and confectionary processing facilities
- Conservation possibilities in fruit and vegetable processing facilities
- Conservation possibilities in bakery processing facilities
- Conservation possibilities in meat processing facilities
- Case studies & field reports.

VI. Suggested Reading

- BEE-NPC Cases studies

I. Course Title : Numerical Techniques and Simulation

II. Course Code : FPE 506

III. Credit Hours : 1+1

IV. Theory

Unit I

Modelling and Simulation: Fundamentals of modeling and simulation; Different steps for modeling and simulation, Types of models; Advantages of modeling and simulation, Application areas of simulation.

Unit II

Solution of partial differential equations models: Differential laplace, Poisson, parabolic and hyperbolic equations, Bender – Schmidt method, finite difference method, finite volume method.

Unit III

Optimization: Optimization theory and methods, Graphical and numerical methods of optimization; experimental optimization; linear and nonlinear un-constrain and constrain optimization, multivariate optimization, genetic algorithm, goal driven optimization.

Unit VI

Modelling and simulation applications of some food engineering operations: Thermal processing, convection & osmotic dehydration, spray & freeze drying, deep fat frying; extrusion process; filtration processes; distillation and Extraction processes.

Unit V

Computational fluid dynamics (CFD) applications in food processing.

V. Practical

- Introduction to various features in different spreadsheet softwares
- Solving problems using functions and/or add-Ins and/or Analysis Tool pack in spreadsheets
- Use of software packages for summarization and tabulation of data, obtaining descriptive statistics, graphical representation of data
- Testing linearity and normality assumption, Testing the goodness of fit of different models
- Testing the hypothesis for one sample t-test, two sample t-test, paired t-test, test for large samples - Chi-squares test, F test, Analysis of variance
- Practice on modelling and simulation softwares i.e. MATLAB, FLUENT, GAMBIT, EDEM, Solid works, ANSYS
- Practice on process optimization softwares i.e. SAS, SPSS, Origin Pro, Design Expert(DX), Minitab, Matlab
- Practice on design optimization softwares i.e. Solid works, ANSYS.

I. Course Title : Computer Aided Design of Food Plant Machinery and Equipment

II. Course Code : FPE 507

III. Credit Hours : 1+2

IV. Theory

Unit I

Introduction - Definition of CAD/CAM, product cycle.

Unit II

Automation, CPU, types of memory, input/output devices, data presentation, data and file structures, data base design, design work station.

Unit III

Graphics terminal, operating devices, plotters and other output devices, CPU secondary storage, Turnkey CAD system, selection criteria, evaluation of alternative systems.

Unit IV

Geometric Modeling Techniques - wireframe, surface and solid modeling, Geometric transformations, Graphics standards.

Unit V

CAM - Introduction to Numerical Control (NC) technology, current status of NC, Influence of NC in design & manufacturing.

Unit VI

Computer aided NC programming in APT language, elements of APT language, APT vocabulary, symbols, numbers and scalars, punctuation, definition, statement labels, notations for APT statement format, statements defining point, line, circle, vector, planes and curves, point to point motion.

V. Practical

- Preparation of manual drawings with dimensions from Models and Isometric drawings of objects and machine components
- Preparation of sectional drawings of selected machine parts
- Drawing of riveted joints and thread fasteners
- Demonstration and practice on computer graphics and computer aided drafting using standard softwares such as AutoCAD and/or Inventor and/or Solidworks and/or Creo and/or Catia
- Computer graphics for food engineering applications
- Practice and use of basic and drawing commands on AutoCAD and Solid works
- Generating simple 2-D drawings with dimensioning using AutoCAD and Solidworks
- Small projects using CAD/CAM
- Practice on assembly using Solidwork assembly tool
- Analysis of machine/equipment component for structural parameters using FEM
- Design optimisation of food machine/equipment using goal driven optimization technique
- Kinematic and dynamic analysis of mechanism and machines using Solidworks motion study tool
- Small projects using CAD/CAM
- To study design standards of general food processing equipment and systems

I. Course Title : Food Safety and Storage Engineering

II. Course Code : FPE 508

III. Credit Hours : 2+1

IV. Theory

Unit I

Overview of food microbiology: Foodborne illness, food spoilage, food fermentation, microbiological physiology and food preservation, microbiological analysis, safety management systems. Overview of foodborne pathogens: Bacterial pathogens, food borne viruses and parasites.

Unit II

Chemical safety of foods: nature of chemical hazards in foods, food safety engineering and control of chemical hazards, food allergen control. Intrinsic and extrinsic parameters for microbial growth and heat inactivation: Intrinsic and extrinsic factors affecting microbial growth, factors affecting heat resistance, combining traditional peroration techniques.

Unit III

Kinetics of microbial inactivation: Microbial inactivation kinetics based on food processing methods: thermal, pressure, pulsed electric field, microwave and radio frequency, ohmic and inductive heating etc. Kinetic parameter for the inactivation of pathogens: *Salmonella, Listeria monocytogenes, Staphylococcus aureus, Escherichia coli, Bacillus cereus, Clostridium, Vibrio*, other pathogens.

Unit IV

Predictive microbial modelling: classification of models: Kinetic & probability, Empirical & mechanistic models, Primary, secondary & tertiary models, Deterministic & stochastic models; Description of main models, Modelling growth curves, Modelling inactivation/survival curves, Secondary models, Probability models; Applications of predictive microbial modelling: Hazard analysis critical control point (HACCP) & quantitative risk assessment (QRA), Microbial shelf-life studies, Temperature function integration and temperature monitors, Product research and development, Design of experiments; Predictive microbial modelling and quantitative risk assessment.

Unit V

Process-dependent microbial modeling: Predictive microbial kinetic models, Temperature-dependent microbial growth kinetic models, Irradiation-dependent microbial growth model, Pulsed electric field-dependent microbial growth model, High-pressure-dependent microbial growth model; Process modeling; Integration of process and microbial growth kinetic models.

Unit VI

Storage and handling systems for grains, horticultural and animal based produces; post-harvest physiology of fruits and vegetables; biochemical changes during storage, production, distribution; storage capacity estimate models, ecology, storage factors affecting losses, storage requirements.

V. Practical

- Rapid methods and automation in microbiology: trends and predictions

- Study on phage-based detection of foodborne pathogens
- Study on real-time PCR
- Study on DNA Array
- Study on immunoassay
- Offline and online assessments for food safety for industry
- Storage pest, insects and rodent control
- Study on storage systems and structures, Shelf life evaluation of packaged food products
- Recent advancements in storage and handling systems
- Hygienic design standards and codes for food processing equipment/ system
- Case studies on food safety engineering, guidelines, regulations.

VI. Suggested Reading

I. Course Title : Equipment, Machine and System Design for Indigenous Food Products

II. Course Code : FPE 509

III. Credit Hours : 0+2

IV. Aim of the course

To develop understanding for mechanization of selected indigenous food products, associated materials of construction, codes and standards, mass balance, specific energy consumption, design, instrumentation, scale of automation, ergonomics, schematics and designing systems/line as a whole.

Students (in group or individual) should be able to evaluate existing production process and categorize whole process in different unit operations such as raw material handling, storage, thermal processing, packaging etc. Computer added design, drafting and simulation of existing system for production and packaging of indigenous food products.

V. Practical

- Visits to indigenous food manufacturing sites and study of existing indigenous food production system
- Study of relevant codes, guidelines and standards for the existing indigenous food production system (product, process, area and personal hygiene)
- Evaluation of available concepts of indigenous food product manufacturing and amelioration
- Computer aided design, drafting and simulation of the selected systems

- Case studies on equipment, machine and system available for the indigenous food products

VI. Suggested Reading

I. Course Title : Operation Research

II. Course Code : FPE 510

III. Credit Hours : 2+1

IV. Theory

Unit I

Introduction to operations research: Elementary concepts and objectives of Operations Research, Applications of operations research in decision making.

Unit II

Linear programming problem: Mathematical formulation of the linear programming problem and its graphical solution, Simplex method.

Unit III

Transportation problem: Definition and mathematical formulation, Initial basic feasible solution, Optimal solution. Assignment problem: Introduction and mathematical formulation, Solution of assignment problem.

Unit IV

Inventory control: Introduction and general notations, Economic lot size models with known demand. Replacement theory: Introduction and elementary concepts, Replacement of items deteriorating with time.

Unit V

Sequencing problem: Introduction and general notations, Solution of a sequencing problem.

Unit VI

Queuing theory: Introduction and classification of queues, Solution of queuing models.

Unit VII

Project planning and network analysis: Introduction and basic definitions in Network Analysis, Rules for drawing network analysis, Critical path method (CPM), Project evaluation and review technique (PERT).

V. Practical

- Studies on application of Linear Programming on food product standardization
- Studies on use of Transportation and Assignment Problems in food plant operations
- Studies on Economic Order Quantity and Replacement Model
- Studies on Sequencing of food plant operations; Studies on Queuing Model
- Network Analysis using CPM and PERT.

I. Course Title : Process Control in Food Industries

II. Course Code : FPE 511

III. Credit Hours : 2+1

IV. Theory

Unit I

Process Control: Dynamic behavior of first/second order systems, Response of first order systems/first order system in series. Block diagrams and transfer functions, Feedback control, P, PI, PID controllers.

Unit II

Measurement of Electrical and Non Electrical Quantities. Motion and displacement measurement: Strain gages, Hall effect devices and Proximity sensors, Large displacement measurement using synchros and resolvers, Shaft encoders. Pressure Measurement: Mechanical devices like Diaphragm, Bellows, and Bourdon tube, Variable inductance and capacitance transducers, Piezo electric transducers, Low pressure and vacuum pressure measurement using Pirani gauge, McLeod gauge, Ionization gauge. Force and Torque Measurement: Load cells and their applications, various methods for torque measurement. Flow measurement differential pressure meter like, Rotameter, Turbine flow meter, Electromagnetic flow meter, hot wire anemometer, Ultrasonic flow meter. Temperature Measurement: Resistance type temperature sensors – RTD & Thermistor Thermocouples & thermopiles, Different types of pyrometers. Humidity measurement and Moisture measurement techniques. Liquid level measurement: Resistive, inductive and capacitive techniques for level measurement, Ultrasonic and radiation methods, Air purge system (Bubbler method).

Unit III

Digital Data Acquisition Systems & Control: Use of signal conditioners, scanners, signal converters, recorders, display devices, A/D & D/A circuits in digital data acquisition. Instrumentation systems. Types of Instrumentation systems. Data–acquisition system. Multiplexing systems. Modern digital data acquisition system.

Unit IV

Industrial Automation. PLC, DCS and SCADA System: Introduction, Basic parts of a PLC, Operation of a PLC, Basic symbols used in PLC realization, Difference between PLC and Hardwired systems, Difference between PLC and computer, Relay logic to ladder logic, Ladder commands, Examples of PLC ladder diagram realization, PLC timers, PLC counters and examples, Classification of PLCs, History of DCS,DCS concepts, DCS hardware & software, DCS structure, Advantages and disadvantages of DCS, Representative DCS, SCADA, SCADA hardware & software.

Unit V

Image Processing Applications: Methodology, Shape analysis, Feature detection and object Location, Three-dimensional processing. Application to food industry: Inspection and inspection Procedures, X-Rayi, Computer vision systems, Electronic nose and Electronic tongue.

Unit VI

Virtual Instrumentation: Introduction to LABVIEW: Virtual instruments, Parts of VI, Project explorer, Front panel and block diagram window, Creating simple VI.

V. Practical

- Study of various for measurement of pressure, temperature, flow, level
- Study of PLC and to program a PLC using Ladder programming & PLC based control of Multi process system
- To make ladder logic diagrams and flow sheet diagrams for control logic
- Study of data loggers- computerized data acquisition and data processing
- Programming and making GUI in LABVIEW and softwares
- Study of SCADA Application Software/ Computerized Control of PC-PLC Based Multi-Process Control System.

I. Course Title : Project Engineering and Management

II. Course Code : FPE 512

III. Credit Hours : 2+1

IV. Theory

Unit I

Overview of project management: Functions and viewpoints of management, evolution of project management, forms and environment of project management.

Unit II

Project life cycle; Project selection: Project identification and screening, project appraisal, project charter, project proposal, project scope, statement of work; Feasibility studies

Unit III

Project planning and scheduling: Work breakdown structure, planning and scheduling of activity networks, network scheduling, precedence diagrams, critical path method, program evaluation and review technique, assumptions in PERT modelling, decision CPM, GERT

Unit IV

Project cost estimating: Technical Analysis and introduction to various component of project installation and commissioning cost and their estimation; Types of estimates and estimating methods, dynamic project planning and scheduling, time-cost trade-offs, resource considerations in projects, resource profiles and levelling, limited resource allocation

Unit V

Project implementation, monitoring and control:, project management process and role of project manager, team building and leadership in projects, organizational and behavioral issues in project management, project monitoring and control, PERT/ cost method, earned value analysis

Unit VI

Elements of Cost of Production; Financing of projects: Debt-Equity ratio etc. Introduction to concepts of inflation, location index and their use in estimating plant and machinery cost. Depreciation concept, Indian norms and their utility in estimation, Capital cost estimation, Working capital estimation, Project Evaluation, break-even analysis, ROI, IRR., Discounted cash flow analysis

Unit VII

Project completion and future directions: Project completion and review; Project management: Recent trends and future directions; Computers in project management

V. Practical

- Studies on Market Survey based on enterprise
- Preparation of Project Report
- Project selection, identification, appraisal and scope
- Methods of monitoring and feasibility of projects
- Studies on investment and repayment plants
- Project monitoring and Control – PERT Modeling

I. Course Title : Food Process Automation and Robotics

II. Course Code : FPE 513

III. Credit Hours : 2+0

IV. Theory

Unit I

Automated evaluation of food quality, food quality quantization and process control, typical problems in food quality evaluation.

Unit II

Data acquisition: Sampling elaboration with examples, concepts and systems for data acquisition such as: ultrasonic signal acquisition, electronic nose data acquisition, frying data acquisition for quality process control, Image acquisition.

Unit III

Data analysis: Data preprocessing, Static data analysis, Dynamic data analysis, Image processing: Image segmentation, Image feature extraction.

Unit IV

Modeling & prediction: Modeling strategies: Theoretical and empirical modeling, Static and dynamic modeling, Linear statistical modeling, ANN modeling. Prediction and classification, Sample classification based on linear statistical and ANN models, Electronic nose data; One-step-ahead prediction.

Unit V

Control: Process control, Internal model control, Predictive control, Neuro-fuzzy PDC for snack food frying process, Systems integration: Food quality quantization and process control systems integration.

Unit VI

Automation in sorting, thermal processing, fresh produce; Automation in food chilling and freezing; In storage, transport, retail systems; fruit vegetable processing; cleaning, grading, canning etc.

Unit VII

Automation in meat processing, carcass production, separation; before and after chilling; Automation in poultry industry; hanging, conveying, processing, packing;

Automation in sea food processing, in unit operations associated.

Unit VIII

Automatic process control in food industry. Process control methods in food industry, current, future trends. Robotics in food industry, specification of food sector robot, control law algorithm.

V. Practical

- To study different types of sensors for measurement of temperature, pressure, flow and level
- To study interfacing systems for analogue to digital signals
- To study sensors for automated food process control
- To study different logic controlling systems
- To study computer vision systems used in industries
- To study machine vision systems used in industries
- To study optical sensors and online spectroscopy for automated quality and safety inspection of food products
- To study supervisory Control and Data Acquisition (SCADA) and related systems for automated process control in the food industry
- To study different configurations of industrial robots
- To study gripper technologies for food industry robots
- To study wireless sensor networks (WSNs) components in the agricultural and food industries
- To study intelligent quality control systems in food processing based on fuzzy logic
- Application of automation and robotics for bulk sorting, chilling and freezing, meat processing, poultry industry, seafood processing, packaging in confectionery etc in food processing industries
- Case studies and field reports on Food Process Automation and Robotics.

I. Course Title : Water and Waste Management
II. Course Code : FPE 514
III. Credit Hours : 2+1

IV. Theory

Unit I

Basic considerations: Characterization of different industry effluents and utilization of by-products; Standards for emission or discharge of environmental pollutants from industries. Elements of importance in the efficient management of wastes.

Unit II

Physical and chemical parameters for waste; oxygen demands; BOD, COD and their interrelationships; residues (solids), fats, oils and grease, forms of nitrogen, sulphur and phosphorus, anions and cations, surfactants, colour, odour, taste, toxicity. Unit concept of treatment of food industry effluent, screening, sedimentation floatation as pre- and primary reactants.

Unit III

Primary treatment, secondary and tertiary waste treatments by physical, chemical and biological methods. Effluent and solid waste utilization by Biological oxidations: Objects, organisms, reactions, oxygen requirements, aeration devices systems: lagoons, activated sludge process, oxidation ditches, rotating biological contractors and their variations and advanced modifications.

Unit IV

Wastewater treatment systems. Physical separations, coagulation and flocculation; micro-strainers, filters, ultra-filtration and reverse osmosis; water softening. Physico-chemical separations: activated carbon adsorption, ion-exchange electro-dialysis and magnetic separation. Chemical oxidations and treatment coagulation and flocculation. Disinfection. Handling disposal of sludge.

Unit V

Waste management strategies and value added products from of agri-food processing industry; Recovery of biologicals from fruit, vegetables, dairy, meat, fish and poultry processing industry.

V. Practical

- Determination of Alkalinity, Acidity and pH of a given waste water sample
- Determination of electric conductivity of a given sample
- Determination of hardness (Chlorides and Sulphates) of a given waste water sample
- Determination of Solids in wastewater, Total Solids, Suspended Solids, Dissolved Solids, Volatile Solids, Fixed Solids, Settleable Solids
- Estimation of dissolved oxygen and BOD exerted by the given waste water sample
- Estimation of COD exerted by the given waste water sample
- Determination of Nitrates in waste water
- Determination of Fats, oils and greases in waste water
- Determination of fecal contamination of water- qualitative and quantitative Estimation
- Determination of SPC of different wastes
- Visit of an effluent treatment plant in a food processing industry.

I. Course Title : Food Analytical Techniques

II. Course Code : FPE 605

III. Credit Hours : 1+2

IV. Theory

Hands on experience on advance methods, equipment and instruments used for analysis of raw material, food products and confirmation of standards. Offline and online assessment of food properties.

V. Practical

Practice on UV-Visible, IR, Raman, & Mass spectroscopy.
Practice on Fluorescence, Turbidimetric and related techniques.
Practice on NMR/ESR spectroscopy.
Practice on general and advanced chromatographic (HPLC, GC, Paper, TLC/HPTLC, Ion, Flash etc.) techniques.
Practice on biological techniques such as Electrophoresis, PCR/RTPCR, Immunoassays etc
Practice on Immuno based analytical techniques such as ELISA & Lateral flow assay.
Determination of common adherents, colour, flavours and composition using specified methods.
Separation of selected biomolecules (protein, colour, amino acids, fat, colour, flavours, peptides, anti/ nutritional factors, casein etc) using different techniques.
Gel-filtration of biomolecules.
SDS gel electrophoresis and molecular weight determination.
Measurement of size and zeta potential of colloidal solution or emulsion using dynamic light scattering/ particle size analyser.
Practice on purification of selected biomolecules.
Estimation of minerals using AAS.
Determination of specific and non-specific antimicrobial factors of selected biomolecules.
Determination of health benefits of selected biomolecules/ products.
Correlation of offline with online assessment of selected parameters.
Correlation among industrial, national and international methods of selected concerned parameters.

Vol. 4

Food Technology
– Safety and Quality

Preamble
(Safety and Quality)

Effective food safety and quality management systems are key not only to safeguarding the health and well-being of people but also to fostering economic development and improving livelihoods by promoting access to domestic, regional and international markets. Ensuring food safety is a public health priority. It incurs loss to global trade leading to further food waste, which can no longer be tolerated in a world where many still suffer from hunger. Effective food safety and quality management systems are key not only to safeguarding the health and well-being of people but also to fostering economic development and improving livelihoods by promoting access to domestic, regional and international markets.

Over the years Food Safety and Quality studies immersed as a scientific discipline describing handling, preparation, and storage of food in ways that prevent food-borne illness. This was well realized by the 5th Deans' Committee while they chose to have 'Food Safety and Quality Assurance' as one of the departments at College of Food Technology under Agricultural University setup in the country. Food Safety and Quality has been an area of priority for consumers, retailers, manufacturers and regulators. In the country FSSAI is now taking proactive steps in interest of consumers and to implement science based regulations related to food. This motivated the BSMA Committee for Food Science and Technology to come up with a new stream of M.Tech. and Ph.D. programme in the area Food Safety and Quality.

Food Safety and Quality Management is rapidly gaining importance both at national as well as international levels due to various reasons, viz. implementation of FSS Act 2006, globalization of food trade, harmonization of national standards with CODEX, legal changes at national and international levels etc. To implement the Act in the country, there is a need for human resources at various levels involving different stakeholders in the food chain from farm to fork which includes Auditors, Designated Officers, Adjudicating Officers and Food Safety Officers, Food Auditors, Food Analysts, Food Handlers etc. Development of trained human resource in food safety sector is essential for the future growth of food processing and national – international trade from it.

Present M. Tech. Food Technology (Safety and Quality) course frame work has its parity with national frame work with credit distribution among the different course types core and optional subject with due credits to seminar and research. Present curriculum at UG level offers adequate introduction on the safety and quality basics through that courses related to microbiology, chemistry, nutrition, basic analytical techniques, including the aspects of plant sanitation and HACCP. For advancement of knowledge and core competence courses on food quality, analysis, handling of food pathogens, chain traceability etc are kept as compulsory. The course content also offer opportunity to learn statistical and engineering aspect of quality including robust knowledge on risk assessment.

Here besides theory teaching practical hands on exposure is also a focus. Other core courses may be selected as per the resources and need analysis which are related to global regulatory and certification requirements, toxicology, food informatics etc. Future researchers as per their interest may find and opportunity to opt for a formal learning on research methodology and advanced food chemistry. Course structure also provides scope for learning across the PG departments. Master students of safety-quality will also have option to study Emerging Techniques in Food Packaging, Bio-processing, Down Stream Engineering, Industrial Manufacturing, Numerical Technique and Stimulation, Storage Engineering, Energy Management and Auditing in Food Industry etc.

Ph.D. programme in Safety and Quality is first of its kind in the country which intends to offer Ph.D. on this specialization as a formal degree. So far limited work in this area is taking place in the country and that to under general food technology programmes. The major highlights of Ph.D. programme are a formal course structure focused on the discipline of safety and quality with an opportunity to sharpen the instrumentation skill in a lab course. The researchers will be exposed to advances in food quality and safety assessment, health claim validation, toxicology and risk assessment, etc. along with food law making process nationally and at international front.

Thus the M.Tech. programme is intended to offer the industry ready professionals for food processing sector on one hand while they would be given training so that they can ponder upon the industry problems to offer solution either through deep scientific research or problem solving approach for quick industry solution and immediate response. The programme will also be good for who enjoy quality control job or interested in strengthening their proficiency in design and implementations of quality management systems. The programme shall also open new vista for entrepreneurs who intend to diversify in Food Safety and Quality Aspects. While Ph.D. programme is envisaged to begin a new era of food safety and quality research. While proposing this programme it is believed that this programme will also cover research gap in the area and will provide primary data from the country to be used in international platforms like Codex which has been lacking in the past. The committee also has taken care that course in safety quality should offer knowledge opportunity matching to contemporary global scenario in the field. The committee hopes that the course will meet the expectations of different stakeholders of the sector and learners.

Course Title with Credit Load
M.Tech. in Safety and Quality

Major Courses

Course Code.	Course Title	Credit Hours
FSQ 501	Techniques in Food Quality Analysis*	2+2
FSQ 502	Microbiology of Food Spoilage and Pathogens*	2+1
FSQ 503	Advanced Food Chemistry	2+1
FSQ 504	Global Food Laws and Regulations	2+0
FSQ 505	Food Safety Management Systems and Certification	2+1
FSQ 506	Process and Products Monitoring for Quality Assurance	2+0
FSQ 507	Quality Concepts and Chain Traceability*	2+0
FSQ 508	Management of Food By-products and Waste	2+0
FSQ 509	Special Problem/ Summer Internship	0+2
FSQ 510	Toxicology of Food Ingredients and Products	2+1
FSQ 511	Food Plant Utilities and Sanitation	2+0

*CompulsoryRest of the courses will be decided by the students advisory committee keeping the minimum limits set for award of degree.

Minor Courses

Course Code.	Course Title	Credit Hours
FPT 502	Emerging Technologies in Food Packaging	2+0
FPT 503	Industrial Manufacturing of Food and Beverages	2+1
FPT 504	Food Material and Product Properties	2+1
FPT 514	Food Ingredients and Additives	2+1
FPT 510	Aseptic Processing and Packaging	2+1
FPE 502	Engineering Properties of Food Materials	2+1
FPE 504	Bioprocessing and Down Stream Engineering	2+1
FPE 506	Numerical Technique and Stimulation	1+1
FPE 508	Food Safety and Storage Engineering	2+1

Supporting Courses

Course Code.	Course Title	Credit Hours
BSH 501	Research Methodology	2+0
BSH 502	Food Informatics	1+1
FBM 501	Post-Harvest Management	2+1

Course Code.	Course Title	Credit Hours
FBM 502	Food Business Management	2+0
FBM 503	Food Processing Entrepreneurship and Start up	0+1
FPE 515	Energy Management and Auditing in Food Industry	2+1
FPE 510	Operation Research	2+1

Common Courses

S. No.	Course Title	Credits
1.	Library and Information Services	1
2.	Technical Writing and Communications Skills	1
3.	Intellectual Property and its Management in Agriculture	1
4.	Basic Concepts in Laboratory Techniques	1
5.	Agricultural Research, Research Ethics and Rural Development Programmes	1

These courses are available in the form of e-courses/MOOCs. The students may be allowed to register these courses/similar courses on these aspects, if available online on SWAYAM or any other platform. If a student has already completed any of these courses during UG, he/she may be permitted to register for other related courses with the prior approval of the HoD/BoS.

Seminar

Course Code	Course Title	Credit Hours
FSQ 599	Seminar	0+1

Course Contents
M.Tech. in Safety and Quality

I. Course Title : Techniques in Food Quality Analysis
II. Course Code : FSQ 501
III. Credit Hours : 2+2

IV. Theory

Unit I

Sampling Procedures, Calibration and Standardization: Sub- sampling and its procedures, LOD, LOQ, Internal standards, Reference standards and certified reference materials. Spectroscopy techniques: Operation, calibration and standardization procedures as applicable to particular technique. Principles and applications of pH Meter, Digital analyzer, Auto-analyzer, Ultraviolet-visible spectroscopy (UV-VIS), Infra-Red, Fourier-Transform Infrared Spectroscopy (FTIR), Near Infra Red (NIR), Atomic Absorption spectroscopy (AAS).

Unit II

Chromatography Techniques: Principles, Components and applications of (i) Paper Chromatography-Ascending and Descending-One dimensional & Two dimensional (ii) Thin layer chromatography (iii) Ion Exchange (iv) GC (v) GLC (vi) HPLC (vii) HPTLC (viii) GCMS (ix) LCMS (x) Amino acid Analyzer.

Unit III

Separation Techniques: Dialysis, Gel filtration, Electrophoresis: Principles, components and applications of (i) Paper (ii) Starch (iii) Gel (iv) Agar-gel (v) Polyacrylamide gel (vi) Moving boundary (vii) Immuno electrophoresis. Centrifugation: Types of centrifuge – Ordinary and Ultracentrifuge- Principle and applications.

Unit IV

Principle, Components and Applications of (i) Differential scanning calorimetry (DSC) (ii) Thermogravimetric analysis (TGA) (iii) Isothermal microcalorimetry (IMC) (iv) Thermomechanical analysis (TMA) (v) Isothermal titration caloritmetry (ITC) (vi) Dynamic elemental thermal analysis (DETA) (vii) Nuclear magnetic resonance (NMR) (viii) Scanning electron microscopy (SEM) (ix) Transmission electron microscopy (TEM) (x) X-ray diffraction technique (XRD) (xi) Rapid visco-analyzer (xii) Texture analyzer and (xiii) Micro-dough lab.

V. Practical

- Analysis and characterization of pigment in fruits by UV-VIS.
- Characterization of starches by FTIR spectroscopy.
- Assessment of microstructure of food components by SEM/Reviewing a micrograph obtained through SEM
- Study of thermal denaturation of proteins and food enzymes by DSC.
- Quantization of allergenic proteins by LCMS.

- Separate and identification of pesticides in food samples by HPLC.
- Identification and molecular characterization of proteins by SDS-PAGE.
- Quantization of lipids and fatty acids using TLC.
- Assessment of pasting properties of starches and flours/flour-blends using RVA.
- Analysis of textural properties of food products with texture analyzer.
- Comparative rheological study of wheat flour samples of different varieties.
- Differential thermal analysis (DTA) and Thermogravimatric Analysis of a food samples
- A rapid, visual demonstration of protein separation by gel filtration chromatography.
- Amino acid profiling of food samples

I. Course Title : Microbiology of Food Spoilage and Pathogens

II. Course Code : FSQ 502

III. Credit Hours : 2+1

IV. Theory

Unit I

Food Borne Pathogens, Host Invasion, Pathogenesis, Significance to public health Food hazards and risk factors, Pathogenic foodborne microorganisms – *Salmonella, Pathogenic Escherichia coli* and other *enterobacteriaceae, Staphylococcus aureus, Listeria monocytogenes, Clostridium botulinum, Clostridium perfringens and Bacillus cereus* Other Gram-positive pathogens, *Campylobacter, Brucella, Aeromonas, Vibrio cholerae, Mycobacterium, Shigella.*

Unit II

Fungal and viral food-borne disorders, Food-borne important animal parasites, Mycotoxins, Incidence and behavior of microorganisms in meat, poultry, milk and milk products, fresh agro produce, sea foods.

Unit III

Controlling pathogens and microbial toxin via food processing, Microbial growth and shelf life, Modeling of microbial growth, Safety concerns of food processed through non thermal processing, management of microbial risk and toxin in foods through HACCP, Risk in antimicrobial nano materials, Risk assessment and predictive modeling

Unit IV

Molecular approaches for detection and identification of food borne pathogens, Enzyme Immunoassay (EIA), Enzyme-linked immunosorbent assay (ELISA), Radioimmunoassay (RIA) - instrumentation and applications of each immunoassay technique. DNA: DNA purification, DNA Fingerprinting. PCR/RTPCR (Real time) based analysis and sequencing, Biosensors, Recombinant DNA technology; Microchip based techniques, cDNA and genomic libraries, immunochemical techniques.

V. Practical

- Preparation of common laboratory media and special media for cultivation of bacteria, yeast & molds.
- Isolation and identification of pathogens.
- Coliforms analysis of milk and water samples.
- Identification tests for bacteria in foods: IMVIC urease, catalase, coagulase, gelatin and fermentation (acid/gas).
- Determination of thermal death characteristics of bacteria.
- Determination of DNA and RNA of spoilage microorganism using PCR.
- Detection of DNA of trace components allergens, like nuts using ELISA.
- DNA/RNA based microarray experiment.
- Demonstration of DNA fingerprinting.
- Determination of growth and activity of microorganisms in incubator.
- Determination of preservatives and food colours using Biosensor.
- Process time calculation for an indicator organism
- Microbes responsible recall – case studies.

- Schmidt RH and Rodrick GE. 2013 *Food Safety Handbook* Wiley

I. Course Title : Advanced Food Chemistry

II. Course Code : FSQ 503

III. Credit Hours : 2+1

IV. Theory

Unit I

Composition, nutritional and functional value of food: Water activity and sorption phenomenon, Engineered foods and influencing water activity and shelf-life; Chemical reactions of carbohydrates–oxidation, reduction, with acid & alkali; Maillard reaction, Caramelization, Ascorbic acid oxidation, Resistant Starch, Soluble and Insoluble fibre, Pigments and approaches to minimize the impact of food processing, Molecular Mobility.

Unit II

Structure and Properties of proteins; electrophoresis, sedimentation, amphoterism, denaturation, viscosity, gelation, texturization, emulsification, foaming, protein-protein and other interactions in food matrix; Lipids: melting point, softening point, smoke, flash and fire point, turbidity point, polymorphism and polytypism; polymerization and polymorphism, flavor reversion, auto-oxidation and its prevention, fat in food matrix like fat globule in milk, PUFA, MUFA, CLA, ω - fatty acids, trans fatty acids, phytosterol, etc.

Unit III

Description of food flavours; Flavour enhancers, Food acids their tastes and flavours, Principles and techniques of flavour encapsulation, types of encapsulation; Factors affecting stabilization of encapsulated flavour and their applications in food industry.

Unit IV

Processing and packaging induced chemicals and their control – acrylamide, nitrosamines, carcinogenic and genotoxicchlorpropanols such as 3-monochloropropane-1, 2-diol (3-MCPD), PAHs (in grilled and smoked products), dioxine, histamine, ethyl carbamate, furan, bisphenol A or phthalates from plastic materials, microplastics, 4-methylbenzophenone and 2-isopropylthioxanthone from inks, mineral oil from recycled fibres or semicarbazide from a foaming agent in the plastic gasket.

V. Practical

- Estimation of protein content in food samples using spectroscopic methods
- Study of effect of heat on protein denaturation using enzymes
- Study of effect of various salt solutions on solubility of proteins
- Separation of milk proteins by salting out method
- Separation of proteins using chromatographic methods
- Fractionation of proteins
- Extraction and purification of essential oil/ flavouring compound of a natural source
- Study the process of starch retrogradation, gelatinization and modification
- Estimation of crude and dietary fibres in given food sample
- Analysis of resistant starches
- Estimation of various antioxidants, polar compounds and free fatty acids in frying oils
- Extraction and purification of natural plant pigment
- Functional properties and isoelectric point of proteins
- Qualitative and quantitative evaluation of processing and packaging induced chemicals
- Qualitative identification of different flavouring compounds

I. Course Title : Global Food Laws and Regulations

II. Course Code : FSQ 504

III. Credit Hours : 2+0

IV. Theory

Unit I

International Plant Protection Convention, world organization for animal health (OIE), sanitary and phytosanitary measures (SPS), Codex Alimentarius, FAOLEX, OECD Agriculture and Fisheries, International Trade Centre's Standards Map, FAO Food safety and quality emergency Prevention, JFSCA, Fundamental Principles of food safety governance, Risk Analysis as a Method to Determine the Regulatory Outcome, Increasing Responsibility of Businesses (Private) Risk Assessors, Concept of harmonization of global food laws,

Unit II

EU Food Safety Standards - Regulation 178 of 2002, The European food safety authority (EFSA), A critical overview of the EU food safety policy and standards, COMESA Food Safety Standards - An overview, Case Studies in Food Safety Standards in EU-COMESA Trade, Private voluntary standards (PVS) and EU food safety standards, FDA Food safety modernization Act (FSMA), FSPCA Preventive Controls for Human Food, Foreign Supplier Verification Programs (FSVP), Food Facility Registration, FDA - Current Good Manufacturing Practices (CGMPs)

Unit III

Hazard Analysis & Critical Control Points (HACCP) guidelines, Foreign Food Facility Inspection Program, International and Interagency Coordination, Registration of Food Facilities, Seafood Imports and Exports, Regulation on GM Foods, Regulations on Irradiated foods, Global Regulations on Health Foods, International Law on Adequacy of thermal processing, Grain Fumigation for Export, Law of trading horticultural Products, Safety Frame Applied to Food Applications of Nanotechnology.

Unit IV

Review of Indian Regulatory Scenario in Food and Food Products - Food Safety and Standards (FSS) Act, 2006, FSS Rules and Regulations, Agricultural Produce Act, 1937 (Grading and Marketing), Export (Quality Control & Inspection), Act, 1963 and Rules, Bureau of Indian Standards relevant to food safety, Legal Metrology Act, International Food Control Systems/ Laws

I. Course Title : Food Safety Management Systems and Certification

II. Course Code : FSQ 505

III. Credit Hours : 2+0

IV. Theory

Unit I

Food safety management systems and its requirements for any organization in the food chain, Block chain concept, Global food safety initiative (GFSI), PAS 220, Prerequisite programs on food safety for food manufacturing, Audits: Introduction, objectives, documentation, responsibilities.

Unit II

Food safety plan overview, Good manufacturing practices and other prerequisite programs, GAP and GMP, Preliminary Steps in Developing a food safety plan, Resources for food safety plans, HACCP, TACCP and VACCP.

Unit III

Biological/ Chemical/ Physical and Economically motivated food safety hazards, Process preventive controls, Food allergen preventive controls, Sanitation preventive controls, supply chain preventive controls, verification and validation Procedures, Record Keeping Procedures, Recall Plan

Unit IV

FSMS and FSSC 22000. ISO 22003, ISO 20005 and traceability in food chain, ISO 14000 series – certification and its importance, ISO 17025 - General requirements for the competence of testing and calibration laboratories, BRC Standard, BRC Storage and Distribution, SQF, Southern Rocklobster Seafood, Retailer programs like Woolworths, Coles, Costco and ALDI, Concept of Auditing.

I. Course Title : Process and Products Monitoring for Quality Assurance

II. Course Code : FSQ 506

III. Credit Hours : 2+0

IV. Theory

Unit I

Variability of the Production Process - Control chart of the middle values and ranges, Medians and ranges, Middle values and standard deviations, Largest and smallest selected value and other individual values.

Unit II

Automation of the Control of Production Processes, Fluorescence cytometry for the rapid analysis of food microorganisms, Infrared spectroscopic methods,

Unit III

Machine vision for the food industry, Ultrasonic methods, Sampling procedures for on line quality

Unit IV

Evaluation the Capability of Production Process and Machine, Chemical sensors RFID, Analysis of the Current State of the Regulation of Manufacturing Processes

V. Suggested Reading

- Rodríguez MEP. 2018. *Process Monitoring and Improvement Handbook,* Second Edition 2018 by ISBN: 978-0-87389-974-1
- *Food Process Monitoring Systems* 1993, Springer

I. Course Title : Quality Concepts and Chain Traceability

II. Course Code : FSQ 507

III. Credit Hours : 2+0

IV. Theory

Unit I

Quality – Concepts, Quality as wining strategy, Total quality management TQM: Introduction, definitions and principles of operation, Tools and Techniques, such as, quality circles, 5 S Practice, Total quality control (TQC), Total employee involvement (TEI), Problem solving process, Quality function deployment (QFD), Failure mode and effect analysis (FMEA), Fault Tree Analysis (FTA), Kizen, Poka-Yoke, QC Tools, PDCA Cycle, Quality Improvement Tools, TQM implementation and limitations, JH – Autonomous maintenance

Unit II

Introduction, Content, Methods, Advantages and Limitation of: Just –in –Time and Quality Management KANBAN system, Total productive maintenance (TPM), QS 9000. Basic concept, Principle, methodology of contemporary trends: Lean manufacturing, Agile manufacturing, World class manufacturing, Concurrent engineering, Bench marking, Cost of quality (COQ) system.

Unit III

Reliability engineering fundamentals; Failure data analysis; Failure rate; mortality curve; Concept of burn in period; Useful life and wear out phase of a system; Mean time to failure (MTTF); Mean time between failure, (MTBF) and mean time to repair (MTTR); Reliability in terms of Hazard rate and failure density, Measurement systems analysis for accuracy, Probability for quality.

Unit IV

SQC -Statistical quality control– X/ R/ p and c chart, Shewhart and types of control charts, Process capability analysis, process capability index. Acceptance sampling by variables and attributes, design of sampling plans, single, double, sequential and continuous sampling plans, design of various sampling plans for food industry (Note:SQC tables can be used in the examination), Capability analysis. Statistical process control.

Unit V

Traceability in food safety management, Applications of traceability, Traceability challenges, Traceability requirements and standards: ISO 22005, Traceability implementation & application: Traceability data & process flow, Traceability process participants, Traceable item, Batch/Lot and Traceability links management, Food authenticity tools.

V. Suggested Reading

I. Course Title : Management of Food By-products and Waste

II. Course Code : FSQ 508

III. Credit Hours : 2+1

IV. Theory

Unit I

Management of Food Waste, Principles of sustainable systems and Green chemistry, Waste management purpose and strategies, Waste & its consequences in pollution and global warming, Food waste classification, Mitigation measures for food processing wastes, Food waste Handling and Management laws – National and international.

Unit II

Approaches to Solid Waste Management - Bio gas and electricity generation, Bioactive compounds extraction, Sourcing natural colour, Valorization, Biofueling, Biofertilizers, Bio-ethanol, Activated carbon, Biochar, other biological approaches, Use for biodegradable plastic, biofertilizers and environmental bioremediation.

Unit III

Approaches to Effluent Waste Management Basic unit operations in wastewater treatment, Anaerobic digestion of organic residues and wastes, Fundamentals and applications of anaerobic digestion for sustainable treatment of food industry wastewater, Effluent treatment strategies for dairy/ brewery/ winery, Common biological treatment processes and on-site treatment systems.

Unit IV

Case studies, commercially viable practices and success stories of value added products of waste and by-products from processing of different plant and animal food products, Food waste for pulp & paper, flavorings and aromas production

V. Practical

- Study of waste utilisation processes by site visit/ site plan studies
- Characterization of effluent for Dissolved solids (TDS), Suspended solids, BoD, CoD,
- Nitrogen (as N), Phosphorus (as P), Alkalinity (as $CaCO_3$), Sulphate (as SO_4), Total organic carbon (TOC)
- Characterization of food waste as feedstock for anaerobic digestion
- Various treatments in use for waste disposal: study on operational precautions;
- Extraction of banana fibre,
- Utilisation of ghee residue in caramel toffee;
- Extraction of volatile oils from organic waste;
- Use of fruit/vegetable residue for the production of cellulose;
- Use of mango kernels for manufacturing of starch;
- Production of pectin/citric acid from organic waste

I. Course Title : Toxicology of Food Ingredients and Products

II. Course Code : FSQ 510

III. Credit Hours : 2+1

IV. Theory

Unit I

General Concepts in Food Toxicology: Definitions, General principles of food toxicology, Toxicology terminologies – Acute, Subacute, Subchronic and Chronic toxicity and other important terminologies; Classification of toxicants, Food Allergy, Food Toxicity, Food Idiosyncrasy, Common food adulterants, Risk assessment, Common techniques for identification/quantification of food toxins, LD50 and LC50 oral-dermal-inhaled, feeding trials and in vitro tests for toxicology.

Unit II

Toxicology of Food additives: Food additives toxicity, Safety Determination of direct and Indirect Food Additives, Acceptable daily intake (ADI), estimated daily intake (EDI), Interaction in food matrix, Evaluation of new and emerging ingredients, Toxicological Study Requirements as per FSSAI for the approval of non-specified foods/food ingredients,

Unit III

Toxicants and contaminants in food: algal toxins, plant toxins and anti-nutrients, dietary estrogens and antiestrogens, Inherent toxins & allergens, process induced toxicants, toxins from packaging, fumigants, safety challenges in of genetically engineered foods, pesticides, heavy metals, carcinogens, polycyclic aromatic hydrocarbons etc.,

Unit IV

Nutraceuticals and functional foods: toxicity and toxicological clearance from regulator, Interactions of prescription drugs, food, alcohol and nutraceuticals. National and international regulatory aspects of health foods and nutraceuticals.

V. Practicals

- Determination of trypsin inhibitors in legumes
- Estimation of phytates/oxalates in cereals/legumes
- Determination of Acrylamide and 5-hydroxymethylfurfural formation in reconstituted potato chips during frying
- Determination of Hydroxymethylfurfural in Baby Foods
- Metals and toxic Metals e.g. Cd, Hg etc.
- Pesticide residues e.g. Dioxin, Aldrin, Malathion etc.
- Mycotoxins, Argemone, Khesari dal, Ergot, Karnal bunt, Dhatura, etc.

- Allergens, Antibiotic & hormone residues, Veterinary drug residue,
- Other new contaminants and toxins (For example: Cyclopiazonic acid in Buckwheat flour)
- Determination of Naturally Occurring Toxic Substances (NOTS) and Deoxynivalenol (DON)
- Elisa for toxins and allergens

I. Course Title : Food Plant Utilities and Sanitation

II. Course Code : FSQ 511

III. Credit Hours : 2+0

IV. Theory

Unit I

General principles of food plant Design and layout, CIP system, sanitizers used in food industry. Personnel hygiene and assessment of surface sanitation by swab and rinse method

Unit II

Sanitation of coolers/chillers/freezers, Design of warehouses, conventional & modern storage structures for fruits, vegetables, meat and marine products, pest and rodent control

Unit III

Waste disposal for Food Plant Hygiene and Sanitation, ETP design and layout, Food hygiene and safety in transportation, with a focus on warehouse storage and refrigerated ships, Process water quality and treatments at plant level, Process plant sanitation - chemistry and water in CIP

Unit IV

Preparation of a sanitation schedule for food preparation area, testing of sanitizers and disinfectants, Steam generation and performance, Boiler operation, forced and induced draught. Flue gas composition and performance analysis, Process air generation, air requirement & supply system. Air Moving and vacuum equipment, Power supply system for food process plants and plant earthing.

FSQ 699	Seminar II	0+1

Course Contents
Ph.D. in Safety and Quality

I. Course Title : Food Quality and Safety Assessment
II. Course Code : FSQ 601
III. Credit Hours : 1+2
IV. Theory

Physical quality - Advances in Quantitative Evaluation of Physical Characteristics of Food as an indicator of quality, modern approaches for colour, texture and microstructure of food

Chemical Quality - Advances in instrumentation used for chemical analysis of foods and methods developed for rapid analytical methods, modern non-destructive testing methods, newer biomarkers for food authenticity, and approaches for using an analyte protectant in gas chromatographic analysis. Review of recent updates on the chemical safety threats such as contaminants from agrochemicals, process, packaging materials and environment.

Biological Quality - Updates in molecular biological approaches for rapid detection, Relevance of metabolomics, transcriptomics and proteomics in food analysis and quality evaluations and current food industry applications, Emerging microbial and other macro-biological threats for foods: mitigation and detection.

V. Practicals

- Lab exercises on food microstructures
- Food authentication, newer approaches in food analysis
- Complex culture isolation and identification
- Molecular methods to detect pathogens
- Individual exercise on design of experiments in food analysis and inter learner parity.
- Protein based detection of genetic modification ingredient
- Detection of 3-monochloropropane-1,2-diol (MCPD) esters, mineral oil saturated hydrocarbons (MOSH) or mineral oil aromatic hydrocarbons (MOAH), or polyfluorinated alkyl substances (PFAS)
- Species differentiation in meat - tryptic digestion of myosine by LC-MS/MS

Syllabus of Supportive Courses

I. Course Title : Post-Harvest Management
II. Course Code : FBM 501
III. Credit Hours : 2+1
IV. Theory

Unit I

Post-harvest handling of F&V. Maturity indices, harvesting and post-harvest handling of fruits and vegetables. Respiration and ripening process. Factors affecting respiration and ripening. Pre and post-harvest factors affecting quality on post-harvest shelf life. Chemicals used for hastening and delaying ripening of fruits and vegetables. Methods of storage – precooling, prestorage treatments, low temperature storage, controlled atmospheric storage, hypobaric storage, irradiation and low cost storage structures, Cleaning & Washing machinery and methods for grading.

Unit II

Packing technology for export. Fabrication of types of containers, cushioning material, vacuum packing, poly shrink packing, specific packing for export of mango, banana, grapes kinnow, sweet orange, and mandarin etc. Principles of preservation by heat, low temperature, chemicals and fermentation. Cut fruits and vegetables.

Unit III

Post-harvest practices for safe storage of food grains. Preparation of threshing, threshers for different crops, parts, terminology, care and maintenance. Winnowing, manual and power operated winnowers. Groundnut decorticators- hand and power operated, principles of working. Maize shellers & castor shellers. Drying- grain drying method and equipment. Grain storage and practices.

Unit IV

Post-harvest technology for major spices (black pepper, cardamom, coriander, cinnamon, ginger, onion and garlic, paprika, saffron, turmeric), their post-harvest diseases and storage pests and their management; Packaging and storage of spices and spice powders.

V. Practical

- Macro quality analysis, grading, packaging.
- Harvesting indices of different vegetable crops;
- Grading and packing of vegetables;
- Practice in judging the maturity of various fruits and vegetables.
- Conservation of zero energy cool chambers for on farm storage.
- Determination of physiological loss in weight (PLW), total soluble solids (TSS), total sugars, acidity and ascorbic and content in fruits and vegetables. Packing methods and types of packing and importance of ventilation.

- Pre-cooling packing methods for export or international trade. Methods of prolonging storage life.
- Effect of ethylene on ripening of banana, sapota, mango, sapota.
- Identification of equipment and machinery used is preservation of fruits and vegetables.
- Preservation by drying and dehydration.
- Visit to local processing units.
- Visit to local market yards and cold storage units.
- Visit to local market and packing industries.

VI. Suggested Reading

II. Course Code : FBM 502

III. Credit Hours : 2+0

IV. Theory

Unit I

Business management; introduction, theories and functions, food industry management; marketing management and human resource development, personal management. Sectors in food industry and scale of operations in India.

Human resource management, study the basics about HR and related policies and capacity mapping approaches for better management. Consumer Behavior towards food consumption, consumer surveys by various institutes and agencies, Various journals on consumer behaviour and market research, Internet based data search.

Unit II

Materials management – types of inventories, inventory costs, managing the inventories, economic order quantity (EOQ). Personnel management – recruitment, selection and training, job specialization. Marketing management – definitions, planning the marketing programmes, marketing mix and four P' s. Financial management – financial statements and rations, capital budgeting. Project management – project preparation evaluation measures.

Unit III

International trade; basics, classical theory, theory of absolute advantage. theory of comparative, modern theory, free trade- protection, methods of protection, quotas, bounties, exchange control, devaluation, commercial treaties, terms of trade, balance of payments, EXIM policy, foreign exchange, mechanics of foreign exchange, GATT, WTO, role of WTO,

International Trade in agriculture. World trade agreements related with food business, export trends and prospects of food products in India.

Unit IV

World consumption of food; patterns and types of food consumption across the globe. Ethnic food habits of different regions. Govt. institutions related to international ad trade; APEDA, Tea board, spice board, wine board, MOFPI etc. management of export import organization, registration, documentation, export import logistics, case studies. Export and import policies relevant to horticultural sector. Project: Consumer Survey on one identified product - both qualitative and quantitative analysis (say, Consumer behavior towards Pickles and Chutneys).

I. Course Title : Food Processing Entrepreneurship and Start-up
II. Course Code : FBM 503
III. Credit Hours : 1+1

IV. Theory

Unit I

Assessing overall business environment in the Indian economy. Overview of Indian social, political and economic systems and their implications for decision making by individual entrepreneurs. Globalisation and the emerging business/ entrepreneurial environment.

Unit II

Concept of entrepreneurship; entrepreneurial and managerial characteristics; managing an enterprise; motivation and entrepreneurship development; importance of planning, monitoring, evaluation and follow up; managing competition; entrepreneurship development programs; Social Responsibility of Business.

Unit III

SWOT analysis, Generation, incubation and commercialization of ideas and innovations. Government schemes and incentives for promotion of entrepreneurship. Government policy on Small and Medium Enterprises (SMEs)/ SSIs. Export and Import Policies relevant to food sector. Venture capital. Contract farming and joint ventures, public-private partnerships. Overview of horti inputs industry. Characteristics of Indian food processing and export industry.
Communication Skills: Structural and functional grammar; meaning and process of communication, verbal and non-verbal communication; listening and note taking, writing skills, oral presentation skills; field diary and lab record; indexing, footnote and bibliographic procedures. Reading and comprehension of general and technical articles, précis writing, summarizing, abstracting; individual and group presentations, impromptu presentation, public speaking; Group discussion. Organizing seminars and conferences.

V. Practical/Assinments/Case studies

- Study of a regulated market,
- Study of a fruit and vegetable market,
- Study of State and Central Warehousing Corporation
- Study of functioning of a regional rural bank and commercial bank for loan.
- Study of food processing enterprise,
- Formulation of project reports for financing food Industry,
- Working out repayment plans,
- Legal Issues in Product Development, Marketing and Market Segments
- Case studies: Innovations in Dairy industry, Bakery industry, fats and oils industry, fruit and vegetable industry, primary and secondary processing of cereals, brewing industry.

Note: In practical of plant design and project engineering a plant design problem should be assigned to a group of (3-4) students. The students should carry out the conceptual design, flow sheeting, material and energy balance calculations, and cost and profitability analysis of any Food Plant.

I. Course Title : Research Methodology
II. Course Code : BSH 501
III. Credit Hours : 2+0

IV. Theory

Unit I

Introduction to Research, Objective and importance of research, Types of research, steps involved in research, Ethical considerations in research, Defining research problem, Research design, Methods of research design, Laboratory safety considerations.

Unit II

Sampling techniques, Classification of Data, Methods of Data Food informatics Collection, designing of experiments, characteristics of a good design: selection of variables, design matrix, factorial design, fractional factorial design, Principal Component Analysis, Taguchi methods.

Unit III

Data Analysis and interpretation Data analysis, Statistical techniques and choosing an appropriate statistical technique, Optimization techniques, Bioassays- direct and indirect.

Unit IV

Hypothesis, Hypothesis testing, sampling and Non- sampling errors, Data processing software, statistical inference, Interpretation of results.

Unit V

Technical Writing and reporting of research, referencing and referencing styles, Research journals, Indexing and citation of journals, acknowledgement, conflict of interest, Intellectual property, plagiarism.

I. Course Title : Food Informatics

II. Course Code : BSH 502

III. Credit Hours : 2+0

IV. Theory

Unit 1

Informatics: Meaning and purpose, Making food-related information available for food researchers, Smart Data searching, Data Retrieval, File search or text search in file on a system, Meta Search Engines. Major centers of food research in India and abroad,

Unit 2

Data bases and Management in Food Processing, Data storage and distribution by using various information technology tools and methods, Computer vision for food detection, segmentation and recognition, 3D reconstruction for food portion estimation Augmented reality for food monitoring.

Unit 3

Evaluation protocols of dietary monitoring/management systems, Mobile computing for dietary assessment Smartphone technologies for dietary behavioral patterns, Dietary behavioral pattern modelling using sensors and/or smartphones

Unit 4

Laboratory Information Management System (LIMS) introduction and applications, LIMS in the food safety workflow, Wearable Food Intake Monitoring Technologies, Computerized food composition (nutrients, allergens) analysis

Unit 5

Chemometric techniques - to gain fundamental understanding of complex food systems through the combination of data from independent measurement techniques, Product lifecycle tracing and tracking – ICT tools and technique

Foreword

THE ICAR has been continuously striving to bring necessary reforms for quality assurance in agricultural education. The Council has appointed National Core Group and BSMA Committees for revision and restructuring of Post-graduate and Doctoral syllabi in consultation with all the stakeholders to meet the challenges and harness opportunities in various disciplines of agriculture and allied sciences. It has been observed that a paradigm shift is necessary in academic regulations to comply with various provisions of National Education Policy-2020. It is heartening to note that the respective Committees have taken due care by following flexible, multi-disciplinary and holistic approach while developing the syllabus and academic regulations. The students are given opportunities to select the courses to support their planned research activities, to register for online courses and to pursue internship for development of entrepreneurship during Masters' programme. Further, the Teaching Assistantship has been introduced to provide experience to the Ph.D. scholars on teaching, evaluation and other related academic matters. This is an important part of doctoral training all over the world and it is expected to address the shortage of faculty in many institutions/universities. By intensive discussion with the subject experts and based on the feedback from the faculty and students, the syllabus of Masters' and Doctoral programmes in 79 disciplines was restructured and new courses were introduced. The syllabus has been revised suitably with the view to equip the students to gain knowledge, enhance their employability and skill sets to mould towards entrepreneurship and build themselves to prepare for global competitiveness. The opinions and suggestions invited from the concerned institutions, eminent scientists and other stakeholders were also reviewed by the Committees.

The Council sincerely thanks Dr Arvind Kumar, Chairman of the National Core Group and its members for the guidance to develop the syllabus in line with contemporary and projected national and global agricultural trends. The Council acknowledges the dedicated efforts and contribution of all the Chairpersons and members of 19 BSMA Committees for preparation of the syllabus. It gives me immense pleasure to express profuse thanks to the Agricultural Education Division for accomplishing this mammoth task under the guidance of Dr N.S. Rathore, former DDG and Dr R.C. Agrawal, DDG. I compliment Dr G. Venkateshwarlu, former ADG (EQR) for his sincere efforts and overall coordination of the meetings. Special thanks to DKMA for bringing out the entire syllabus in six volumes.

(T. Mohapatra)

Date: 13th August 2021
Place: New Delhi-110 001

Preface

THE curricula development is a part of the continued process and effort of the ICAR in this direction for dynamic improvement of national agricultural education system. In this resolve, the ICAR has constituted a National Core Group (NCG) for restructuring of Master's and Ph.D. curriculum, syllabi and academic regulations for the disciplines under agricultural sciences. On the recommendations of the NCG, 19 Broad Subject Matter Area (BSMA) Committees have been constituted by the ICAR for revising the syllabus. These Committees held discussions at length in the meetings and workshops organized across the country. The opinions and suggestions invited from institutions, eminent scientists and other stakeholders were also reviewed by the Committees. The respective BSMA Committees have examined the existing syllabus and analysed carefully in terms of content, relevance and pattern and then synthesized the new syllabus.

The revised curricula of 79 disciplines has been designed with a view to improve the existing syllabus and to make it more contextual and pertinent to cater the needs of students in terms of global competitiveness and employability. To mitigate the concerns related to agriculture education system in India and to ensure uniform system of education, several changes have been incorporated in common academic regulations in relation to credit load requirement and its distribution, system of examination, internship during Masters programme, provision to enrol for online courses and take the advantage of e-resources through e-learning and teaching assistantship for Ph.D. scholars. As per recommendations of the National Education Policy-2020, the courses have been categorized as Major and Minor/Optional courses. By following the spirit of Choice Based Credit System (CBCS), the students are given opportunity to select courses from any discipline/department enabling the multi-disciplinary approach.

We place on record our profound gratitude to Dr Trilochan Mohapatra, Director General, ICAR, New Delhi, for providing an opportunity to revise the syllabi for PG and Ph.D. programs in agriculture and allied sciences. The Committee is deeply indebted to Dr R.C. Agrawal, DDG (Agri. Edn), and to his predecessor Dr N.S. Rathore for their vision and continuous support. Our thanks are due to all Hon'ble Vice Chancellors of CAUs/SAUs/DUs for their unstinted support and to nominate the senior faculty from their universities/institutes to the workshops organized as a part of wider consultation process.

The revised syllabi encompass transformative changes by updating, augmenting, and revising course curricula and common academic regulations to achieve necessary quality and need-based agricultural education. Many existing courses were upgraded with addition and deletion as per the need of the present situation. The new courses have been incorporated based on their importance and need both at national and international level. We earnestly hope that this document will meet the needs and motivate different stakeholders.

G. Venkateshwarlu	Arvind Kumar
Member-Secretary	Chairman, National Core Group

Overview

A National Core Group has been constituted by ICAR for development of Academic Regulations for Masters and Ph.D. programmes, defining names and curricula of Masters' and Ph.D. disciplines for uniformity and revision of syllabi for courses of Masters' and Ph.D. degree disciplines. On the recommendations of the members of National Core Group, 19 Broad Subject Matter Area (BSMA) Committees have been constituted for revising the syllabus. These committees have conducted several meetings with the concerned experts and stakeholders and developed the syllabus for their respective subjects. While developing the syllabi, various provisions of National Education Policy-2020 have also been considered and complied to provide quality higher education and develop good, thoughtful, well-rounded, and creative individuals. Necessary provisions have been made in the curricula to enable an individual to study major and minor specialized areas of interest at a deep level, and also develop intellectual curiosity, scientific temper and creativity.

I express my gratefulness to Dr Arvind Kumar, Vice-Chancellor, Rani Lakshmi Bai Central Agricultural University, Jhansi and Chairman, National Core Group under whose guidance the syllabi for Master's and Doctoral programme is completed. His vast experience in agricultural education and research helped in finalising the syllabi. I wish to place on record the suggestions and directions shown by Dr N.S. Rathore, former Deputy Director General (Education) and Dr G. Venkateswarlu, ADG (EQR) and Member Secretary, National Core Group throughout the period without which the present target could not have been achieved. I am extremely thankful to 19 BSMA Committees for their stupendous job in restructuring and articulating curricula in the light of technological developments and employability prospects in agriculture and allied sciences. I also appreciate and acknowledge the efforts made by Dr S.K. Sankhyan, Principal Scientist (EQR), Dr S.K. Singh, Project Director (DKMA), Mr Punit Bhasin, Incharge, Production Unit (DKMA), Dr Kshitij Malhotra and Dr Sumit Saini, Research Associates to take up the work of editing, proof reading, finalizing and bringing out these six volumes of BSMA in this shape.

I also take this opportunity to express a deep sense of gratitude to Dr Trilochan Mohapatra, Secretary, DARE and Director General, ICAR for his guidance, cordial support and valuable input throughout the revision of the syllabus by BSMA, which helped in completing this task through various stages. The support and help extended by all Deputy Director Generals and the staff of Education Division is also greatly acknowledged.

During this comprehensive exercise of upgrading the course contents, the much-needed academic support, hospitality and participation rendered by Hon'ble Vice-Chancellors of CAUs/SAUs/DUs is greatly acknowledged. My deep sense of gratitude goes to Deans, Directors, Professors, Heads, faculty members and students at the universities who contributed by their effective participation and interaction.

R.C. Agrawal

Contents

Common Academic Regulations for PG and Ph.D. Programmes

1. Academic Year and Registration

- An academic year shall be normally from July to June of the following calendar year otherwise required under special situations. It shall be divided into two academic terms known as semesters. Dates of registration, commencement of instructions, semester end examination, end of semester and academic year, etc. The Academic Calendar shall be developed by the concerned University from time to time and notified accordingly by the Registrar in advance.
- An orientation programme shall be organized by the Director (Education)/ Dean PGS for the benefit of the newly admitted students immediately after commencement of the semester.
- On successful completion of a semester, the continuing students shall register for subsequent semester on the date specified in the Academic/ Semester Calendar or specifically notified separately. Every enrolled student shall be required to register at the beginning of each semester till the completion of his/ her degree programmes.

2. Credit requirements

2.1 Framework of the courses

The following nomenclature and Credit Hrs need to be followed while providing the

syllabus for all the disciplines:

		Masters' Programme	Doctoral Programme
(i)	**Course work**		
	Major courses	20	12
	Minor courses	08	06
	Supporting courses	06	05
	Common courses	05	–
	Seminar	01	02
(ii)	**Thesis Research**	30	75
	Total	70	100

Major courses: From the Discipline in which a student takes admission. Among the listed courses, the core courses compulsorily to be taken may be given *mark

Minor courses: From the subjects closely related to a student's major subject

Supporting courses: The subject not related to the major subject. It could be any subject considered relevant for student's research work (such as Statistical Methods, Design of Experiments, etc.) or necessary for building his/ her overallcompetence.

Common Courses: The following courses (one credit each) will be offered to all students undergoing Master's degree programme:

1. Library and Information Services
2. Technical Writing and Communications Skills
3. Intellectual Property and its management in Agriculture
4. Basic Concepts in Laboratory Techniques
5. Agricultural Research, Research Ethics and Rural Development Programmes

Some of these courses are already in the form of e-courses/ MOOCs. The students may be allowed to register these courses/ similar courses on these aspects, if available online on SWAYAM or any other platform. If a student has already completed any of these courses during UG, he/ she may be permitted to register for other related courses with the prior approval of the Head of Department (HoD)/ Board of Studies (BoS).

2.2 Supporting Courses

The following courses are being offered by various disciplines (The list is only indicative). Based on the requirement, any of the following courses may be opted under the supporting courses. The syllabi of these courses are available in the respective disciplines. If required, the contents may be modified to suit the individual discipline with approval of the concerned BoS:

Code	Course Title	Credit Hours
STAT 501	Mathematics for Applied Sciences	2+0
STAT 502	Statistical Methods for Applied Sciences	3+1

Course Code	Course Title	Credit Hours
STAT 511	Experimental Designs	2+1
STAT 512	Basic Sampling Techniques	2+1
STAT 521	Applied Regression Analysis	2+1
STAT 522	Data Analysis Using Statistical Packages	2+1
MCA 501	Computers Fundamentals and Programming	2+1
MCA 502	Computer Organization and Architecture	2+0
MCA 511	Introduction to Communication Technologies, Computer Networking and Internet	1+1
MCA 512	Information Technology in Agriculture	1+1
BIOCHEM 501	Basic Biochemistry	3+1
BIOCHEM 505	Techniques in Biochemistry	2+2

2.3 Syllabus of Common Courses for PG programmes

LIBRARY AND INFORMATION SERVICES (0+1)

Objective

To equip the library users with skills to trace information from libraries efficiently, to apprise them of information and knowledge resources, to carry out literature survey, to formulate information search strategies, and to use modern tools (Internet, OPAC, search engines, etc.) of information search.

Practical

Introduction to library and its services; Role of libraries in education, research and technology transfer; Classification systems and organization of library; Sources of information- Primary Sources, Secondary Sources and Tertiary Sources; Intricacies of abstracting and indexing services (Science Citation Index, Biological Abstracts, Chemical Abstracts, CABI Abstracts, etc.); Tracing information from reference sources; Literature survey; Citation techniques/ Preparation of bibliography; Use of CD-ROM Databases, Online Public Access Catalogue and other computerized library services; Use of Internet including search engines and its resources; e-resources access methods.

TECHNICAL WRITING AND COMMUNICATIONS SKILLS (0+1)

Objective

To equip the students/ scholars with skills to write dissertations, research papers, etc. To equip the students/ scholars with skills to communicate and articulate in English (verbal as well as writing).

Practical (Technical Writing)

- Various forms of scientific writings- theses, technical papers, reviews, manuals, etc.;
- Various parts of thesis and research communications (title page, authorship contents page, preface, introduction, review of literature, material and methods, experimental results and discussion);
- Writing of abstracts, summaries, précis, citations, etc.;

- Commonly used abbreviations in the theses and research communications;
- Illustrations, photographs and drawings with suitable captions; pagination, numbering of tables and illustrations;
- Writing of numbers and dates in scientific write-ups;
- Editing and proof-reading;
- Writing of a review article;
- Communication Skills - Grammar (Tenses, parts of speech, clauses, punctuation marks);
- Error analysis (Common errors), Concord, Collocation, Phonetic symbols and transcription;
- Accentual pattern: Weak forms in connected speech;
- Participation in group discussion;
- Facing an interview;
- Presentation of scientific papers.

INTELLECTUAL PROPERTY AND ITS MANAGEMENT IN AGRICULTURE (1+0)

Objective

The main objective of this course is to equip students and stakeholders with knowledge of Intellectual Property Rights (IPR) related protection systems, their significance and use of IPR as a tool for wealth and value creation in a knowledge-based economy.

Theory

Historical perspectives and need for the introduction of Intellectual Property Right regime; TRIPs and various provisions in TRIPS Agreement; Intellectual Property and Intellectual Property Rights (IPR), benefits of securing IPRs; Indian Legislations for the protection of various types of Intellectual Properties; Fundamentals of patents, copyrights, geographical indications, designs and layout, trade secrets and traditional knowledge, trademarks, protection of plant varieties and farmers' rights and biodiversity protection; Protectable subject matters, protection in biotechnology, protection of other biological materials, ownership and period of protection; National

Biodiversity protection initiatives; Convention on Biological Diversity; International Treaty on Plant Genetic Resources for Food and Agriculture; Licensing of technologies, Material transfer agreements, Research collaboration Agreement, License Agreement.

Suggested Readings

BASIC CONCEPTS IN LABORATORY TECHNIQUES (0+1)

Objective

To acquaint the students about the basics of commonly used techniques in laboratory.

Practical

- Safety measures while in Lab;
- Handling of chemical substances;
- Use of burettes, pipettes, measuring cylinders, flasks, separatory funnel, condensers, micropipettes and vaccupets;
- Washing, drying and sterilization of glassware;
- Drying of solvents/ chemicals;
- Weighing and preparation of solutions of different strengths and their dilution;
- Handling techniques of solutions;
- Preparation of different agro-chemical doses in field and pot applications;
- Preparation of solutions of acids;
- Neutralisation of acid and bases;
- Preparation of buffers of different strengths and pH values;
- Use and handling of microscope, laminar flow, vacuum pumps, viscometer, thermometer, magnetic stirrer, micro-ovens, incubators, sandbath, waterbath, oilbath;
- Electric wiring and earthing;
- Preparation of media and methods of sterilization;
- Seed viability testing, testing of pollen viability;
- Tissue culture of crop plants;
- Description of flowering plants in botanical terms in relation to taxonomy.

Suggested Readings

1. Furr AK. 2000. *CRC Hand Book of Laboratory Safety*. CRC Press.

2. Gabb MH and Latchem WE. 1968. *A Handbook of Laboratory Solutions*. Chemical Publ. Co.

AGRICULTURAL RESEARCH, RESEARCH ETHICS AND RURAL DEVELOPMENT PROGRAMMES (1+0)

Objective

To enlighten the students about the organization and functioning of agricultural research systems at national and international levels, research ethics, and rural development programmes and policies of Government.

Theory

UNIT I History of agriculture in brief; Global agricultural research system: need, scope, opportunities; Role in promoting food security, reducing poverty and protecting the environment; National Agricultural Research Systems (NARS) and Regional Agricultural Research Institutions; Consultative Group on International Agricultural Research (CGIAR): International Agricultural Research Centres (IARC), partnership with NARS, role as a partner in the global agricultural research system, strengthening capacities at national and regional levels; International fellowships for scientific mobility.

UNIT II Research ethics: research integrity, research safety in laboratories, welfare of animals used in research, computer ethics, standards and problems in research ethics.

UNIT III Concept and connotations of rural development, rural development policies and strategies. Rural development programmes: Community Development Programme, Intensive Agricultural District Programme, Special group – Area Specific Programme, Integrated Rural Development Programme (IRDP) Panchayati Raj Institutions, Co-operatives, Voluntary Agencies/ Non-Governmental Organisations. Critical evaluation of rural development policies and programmes. Constraints in implementation of rural policies and programmes.

Suggested Readings

1. Bhalla GS and Singh G. 2001. *Indian Agriculture - Four Decades of Development*. Sage Publ.
2. Punia MS. *Manual on International Research and Research Ethics.* CCS Haryana Agricultural University, Hisar.
3. Rao BSV. 2007. *Rural Development Strategies and Role of Institutions - Issues, Innovations and Initiatives*. Mittal Publ.
4. Singh K. 1998. *Rural Development - Principles, Policies and Management*. Sage Publ.

2.4 Mandatory requirement of seminars

- It has been agreed to have mandatory seminars one in Masters (One Credit) and two in Doctoral programmes (two Credits).
- The students should be encouraged to make presentations on the latestdevelopments and literature in the area of research topic. This will provide training to the students on preparation for seminar, organizing the work, critical analysis of data and presentation skills.

3. Residential requirements

- The minimum and maximum duration of residential requirement for Masters'

Degree and Ph.D. Programmes shall be as follows:

P.G. Degree Programmes	Duration of Residential Requirement	
	Minimum	Maximum
Masters' Degree	2 Academic Years (4 Semesters)	5 Academic Years (10 Semesters)
Ph.D.*	3 Academic Years (6 Semesters)	7 Academic Years (14 Semesters)

*Student may be allowed to discontinue temporarily only after completion of course work

In case a student fails to complete the degree programme within the maximum duration of residential requirement, his/ her admission shall stand cancelled. The requirement shall be treated as satisfactory in the cases in which a student submits his/ her thesis any time during the 4^{th} and 6^{th} semester of his/ her residentship at the University for Masters' and Ph.D. programme, respectively.

4. Evaluation of course work and comprehensive examination

- For M.Sc., multiple levels of evaluation (First Test, Midterm and Final semester) is desirable. However, it has been felt that the comprehensive examination is redundant for M.Sc. students.
- For Ph.D., the approach should be research oriented rather than exam oriented. In order to provide the student adequate time to concentrate on the research work and complete the degree in stipulated time, the examination may have to be only semester final. However, the course teacher may be given freedom to evaluate in terms of assignment/ seminar/ first test.
- For Ph.D., the comprehensive examination (Pre-qualifying examination) is required. As the students are already tested in course examinations, the comprehensive examinationshould be based onoral examinationby an external expert and the evaluation should cover both the research problem and theoretical background to execute the project. This shall assess the aptitude of the student and suitability of the student for the given research topic. The successful completion of comprehensive examination is to obtain the "Satisfactory" remark by the external expert.

5. Advisory System

5.1 Advisory Committee

- There shall be an Advisory Committee for every student consisting of not fewer than three members in the case of a candidate for Masters' degree and four in the case of Ph.D. degree with the Advisor as Chairperson. The Advisory Committee should have representatives from the major and minor fields amongst the members of the Post-graduate faculty accredited for appropriate P.G. level research. However, in those departments where qualified staff exists but due to unavoidable reasons Post-graduate degree programmes are not existing, the staff having Post-graduate teaching experience of two years or more may be included in the Advisory Committee as member representing the minor.
- At any given time, a P.G. teacher shall not be a Chairperson, Advisory Committee (including Master's and Ph.D. programmes) for more than five students.

- The Advisor should convene a meeting of the Advisory Committee at least once in a Semester. The summary record should be communicated to the Head of Department, Dean of the College of concerned, Director (Education)/ Dean PGS and Registrar for information.

Advisor/ Co-guide/ Member, Advisory Committee from other collaborating University/ Institute/ Organization

- In order to promote quality Post-graduate research and training in cutting edge areas, the University may enter into Memorandum of Understanding (MOU) with other Universities/ Institutions for conducting research. While constituting an Advisory Committee of a student, if the Chairperson, Advisory Committee feels the requirement of involving of a faculty member/ scientist of such partnering university/ Institute/ Organization, he/ she may send a proposal to this effect to Director (Education)/ Dean PGS along with the proposal for consideration of Student's Advisory Committee (SAC).
- The proposed faculty member from the partnering institution can be allowed to act as Chairperson/ Co-guide/ Member, SAC, by mutual consent, primarily on the basis of intellectual input and time devoted for carrying out the research work at the particular institution. The faculty member/ scientist of partnering institutions in the SAC shall become a temporary faculty member of the University by following the procedure approved by the Academic Council.

Allotment of students to the retiring persons

Normally, retiring person may not be allotted M. Sc. Student if he/ she is left with less than 2 years of service and Ph.D. student if left with less than 3 years of service. However, in special circumstances, permission may be obtained from the Director (Education)/ Dean PGS, after due recommendation by the concerned Head of the Department.

Changes in the Advisory Committee:

(i) Change of the Chairperson or any member of the Advisory Committee is not ordinarily permissible. However, in exceptional cases, the change may be effected with due approval of the Director of Education/ Dean PGS.

(ii) Normally, staff members of the university on extra ordinary leave or on study leave or who leave the University service will cease to continue to serve as advisors of the Post-graduate students of the University. However, the Director (Education)/ Dean PGS may permit them to continue to serve as advisor subject to the following conditions:

  (a) The concerned staff member must be resident in India and if he/ she agrees to guide research and must be available for occasional consultations;

  (b) An application is made by the student concerned duly supported by the Advisory Committee;

  (c) In case of a Ph.D. student, he/ she must have completed his/ her comprehensive examinations and the research work must be well in progress and it is expected that the student will submit the thesis within a year;

  (d) The Head of the Department and the Dean of the College concerned agree to the proposal;

(e) The staff member, after leaving the University service is granted the status of honorary faculty's membership by the Vice-Chancellor on the recommendation of the Director (Education)/ Dean PGS for guiding as Chairperson or Member, Advisory Committee the thesis/ theses of the student(s) concerned only.

(iii) In case the Chairperson/ member of a Student's Advisory Committee retires, he/ she shall be allowed to continue provided that the student has completed his course work and minimum of 10 research credits and the retiring Chairperson/ member stays at the Headquarters of the College, till the thesis is submitted.

(iv) If the Chairperson/ member proceeds on deputation to another organization, he/ she may be permitted to guide the student provided his/ her new organization is at the Headquarters of the College and his/ her organization is willing for the same.

(v) The change shall be communicated to all concerned by the Head of Department.

6. Evaluation of research work

- It is highly desirablefor Ph.D. programme and this should be done annually as an essential part of research evaluation. The Student Advisory Committee shallreview the progress of research and scrutinize annual progress reports submitted by the student.
- Midterm evaluation of Ph.D. (to move from JRF to SRF) is a mandatory requirement for all the funding agencies. Hence, the second review of annual progress report need to be done after completion of two years. The successful completion enables the students to become eligible for SRF.

6.1 Prevention of plagiarism

- An institutional mechanism should be in place to check the plagiarism. The students must be made aware that manipulation of the data/ plagiarism is punishable with serious consequences.

7. Learning through online courses

- In line with the suggestion in new education policy and the initiatives taken by ICAR and MHRD in the form of e-courses, MOOCs, SWAYAM, etc. and also changes taking place globally in respect of learning through online resources it has been agreed to permit the students to enrol for online courses. It is expected that the provision of integrating available online courses with the traditional system of education would provide the students opportunities to improve their employability by imbibing the additional skills and competitive edge.

The Committee recommends the following points while integrating the online courses:

1. Board of Studies (BoS) of each Faculty shall identify available online courses and a student may select from the listed courses. The interested students may provide the details of the on-line courses to the BoS for its consideration.
2. A Postgraduate student may take up to a maximum of 20% credits in a semester through online learning resources.
3. The host institute offering the course does the evaluation and provide marks/ grades. The BoS shall develop the conversion formula for calculation of GPA and it may do appropriate checks on delivery methods and do additional evaluations, if needed.

8. Internship during Masters programme

Internship for Development of Entrepreneurship in Agriculture (IDEA)

Currently, a provision of 30 credits for dissertation work in M.Sc./ M.Tech/ M.F.Sc./ M.V.Sc. programmes helps practically only those students who aspire to pursue their career in academic/ research. There is hardly any opportunity/ provision under this system to enhance the entrepreneurship skills of those students who could start their own enterprise or have adequate skills to join the industry. Therefore, in order to overcome this gap, an optional internship/ in-plant training (called as IDEA) in lieu of thesis/ research work is recommended which will give the students an opportunity to have a real-time hands-on experience in the industry.

It is envisaged that the internship/ in-plant training would enhance the interactions between academic organizations and the relevant industry. It would not only enable the development of highly learned and skilled manpower to start their-own enterprises but also the industry would also be benefitted through this process. This pragmatic approach would definitely result in enhancedpartnerships between academia and industry.

The main objectives of the programme:

1. To promote the linkages between academia and industry
2. To establish newer University – Cooperative R&D together with industry for knowledge creation, research and commercialization
3. Collaboration between Universities and industries through pilot projects
4. To develop methods for knowledge transfer, innovation and networking potential
5. To enhance skill, career development and employability

Following criteria for IDEA will be taken into consideration:

- At any point of time there will not be more than 50% of students who can opt under IDEA
- Major Advisor will be from Academia and Co-advisor (or Advisory Committee member) from industry
- Total credits (30) will be divided into 20 for internship/ in-plant training and10 for writing the report followed by viva-voce similar to dissertation
- Work place will be industry; however, academic/ research support would be provided by the University or both. MoU may be developed accordingly
- The IPR, if any, would be as per the University policy

9. Teaching assistantship

- Teaching assistantship shall be encouraged. This will give the required experience to the students on how to conduct courses, practical classes, evaluation and other related academic matters. This is an important part of Ph.D. training all over the world and it is expected to address the shortage of faculty in many institutions/ universities.
- The fulltime doctoral students of the University with or without fellowship may be considered for award of Teaching Assistantships in their respective Departments. The Teaching Assistantship shall be offered only to those doctoral students who have successfully finished their course work. Any consideration for award of Teaching Assistantships must have the consent ofthe supervisor concerned.
- Teaching Assistantships shall be awarded on semester to semester basis on the recommendation of a screening/ selection committee to be constituted by the

ViceChancellor. All classes and assignments given to the Teaching Assistants, including tutorials, practicals and evaluation work shall be under the supervision of a faculty member who would have otherwise handled the course/ assignment.

- Each Ph.D. student may be allowed to take a maximum of 16 classes in a month to UG/ Masters students.
- No additional remuneration shall be paid to the students who are awarded ICAR JRF/ SRF. The amount of fellowship to be paid as remuneration to other students (who are receiving any other fellowship or without any fellowships) may be decided by the concerned universities as per the rules in force.However, the total amount of remuneration/ and fellowship shall not exceed the amount being paid as JRF/ SRF of ICAR.
- At the end of each term, Teaching Assistants shall be given a certificate by the concerned Head of the Department, countersigned by the School Dean, specifying the nature and load of assignments completed.

10. Registration of project personnel (SRF/ RA) for Ph.D.

- A provision may be made to enable the project personnel (SRF/ RA) to register for Ph.D. However, this can be done only if they are selected based on some selection process such as walk-in-interview. The prior approval of PI of the project is mandatory to consider the application of project personnel (SRF/ RA) for Ph.D. admission
- The candidates need to submit the declaration stating that the project work shall not be compromised because of Ph.D. programme. Further, in order to justify the project work and Ph.D. programme, the number of course credits should not be more than 8 in a semester for the project personnel (SRF/ RA) who intend to register for Ph.D.

11. Compliance with the National Education Policy-2020

- While implementing the course structure and contents recommended by the BSMA Committees, the Higher Education Institutions (HEIs) are required to comply with the provisions of National Education Policy-2020, especially the following aspects:
- Given the 21st century requirements, quality higher education must aim to develop good, thoughtful, well-rounded, and creative individuals. It must enable an individual to study one or more specialized areas of interest at a deep level, and also develop character, ethical and Constitutional values, intellectual curiosity, scientific temper, creativity, spirit of service, and 21st century capabilities across a range of disciplines including sciences, social sciences, arts, humanities, languages, as well as professional, technical, and vocational subjects. A quality higher education must enable personal accomplishment and enlightenment, constructive public engagement, and productive contribution to the society. It must prepare students for more meaningful and satisfying lives and work roles and enable economic independence (9.1.1. of NEP-2020).
- At the societal level, higher education must enable the development of an enlightened, socially conscious, knowledgeable, and skilled nation that can find and implement robust solutions to its own problems. Higher education must form the basis for knowledge creation and innovation thereby contributing to a growing national economy. The purpose of quality higher education is, therefore, more than the creation of greater opportunities for individual employment. It represents the key to more vibrant, socially engaged, cooperative communities and a happier,

cohesive, cultured, productive, innovative, progressive, and prosperous nation (9.1.3. of NEP-2020).

- Flexibility in curriculum and novel and engaging course options will be on offer to students, in addition to rigorous specialization in a subject or subjects. This will be encouraged by increased faculty and institutional autonomy in setting curricula. Pedagogy will have an increased emphasis on communication, discussion, debate, research, and opportunities for cross-disciplinary and interdisciplinary thinking (11.6 of NEP-2020).
- As part of a holistic education, students at all HEIs will be provided with opportunities for internships with local industry, businesses, artists, crafts persons, etc., as well as research internships with faculty and researchers at their own or other HEIs/ research institutions, so that students may actively engage with the practical side of their learning and, as a by-product, further improve their employability (11.8 of NEP-2020).
- HEIs will focus on research and innovation by setting up start-up incubation centres; technology development centres; centres in frontier areas of research; greater industry-academic linkages; and interdisciplinary research including humanities and social sciences research (11.12. of NEP-2020).
- Effective learning requires a comprehensive approach that involves appropriate curriculum, engaging pedagogy, continuous formative assessment, and adequate student support. The curriculum must be interesting and relevant, and updated regularly to align with the latest knowledge requirements and to meet specified learning outcomes. High-quality pedagogy is then necessary to successfully impart the curricular material to students; pedagogical practices determine the learning experiences that are provided to students, thus directly influencing learning outcomes. The assessment methods must be scientific, designed to continuously improve learning and test the application of knowledge. Last but not least, the development of capacities that promote student wellness such as fitness, good health, psycho-social well-being, and sound ethical grounding are also critical for high-quality learning (12.1. of NEP-2020).

Definitions of Academic Terms

Chairperson means a teacher of the major discipline proposed by the Head of Department through the Dean of the College and duly approved by the Director of Education/ Dean Post Graduate Studies (or as per the procedure laid down in the concerned University regulations) to act as the Chairperson of the Advisory Committee and also to guide the student on academic issues.

Course means a unit of instruction in a discipline carrying a specific number and credits to be covered in a semester as laid down in detail in the syllabus of a degree programme.

Credit means the unit of work load per week for a particular course in theory and/ or practical. One credit of theory means one class of one clock hour duration and one credit practical means one class of minimum two clock hoursof laboratory work per week.

Credit load of a student refers to the total number of credits of all the courses he/ she registers during a particular semester.

Grade Point (GP) of a course is a measure of performance. It is obtained by dividing the per cent mark secured by a student in a particular course by 10, expressed and rounded off to second decimal place.

Credit Point (CP) refers to the Grade point multiplied by the number of credits of the course, expressed and rounded off to second decimal place.

Grade Point Average (GPA) means the total credit point earned by a student divided by total number of credits of all the courses registered in a semester, expressed and rounded off to second decimal place.

Cumulative Grade Point Average (CGPA) means the total credit points earned by a student divided by the total number of credits registered by the student until the end of a semester (all completed semesters), expressed and rounded off to second decimal place.

Overall Grade Point Average (OGPA) means the total credit points earned by a student in the entire degree programme divided by the total number of credits required for the P.G. degree, expressed and rounded off to second decimal place.

Preamble and Acknowledgement
BSMA–Fisheries Science 2020

India's Fisheries sector includes aquaculture and capture fisheries with varied resources and potential, engaging over 14.50 million people at the primary level and many more along the value chain. This sunrise sector grew at an impressive Cumulative Average Growth Rate (CGAR) of 8% annually. Aquaculture has surpassed its production than capture fisheries in India by topping second in World's fish and shrimp production. India has witnessed strong growth in exports of fishery products in the last decade. The country is also foremost exporter of fish contributing 5.23% of the Gross Domestic Value to the agriculture sector and 0.96% to the GDP of the country. Indian Council of Agricultural Research, is spearheading national programmes on aquaculture and fisheries research, higher education and frontline extension through a network of Central Research Institutes and State Fisheries Universities.

Major Aquaculture components such as stock improvement, water, energy, health, and feed management and access processing machineries and export markets are responsible for the CGAR. Aquaculture feed and health management has become an important component for sustainable growth and development of the industry. Advanced genetic breeding programs have strongly supported industry growth in the last five years. Besides being a source of health as well as wealth, fisheries and aquaculture provide jobs and livelihood to millions. Globally, fisheries and aquaculture research and education has moved ahead at a rapid pace in response to the diversity and increasing specialisations in the fisheries sector.

Besides the core skills, the sector also requires human assets to support developmental and regulatory processes and entrepreneurship capacity. Highly specialised quality human resources will be one of the central engines which drive the research and development essential to enable fisheries and aquaculture to meet the future demands. The fisheries education curriculum provides the decent knowledge of the subject and the industry but practical skills in bringing entrepreneurial prospects is still lacking for the students. This compilation would pave way for attracting and retaining the talents to fisheries and aquaculture sector for improving fish productivity and consumption at the national level. Fisheries and aquaculture industry is looking for cream of the cream to improve its performance. Thus, the Fisheries education system should be subjected to constant innovations and reforms, particularly with respect to redesigning of curricula and syllabi, innovative pedagogy, developmental orientation, entrepreneurship, soft skill development, etc. It's imperative to prepare the graduates and equip them not only to effectively respond to the emerging needs and challenges, but also to become creative and proactive partners in piloting this knowledge-led revolution.

Presently, four year degree programme in Bachelor of Fisheries Science (B.F.Sc.) is being offered in 40 colleges, while PG programs are offered by 20 colleges. The present yearly intake capacity of B.F.Sc., M.F.Sc. furthermore, Ph.D. programs are around 1500; 500 and 200 respectively, while the yearly out-turn might be around 85-95% of intake. In addition to this, India's Gross Enrolment Ratio (GER) to higher education was found to be >25% and lags behind many developed and developing countries. As aquaculture sector is rewarding the highest CGAR report to its allied farming sectors, it's inevitable that we need to produce more at least 10% of the total agri-graduates produced in the country. Apart from increasing the number of seats, maximum capacity utilization of the available infrastructure facilities would be a long-term value to Higher Education (HE). Strengthening the HE infra by government resources alone may not be adequate to cater to the requirement of human resource development in fisheries sector. All the Fisheries Colleges can take extra efforts to lift the standards of upbringing the competent fisheries professionals by adopting the appropriate Student: Teacher ratio less than 1: 10. Restructuring of postgraduate curricula and syllabi to upgrade the competence and standard of human resource in fisheries is also necessary and for this ICAR has constituted Broad Subject Matter Area specialists (BSMA) committee. The present exercise of revising and reorienting the postgraduate curricula was initiated by ICAR in 2007.

Present BSMA in Fisheries science has given a major thrust to restructuring of syllabus by introducing the contents catering the need of present scenario and future need keeping in view the environmental, societal issues and job opportunities. At present scenario committee recommends 12 disciplines, which is two disciplines less than the recommendation of previous BSMA committee (2013).

Fisheries sector is growing fast and hence it needs compatible and competent human resources for its sustainable development. A set target of 22 mmt has been assigned to achieve by 2030 under the Blue Revolution program of the Govt. Hence, higher education in Fisheries Science will be a driving force to achieve this huge target within coming 10 years. This coincides with the restructuring of the course curriculum of the Master and Ph.D. of Fisheries science as under taken by the BSMA committee. The workshop was fully dedicated for the syllabus revision activities and for discussing the academic reformations. The committee were concerned about sustainability, food safety, consumer demand, climate smart aquaculture, alternative sources and sensory evaluation for GM plants or animals.

Along with restructuring the syllabus some changes in academic rules have been proposed so as to strengthen the soft skill capability of the students. Considering the recent UGC guide lines for the Ph.D as the minimum qualification for the Assistant Professor, overall development of Ph.D students pertaining to quality research, teaching ability and leadership quality have been addressed. Teaching assistantship has been proposed to involve the Ph.D students in teaching programme so as to facilitate the Ph.D students to teaching programme before joining as a Assistant Professor in a college.

Fisheries colleges are rapidly coming up all over the country almost in all the states. ICAR's recommendations for starting of a new college are to be implemented still more effectively in our country. Similarly we cannot wait for a long to implement a newly recommended disciplines, which has its relevance in the present context and may loose its priority in due course of time. Hence, committee request ICAR to facilitate the implementation of these new programs by all the colleges in a specific period of time.

The key issues specially addressed in the revision of course curricula at PG and doctoral levels are: supply of high quality germplasm to farming community, compounded feed supply to intensive aquaculture production units, strategic bio-available micro-nutrient supplements, water use for super and supra intensive aquaculture, production designs for fish rearing amenable to automation and mechanization, clean fish production to be taken up as a national mission, phyto-sanitary measures for traceability and quality assurance of products of fish and fishery products, onward linkages for processing and marketing of the fishes, cold chain infrastructure for fish meats, entrepreneurship building and economic analysis of various fish production including pricing, insurance, credit, technological backstopping and assessment of economic losses associated with inadequate prioritization of the aquaculture enterprise.

The implementation of the new and restructured post graduate course curricula is expected to build knowledge and skill portfolio of the students so as to enhance their employability and marketability as multi-service providers with practical skills and comprehensive knowledge of the entire subject area after masters. The doctorates should, in turn, prove as specialists, in the field of their specialization. The valuable inputs received from the stake holders, viz. eminent academicians, scientists, extension workers, pharmaceutical/aquaculture industry, leading consultants, state fisheries department etc. have immensely helped in preparation of this document.

We are thankful to Dr Arvind Kumar, Vice Chancellor, RLBCAU Jhansi, ICAR and all the members of the BSMA Committee on Fisheries Science and the participants of consultative workshop for their valuable suggestions and contributions for the development of the curricula and syllabi. Our thanks are due to Dr T. Mohapatra Secretary, DARE and D.G, ICAR and the DDG (Edn.), for their support in bringing out this document. We also thank Dr G. Venkateshwarlu Assistant Director General (EQR) Member Secretary, BSMA, for his untiring assistance throughout the consultation process till final documentation. The extensive help rendered by TNJFU and ICAR-CIFE, Mumbai for organizing various BSMA committee meetings with the students and faculty and industry personnels for the syllabus activities is duly acknowledged. We hope that this document will serve as a guide and help in achieving uniformly high standards in postgraduate education in Fisheries Science across the country.

ICAR also can issue a guidelines along with the revamped syllabus of BSMA -2020 to all the institutes to adopt the newly revised syllabus scrupulously with only a little flexibility of 10 %.

The BSMA Committee of Fisheries experts have been of great help for the past many months to work consistently with the Chairman and the Convener to give a shape to the curriculum for the PG and PhD programs of Fisheries Science.

We firmly believe that this exercise of major revamping of the PG and Ph.D Syllabus will naturally raise the bar for the students undergoing these programs and would ensure ‘quality’ in higher education offered in Fisheries Science.

Prof. S. Felix
Chairman

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 5

Fisheries Science
– Aquaculture

Preamble
(Aquaculture)

India's Fisheries sector includes aquaculture and capture fisheries with varied resources and potential, engaging over 14.50 million people at the primary level and many more along the value chain. This sunrise sector grew at an impressive Cumulative Average Growth Rate (CGAR) of 8% annually. Aquaculture has surpassed its production than capture fisheries in India by topping second in World's fish and shrimp production. India has witnessed strong growth in exports of fishery products in the last decade. The country is also foremost exporter of fish contributing 5.23% of the Gross Domestic Value to the agriculture sector and 0.96% to the GDP of the country. Indian Council of Agricultural Research, is spearheading national programmes on aquaculture and fisheries research, higher education and frontline extension through a network of Central Research Institutes and State Fisheries Universities.

Major Aquaculture components such as stock improvement, water, energy, health, and feed management and access processing machineries and export markets are responsible for the CGAR. Aquaculture feed and health management has become an important component for sustainable growth and development of the industry. Advanced genetic breeding programs have strongly supported industry growth in the last five years. Besides being a source of health as well as wealth, fisheries and aquaculture provide jobs and livelihood to millions. Globally, fisheries and aquaculture research and education has moved ahead at a rapid pace in response to the diversity and increasing specialisations in the fisheries sector.

Besides the core skills, the sector also requires human assets to support developmental and regulatory processes and entrepreneurship capacity. Highly specialised quality human resources will be one of the central engines which drive the research and development essential to enable fisheries and aquaculture to meet the future demands. The fisheries education curriculum provides the decent knowledge of the subject and the industry but practical skills in bringing entrepreneurial prospects is still lacking for the students. This compilation would pave way for attracting and retaining the talents to fisheries and aquaculture sector for improving fish productivity and consumption at the national level. Fisheries and aquaculture industry is looking for cream of the cream to improve its performance. Thus the fisheries education system should be subjected to constant innovations and reforms, particularly with respect to redesigning of curricula and syllabi, innovative pedagogy, developmental orientation, entrepreneurship, soft skill development, etc.Its imperative to prepare the graduates and equip them not only to effectively respond to the emerging needs and challenges, but also to become creative and proactive partners in piloting this knowledge-led revolution.

Presently, four year degree programme in Bachelor of Fisheries Science (B.F.Sc.) is being offered in 34 colleges as, while Master and Ph.D programme are offered by 19 and 8 colleges, respectively. Present yearly intake capacity of B.F.Sc., M.F.Sc. and Ph.D. programmes are 1, 079; 417 and 181 respectively, while the yearly outturn might be around 85-95% of intake. In addition to this, India's gross enrolment ratio to higher education was found to be >15% and lags behind many developed and developing countries. .As aquaculture sector is rewarding the most highest CGAR report to its allied farming sectors, its inevitable that we need to produce more at least 10% of the total agri-graduates produced in the country.Increasing the number of seats alone will not be an ideal solution.Maximum capacity utilization of the available infrastructure facilities would be a long term value to Higher Education (HE) .Strengthening the HE infra by government resources alone may not be adequate to cater to the requirement of human resource development in fisheries sector.All the Fisheries Colleges can take extra efforts to lift the standards of upbringing the competent fisheries professionals by adopting the appropriate Student: Teacher ratio of 1: 10. Restructuring of postgraduate curricula and syllabi to upgrade the competence and standard of human resource in fisheries is also necessary and for this ICAR has constituted broad subject matter area specialists (BSMA) committee. The present exercise of revising and reorienting the postgraduate curricula was initiated by ICAR in 2007, but still more than 40% colleges have no Master programme and 80% have no Ph.D programme. It is high time to give utmost priority to the higher education in Fisheries Science in the country. Hence, ICAR should ensure the implementation of BSMA recommendation in all the fisheries colleges by adopting various strategies. It has been observed that some colleges have only one Master or Ph.D programme, which may not satisfy the credit requirement for major and minor subjects of the on-going programs. At this juncture we are unable to implement all the disciplines recommended by the BSMA on one hand and new emerging disciplines needs to be implemented on the other hand. Hence, a suggestive guidelines from ICAR to be followed for the quick implementation of all the discipline in a phasing manner with a total span of five years. Present BSMA in fisheries science has given a major thrust to restructuring of syllabus by introducing the contents catering the need of present scenario and future need keeping in view the environmental, societal issues and job opportunities. Considering the intensive aquaculture and increased consumption rate of fish in future, the committee felt the need of new courses like Fish Pharmacology and Toxicology and Fish Quality Assurance Management so as to ensure healthy fish production and quality fish products available to the consumer. It may not be easy to run these courses initially by all the colleges due to non-availability of faculty in these specialised disciplines, however, it can be initiated in some few colleges, who have the strength to run these courses and later by others. At present scenario committee recommends 15 disciplines which includes two more disciplines than the recommendation of previous BSMA committee (2013).

Fisheries sector is growing fast and hence it needs compatible and competent human resources for its sustainable development. A set target of 22 mmt has been assigned to achieve by 2030 under the Blue revolution programme of the Govt. Hence, higher education in Fisheries Science will be a driving force to achieve this huge target within coming 10 years. This coincides with the restructuring of the course curriculum of the Master and Ph.D of Fisheries science as under taken by the BSMA committee. The workshop was fully dedicated for the syllabus revision activities and for discussing the academic reformations. The committee were concerned about sustainability, food safety, consumer demand, climate smart aquaculture, alternative sources and sensory evaluation for GM plants or animals.

Along with restructuring the syllabus some changes in academic rules have been proposed so as to strengthen the soft skill capability of the students. Considering the recent UGC guide lines for the Ph.D as the minimum qualification for the Assistant Professor, overall development of Ph.D students pertaining to quality research, teaching ability and leadership quality have been addressed. Teaching assistantship has been proposed to involve the Ph.D students in teaching programme so as tofacilitate the Ph.D students to teaching programme before joining as a Assistant Professor in a college.

Fisheries colleges are rapidly coming up almost in every states. But running the fisheries colleges with inadequate facilities and with a very few faculty compromises the teaching quality for which students are deprived off getting complete knowledge on the whole subjects. ICAR's recommendations for starting of a new college are to be implemented still more effectively in our country. Similarly we can not wait for a long to implement a newly recommended disciplines, which has its relevance in the present context and may loose its priority in due course of time. Hence, committee request ICAR to facilitate the implementation of these new programs by all the colleges in a specific period of time.

The key issues specially addressed in the revision of course curricula at PG and doctoral levels are: supply of high quality germplasm to farming community, compounded feed supply to intensive aquaculture production units, adoption of Fish Pharmacology and Toxicology concepts, strategic bio-available micro-nutrient supplements, water use for super and supra intensive aquaculture, production designs for fish rearing amenable to automation and mechanization, clean fish production to be taken up as a national mission, phyto-sanitary measures for traceability and quality assurance of products of fish and fishery products, onward linkages for processing and marketing of the fishes, cold chain infrastructure for fish meats, entrepreneurship building and economic analysis of various fish production including pricing, insurance, credit, technological backstopping and assessment of economic losses associated with inadequate prioritization of the aquaculture enterprise.

The implementation of the new and restructured post graduate course curricula is expected to build knowledge and skill portfolio of the students so as to enhance their employability and marketability as multi-service providers with practical skills and comprehensive knowledge of the entire subject area after masters. The doctorates should, in turn, prove as specialists, in the field of their specialization. The valuable inputs received from the stake holders viz. eminent academicians, scientists, extension workers, pharmaceutical/aquaculture industry, leading consultants, state fisheries department etc. have immensely helped in preparation of this document.

We are thankful to Dr Arvind Kumar, Vice Chancellor, RLBCAU Jhansi, ICAR and all the members of the BSMA Committee on Fisheries Science and the participants of consultative workshop for their valuable suggestions and contributions for the development of the curricula and syllabi. Our thanks are due to Dr T. Mohapatra Secretary, DARE and D.G, ICAR. and Dr N.S. Rathore DDG (Edn.), for their support in bringing out this document. We also thank Dr G. Venkateshwarlu Assistant Director General (EQR) Member Secretary, BSMA, for his untiring assistance throughout the consultation process till final documentation. The extensive help rendered by TNJFU and ICAR-CIFE, Mumbai for organising various BSMA committee meetings with the students and faculty and industry personnels for the syllabus activities is duly acknowledged. We hope that this document will serve as a guide and help in achieving uniformly high standards in postgraduate education in Fisheries Science across the country.

Course Title with Credit Load
M.F.Sc. in Aquaculture

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
AQC 501	Freshwater Aquaculture Production Systems	2+1
AQC 502	Coastal Aquaculture and Mariculture Farming Systems	2+1
AQC 503	Hatchery Technology for Finfishes and Shellfishes	2+1
AQC 504	Aquaculture Policy and Planning	1+1
AQC 505	Fish Nutrition and Feed Technology	2+1
AQC 506	Soil and Water Quality Management in Aquaculture	2+1
AQC 507	Therapeutics and Health Management in Aquaculture	2+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a student's major subject)	
AQC 508	Larval Nutrition and Live Feed Production	1+1
AQC 509	Aquaculture Engineering	1+1
AQC 510	Open Water aquaculture	1+1
AQC 511	Commercial Ornamental Fish Breeding and Culture	1+1
AQC 512	Computer Application in Aquaculture Data Processing	0+1
AQC 513	Inland Saline Aquaculture	1+1
AQC 514	Multilevel Integrated Aquaculture Systems	1+1
AQC 515	Coldwater Aquaculture and Recreational Fisheries	1+1
AQC 516	Recirculating Aquaculture Systems	1+1
	Supporting courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for student's research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	

Course Code	Course Title	Credit Hours
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**
	Masters'seminar	**1 Credits**
AQC 591	Masters' Seminar	0+1
	Masters' Thesis Research	**30 Credits**
AQC 599	Masters' Research (Semester III)	0+15
AQC 599	Masters' Research (Semester IV)	0+15
	Total M.F.Sc Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Aquaculture

I. Course Title : Freshwater Aquaculture Production Systems
II. Course Code : AQC 501
III. Credit Hours : 2+1

IV. Aim of the course

To gain knowledge and understand the recent advances in freshwater fish and prawn farming under different culture systems.

V. Theory

Unit I

Introduction: Present status, hindrances / problems / constraints and prospects for fish and prawn farming in global and Indian perspective. Development process, different supports and driving factors forproduction enhancement.

Unit II

Aquaculture systems: Extensive, semi-intensive and intensive culture of fish and prawn. Partitioned aquaculture systems: raceways, tanks, flow-through systems, polyculture, and composite fish culture. Cages and enclosure. Peri-urban aquaculture systems: aquaponics, RAS, flow- through systems, bio-floc technology and land based aquaculturesystems.

Unit III

Aquaculture practices for cultivable species: Carps, Catfish, Snakeheads, Featherbacks, Tilapia, Mahseer, Trouts and freshwater Prawn. Grow out practices: pre stocking, post stocking management, harvesting and BMP. Other alternative species for high production. Species selection and crop planning. Economics of different fish farming systems

Unit IV

Freshwater prawn farming: Monoculture practice of prawn in ponds, all-male culture and its advantages, polyculture with carps, prawn farming in inland saline soils. Nursery rearing, sex segregation, pond preparation, stocking, feeding and water quality management, disease prevention and treatment; Harvesting methods, handling and BMP.

Unit V

Integrated farming systems: Design, farming practices, constraints and economics of IFS of fish with vegetables, fodder, paddy, cattle, pig, poultry, duck, rabbit and quail. IMTA, Freshwater pearl culture, multi- level integrated system. Resource utilization and conversion of waste towealth.

Unit VI

Wastewater-fed aquaculture: Water treatment methods, species selection, culture practices, harvesting and depuration process. Merits and demerits of wastewater fed aquaculture systems. Pre-requisites and precautions to be taken in the technology adoption.

VI. Practical

Identification of commercially important cultivable finfish and shellfish species; Assessment of seed quality- stress test; pre-stocking factors evaluation and observation; Calculating carrying capacity of pond and stocking density; Check tray assessment and feed ration calculation; Sampling process and species wise growth estimation; Farm feed production and feeding; Lime and fertilizer requirement calculations; Farm visits and observation; Records keeping and data analysis; Modelling of different culture systems.

I. Course Title : Coastal Aquaculture and Mariculture Farming Systems

II. Course Code : AQC 502

III. Credit Hours : 2+1

IV. Aim of the course

To gain knowledge in establishing and managing different fish/shellfish farming systems in coastal zone and marine waters.

V. Theory

Unit I

Introduction: Overview of coastal aquaculture and open sea mariculture; Present trend and future prospects in India. Practices in tropical countries, production levels and adoption of technology. Major bottlenecks in the practices

Unit II

Different farming systems: Cage and pen culture – types, site selection, construction, specifications for different species; Raft and rack culture – Principles, site selection, design and construction; operations and troubles shooting, threats and environmental issues; Land based aquaculture. Principle, design, construction and operations, rules and legislations

Unit III

Aquaculture of finfishes: Distribution, biology, seed collection, nursery rearing, weaning on artificial feed, culture techniques, feeding strategies, constraints and scope (Seabass, milkfish, mullets, pearlspot, sea breams, grouper, snapper, cobia, pompano).

Unit IV

Shrimp farming (*Penaeus monodon, P. indicus, P. semisulcatus, and Litopenaeusvannamei*): Systems of farming – extensive, semi- intensive, intensive and super intensive (Biofloc, RAS, etc.); site selection, design and construction of culture systems, pond preparation, stocking, feed and water quality management, disease prevention and treatment; use of probiotics and prebiotics: harvesting and handling; continuous stocking and harvesting, staggered harvest, management of differential growth; shrimp farming in undrainable ponds. Mud crab fattening, production of soft-shell crabs and Lobster culture.

Unit V

Culture practices for marine molluscs and echinoderms: Present status and future prospects in India, Species cultured (mussels, oysters, pearl oysters, clams, abalone, sea cucumber) distribution, biology, practices followed in India and other Asian countries, farming methods–different types and culture methods; Problems and prospects.

Unit VI

Seaweed farming: Major seaweed species of commercial importance; tissue culture of seaweeds, methods of culture; farming of agar, algin and carragenan yielding species; emerging trends in their farming inopen seas; Integration with other coastal and marine farming systems.

VI. Practical

Identification of commercially important cultivable finfish and shellfish species; Assessment of seed quality, rearing techniques; Feeds for nursery rearing, preparation and evaluation; pre-stocking factors in different systems, valuation and observation; Calculating carrying capacity of pond and stocking density; Cage construction, pen construction and identification of bottlenecks; Sampling process and species wise growth estimation; Construction of rafts and mollusc culture; Seaweed collection and identification; Farm feed production and feeding; Disease identification and management; Visits to cage sites and observation; Records keeping and data analysis; Modelling of different culture systems.

I. Course Title : Hatchery Technology for Finfishes and Shellfishes

II. Course Code : AQC 503

III. Credit Hours : 2+1

IV. Aim of the course

To learn research outlines and recent advances in seed productionand hatchery management of commercially important cultivable finfishes and shellfishes.

V. Theory

Unit I

Introduction: Current status; problems and prospects of seed of different shellfish species – freshwater and marine. Site selection and techniques of collection; identification and segregation of finfish and shellfish seed, handling, packing and transportation. Natural collection processes and their merits and demerits.

Unit II

Reproductive biology: Morphology and reproductive physiology; gonad anatomy; histology of gonad; Hormonal pathways and mode of control; Spermatogenesis and oogenesis; gametology (evaluation of milt and egg); Overview of current developments in reproductive biology of commercially important finfishes and shellfishes.

Unit III

Environmental and nutritional control of reproduction: Reproductive cycles, factors influencing reproduction (Photoperiod, change in water quality and quantity, temperature, lunar cycle, etc.), simulated environment and exogenous hormonal stimuli. Nutritional factors (types of feed - live and prepared feeds, nutritional quality, quantity, feeding management, feed utilisation, etc.) affecting maturation, spawning and nursery rearing.

Unit IV

Induced spawning: Brooder development, quality and its health management, transportation of brooders, hormonal and environmental stimulation, use of different natural, synthetic hormones and analogues and their application; GnRH and LINPE models, PIT tagging, Canulation and volitional spawning, Estimation of spawning efficiency, cryopreservation of gametes.

Unit V

Hatchery management: Indian major and minor carps, exotic carps, catfishes, tilapia, mahseer, murrels, Trout, Seabass, milkfish, mullets, grouper, snapper, breams, pompano, and cobia. Seed production of commercially important prawns (*Macrobrachiumrosenbergii*), shrimps (*Penaeus monodon, P. indicus, P. semisulcatus, and Litopenaeusvannamei*), crabs (*Scylla serrata, Portunuspelagicus*), spiny lobsters (*Panulirus*spp), mussels, edible oysters, pearl oyster and clams. Hatchery protocols, water quality management, larval rearing, estimations, troubleshooting in hatcheries, record keeping, packing and transport of seed, anaesthetics in fish seed transport. Quarantine and Hatchery protocols and biosecurity principles; sanitary and phytosanitary (SPS) measures; Better Management Practices (BMPs); packaging and transport of seed. SPF brood stock development.

Unit VI

Seed quality: Hatchery protocols, water quality management, larval rearing, estimations, trouble shooting in hatcheries, record keeping, packing and transport of seed, anaesthetics in fish seed transport. Quarantine and Hatchery protocols and biosecurity principles; sanitary and phytosanitary (SPS) measures; Better Management Practices (BMPs); packaging and transport of seed. SPF brood stock development. Economics of seed production of different species

VI. Practical

Study of primary and secondary sexual characters; Brooder handling and morphological features recording; Gonadal development observation in carps and other cultivable finfishes; Histological observation of gonads and eggs; Estimation of GSI, Fecundity, Absolute fecundity, Egg parameters, Ovarian features; Collection and identification of cultivable finfish seed; Seed quality character identification; Observation and analysis of inducing agents; Induced breeding of fishes through various inducing agents; Evaluation of carp milt and egg; Cryopreservation of gametes; Preparation of brood and larval feed for different cultivable finfish; Packing and transportation of cultivable finfish seed; Visit to different finfish hatcheries.

I. Course Title : Aquaculture Policy and Planning

II. Course Code : AQC 504

III. Credit Hours : 1+1

IV. Aim of the course

To gain in depth knowledge to develop aquaculture policies for the sustainable aquaculture practices.

V. Theory

Unit I

Sustainability issues: Environmental and Socio-economic issues; Exotic species introduction; escapement; contamination of indigenous gene pool; salinization of soil and water; environmental impact; over exploitation of wild stocks; mangrove deforestation. EIA, eco-system approach to aquaculture. Conflicts over water and land use; conflicts of interest between aqua farmers and fishermen, aquaculture andother enterprises; social issues; anti-dumping duties.

Unit II

Climate Change Impact: Weather elements of concern in aquaculture, Green house gases, global warming and their impact, Carbon sequestration in aquaculture, Microplastics in Aquaculture, measures and tools to reduce energy use and greenhouse gas emission in aquaculture.

Unit III

Strategies for sustainability: Sustainability concept; food security; biosecurity; organic farming; responsible aquaculture; rotational aquaculture; bioremediation; role of biotechnology, traceability. Energy conservation. Application of renewable energy in aquaculture- solar energy, wind, and tidal energy, Seed certification, Sustainable use of antibiotics, minimal water exchange system, natural productivity, preservation of natural resources.

Unit IV

Guiding principles for sustainable aquaculture: Coastal Aquaculture Guidelines Source Book, FAO Code of Conduct for Responsible Fisheries; Holmenskollen Guidelines for Sustainable Aquaculture. BMP, CRZ implications, CAA and it's role, ecolabelling, organic certification. PCB and State water bodies protection guidelines.

VI. Practical

Visit to conventional aquafarm to see the management of used water; Survey on environmental impact on nearby aquaculture farms; Applications of remote sensing and GIS (geographical information system); Economic evaluation of aquaculture practices. Case studieson environmental issues of different types of farms.

I. Course Title : Fish Nutrition and Feed Technology

II. Course Code : AQC 505

III. Credit Hours : 2+1

IV. Aim of the course

To learn the nutritional requirements and feed equipment's of major cultivable to develop new and novel feeds for the commercial aquaculture

V. Theory

Unit I

Introduction: Need for studying the nutritional requirements of cultivable fishes, feed formulation, Methods to study the nutritional requirements, and its need.

Unit II

Feed ingredients and Feed preparation: Commonly used feed ingredients in aqua feeds, Novel feed ingredients, estimation of quality of feed ingredients, Qualities of feed ingredients that determine feed quality, Selection of ingredients, Formulation of feeds, Feed processing and making. Different feed preparation methods.

Unit III

Types of feeds: Floating, semi-floating, sinking and stable feeds for aquaculture, Feed making methods for different feeds, Nutrient leeching in feeds, feed quality determination and feed making, Evaluation of feeds, Simulated system evaluation, lab analysis.

Unit IV

Advanced feeds: High energy feeds, Alternative protein sources for feeds, maturation diets to enhance breeding efficiency, Larval feeds, bio availability in feeds, High FCE and economic benefits of feeding in the farming, Live feed enrichment, Bio-routing of nutrients, Chemo-therapeutants, Other growth promoting agents through live feeds. Evaluation of bio-accumulation and bio-utilisation.

Unit V

Feed processing technology: Common processes in feed manufacture; Grinding, Dosing, Homogenization; Extrusion cooking; Complimentary processes; Drying, crumbling, coating; Use of binders; Feed manufacture productions with high energy diets vacuum coating with lipid. Equipments used in feed manufacture; Pulverizer, grinder, mixer, pelletizer, crumbler, drier, Extruder/Expander, Vacuum coater, fat sprayer

Unit VI

Quality control in fish feed manufacturing: Quality control procedures, raw materials, finished products; Geometrical, and physical feature; Mechanical characteristics in air, Behavioural characteristics in water, Feed economics and evaluation criteria: FCR, AFCR, SGR, PRE, ERE, PER, NPU.

VI. Practical

Nutritional requirements determination for different species; Collection and analysis of different feed ingredients; Feed formulation with different feed ingredients;

Feed quality analysis; Evaluation process in farms and labs; Visit to feed mills and feed making process; Economic analysis of feeding and non feeding systems; Identification of different feed additives; Observation of novel feeds and their utilization

I. Course Title : Soil and Water Quality Management Inaquaculture

II. Course Code : AQC 506

III. Credit Hours : 2+1

IV. Aim of the course

To learn effective soil and water quality management practices foraquaculture

V. Theory

Unit I

Soil and water interaction: Physical and chemical properties of soil and water, Productivity vs. nutrient quality and quantity of soil and water; Aquatic microorganisms and their role in carbon, Nitrogen, Phosphorus and sulphur cycles and impact on aquatic habitats andspecies.

Unit II

Soil and water quality monitoring: Soil and water quality standards; Equipment used for soil and water quality estimations, Automated systems for monitoring, Quality checks and management, aeration system for water quality management.

Unit III

Fertilizers and manures: Different kinds of fertilizers and manures, Fertilizer grade, source, rate and frequency of application, Biofertilizers, Use of treated sewage for pond fertilization, Ecological changes taking place after fertilizing, primary production, degradation of molecules in aquatic environment, Utilization of bioactive compounds by microorganisms.

Unit IV

Soil and water conditioners: Biological indicators, Chemical and physical method of conditioning, Prebiotics, Probiotics, Minerals, Micro-nutrients and additives.

Unit V

Development of suitable soil and water quality: Cat clay/pyrite soil, Seepage, water treatment, Water filtration devices, Aeration, Chlorination, Ozonization and UV radiation, Algal bloom control, Eutrophication, Aquatic weed management, Water quality management in hatcheries.

Unit VI

Waste water treatment practices: Waste discharge standards, Role of microorganisms in fish production, Fish health and fish safety; Microbial load and algal blooms.

VI. Practical

Preparation of water quality charts and maintenance; Equipment used in soil and water analysis; Soil sampling, determination of soil moisture and bulk density; pond filling, Analyses of mud acidity and soil texture; Measurements of temperature, pH, conductivity, salinity, transparency, turbidity and solids; Analyses of dissolved oxygen, alkalinity and hardness, phosphorus, nitrogen; Estimation of primary productivity and chlorophyll; Application of fertilizers and pond liming; Analysis of toxic elements, microbial techniques, Visit to effluent treatment plant.

I. **Course Title** : **Therapeutics and Health Management in Aquaculture**
II. **Course Code** : **AQC 507**
III. **Credit Hours** : **2+1**

IV. **Aim of the course**

To gain knowledge on health management in aquaculture systems through diagnosis, treatment and preventing the disease outbreaks to protect aquaculture production.

V. **Theory**

Unit I

Diseases of fishes: Bacterial, Fungal, Viral diseases of fishes in farm ponds, Natural waters, and incidental outbreaks, Nutritional disorders and environmental diseases, situations for disease outbreaks, Natural immunity and disease control.

Unit II

Control of diseases in aquaculture systems: Control measures for fish diseases, Environmental and nutritional support methods for disease management, Immune modulation, Immunostimulation, Use of vaccines and other preventive methods, Control of diseases in various aquaculture systems, their limitations and benefits.

Unit III

Therapeutics: Concept of therapeutics in aquaculture, effectiveness of medication, Drugs in aquaculture, Herbal therapeutants, Use of and disuse chemicals in aquaculture, Legislation and jurisprudence in therapeutics for aquaculture organisms, Shrimp farming and control mechanism, Drug therapies for ornamental fishes, Biotraceability of antibiotics use in aquaculture.

Unit IV

Health management plans for hatcheries: Special features of hatcheries and health management of brooders, larvae, fry and young ones, Disease impacts on hatchery production, Disinfection protocol, Live feed crash due to diseases, Communicable diseases and their mechanism of spreading, Controlling outbreak of viral infections in all types of hatcheries, Economic benefits of investment in disease management.

Unit V

Modern treatment methods for fishes: Treatment methods currently in practice, isolation, Hospital tanks, Disinfection, Oral drug administration, immersion, Brooder treatment for immunity enhancement, mass treatment protocol, vaccination, advantagesand disadvantages.

Unit VI

Other health management aspects: Health improvement through feeds, Medicated feeds, Chemicals for treatment of external and internal diseases, Parasite treatment, health improvement after treatment, SPF, SPR and SPT seeds, their production protocols.

VI. **Practical**

Identification of disease conditions: Pathological features observation in cultivable fishes; Collection of diseased specimens and identification; Developing treatment protocols for fishes; Analysis of environmental situation favouring disease outbreaks;

Epidemic conditions in farms identification; Preparation of medicated feeds, validation and observation; Hospital tanks and management; Probiotics and prebiotics identification of their effects; Visit to hatcheries and farms to collect the specimens; Economics of different treatment methods.

I. Course Title : Larval Nutrition and Live Feed Production

II. Course Code : AQC 508

III. Credit Hours : 1+1

IV. Aim of the course

To learn the nutritional requirements of fish/shellfish larvae and techniques on mass culture and bio-enrichment of live food organisms.

V. Theory

Unit I

Larval nutrition: Nutritional requirements of finfish and shellfish larvae, Nutritional quality of commonly used live feed, Comparison of live feeds against the prepared feeds, Nutritional disorders in larvae, Larval feeds utilization and advantages.

Unit II

Formulation and preparation of artificial feeds: For larval rearing, Micro particulate diets, Particulate and microencapsulated diets, High energy feeds, energy sparing nutrients in larval feeds.

Unit III

Biology of live feeds: Important live feeds and their biological features, Identification of new live feeds, Live feed use in different forms, Advantages and disadvantages. Important microalgae, rotifers, artemia, infusoria, cladocerans, copepods, oligochaetes, nematode and insect larvae. Bio-enrichment of live feed, Biofilm/periphyton and its use, Culture of single cell proteins and their nutritional quality.

Unit IV

Live feeds research in India, Around the world, New techniques developed in live feed use. Quality determination and cost benefit analysis, Production methods for different micro feeds, lab analysis of quality.

VI. Practical

Collection, identification and isolation of live feed using various techniques, Preparation of various culture media, Preparation and maintenance of stock microalgal culture; Preparation of formulated feeds for rearing finfish and shellfish larvae; Mass culture of microalgae, cladocerans, copepods and rotifers; Hatching of artemia and enrichment; Culture of infusoria, earthworms and chironomidlarvae; Evaluation of different prepared feeds.

I. Course Title : Aquaculture Engineering

II. Course Code : AQC 509

III. Credit Hours : 1+1

IV. Aim of the course

To learn basic aspects of different aquaculture farm designing for effective management and optimum yield.

V. Theory

Unit I

Site selection: Criteria for site selection, Correction factors, Survey methods, Earth work calculations and cost estimation; water resources and their suitability, Suitability of soil from stability and productivity point of view; Land conversion effects and Environmental Impact Assessment (EIA).

Unit II

Estimation in farm construction: Area and volume calculations for an aquafarm and water bodies, surveying and leveling (chain, compass and plain table survey, dumpy level and the odolite).

Unit III

Design, layout planning and construction of different types of production systems: Types of ponds, shape, size and orientation, Design of embankments, Ponds and tanks, Water distribution, canals and exchange structures (inlets, outlets, sluice gates, and monks); Design of feeder channels and drainage systems. Pens, cages (fixed, floating, semi-submerged and tray cages) raceways, Flow-through systems and re-circulatory aquaculture systems (RAS), aquaponics, Feed dispensers, Demand feeders and effluent treatment systems (ETS), Automation in aquaculture.

Unit IV

Design and construction of hatcheries: (carp, freshwater prawn, shrimp and trout). Selection of aquaculture equipment and implement: Selection criteria and maintenance of water pumps, Water filtration systems, Principles of aeration, Aerators, Oxygen budgeting, Aeration grid, Automatic and demand feeders, Soil and water samplers. Aquifers, soil permeability, Hydraulic conductivity, Water budgeting, Water harvesting, Multiple uses of water, Economic impactof modernization in aquafarms

VI. Practical

Estimation in construction, Model development, Visit to aqua farms and hatcheries, Survey - contour survey and mapping, chain and compass survey, Dumpy leveling, Evaluation of performance of seepage control measures, Layout planning and design of hatcheries (carp, freshwater prawn, shrimp and trout) and farms including their costing and evaluation, Estimation of pump capacity, Estimation of construction cost of ponds, Hatchery shed, Aeration devices and Evaluation of their capacity.

I. Course title : Open Water Aquaculture

II. Course code : AQC 510

III. Credit Hours : 1+1

IV. Aim of the course

To learn about the open water aquaculture for production enhancement

V. Theory

Unit I

Introduction: Overview of global scenario of aquaculture in open waters, open water resources in India, Present status, Utilization, Prospects of production augmentation, Utilization of open water bodiesfor aquaculture to enhance production

Unit II

Different culture systems: Cages, pens and enclosures in open waters, Seed stocking, quality and quantity, Cages for sea, estuaries, reservoirs, lakes and canals, Pen culture, Selection of site for sea farming, Different designs of open sea farming structures-construction of cages-bioengineering problems and solutions, Species selection for open water aquaculture, Rearing of fingerlings, advanced fingerlings and table size fish in open water bodies.

Unit III

Practices: Ranching in open waters, species quality and quantity, Natural feed enhancement, Supplementary feeding in cages, Stock assessment, Harvesting and conflicts with irrigation, Drinking water and hydroelectric projects on open water farming.

Unit IV

Environmental impact of Open water Aquaculture: Salinity intrusion, Effluent, discharge, Eutrophication, Chemical residues including antibiotics and hormones, Destruction of natural habitat including paddy field and mangroves, Social issues and conflicts with other users on resources

VI. Practical

Different types of cage materials, fabrication of cages and pens and their installation. Determination of stocking density in cages and pens, Feeding in cages and pens, Stock assessment in cages and pens; Environmental impact of cages and pens, Visit to cages and pen sites.

VII. Suggested Reading

I. Course Title : Commercial Ornamental Fish Breeding and Culture

II. Course Code : AQC 511

III. Credit Hours : 1+1

IV. Aim of the course

To gain knowledge on advanced ornamental fish production technologies and aquatic ornamental plant propagation.

V. Theory

Unit I

Introduction: Global status of ornamental fish trade, present status and prospects of ornamental fish farming and trade in India, Indian ornamental fish diversity and its status, Prospects of production of new strains / varieties, Ornamental fish breeding techniques towards strain development.

Unit II

Design and construction: Self-maintained aquarium, species compatibility, High value species, Aquarium maintenance and care, Common aquarium plants and their identification, Gadgets used in freshwater and marine aquarium, aerators, Filters (UV, trickling and biofiltration), Protein skimmers, Ozonizer, thermostatic heater, Chiller, Lighting, Water conditioners, etc.

Unit III

Captive Breeding techniques: Mass production of commercially important freshwater and marine ornamental fishes, Nursery and grow out culture of commercially important ornamental fish species in Raceways, RAS etc., Hybrids development, Feed and feeding, Color enhancement through pigmented feed, Novel feeds, Common diseases, and control, Water quality management.

Unit IV

Transportation and Trading of Ornamental Fishes: Medicines and chemicals used in the ornamental fish industry, Anaesthetics, packing, transportation and marketing strategies. Culture unit for entrepreneurship development, Socio-economic upliftment through backyard ornamental fish farming, Micro-traders in ornamental fish marketing.

VI. Practical

Identification of common ornamental fishes; Plants and gadgets used in aquariums; Breeding of commercially important ornamental fishes, Visit to ornamental fish units, Aquarium fabrication, Setting and maintenance, Application and use of medicines/chemicals.

I. Course Title : Computer Application In Aquaculture Dataprocessing

II. Course Code : AQC 512

III. Credit Hours : 0+1

IV. Aim of the course

To understand the scope on the computer application in the aquaculture process flow and systems

V. Practical

Computer application basics; Different common software installation and application; Identification of farm based software; Installation and application; Application of SPSS, SAS, SYSTAT and STATISTICA for analysis and presentation of fisheries data; Basic concepts of database management systems: Introduction to MS-ACCESS, ORACLE (RDBMS); Exercise on analysis of data using MS-EXCEL, SPSS, SAS, FISAT, SYSTAT and STATISTICA; Creation of Database using MS-ACCESS, ORACLE, Linear modelling of Feed formulation software installation and use.

I. Course title : Inland Saline Aquaculture

II. Course code : AQC 513

III. Credit Hours : 1+1

IV. Aim of the course

To understand the scope for expanding aquaculture in inland saline waters for effective use

V. Theory

Unit I

Introduction: Inland saline waters, surface and ground water, Quality parameters of inland saline water in India, Global and national status of inland saline soils and underground saline water, Causes and process of salinization, geo-morphological changes, Problems of salinization, Potential for aquaculture.

Unit II

Soil and water characteristics: Comparison with coastal waters, Ionic amendment, water conditioning, Technological and engineering interventions for water quality improvement, Nutrient sparing and chelation in inland saline water.

Unit III

Potential candidate species: Sea bass, pearl spot, milk fish, mullet, shrimps, freshwater prawn, tilapia, cobia, pompano and selective carps for culture, Constraints and solutions, Alternate species with breeding possibilities, Metabolic interactions and growth promotion in altered water systems, Different farming systems.

Unit IV

Socio-economic Importance of Inland Saline Aquaculture: Nutritional intervention in inland shrimp farming; Economics of various finfish and shellfish culture in inland saline arenas; Integrated inland saline aquaculture systems; Recommendations for an action plan.

VI. Practical

Inland saline soil and water sample collection, analysis and ionic amendments, Visit to inland saline water farms, Case studies of inland saline farms, Evaluation of different systems with regard to species cultured, Trials with different species in known inland saline water bodies.

I. Course Title : Multilevel Integrated Aquaculture Systems

II. Course Code : AQC 514

III. Credit Hours : 1+1

IV. Aim of the course

To gain knowledge on advanced integration practices along with aquaculture for enhancing aquaculture production.

V. Theory

Unit I

Integrated fish farming: Global status, integration with agricultural (paddy), horticultural crops (vegetable and fruits) and livestock (cattle, poultry, ducks, pigs and other terrestrial animals). Effective recycling of wastes, nutrient budgeting in different integrated farming systems. Production levels and economics.

Unit II

Bioprocessed manures in integration: Vermicompost, farmyard manure/ compost, biogas slurry, etc. Advantages of biomanures, Control of microbial interactions, Fermentation of manures.

Unit III

Concepts: Integrated multitrophic aquaculture systems and design of an IMTA unit, Aqua tourism. Aquaponics: concept, Principles, types and operation, Multilateral interaction and reserve management.

Unit IV

Bio-resource flow in integrated aquaculture system: Discharge of nutrient wastes from integrated aquafarms; environmental effects, and potential for integrated multi-trophic aquaculture, An economic analysis of different integrated culture systems.

VI. Practical

Preparation of vermicompost; Analysis of nutrient value of different manures; Design of various integrated farming models; Different models of aquaponics; Nutrient analysis and management in aquaponics; Visit to integrated farms; Economics of different integrated systems with case studies.

VII. Suggested Reading

I. Course Title : Cold Water Aquaculture and Recreational Fisheries

II. Course Code : AQC 515

III. Credit Hours : 1+1

IV. Aim of the course

To learn about the breeding and culture of different cold water fishes and their importance as sport fisheries or sport fish

V. Theory

Unit I

Introduction: Status of cold water fisheries in World with special reference to India, Biology, breeding and culture of trouts (*Oncorhynchus mykiss, Salmo truttafario, Schizothoraichthys esocinus, S. longipinnis, S. niger, Schizothorax richadsonii*), Mahseer (*Tor putitora, Tor tor, Tor khudree*), Common carp (*Cypinuscarpio cummuinis, Cyprinuscarpio specularis*). Specific environmental parameters pertaining to cold water fish culture and metabolic interaction, Feeds suitable for cold water aquaculture.

Unit II

Culture of coldwater fishes: Construction and management of coldwater fish farms, Effect of exotic fish introduction on indigenous fish fauna, Polyculture of exotic carps in mid hill region based on three Chinese carps, post-harvest and harvest issues in trouts with regards to cold water species, Special factors for consideration in cold water fish seed production and nursery rearing.

Unit III

Introduction to sport fisheries: Sports fishes and their life history, Equipments for sports fishing, fishing methods, area suitable for sports fishing, etc. Management and conservation of sports fisheries through aquaculture, Sport fisheries and tourism, recreational aquaculture.

Unit IV

Issues and Desired Interventions: Potential and Innovative Strategies for the Development of Cold water Aquaculture in India- problems encountered in fisheries development of rivers supporting cold water fisheries.

VI. Practical

Identification of cold water fish species; Primary and secondary sexual characters in coldwater fishes; Different breeding methods for coldwater fishes; Identification of larval stages of trout and mahseer; Preparation of hatchery layout for coldwater fishes; Studies on different types of sports fishing equipment; Visit to cold water fish hatchery.

I. Course Title : Recirculating Aquaculture Systems (RAS)

II. Course Code : AQC 516

III. Credit Hours : 1+1

IV. Aim of the course

To gain complete knowledge about the recirculating aquaculture systems and its recent developments

V. Theory

Unit I

Introduction: Evolution of intensive culture technologies, Need for intensification in aquaculture, Land and water constraints, Conflicts between enterprises for water use, Need for RAS, Current status and prospects of RAS in world with special reference to Asian countries.

Unit II

System engineering: Basic needs for the construction of RAS, Design of RAS, water re-use methods, Water budgeting, culture tanks, shape and size, Special features, waste solids removal, Cornell dual-drain system, Settling basins and tanks- design, Fabrication and construction, Water collection and sludge removal

Unit III

Filters: Mechanical filters, Biofilters- trickling towers, Floating bead filters, Fluidized sand beds, Down flow micro-bead biofilter, Moving bed bioreactors; aerators.

Unit IV

Management of RAS: Waste management, feeding management. Animal health management in RAS. Economic viability of RAS for various commercially important finfishes. Challenges in uplifting RAS practices.

VI. Practical

Species for RAS; Calculating stocking density of fishes in RAS; Determining the controlling flow rate; Calculating required design flow rate for DO; Calculating tank sizes; Feeding management in RAS; Waste water management in RAS; Visit to RAS units

AQC 699	Doctoral Research (Semester VI)	0+20
	Total Ph.D Program Credit Hours	100 Credits

Course Contents
Ph.D. in Aquaculture

I. Course Title : Hi-tech Aquaculture Production Systems
II. Course Code : AQC 601
III. Credit Hours : 2+1

IV. Aim of the course

To learn the advanced aquaculture production system research for different species globally

V. Theory

Unit I

Introduction: An overview of global aquaculture production, demand- consumption scenario and emerging trends, Present status, Constraints and future prospects in India and the world, Aquaculture practices indifferent parts of the world, Enhancing carrying capacity in culture systems.

Unit II

Biofloc technology: Principles of biofloc, Different carbon sources, Design of aeration system and biofloc reactor, Carrying capacity, C: N ratio, harvesting of biofloc, Biofloc quality and quantity, Biofloc as feed ingredient, Stocking of fish and shellfish species. Bioremediation in wastewater aquaculture.

Unit III

Minimal water exchange aquaculture systems: Principles of closed system farming, RAS, Components, design of mechanical and biological filters for the water reuse system, Sludge removal, disposal of wastes and control of pollution to the environment, Design of RAS, biofiltration and nitrifiers, Suitable cultivable species for indoor culture systems, polyhouses.

Unit IV

Aquaponics: Principles, Components and design of different aquaponics systems, Components in aquaponics, ratio of fish and plants, Water quality and system maintenance, Resource utilization, Nutrient recycling and zero discharge of nutrients.

Unit V

Running water systems: Flow-through system, Raceways (IPR), IMTA, Partitioned Aquaculture Systems (PAS), Aquamimicry systems.

Unit VI

Other farming methods: Cluster farming, Organic farming, Satellite farming, co-operative farming and conservation aquaculture, Network of production and marketing aspects, Economics of super intensive farming systems, Advantages and disadvantages.

VI. Practical

Design, fabrication and performance evaluation of biofloc systems; Different equipment in closed grow-out system; Aerators, Biofilters, RAS, Raceways, IMTA, PAS and aquaponics systems; Plankton and microbial analysis of biofloc. Studies on different C: N ratio; Nutrient analysis in aquaponics; Visit to hatcheries with super-intensive models. Identification and understanding the network of the systems; Market analysis for the produces; Analysis of economic advantages, case studies

VII. Suggested Reading

I. Course Title : Seed Production and Hatchery management

II. Course Code : AQC 602

III. Credit Hours : 2+1

IV. Aim of the course

To gain knowledge in the latest research in seed production methods for finfishes and shellfishes along with hatchery management technology.

V. Theory

Unit I

Reproductive biology: High value cultivable fishes, Crustaceans and molluscs. Reproductive behaviour of fishes, Sex determination, Anatomy and morphology of reproductive organs, Gametology and factors influencing the gamete quality.

Unit II

Broodstock management: Factors affecting the maturation and spawning of cultivable finfishes and shellfishes, Nutritional and environmental requirement for brood stock and their manipulation for early maturation, Criteria for the selection of brood stock, selective breeding strategies, Tagging, Transportation of broodstock, Natural and synthetic anaesthetics for transport, Vaccines and therapeutics for health management of brood stock, Brood stockquality determination and hormonal dynamics.

Unit III

Induced Spawning: Inducing agents, Factors behind the development of inducing agents, Analogues development, Comparative evaluation of commercially available inducing agents, Artificial insemination in crustaceans and molluscs; cryopreservation of gametes and embryos in finfishes and shellfishes, Artificial fertilization protocols.

Unit IV

Larval Nutrition: nutritional requirement of larvae and post larvae, live food culture, nutritional enrichment of live food organisms, different live feed products like powdered algae, algal paste, micronized algae, vitamin fortified algal products, formulation of artificial diets.

Unit V

Hatchery management: Water quality management in hatcheries; physico-chemical and biological approaches; Strategies to control diseases in hatcheries, Diagnosis, quarantine procedure, Prebiotics, Probiotics use in hatcheries, Seed quality testing methods and seed certification, Use of immunostimulants and immune modulators in hatcheries, SPF and SPR, Effluent treatment in hatcheries, Seed transportation methods.

Unit VI

Seed production and hatchery technology: Advances in seed production of commercially important finfishes and shellfishes, Artificial propagation of seaweeds (tissue culture), Recent technologies for enhancing survival and growth in nurseries, Nursery technology for different finfishes and shellfishes, Legal issues in seed quality and marketing.

VI. Practical

Determination of brood stock quality; Quantitative and qualitative determination of fish gametes like sperm motility, viability, counts; Cryopreservation of fish and shellfish gametes; Artificial fertilization in fishes; Project preparation for constructing hatchery (freshwater fish, marine fish, shrimp, molluscs); Broodstock quarantine in hatcheries; Live feed culture; Methods to identify quality of seeds (stress test, microscopic examination); Water quality management in hatcheries; Disease identification and treatment in hatcheries; Visit to hatcheries.

I. Course Title : Aquaculture Ecosystem Management and Climate Change

II. Course Code : AQC 603

III. Credit Hours : 2+1

IV. Aim of the course

To learn the impact of aquaculture on ecosystem management and climate change effects.

V. Theory

Unit I

Aquaculture and ecosystem relationship: Ecosystems and productivity, Biotic interaction within ecosystems and ecological homeostasis, Climate; Weather elements of concern in aquaculture, Greenhouse gases, Global warming and their impact.

Unit II

Impact of environment on aquaculture: Raw water source, Physical and chemical characteristics, Contaminants and pollutants (algae, pathogens, heavy metals, pesticides) and their effect on productivity.

Unit III

Impact of aquaculture on environment: Waste water discharge, Its quality and quantity, Impacts of effluents on ecosystems, Chemical degradation of soil and water.

Unit IV

Environment monitoring: Problems and preventive measures of antibiotic and drug residues, Salinization of soil and water, Eutrophication, Environment impact assessment and environmental audit.

Unit V

Sensor based monitoring: Biosensors in aquatic environment, Toxicity assessment, eco-labeling and traceability, Environment management.

Unit VI

Environment threats: Introduction of exotics and escape of farmed fish, Pathogens in aquatic environment, Safety of aquaculture products, Role of microbes in aquatic environment, Assessment of probiotic impact in aquaculture.

VI. Practical

Waste water analysis, Toxicity assessment studies; Eco-labelling and traceability, Isolation, nutrients budgeting, Quantification and administration of solid and liquid doses, Physical and chemical characteristics of soil, Design and construction of effluent treatmentplant.Carbon credit/ budgeting.

I. Course Title : Fish and Shellfish Physiology and Endocrinology

II. Course Code : AQC 604

III. Credit Hours : 2+1

IV. Aim of the course

To gain knowledge on finfish and shellfish endocrinology and physiological aspects.

V. Theory

Unit I

Endocrine system: Endocrine glands in fishes, Hormones and their kinetics, Structure and function of neuro-endocrine system in finfish and shellfish, Hormonal control of physiology.

Unit II

Hormones: Chemical nature of hormones, synthesis, storage, Release and control of hormones, Homeostasis, Endocrine control of growth and metabolism in fishes, Exogenous hormone administration, Implication, Impact on the general health and wellbeing of fishes.

Unit III

Influence of hormones: Eco-physiology, Adaptive mechanisms - reversible and irreversible changes, Physiology of migration and behaviour.

Unit IV

Neurophysiology: Neurosecretory system in fishes, Crustaceans and molluscs, Neurotransmitters, Physiology of ecdysis.

Unit V

Reproductive physiology: Endocrine control of maturation, spermatogenesis, oogenesis, spawning vitellogenesis.

Unit VI

Respiratory physiology: Gas exchange concept, Excretion and osmoregulation.

VI. Practical

Dissection of finfish and shellfish to study endocrine glands, Hormone assay – ELISA, Histological techniques to study reproductive and endocrine glands, Identification of moult stages, Application of respirometer and osmometer.

I. Course Title : Feed Management in Aquaculture

II. Course Code : AQC 605

III. Credit Hours : 1+1

IV. Aim of the course

To learn the latest research in the lines of understanding the influence of environment on nutrient utilization

V. Theory

Unit I

Nutrient dynamics: Influence of nutrient cycles on web/chain, Influence of detrital food web on nutrient distribution, Nutrient loading through feed and fertilizer, Natural feed augmentation for increasing fish production, Different food chains in aquatic ecosystem, Feeding behavior and feeding niche, Effect of environmental parameters on appetite of fish.

Unit II

Eco-friendly feed: Use of exogenous phytase and acidifiers, high energy diets, methods of enhancing feed digestibility, biofloc and probiotics influences.

Unit III

Nutritional pathology: Deficiency and imbalance diseases: essential amino acids, essential n-3 and n-6 fatty acids deficiencies, Micronutrients: fat-soluble vitamins, water-soluble vitamins; Macro- elements, trace-elements and mineral toxicity, Influence of stress on feed intake, Digestion and absorption, Stress indicator and nutritional strategies for mitigate stress.

Unit IV

Feed Management: Impact of feed and nutrition on environment, Nutrients affecting the water quality, Nutritional strategies to reduce the nutrient flow in aquaculture system, Contribution of feed waste to organic load of aquaculture production systems, Role of additives in reducing environmental pollution.

VI. Practical

Practical Study of influence of thermal stress, Hypoxia, Salinity and pH, Stress enzyme. (LDH, catalase, SOD, glutathione peroxidase), Stress hormone (Cortisols) and sex steroid hormone.

VII. Suggested Reading

I. Course Title : Applied Biotechnology in Aquaculture

II. Course Code : AQC 606

III. Credit Hours : 1+1

IV. Aim of the course

To learn about applied biotechnology aspects in aquaculture.

V. Theory

Unit I

Introduction: Scope of biotechnology in fisheries and aquaculture research. Vaccination in fishes- DNA vaccines, sub Unit Vaccines and Biofilm Vaccines.

Unit II

Feed biotechnology: Probiotics, single cell proteins, Neutraceuticals, Gnotobiotics. Recombinant proteins of commercial importance: enzymes, hormones, bioactive compounds, therapeutic proteins. Anti- microbial Peptides and their applications.

Unit III

Environmental Biotechnology: Bioremediation, biosensors, biofouling, treatment of waste water, Applications of biotechnological tools: Transgenic technology, Recombinant DNA, Monoclonal antibodies, Cell lines and stem cell culture, DNA markers and MAS, Biotechnological instrumentation in Aquaculture.

Unit IV

Constraints and Limitations: Biochemical and Molecular Markers; Commercial applications of Fish Biotechnology; Government regulation of Transgenic fish and Biotechnology products.

VI. Practical

Cell culture and cell lines; Development of hybridoma and production of monoclonal antibodies; Preparation of chromosomes from embryos and young fish Ploidy determination by RBC measurement and chromosome numbers; DNA markers; Gene transfer experiments; Northern blotting and southern blotting for integration and expression of transgenes.

I. Course Title : Automation in Aquaculture Systems

II. Course Code : AQC 607

III. Credit Hours : 1+1

IV. Aim of the course

To understand the possible automation in aquaculture systems for efficient management and enhanced income

V. Theory

Unit I

Introduction: Automation principles and procedures, Economic benefits of automation, Comparison of automation in agriculture and allied enterprises, History of automation in aquaculture, Scope for automation and need for automation in aquaculture, Evolution of machines and mechanisation in aquaculture, Advantages and disadvantages of automation, Current status and prospects of automation in World and India.

Unit II

Artificial Intelligence: Definition and application of AI in aquaculture, operating systems, system architecture, modules, AI software and its characteristics; AI in aquaculture, advantages of AI

Unit III

Robotics in aquaculture: Scope for Robotics in aquaculture, ROV, AUV, Drones, ASV, Automation for water quality management and health management in aquaculture, Novel automated systems in the world, technologies in aquaculture.

Unit IV

Software's used in Automation: Use of data acquisition systems in aquaculture. Biological models related to automatic control in aquaculture; Artificial intelligence software focuses on niche markets, A plug-and-play machine vision application for aquaculture.

VI. Practical

Automated systems description and application; Preparation of automation plans for individual systems; Robotics systems and application modules preparation; Drones and their utilization; Energy monitoring systems design and use; Trial automation in any one system.

I. Course Title : Aquaculture Medicine

II. Course Code : AQC 608

III. Credit Hours : 1+1

IV. Aim of the course

To understand the pharmacokinetics of aquaculture drugs and chemicals

V. Theory

Unit I

Anaesthetics: Anaesthetics and methods of anaesthetizing fish and shellfish.

Unit II

Amendments in Aquaculture: Different chemicals and drugs used in aquaculture and dosages, Use of probiotics and immunostimulants in aquaculture

Unit III

Drug Mechanism: Action of different drugs in finfish and shellfish.Bioaccumulation and toxicity

Unit IV

Antibiotics: Antibiotics – use and misuse including development of antibiotic resistant bacteria and their impact on environment and human health

VI. Practical

Antibiotic sensitivity test, Estimation of dose, Estimation of antibiotic residues, Detection of gut colonization by probiotic bacteria

Suggested Broad Areas for Master's and Doctoral Research

- Recirculating aquaculture systems (RAS)
- Development of genetically improved broodstock
- Cryopreservation of gametes and embryos
- Development of vaccines for larvae

- Renewable energy in aquaculture
- Replacement of fish meal ingredient in shrimp and fish feed
- Development of novel feed ingredients
- Ontogeny of digestive system in fish larvae
- Cell lines and stem cell culture
- Inland saline aquaculture
- Dessert Aquaculture
- Arid land aquaculture
- Defense mechanisms and immunity
- Cage and pen culture of marine finfishes
- Study of nutrient dynamics in ponds
- Nutraceuticals for aquaculture feed
- Impact of climate change in aquaculture
- Statistical tools in Aquaculture
- Microbiomes in host environment interactions
- Status of seafood consumption and promotion
- Climate resilient aquaculture
- Carrying capacity and environmental impact in aquaculture
- Development of high resistant materials in the fabrication of cages
- Designing the cost effective probes for the water management
- Automation in aquaculture
- Development or restructuring of the aquaculture systems
- Integration of ANNAMOX nitrogen removal
- Nitrogen removal using Heterotrophic bacteria
- Algal culture and its impact in aquaculture systems
- Development of innovative and advanced filters and sludge units
- Open Ocean Aquaculture
- Aquaponics
- Open water IMTA and land-based IMTA
- Breeding and seed production of new candidate species
- Natural history of the cultured animal throughout its life stages.
- Biology of the cultured animal in terms of an aquaculture perspective
- The management of microbiome in the gut of the fish
- Novel and rapid diagnostic methods for the emerging diseases of commercial importance in Aquaculture
- Hi-Tech Aquaculture systems
- Quality control in feed and feed supplements
- Nutritional requirement of commercially important fishes
- Precision farming in Aquaculture
- Development of Phytogenic compounds to combat the diseases
- Electron-beam irradiation for the major deactivation of anti-nutritional factors.
- Supplementation of Exogenous enzymes to remove anti-nutritional factors
- Supplementation of nutraceuticals in mitigating multiple stressors
- The stress management strategies of super intensive culture
- The Nutrigenomic studies involving transcriptomics, proteomics and metabolomics
- Evaluating flesh quality using different feed supplements.
- Altering the dietary protein/energy ratio to increase the product shelf life.
- Integration of proteomic approaches with genomics and transcriptomis is the need of the hour.
- Bioinformatic capabilities to integrate omics technologies with aquaculture.
- Germplasm study and the analysis of the genetic diversities
- Larval fish nutrition
- Impact of aquaculture amendments
- Organic aquaculture
- Impact of Algal driven aquaculture

- Soil and water quality management
- Functional feed ingredient supplements in aquaculture
- Physiology of the major organs in finfishes and shellfishes
- Gene expression on growth stimulating factors in fishes
- Induce breeding and sex reversal
- Bioremediation and waste management
- Importance of fermentation and fermented products in aquaculture
- Micro and trace minerals requirements for the commercial candidate species
- Development of phyto sanitary measures and Standard operating procedures
- Disease surveillance, forecasting and development of field level diagnostic kits.
- Pigment enhancement studies in Ornamental aquaculture
- Hybridization of cultivable species
- Participatory aquaculture development models
- Control of cyanobacteria in aquaculture systems
- Bio-enrichment of live feed
- Microscopic studies on the microbial community
- Pharmacodynamics of drugs in fish, drug delivery systems, excretion of drugs, residual assays, herbal compounds as therapeutic drugs
- Characterization of parasites infecting fish and shellfish
- Host-parasite relation of various parasites and their biology
- Therapeutic approaches for control of infections
- Histopathological investigations of specific disease conditions
- Economic analysis of aquaculture practices
- Development of tissue specific cell expression systems
- Genetically engineered microorganisms for recombinant protein production
- Design of viral vectors for efficient gene delivery
- Digestibility due to plant to animal ingredient ratio
- Enhancement of digestibility of plant feed ingredients

Fisheries Science
– Fisheries Resource Management

Preamble
(Fisheries Resource Management)

Fisheries is one of the important and fast growing sector in the country which is 1.28% of the national GVA and 7.28% of the Agricultural GVA. It provides livelihood to more than 25 million fishers and fish farmers.

With a coastal length of over 8, 000 km, an EEZ of around 2.02 million sq. km and with vast freshwater resources, fisheries play a vital role. It generates employment for a large coastal and other population, raises nutritional standards, increases food supply and earns foreign exchange. The marine fish landings stood around 3.56 million tonnes (CMFRI, 2019). Due to increasing the demand for the fisheries, fishing vessels are increased drastically to capture these protein rich resources. Unlike mineral resources, fisheries resources are self-renewable if it is properly managed.

During recent years, production from capture fisheries has been stagnating. Unregulated access to these fisheries resulted in significant overcapacity, especially of medium and small trawlers that compete over dwindling fishery resources with mostly impoverished small-scale fishers. The fishery resources are affected due to overexploitation in shore waters, bycatch, habitat alteration and anthropogenic actives. While it is difficult, if not impossible, to regenerate and improve open water fisheries, even small improvements in average yield would significantly enhance national fish production, because of the large extent of open water resources. Hence, it is necessary to recognize appropriate conservation and management measures to improve and sustain production. These resources should be sustainably managed and protected for the following reasons.

- Sustain, protect and increase national seafood supply
- Maintain and improve subsistence fishing
- Protect ecosystem health and sustainability
- Create jobs, support related economic and social benefits, and sustain community resilience

In the absence of a database on standing stocks, catch statistics, gear selectivity, fish behaviour, etc. of both inland and marine stocks, and oceanographic parameters, it would not be possible to come up with any management solutions for conservation of depleting stocks and increased exploitation of underexploited stocks.

Strenuous efforts are needed at central and state levels to upgrade the country's capacity to manage its natural fisheries resources. In this regard, the fisheries resource management discipline will provide the basis for the conservation and management of fisheries resources and it stems from the biological characteristics. According to the FAO definition fisheries resource management is the integrated process of information gathering, analysis, planning, consultation, decision-making, allocation of resources and formulation and implementation, with enforcement as necessary, of regulations or rules which govern fisheries activities in order to ensure the continued productivity of the resources and the accomplishment of other fisheries objectives.

To undertake these tasks, it is essential to understand the fisheries resource through proper education in the field of fisheries resources and its management. The following reasons substantiate the education and research in fisheries resource management.

- To study the biodiversity and biology of threatened and commercially important finfish and shellfishes
- To provide an insight into the various coastal and inland resources, multi user issues and anthropogenic effects on the resources and to devise resource management plans and protect the coastal and inland resources.
- To know the present level of exploitation of marine resources through stock assessment and biodiversity studies and to impart knowledge on conservation measures
- To advance the research on the reproductive endocrinology of threatened and commercially important finfish and shell fishes
- To judiciously exploit fishery resources
- To establish management measures to prevent overfishing, allocate fishing quotas to different fishing groups, implement gear restrictions, and protect sensitive habitats.
- To comply national and international treaties, act and rules
- To meet the sustainable development goals 2, 3, 4, 12, 13 and 14

Accordingly, the syllabus for Fisheries Resource Management is evolved as a multi-disciplinary PG program of study that provides exposure to all dimensions of modern fisheries resource management. This will empower the graduates to take management decisions for sustainable exploitation of national or regional fisheries and achieve the Sustainable development goals.

The following new courses were introduced at Master's level:

1. *FRM 501 Sustainable Fisheries Management	2+1
2. *FRM 503 Climate Change and Fisheries Resource	2+1
3. *FRM 505 Trophodynamics in Aquatic Systems	2+1
4. *FRM 506 Reproductive Biology of Finfish and Shellfish	2+1
5. FRM 509 Bio Systematics of Aquatic Fauna	1+2
6. FRM 512 Advanced Fish Anatomy and Physiology	2+1
7. FRM 513 Fish Histology and Histochemistry	1+1
8. FRM 514 Field techniques in Fisheries Resource Management	0+2

The following courses were suitably revised to study the biodiversity and stock.

1. *FRM 502 Fish Biodiversity and Conservation Biology	2+1
2. *FRM 504 Fish Stock Assessment	2+1
3. *FRM 507 Developmental Biology of Finfish and Shellfish	1+1
4. *FRM 508 Modern Techniques in Fisheries Biology	2+1

The following courses were removed.

1. FRM 505 Fisheries Regulations	2+1
2. FRM 506 Remote Sensing and GIS for Fisheries Management	1+1
3. FRM 50 Integrated Coastal Zone Management	2+1
4. FRM 508 Aquatic Floral Resources	2+1
5. FRM 511 Fishing and Allied Technologies	2+1

At Ph.D. level the following new courses were introduced:

• FRM 603 Functional Physiology of Fishes	(2+1)
• FRM 604 GIS Use in Fisheries Resources	(2+1)
• FRM 605 Fisheries Legislations, Governance and Treaties	(1+1)

The following two courses were suitably revised. Software based course is introduced to derive exploitation status of the fish stock.

- FRM 601 Fisheries Resource Conservation and Restoration Biology (2+1)
- FRM 606 Software Applications in Fish Stock Assessment (1+1)

The following three courses were removed as the subjects overlap with related disciplines:

- FRM 602 Applications of Fisheries Models in Stock Assessment (2+1)
- FRM 605 Data Collection and Estimation of Exploited Fisheries Resources (0+2)
- FRM 606 Fisheries Environmental Assessment (2+1)

Course Title with Credit Load
M.F.Sc. in Fisheries Resource Management

Course Code	Course Title	Credit Hours
	Major courses	
FRM 501	Sustainable Fisheries Management	2+1
FRM 502	Fish Biodiversity and Conservation Biology	2+1
FRM 503	Climate Change and Fisheries Resource	2+1
FRM 504	Fish Stock Assessment	2+1
FRM 505	Trophodynamics in Aquatic Systems	2+1
FRM 506	Reproductive Biology of Finfish and Shellfish	2+1
FRM 507	Developmental Biology of Finfish and Shellfish	1+1
	Minor courses	**8 Credits**
	(From the subjects closely related to a student's major subject)	
FRM 508	Modern Techniques in Fisheries Biology	2+1
FRM 509	Bio Systematics of Aquatic Fauna	1+2
FRM 510	Inland Fisheries Resources Management	2+1
FRM 511	Marine Fisheries Resources Management	2+1
FRM 512	Advanced Fish Anatomy and Physiology	2+1
FRM 513	Fish Histology and Histochemistry	1+1
FRM 514	Field techniques in Fisheries Resource Management	0+2
	Supporting courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its Management in Agriculture	
	4. Basic Concepts in Laboratory Techniques	
	5. Agricultural Research, Research Ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**
	Masters' Seminar	**1 Credit**
FRM 591	Masters' Seminar	0+1
	Masters' Thesis Research	**30 Credits**
FRM 599	Masters' Research (Semester III)	0+15
FRM 599	Masters' Research (Semester IV)	0+15
	Total M.F.Sc Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fishereis Resource Management

I. Course Title : Sustainable Fisheries Management
II. Course Code : FRM 501
III. Credit Hours : 2+1

IV. Aim of the course

To understand the major inland and marine fisheries resources of the world and India. To discuss the major sustainability issues in the inland and marine fisheries sectors. To understand the ways and means to resolve the issues for sustainable fisheries resource management.

V. Theory

Unit I

Inland fisheries: Major inland fisheries resource of the world-India-Overview-State of the fisheries- Fishing gears-and crafts- Catch composition

Unit II

Marine fisheries: Major marine fisheries resources of the world and india-Overview- State of the fisheries -Fishing gears -Catch composition-pelagic, Demersal, Oceanic, Deep sea

Unit III

Sustainability issues in fisheries: Ghost fishing- Overexploitation, Overcapacity, pollution, Habitat degradation/ biodiversity loss, Damming of rivers, Interlinking of rivers , Environmental flows; Fishing conflicts-Exotics; Trans-boundary issues, IUU fishing, Interlinking of rivers-Climate change, By catch and discards.

Unit IV

Sustainable fishing: Components of sustainability, Indicators and goals of sustainability, Eco-friendly fishing, Ecosystem Based Fisheries Management-resilient fishery system

Unit V

Principle of fisheries management-Management approaches: By catch reduction- Rebuilding fishery, Rebuilding stock, Co-management- right based fishing-input control (fishing efforts, mesh regulations, fishing ban, licensing, capital investments, etc)-output control (catch quotas, minimum legal size, etc)- - Fishery reserve-technical measures, Spawning aggregates; trade agreement- Market-based instruments; Access right- Catch sharing-balanced fishing-Subsidy-certification and traceability-Sustainable management approach in lake, Reservoir and bheels.

Unit VI

Responsible fishing practices Precautionary management -Fisheries Co-management: Right based fishing- Catch sharing access right- Balanced fishing.-Technical Guidelines of CCRF for responsible fishing; National and International treaties (National policy on marine fisheries-2017; National policy on inland fisheries-2019; MFRA's; UNCLOS; UNFSA; IOTC)

VI. Practical

Capture fisheries observation at lakes, reservoirs, river stretches, and marine landing centres, Species landings analysis, Interaction with managers Co-operative societies and stakeholders Fleet capacity assessment, Visit to fishery reserves to understand management, Field survey and observation of fisheries issues, Development of management plan.

I. Course Title : Fish Biodiversity and Conservation Biology

II. Course Code : FRM 502

III. Credit Hours : 2+1

IV. Aim of the course

To appreciate the biodiversity of various major aquatic fauna and flora, To understand the major threats to this aquatic biodiversity, To develop management strategies for the conservation of aquatic biodiversity

V. Theory

Unit I

Fish diversity: Fresh water fish diversity- Marine fish diversity-Quantification and importance of biological diversity- abundance- distribution.

Unit II

Species concept for conservation related decisions: Unique species- umbrella species-flagship species, Keystone species, state fish concept, -Endangered species-extinction-recovery-CITES- NBA- Migratory stock- Essential Habitat-EBSA.

Unit III

Biodiversity conservation methods: IUCN criteria - Red List, Marine Protected Areas, Sanctuaries and Biosphere reserves, Establishment of National marine parks, in situ and ex situ conservation, Participatory approach- Conservation value index – criteria – Medicinal and biological, IBI –stock resilience-recovery. Wildlife protection act, Biodiversity Act, International treaties and conventions (CITES, CMS, RAMSAR Convention).

Unit IV

Impacts of anthropogenic intervention on fisheries biodiversity: Exotic species, Damming of rivers, Construction of shore protection walls, Micro hydral power stations, Oil rigs.

Unit V

Aquatic biodiversity: Threats-Over exploitation, habitat reclamation, pollution, habitation, planning and management, tools for conservation, participatory approach -Impact of climate change on the ecosystem biodiversity, health and productivity

Unit VI

Conservation biology of biodiversity: Concept of hotspots- Ecological integrity: Minimum population sizes, Inbreeding depression, Genetic tolerance of extreme conditions, Restoration of populations at risk of extinction, Conservation – management of invasive species- Economic valuation of biodiversity and ecosystems

VI. Practical

Identification of scheduled aquatic organisms and exotic species, Predators of endangered animals, Visit to various aquatic ecosystem for recording the biodiversity, Conservation strategies (case studies), Calculation of trophic levels, Biodiversity indices-IBI, Conservation value Index, Presentation of field study.

I. Course Title : Climate Change and Fisheries Resource

II. Course Code : FRM 503

III. Credit Hours : 2+1

IV. Aim of the course

To become familiar with causes and effects of climate change, To understand the models and methods available for estimating climate change effects, To develop strategies for the mitigation of climate change effects for the management of fisheries resources.

V. Theory

Unit I

Introduction to climate science: Climate and biosphere, Climatic forcing factors, history of earth's climate, Climate change: The physical basis in marine and freshwater systems; Anthropogenic activities, greenhouse gases; Role of oceans; Diagnosing climate change-Scenarios.

Unit II

Climate change threats to fisheries resource: Temperature, Freshwater precipitation and sea level rise- Climate-induced degradation and loss of critical fish habitats. –Resilience - Tolerance limit-Temperature, pH and Salinity- Global warming and ocean acidification on fish early life stages.

Unit III

Climate change: Interaction between biodiversity - Effect on aquatic population –critical habitats-marine -freshwater-estuarine-high seas- endemic resources-Indicators of climate change - Climate change and invasive species.

Unit IV

Impact of Climate change on fish: On fish biology, Reproduction and life stages, Distribution and abundance- Migration patterns-fish physiology- Disease prevalence, Adaptation strategies of fishes towards climate change.

Unit V

Models on climate change and capture fisheries: Trophic dynamics model-Methods for estimating effects of climate change on fishery resources-Long term monitoring- Survey on effects of climate change on fisheries resources -Developing vulnerability index.

Unit VI

Policies and strategies on climate change: Impact of climate change on livelihood, Mitigation (emission reduction, life cycle assessment, carbon sequestration, improved governance) and adaptation strategies (resilience, vulnerability and risk assessment, institutional mechanisms) to climate change-Policy on climate change - IPCC, UNFCCC - Harvesting strategies - fishing right-Fishery resource management- key indicator species monitoring.

VI. Practical

Fish production trend analysis- India- global, Thermal effect on fish biology and reproduction, Climate change effect on fish early life stages- Fish physiology. Biodiversity- Threshold limits-temperature-pH and Salinity, Generation of fish distributional map. Group discussion on climate change, impact and mitigation strategies, Presentation of case studies.

I. Course Title : Fish Stock Assessment
II. Course Code : FRM 504
III. Credit Hours : 2+1

IV. Aim of the course

- To understand the stock concept and principles of fisheries management
- To understand the application of various models and their applications in fisheries management. To get an idea of the interaction of fish population in the ecosystem.

V. Theory

Unit I

Concept of stock and fish stock assessment: Distribution and types of stock - unit stock-mixed stock- straddling stock; Characterization of stock (life history traits, truss network, environmental signals, otolith shape; genetic analyses, applied marks); Principle and general procedure of fish stock assessment; Features of tropical and temperate fish stocks; Role of fish stock assessment in fisheries management.

Unit II

Sampling and measurements for fish stock assessment: Data requirement; Methods of sampling commercial catch, Sampling design and fish measurements; Assessment of fishery under data poor conditions; Survey methods for inland fisheries.

Unit III

Concept of growth and mortality: Principles of growth; Growth parameters-estimation of growth parameters employing hard parts and size frequency, Separation of cohorts, Mortality -Decay curve; types of mortality; Estimation of total, natural and fishing mortality rates.

Unit IV

Recruitment and gear selectivity: Timing and size of recruitment; Factors influencing recruitment; Principle and estimation of gear selectivity – trawl net and gill net selectivity; Eumetric fishing; Stock recruitment relationship– Cushing-Rickers- Beverton and Holt models.

Unit V

Fish stock assessment models: Analytical models: Cohort dynamics and life history; Virtual population analysis; Prediction models (Thompson and Bell model; Yield per recruit model and Relative Yield per Recruit model); Prey-predatory model; Surplus production models / Holistic models: Schaefer's model, Fox model, Swept area method, Stochastic model, Estimation of technical reference point MSY and other yield base reference point; economic and social reference points, Bio-economic modelling, Economic models - MEY, Swept area method - Box model-Bayesian Stochastic models, Multispecies models.

Unit VI

Trophic models: Ecosystem based models– Principles, Applications; Productivity models; Ecopath with Ecosim.

VI. Practical

Cohort analysis; Characterization of fish stock, 11-measurements; Truss network analysis, Otolith shape estimation of growth and mortality parameters (hard parts/ length based/age based), Gear selectivity, Stock recruitment relationship; Analytical models – VPA, Thompson and Bell model, Beverton's Yield per recruit and Relative yield per recruit model, Holistic models - Schaefer and Fox models; Swept area method, MSY, Use of FiSAT, LFDA, CEDA, YIELD. Presentation of case studies on use of ecosystem models.

I. Course Title : Trophodynamics in Aquatic Systems

II. Course Code : FRM 505

III. Credit Hours : 2+1

IV. Aim of the course

To understand the various methods of gut content analysis and various feeding indices To understand the relationship within a community, energy flow To develop linkages between biota and environment

V. Theory

Unit I

Food and feeding adaptations: Food and feeding habits of different types of finfish and shellfishes -Morphological and anatomical adaptation for feeding; Feeding behaviour-Ontogenic changes in food and feeding.

Unit II

Digestion : Food digestion - Energetics- Food partitioning- Larval feed- Gut development.

Unit III

Food web: Food web - food web in nearshore reef, Seagrass and unvegetated ecosystems - Biomarkers - Stable isotopes and fatty acids markers

UNIT IV

Prey predator interaction : Prey density - Predator density—Prey predatory interaction forage theory—Species succession - Food availability - Fishing effect on prey and predator

Unit V

Trophodynamics: Concept of trophodynamics-Methods in food and feeding analysis-Diet analysis -Diet breath- Diet overlapping indices- Energy flow and trophic indices and modelling- Calculation of trophic level.

Unit VI

Application of information on trophodynamics in fisheries management: Trophodynamic indicators- Ecopath with Ecosim model, SEAPODYM model.

VI. Practical

Morphological and anatomical adaptations in finfishes and shellfishes with different feeding habits. Analysis of gut contents, Gastro somatic Index, Use of indices in feeding, digestion and food consumption rates of fishes, Calculation of trophic levels- Mean trophic level, Comparison of mean trophic level between gears-season-space, Analysis of diet breath and diet overlap, Case studies using available data sets.

I. Course title : Reproductive Biology of Finfish and Shellfish

II. Course code : FRM 506

III. Credit Hours : 2+1

IV. Aim of the course

To familiarise with the reproductive system and physiology of reproduction of teleost, elasmobranch, shrimps and molluscs

V. Theory

Unit I

Fish reproduction: Types – Gonads - Sexual differentiation, Reproductive biology: Gonado Somatic Index, Fecundity, Length at first maturity-breeding migration-Environmental influence of breeding cycle.

Unit II

Male reproductive system of finfish and shellfish: Endocrinology-spermatogenesis-sperm morphology.

Unit III

Female reproductive system of finfish and shellfish: Endocrinology- Oogenesis-Ovulation- Atresia- Vitellogenesis.

Unit IV

Physiological control of reproduction in finfish: Fish reproduction –Fish-hormone- Hormone Dynamics- Maturation and spawning, Hormones in spermatogenesis, oogenesis, Yolk formation, Mechanism of sex reversal; Pheromone. hormone based induced reproduction.

Unit V

Physiological control of reproduction in crustaceans (shrimp, crab and lobsters): Maturation and spawning, spermatogenesis, Oogenesis, Yolk formation, Mechanism of sex reversal- Eye stalk ablation.

Unit VI

Physiological control of reproduction in molluscs: Maturation and spawning, Spermatogenesis, oogenesis, Yolk formation, Mechanism of sex reversal – sex Control; Early Embryonic Development Maturity cycle and hormone

VI. Practical

Sexual dimorphism, Study of reproductive organs in finfish and shellfish by dissection, Maturity stage observation, Length at maturity estimation- intra-ovarian periodicity, Dissection of reproductive glands; fish sperm quality analysis – morphology, quantification and motility; Egg quality analysis – morphology, fecundity estimation; Histological techniques- study gonadal maturity stages; Identification of moult stages

I. Course Title : Developmental Biology of Finfish and Shellfish

II. Course Code : FRM 507

III. Credit Hours : 1+1

IV. Aim of the course

To impart knowledge on the collection and identification of eggs and larvae of commercially important finfish and shellfish To understand developmental biology of aquatic organisms.

V. Theory

Unit I

Fish eggs and larvae: Morphology and identification of eggs and larvae of commercially important finfishes, crustaceans, molluscs and echinoderms-morphometry.

Unit II

Methods in Fish eggs and larval study: Quantitative sampling of fish eggs and larvae; Spatial and temporal distribution, Dispersion of eggs and larvae, Effect of environmental parameters on eggs and larvae.

Unit III

Eggs and larval dynamics: Reproductive cycle in fish- Spawning – Environmental cues- Recruitment assessment-Natural food of commercially important finfish and shellfish larvae from egg to adult.

Unit: IV

Larval development: Developmental biology of fish- Shellfish-sea urchin- Stages of development- Cell fate and commitment, Embryonic induction, Differentiation—Organogenesis- Morphogenetic movements,

VI. Practical

Identification of eggs and larvae commercially important species of crustacean and molluscan, Morphometry of eggs and larvae of finfishes, identification keys, Quantitative sampling- finfish and shellfish larvae; Food and feeding habits of larval stages of finfish and shellfishes.

I. Course Title : Modern Techniques in Fisheries Biology

II. Course Code : FRM 508

III. Credit Hours : 2+1

IV. Aim of the course

To be aware of the modern / including molecular techniques that can be applied in fisheries biology

V. Theory

Unit I

Introduction: Advances in molecular technology – DNA extraction and PCR-quality and size of DNA- Sequencing-RNA extraction

Unit II

Electrophoresis: Principles – Types of electrophoresis- Identification of fish using agarose gel electrophoresis- SDS-Page- Staining protein gels- Digital electrophoresis analysis- Other electrophoresis techniques.

Unit III

PCR: Principle; PCR as a rapid detection method- Quantitative real-time PCR-Multiplex PCR- Nested PCR -Developments in molecular genetic techniques in fisheries.

Unit IV

Molecular genetic techniques in fisheries: Metagenomics and meta-transcriptomics- molecular techniques in population studies.

Unit V

Molecular methods in taxonomy: Cytological and Molecular Systematics and DNA Barcoding-barcode analysis.

Unit VI

Fish genetic markers and their applications in fisheries: Use of microarrays and RT-PCR- D-loop polymorphism analysis -Single Nucleotide Polymorphism -Restriction Length polymorphism analysis.

VI. Practical

Molecular laboratory safety issues- Extraction of DNA/ RNA, Barcode generation and analysis, Phylogenetic tree construction using barcode, Allozyme variation, Protein assay -2D gel electrophoresis.

I. Course Title : Bio Systematics of Aquatic Fauna

II. Course Code : FRM 509

III. Credit Hours : 1+2

IV. Aim of the course

To acquire in-depth knowledge on the basics and recent developments in systematics and taxonomy of aquatic fauna

V. Theory

Unit I

Principles of taxonomy: Systematics, Taxonomy and Classification; Importance of taxonomy, Describing and naming of a new species, International Code of

Zoological Nomenclature, and its amendments and rules of Binomial Nomenclature; Zoo Bank and its policies, Morphology, Morphometric, Meristic, Osteology and Soft anatomical characters.

Unit II

Classification of Commercially important finfish: Classification of modern fishes up to order and family levels - Elasmobranchii (Cartilaginous fishes) and Actinopterygii (bony fishes).

Unit III

Classification of Commercially important shellfish: Classification of commercially important invertebrate up to family level: Arthropoda (Prawns, Shrimps, Lobsters and Crabs); Mollusca (Gastropods, Bivalves, Cephalopods and Scaphopods); Echinodermata (Sea Cucumbers), Preparations of dichotomous key.

Unit IV

Methods in taxonomy: Phylogeny and Zoo geography, Modern tools of taxonomy: Cytotaxonomy, Basics of biochemical taxonomy (Electrophoretic studies of muscle myogen, eye-lens protein, enzyme pattern and serology), PCR based methods and DNA finger printing, mitogene in fish identification. Identification of fish through auto-image processing.

VI. Practical

Collections and preparation of field data; Preservation techniques of specimens: Morphology, Graphical representation and statistical analysis of meristic, Morphometric, Osteological and soft anatomical characters; Key Pattern – Dichotomous key – Type of keys –Dichotomous, Bracket, Indented, Branching, Pictorial and computer keys; Protocols followed for describing of a new species, Use of distribution maps; curation and sorting protocols, Visit to freshwater, brackishwater and marine waters (markets; landing centres) of the locality and inventorying of commercially important fishes, Mollusca, Crustacea, Echinodermata (diagnostic characters of the orders, families and species), Modern taxonomical tools. Cytotaxonomy: Karyotyping – preparation and identification of chromosomes, Electrophoresis studies (muscle myogen, eye-lens protein, enzyme pattern and serology), Molecular markers–PCR, RAPD, RFLP, Microsatellites, mini satellites and Mitochondrial DNA and their application in fish phylogenetic studies; Barcoding

III. Credit Hours : 2+1

IV. Aim of the course

To understand the present exploitation and future potential of inland Fisheries. To learn the methodologies for assessments of Inland Fisheries Resources

V. Theory

Unit I

Freshwater fisheries resources India-world: Ponds, Lakes, Bheels, Tanks, Estuaries, Brackish water lagoons, Wetlands, Biosphere reserves and mangroves and derelict water bodies their problems and management aspects, Assessment of carrying capacity of different inland water bodies; Water budgeting, Community participation in fishery resource management.

Unit II

Bheel fisheries resources of India: Open and closed bheels, Productivity conditions, Capture scenario, Prospects of culture based systems.

Unit III

Riverine fisheries resources in India: Present trend of dwindling fisheries resources, Direct and Indirect effects of human intervention in rivers, habitat modification and improvement (rehabilitation of channels and flood plains), Protection and restoration of fish movements (different types of fish passes and enhancement of fish migration), Management and repair of riverine vegetation, Stock enhancement strategies like introduction of new species, Pre- and post-stocking management, Potential risk of stocking.

Unit IV

Cold water fisheries of India: Present trends, Problems due to habitat destruction, Management aspects, Prospects of sports fisheries in India.

Unit V

Reservoir Fisheriesin India: Classification of reservoirs, Present productivity levels, Management practices.

Unit VI

Estuarine fisheries in India: Classification of estuaries- Present productivity level potential; Problem – Management practices.

VI. Practical

Freshwater fish identification, Tagging – different types of tags, Visit to nearest freshwater body; catching methods – catch data analysis on major freshwater resources- Bheels- Estuaries - Reservoirs – lakes, Biodiversity indices – Gear selectivity.

VII. Suggested Reading

- Sugunan VV. 1997. *Reservoir Fisheries of India*. Daya Publ. House.

I. Course Title : Marine Fisheries Resources Management

II. Course Code : FRM 511

III. Credit Hours : 2+1

IV. Aim of the course

To know the present level of exploitation of marine resources and to impart knowledge on conservation measures. To learn the recent methodologies of sustainable exploitation of renewable resources.

V. Theory

Unit I

Status of marine fisheries: Major fishing nations of the world, Major fishing regions, present trend of marine capture fisheries.

Unit II

Marine fish resources: Important finfish and shellfish resources in demersal and pelagic systems; Conservation strategies.

Unit III

Fishery management: Mud bank fishery- wadge bank fishery-Commonly used tools for input and output regulations, Principles of management of fisheries resources, Objectives of management, Issues and challenges of managing multi-gear fisheries.

Unit IV

Sustainability: Principles, Socio-economic, Ecological, Biological and Legal issues-Fisheries co-management - Case studies of fisheries conflicts between sectors, states and nations, Conflict management.

Unit V

Fisheries and fishing methods in open waters: Inshore fisheries (up to 50 m depth), Offshore fisheries (50-200 m depth) -High sea fisheries.

Unit VI

Conservation aspects: Marine Biodiversity of selected areas including coral reef conservation, Biodiversity principles, Categorization of species into endangered; Indeterminate and extinct varieties- Managing the highly exploited fishery resources.

VI. Practical

Marine fishery resources – visit to nearest marine landing centres, Length frequency analysis – catching method, Catch data analysis on marine fishery resources of India. Closed season studies – gear selectivity.

VII. Suggested Reading

I. **Course Title** : **Advanced Fish Anatomy And Physiology**

II. **Course Code** : **FRM 512**

III. **Credit Hours** : **2+1**

IV. **Aim of the course**

To impart an in depth knowledge on anatomy and physiological regulations in fishes for better fisheries resource management

V. **Theory**

Unit I

Principles of Fish anatomy: Study of internal anatomy of important groups of finfish and shellfish, Body form, swimming mechanisms and buoyancy regulation- bioenergetics, strategies for buoyancy regulation- Fish behaviour and regulatory mechanism- alarm reaction-transduction mechanism, Sense organs and their functions. Hearing mechanism and specialization. Physiology of photoreceptors and pineal organ.

Unit II

Anatomy and physiology of digestive system: Digestive organ and their mechanism, Functions, Feed ingestion and feeding mechanism - Feeding mechanisms and their control, Effect of starvation.

Unit III

Anatomy and physiology of excretory system: Excretory organs in fish and shellfish and their functions, Mechanism of excretion of nitrogenous waste, Osmoregulation in freshwater fishes, Marine fishes, Elasmobranches, Crustaceans and molluscs.

Unit IV

Muscle physiology: Striated and smooth muscle, Adaptations of muscles for various activities, Neuronal control of muscle contraction, Electric organs, Stenohaline and Euryhaline animals and their tolerance capacity.

Unit V

Endocrine and exoocrine glands: Hormones and their role in appetite, Osmoregulation, Calcium metabolism, Cardiovascular regulation and behaviour, hormone receptors, Endocrine disruption, Mechanism of hormone synthesis, Release, transport and action, Hormone receptors and their characteristics, Neuroendocrine regulation of gametogenesis, Maturation and ovulation processes.

Unit VI

Adaptations to Stress: Basic concept of environmental stress, Acclimatization, Avoidance and tolerance, Stress and Hormones.

VI. **Practical**

Dissection of different shellfishes and finfishes to understand their internal organs. Influence of temperature and salinity on metabolism, Display of visceral organs; dissection of fish bones and skeleton, Oxygen consumption in relation to body size/ stress/anesthesia, Chronic and acute responses to environmental changes (temperature and salinity) on metabolism, Collection and analysis of body fluids, blood sampling; gamete collection, Oxygen consumption in relation to body size/

stress/anesthesia, Haematology, Acute and chronic stress markers (estimation of glucose, cortisol, total protein, AST, ALT, LDH), Analysis of digestive enzyme activities. Measuring osmoregulatory parameters. measuring reproductive hormones; Audio visual recording of behaviour in simulated experiment.

I. Course title : Fish Histology and Histochemistry

II. Course code : FRM 513

III. Credit Hours : 1+1

IV. Aim of the course

To know the present level of exploitation of marine resources and to impart knowledge on conservation measures. To learn the recent methodologies of sustainable exploitation of renewable resources.

V. Theory

Unit I

Fundamentals of histology: Epithelial, Connective, Muscular, Nervous and other specialized tissues.- Tools in histology: Principles, design and functioning of microtomes, Automated microtomes, Ultra microtome, Cryostat, Problems and troubleshooting.

Unit II

Techniques in histology: Sample preparation, Obtaining tissue samples, Handling reagents, Fixatives (types of fixatives and effect on tissue), Processing of fixed samples, dehydration (procedure and significance), Embedding, Block making, Staining (staining methods histochemical and immunohistologial methods), dyes and Dye binding reactive groups, Mordants and mordanting, Temporary and permanent preparations, Whole mount preparation

Unit III

Fundamentals of histochemical techniques: Principle and practice, Detection of glycogen, Neutral and acid mucopolysaccharides, Detection of basic proteins, Detection of specific and nonspecific lipids, detection of nonspecific esterases, Detection of acid /alkaline phosphatase.

Unit IV

Systemic Histology: Study of Microscopic structure of the organs of digestive, Respiratory, Urinary, Reproductive, Nervous and cardiovascular systems, Sense organs, endocrines and Lymphoid organs of fish and shellfish.

VI. Practical

Histology slide preparation- studying the general architecture of various tissues- staining- vital staining- histochemistry, Enzyme detection: acid phosphatase, Alkaline phosphatase, Esterases, Nucleic acid staining: Methyl green, Pyronine, Feulgen stain. Study of different types of tissue with help of permanent slides, Effect of fixatives, fixation of tissues, Block preparation and sectioning, Mucolpolysaccharide staining, AB pH 1.5, 2.5. Proteins and lipid staining, Microscopic examination and identification of tissues.

I. Course Title : Field Techniques In Fisheries Resource Management

II. Course Code : FRM 514

III. Credit Hours : 0+2

IV. Aim of the course

To learn field skills in fishery biology and resources management

V. Practical

Planning a fish survey- survey protocol, Fishery dependant sampling- Netting and trapping: Seine nets; Trawl nets; Hand nets, throw nets and push nets; Gill nets and trammel nets (Set nets); Traps- hook and line, Assessing CPUE, Fishery independent sampling Snorkelling- SCUBA survey – line transect- manta survey- Tagging, Underwater Visual Census; Hydro–Acoustics-Electrofishing, Egg and larval collection-abundance estimation.

Course Contents
Ph.D. in Fisheries Resource Management

I. Course Title : Fisheries Resource Conservation and Restoration Biology

II. Course Code : FRM 601

III. Credit Hours : 2+1

IV. Aim of the course

To understand the protection needs of fisheries resources and aquatic system and restore them to sustain the fisheries resources

V. Theory

Unit I

Functions and importance of Aquatic habitats: Mangrove, Corals, Seagrass beds, and dunes, Turtle nesting grounds, horseshoe crab habitat; Role and functions of aquatic habitat; Human activities and pollution sources; Effects of Conservation Practices on Aquatic Habitats and Fauna.

Unit II

Aquatic habitat conservation: Freshwater habitat and Marine water habitat; Erosion and sediment control-transplantation-stocking-population stabilisation.

Unit III

Restoration and Management: Restoration of freshwater and marine water; Storm water management; Restoration challenges of aquatic habitats, Spawning/ feeding ground protection, Fish refugee-ex-situ conservation.

Unit IV

Marine parks: Formation guidelines- Ecosystem stability- Population viability-effect-coral restoration- Seagrass meadow formation-artificial reef-Heritage sites-Protection of spawning aggregates-.ranching- Relocation-critical stock/ Critical viability stock-Bio-augmentation.

Unit V

Land development guidelines for protection of aquatic habitats: Beach creation and beach maintenance –Aquatic habitat protection and restoration programs, Projects and policies; Governance and regulation

Unit VI

Ecosystem Valuations: Carbon sink- carbon Budgeting –Economic and financial aspects; Economic value of aquatic habitat.

VI. Practical

Visit to natural aquatic habitats like ponds, lakes, rivers, streams, springs, estuaries, bays, and various types of wetlands. Visit to Marine national parks- Eco-sensitive zones. Sampling methods; Isolation, identification and enumeration of aquatic organisms from diverse aquatic habitats; Suggest management plan for aquatic habitat protection- permit application form. Valuation of ecosystems – awareness on fisheries resource conservation. Visit to reservoir and assess the threats and developing plan for stock rebuilding. Seagrass, Mangrove restoration. Reservoir stock/ ranching

I. Course Title : Assessment of Aquatic Biodiversity And Ecosystem

II. Course Code : FRM 602

III. Credit Hours : 2+1

IV. Aim of the course

To enrich the knowledge on aquatic biodiversity, assessment of healthiness using indices, threats and conservation needs.

V. Theory

Unit I

Introduction to Aquatic Biodiversity assessments: Measurement, Methods for sampling and analysis, Scales and indices of biodiversity assessment – Biodiversity monitoring- Biotic integrity index-fish- Benthos-Plankton.

Unit II

Biodiversity assessment in ecosystems: (Inland and Marine Resources) Rivers, lakes, estuaries intertidal (mangrove and coral reefs) and gulf and island ecosystem.

Unit III

Threats to biodiversity: Over exploitation, Land reclamation, Exotic species – pollution, habitation, Climate change, Conversion of agricultural land and aquacultural farms (case studies pertaining to sensitive marine/estuarine/freshwater hot spots).

Unit IV

Impacts of anthropogenic intervention on aquatic biodiversity: Damming of rivers, Linking of rivers, Construction of sea walls, Micro hydel power stations, oil rigs, Biodiversity loss, extinction risk and endangered species management.

Unit V

Conservation and Restoration: Declaration of mangrove sanctuaries and mangrove afforestation, Marine protected areas, Riverine ecosystem and diversity management Plan, Introduction of exotic species and their implications, Bio-monitoring, Genetic diversity and conservation.

Unit VI

Ecosystem Conservation Acts: Legal and institutional acts, Regimes of biodiversity: International and national conventions, Biodiversity Acts- Biodiversity Boards/Authority, Benefit sharing mechanism- IUCN criteria – Red List, Wildlife protection act, International treaties, ETP species.

VI. Practical

Preparation of records and inventories of biodiversity of any three critically important ecosystems based on secondary data and field visits. Comparison of biodiversity indices; assessment of biotic integrity index. Compilation of all important International and National laws and conventions related to biodiversity. Collection and identification of flora and fauna from biodiversity hotspot. Identification of scheduled aquatic fauna. Data sheet preparation on IUCN criteria. Assess threats to aquatic biodiversity. Development of conservation plans. Analysis of earlier biodiversity study reports.

I. Course Title : Functional Physiology of Fishes

II. Course Code : FRM 603

III. Credit Hours : 2+1

IV. Aim of the course

To understand advanced concepts in physiology of finfish and shell fishes

V. Theory

Unit I

Growth and metabolism: BMR- SDA- Bioenergetics-energy requirement of fish-energy budgeting-digestion-liver function-starvation effect.

Unit II

Sense organs and their functions: Hearing mechanism and specialization, Vision and mechanosensation – photoreceptors; Olfaction. Vision

Unit III

Neurophysiology: Nerve gap junction, Potential, Nerve Pulse, Passage, Circadian rhythm.

Unit IV

Endocrinology physiology: Migration physiology, Endocrine glands, Hormone, Endocrine disruptor- Osmoregulation; Excretion, Blood parameters and hormones, Regulation of electrolytes and ions.

Unit V

Reproductive physiology: Reproductive behaviour – hormones, embryonic development – Pheromones and other signals, Ecomorphology; strategies for buoyancy regulation.

Unit VI

Stress physiology: Stress resistance, Stress tolerance- General Adaptive Syndrome-Immune system – Responses to temperature, Hypoxia and anoxia

VI. Practical

Fish anesthetisation. Analysis of blood composition –blood volume measurement. Histological analysis of gills. Energy requirement studies. Estimation of gross energy and digestible energy of feed. Measuring osmoregulatory parameters. Measuring of cortisol –water regulation. Measuring reproductive hormones. Electro-olfactograms.

Chronic and acute responses to environmental changes. Stress study- symptoms. Observe embryonic development.

I. Course Title : GIS use in Fisheries Resources

II. Course Code : FRM 604

III. Credit Hours : 2+1

IV. Aim of the course

To apply the knowledge in GIS for assessment and management of fisheries sector.

V. Theory

Unit I

GIS in Fisheries: Applications of Geographical Information Systems (GIS) based on spatial decisions in fisheries resources.

Unit II

GIS applications in MPA: Application of GIS to evaluate efficiency of Marine Protected Areas (MPA) in India.

Unit III

GIS in shrimp aquaculture: Applications of GIS for sustainable management of shrimp culture in India.

Unit IV

Fish modelling: Modelling of essential fish habitats based on remote sensing, spatial analysis and GIS.

Unit V

Geographical Information Systems: Their past, present and future use in global marine fisheries.

Unit VI

GIS applications in Mangroves: Application of GIS in the management of mangrove forests and Marine Protected Area.

VI. Practical

Applications of GIS software in fisheries resource management. Mapping of fisheries resources using GIS. Exercises in Arc GIS/ Open sources software.

I. Course Title : Fisheries Legislations, Governance and Treaties

II. Course Code : FRM 605

III. Credit Hours : 1+1

IV. Aim of the course

To familiarise various legislation, agreement under international law which govern responsible utilisation of fisheries resources

V. Theory

Unit I

Overview of legislation: Critical review of fisheries regulatory and developmental setup in centre and states (spheres of responsibility and division of power); Need for fisheries management; Regulatory, Legal and enforcement regimes. Developmental planning for fisheries; Plan allocation, Programs and performance of fisheries sector; Regional disparities and balanced development; Political economy of fisheries development political ecology.

Unit II

National policies and regulations: Objectives, Salient features and amendments: Indian Fisheries Act, Biodiversity Act, The Environmental (Protection) Act; Policy and regulatory environment in marine fisheries and mariculture Sector (National Policy on Marine Fisheries, MFRA, Deep sea fishing policy, Guidelines for deep sea vessels, Policy on Mariculture, seed certification), Inland Fisheries and Aquaculture Sector (National Policy on Inland Fisheries and Aquaculture), Wet lands, Heritage sites, Hot spots; Brackishwater Aquaculture Sector (CAA), Processing Sector (MPEDA Act; HACCP/ ISO Standards / Food safety/ Quality Safety Management Systems). Fish Marketing and Trade policies, institutionalization of stakeholder participation and Developing policy framework for fisheries.

Unit III

International policy and regulatory scenario in fisheries sector: FAO's CCCRF; IUU; MCS; UN's Law of the Sea and other conventions; treaties; SAARC, NACA, CBD, CITES, MARPOL, IWC, EU's Common Fisheries Policy, RAMSAR-SDG- RFMOs; Fisheries policy and regulation of selected countries in Asian American and Australian regions, Eco-labeling and Certification.

Unit IV

Governance: Need for fisheries governance and institutional framework, Formal and traditional, Fisheries Law, Rights based fisheries, Improve fisheries governance, Multi-stakeholder processes in governance, Case studies in self-governance in the fisheries sector.

VI. Practical

Review of the existing fisheries policies: suggest and draft ideal inland and marine fishery legislations for India. Fisheries regulatory, legal and enforcement regimes-responsibilities of the centre and states of India. Preparation of management plans for specific fisheries. Visit to appropriate Government organizations/research, institutions/NGOs and preparation of working report. Impact survey on regulations-group discussion on fisheries regulations. Comparison of policies and acts with neighbouring countries. Comparison of Fisheries Regulation Acts of different states.

I. Course Title : Software Applications in Fish Stock Assessment

II. Course Code : FRM 606

III. Credit Hours : 1+1

IV. Aim of the course

To familiarise various software available for stock assessment and use for taking decision to optimally exploit the stock.

V. Theory

Unit I

Introduction to sampling and data collection: Collection of fishery data, Field procedure, Abundance estimation, Transect Study, Sampling-survey, Fish landing centre, Exploratory survey, Fishery independent survey, Non-extractive abundance sampling, Catch effort assessment.

Unit II

Models: single species, Biomass dynamics, Cohort analysis, YPR, Depletion model; Multispecies – Descriptive multispecies, Dynamic multispecies, Aggregate system and Dynamic system models.

Unit III

Softwares: Software for fish stock assessment-open source. Computer based softwares, FiSAT/CEDA/LEDA/LFDA

Unit IV

R program: basics- Application of R program in fisheries.

VI. Practical

Collection of fishery data at landing centres from different gears separately. Details of craft and gear of landing centres and recording of data in the entry forms. Collection of length frequency data for various groups of finfish and shellfish. Estimation of age and growth based on length frequency data. Growth, mortality, population and stock parameters employing computer based softwares, FiSAT/ CEDA/LEDA/LFDA, YIELD and PAR Fish Length structured VPA, Thompson and Bell yield stock prediction for single and multi-fleet version. RAPFISH. Types of simulation model: yield-per-recruit and dynamic logistic model. Multispecies model-Multispecies Virtual population dynamcis. Beverton and Holt yield-per-recruit model; biomass-per-recruit. Relative yield-per-recruit model and yield isopleth. ECOPATH With ECOSIM. Introduction to R program in fisheries. R-programme in stock assessment.

I. Course Title : Coral Reef Management

II. Course Code : FRM 607

III. Credit Hours : 1+1

IV. Aim of the course

To enhance the knowledge on coral reefs, their importance, conservation and restoration management:

V. Theory

Unit I

Introduction: Type of coral reefs and their distribution. Origin of coral reefs – coral reefs of the world, Ecology of coral reefs, factors influencing growth, Productivity of coral reefs, Plants and animals associates of living reef corals and fringing reefs.

Unit II

Reef types: Types of corals - Soft coral, Hard corals, Biology of corals (Nutrition, production, larval dispersal and settlement), Coral resource, Field assessment.

Unit III

Bioactive substances: Bioactive substances of soft and hard corals, Extraction, Analysis, identification, Classification of biactive compounds.

Unit IV

Coral reef management: Economic importance of coral reefs, Ecological role, Threats, Sedimentation in coral reef environment, Restoration.

VI. Practical

Collection and identification of soft and hard corals, Survey of corals and mapping, identification of associated organisms, preparation of checklist and associated organisms of Indian coast- Predatory animals of corals, Extraction of bioactive substances from soft and hard corals. Observations of destructive methods of corals and coral reef fishes. Coral restoration-valuation.

Suggested Broad Areas for Master's and Doctoral Research

- Mapping of fisheries resources in different freshwater, brackish water and marine water bodies
- Impact of intensive-aquaculture activities on biodiversity of coastal ecosystems
- Fish stock assessment in different freshwater bodies using FiSAT
- Analysis of productivity in different freshwater bodies
- Assessment of bycatch from trawl, bottom set gillnet and other gears
- Sea ranching and effect of ranching in the marine ecosystem

- Biology and assessment of deepsea fishery resources
- Estimation of biodiversity and abundance of endangered species of sponges, corals, gastropods, bivalves, sea cucumbers, fishes, sea snakes, turtles, birds and marine mammals
- Effect of conservation measures in the restoration of depleting fish stocks
- Development of proper guidelines for commercial deep sea fishing
- Impact of Coastal Regulation Zone on the stock replenishment
- Monitoring, Control and Surveillance (MCS) systems for inland and marine capture fisheries
- Collection of satellite information on various aquatic resources and ground truthing Interpretation of satellite pictures for resource management
- Use of remote sensing for Potential Fish Zone
- Estimation of flora and faunal diversity of mangroves and coral reefs.
- Estimation of fleets and catches at landing sites for effective fisheries management
- Neurohormones controlling the reproduction of commercial crustacean Species
- Identification of commercially important species of finfish and shellfish eggs and larvae, spat.
- Forecasting the fishery potential through the study of abundance of finfish and shellfish eggs and larval in the marine ecosystem.
- Studies on migratory pattern of fishes
- Food and feeding habits of larval stages of shell and finfishes.
- Catalogue preparation of commercially important fishes (FW, BW and Marine)
- Studies on biodiversity estimates for coastal resources, fresh water bodies.
- Upgradation of food and feeding habit of commercially important fishes and shellfishes using latest techniques
- Microsatellite based identification of commercial fishes
- Karyotaxonomy of commercially important fishes and shellfishes
- Ecopath modelling for minor reservoir, small waterbody
- Conservation biology and marine pollution
- Coral reef reproduction, assessment, monitoring and management
- Assessment of Coral reef associated fauna and flora biodiversity
- Remote sensing and geospatial analysis of coral reef ecosystem.
- Spawning grounds characterisation
- Estimation of MSY in various marine ecosystems
- Stock assessment and biology of Indigenous and endemic fisheries resources
- Multispecies fish stock assessment
- Fish stock assessment in various freshwater, brackishwater and marine ecosystems using FiSAT
- Mapping of coral resources and conservation strategies
- Mapping of seaweed resources
- Up gradation and Molecular characterization of various seaweed species available in the marine ecosystem
- Spawning biomass estimation
- Estimation of Taxonomic distinctness for major finfish and shellfish resources using molecular tools

Vol. 5

Fisheries Science
– Aquatic Environment Management

Preamble

(Aquatic Environnent Management)

The objective of this course is to develop specialised human resources equipped with the latest knowledge related to changes in Aquatic Environment Management strategy in light of changing ecological condition, climatic variability and their impact on fish and fisheries.

The course provides advance skills and exposure in the wide range of topics necessary for the aquatic environment management at the post-graduate and doctoral levels.

Emphasis is given both on developing expertise in the techniques, understanding future environmental challenges and different gametes of aquatic environmental management including coastal zone management.

The new and innovative courses included for M.F.Sc. are Climate Change: Impact and Management, Inland Aquatic Resource Management and Utilization and Management of Aquatic Algal Resources and for Ph.D. Water Issues Challenges and governance and Aquatic Plant Resource and its Management. Practical credits have been enhanced and more emphasis is given towards field exposure and case studies based learning. These courses may help in understanding the policy issues related to Aquatic Environment Management.

Course Title with Credit Load
M.F.Sc. in Aquatic Environnent Management

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
AEM 501	Inland Aquatic Resource Management	2+1
AEM 502	Chemical Interactions in Aquatic Environment	2+1
AEM 503	Analytical Techniques in Environnemental Sciences	1+2
AEM 504	Climate Change: Impact and Management	1+0
AEM 505	Aquatic Pollution and Management	2+1
AEM 506	Eco-toxicology	1+1
AEM 507	Coastal Ecology and Coastal management	2+1
AEM 508	Aquatic Microbiology	1+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
AEM 509	Aquatic Environment and Biodiversity	1+1
AEM 510	Plankton Ecology and Trophic Dynamics	1+1
AEM 511	Environmental Biotechnology	1+1
AEM 512	Fisheries Oceanography	1+1
AEM 513	Utilization and Management of Aquatic Algal Resources	2+1
AEM 514	Restoration Ecology	1+1
	Supporting courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Credits	**39 Credits**

Course Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
AEM 591	Master's Seminar I	0+1
	Masters' Thesis Research	**30 Credits**
AEM 599	Master's Research (Semester III)	0+15
AEM 599	Master's Research (Semester IV)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Aquatic Environnent Management

I. Course Title : Inland Aquatic Resource Management

II. Course Code : AEM 501

III. Credit Hours : 2+1

IV. Aim of the course

- To educate the students on ecology of wetlands and its importance
- Manipulation and mapping of wetlands for sustainable management of these ecosystems.

V. Theory

Unit I

Types of inland aquatic resources: Concept of watershed; Lacustrine, Riverine, Wetland~~s~~, Floodplain~~s~~, Swamp~~s~~ and Pond~~s~~, Habitat characteristics, Flora and Fauna, Economic importance; Relationship between productivity (primary and secondary) and fish yield.

Unit II

Wetlands: Trophic classifications, Functions, Degradation of wetlands (causes consequences; Constructed wetlands; Restoration, Conservation and management of wetlands, Ecological services and livelihood from wetland.

Unit III

Ecological engineering: Concept, Application and restoration; Resource enhancement; Biomanipulation - Top-down and bottom-up methods; Integrated Environment Management (IEM) Programme, Ramsar convention.

Unit IV

River continuum concept and new paradigm shift, River linking; Mapping of aquatic resources using remote sensing and GIS.

Unit V

Water budget and Environmental flow, Its significance in water conservation and ecology, Environmental Economics and auditing, Ecosystem approach to resource management.

Unit VI

Wasted and degraded resources, Coastal and inland saline areas, Adaptations of organisms, restoration/remediation strategies, Prospects of gainful use of available technologies.

VI. Practical

Collection, preservation and analysis of flora and fauna (plankton, macrophytes and benthos) of wetland/degraded aquatic ecosystem. Calculation of shoreline development index and morphometry. Calculation of Morpho-edaphic index. Field visits to select~~ed~~ lakes/wetlands/degraded/restored ecosystem.

- Nath S. (Ed). 2008. *Recent Advances in Fish Ecology Limnology and Eco Conservation* Vol 7. Narendra Publishing House, New Delhi.

I. Course Title : Chemical Interactions in the Aquatic Environment

II. Course Code : AEM 502

III. Credit Hours : 2+1

IV. Aim of the course

- To acquaint the students with basic principle of chemistry with special reference to soil chemistry
- To study physical, chemical, biological and geological interactions in the aquatic environment.
- To study the nutrient dynamics and fate of contaminates in the aquatic environment.

V. Theory

Unit I

Basic principles: Chemical kinetics, Chemical equilibrium and Redox chemistry, Solubility concept, Dissolution kinetics.

Unit II

Sediment properties: Weathering of rocks; Soil formation, Soil profile, Mineral weathering; transformation, weathering products, Structure of oxide and silicate minerals, Sources of charge, adsorption on to clay minerals of major cations and anions, Double layer, Ion exchange - concept and source of cation exchange capacity (CEC), Sediment texture.

Unit III

Nutrient dynamics: Nutrient holding capacity of sediments and fixation, Processes controlling elemental cycling.

Unit IV

Transport of nutrients: Availability of Nutrients and productivity inaquatic ecosystem

Unit V

Processes in the degradation and conversion of organic matter, Humus and biogeochemical substances.

Unit VI

Fate of Contaminants: Degradable and non-degradable contaminants, Speciation and transport of contaminants, Bio-availability; Bio-accumulation and Biomagnification.

VI. Practical

Sample collection techniques

Determination of physicochemical parameters of sediment – pH, electrical conductivity, redox potential, soil texture, bulk density, particle density, porosity, total and organic carbon, total and available nitrogen, phosphorus, potassium and micronutrients; C: N: P ratio, CEC

VII. Suggested Reading

I. Course Title : Analytical Techniques in Environmental Sciences

II. Course Code : AEM 503

III. Credit Hours : 1+2

IV. Aim of the course

- To teach the student advance analytical techniques employed in environmental studies
- To acquaint the student to the advanced instrumentation employed in environmental studies

V. Theory

Unit I

Qualitative and quantitative analytical techniques including Gravimetric and volumetric analyses used in environmental science, Sampling techniques and procedures, Factors affecting the choice of analytical techniques, Interferences and their minimization, Laboratory safety measures.

Unit II

Photometric techniques: Theory, instrumentation and application of spectrophotometry and spectroscopy, AAS, FT-IR, ICP-MS, XRD, XPS, Biosensor, Microscopic Techniques etc. Theory and applications of electrophoresis, Principles and uses of ultra-centrifugation, Tracer Techniques, Isotopes in environmental analysis.

Unit III

Separation techniques: Chromatography – theory, instrumentation and applications of thin layer, paper, ion-exchange, size exclusion, high performance liquid and gas, Methods of preparing biological samples for chromatographic analysis, GC-MS.

Unit IV

Bioanalysis techniques: Immunoassay – Principle, methods and applications and Biosensors – components, characteristics, applications, impacts and challenges. **Nanotechnology:** Preparation of nanoparticles, characterization and applications

VI. Practical

Estimation of environmental parameters by UV-Visible spectrophotometer, Estimation by AAS, Estimation of environmental parameters using HPLC, Estimation of environmental parameters using GC/GC-MS, Estimation of environmental parameters by CHNS analyser, etc.

I. Course Title : Climate Change: Impact and Management

II. Course Code : AEM 504

III. Credit Hours : 1+0

IV. Aim of the course

- To understand global warming, its impact on the aquatic environment and fisheries
- To know about the different legislation across the country to combat climate change

V. Theory

Unit I

Weather and climate, Greenhouse effect, Radiative balance, Climatic migration, Impact on women; Carbon Sequestration and trading, Projected trends of climate change and disasters.

Unit II

Climate change, Its impacts, Aquatic ecosystem, Capture and culture fisheries, Carbon footprint in fisheries and aquaculture.

Unit III

Ocean acidification, Global ocean circulation, El Nino and Southern Oscillation, IPCC and its reports, UNFCCC, Kyoto Protocol, Politics of climate change.

Unit IV

Climate change adaptation and mitigation, Vulnerability assessment, Mitigation and Adaptation measures, Climate-resilient aquaculture, Climate smart villages-NICRA.

I. Course Title : Aquatic Pollution and Management

II. Course Code : AEM 505

III. Credit Hours : 2+1

IV. Aim of the course

- To impart fundamental and advanced knowledge on different aspects of aquatic pollution
- To impart fundamental and advanced knowledge on management of different aquatic resources

V. Theory

Unit I

Aquatic pollution: Sources, types and impacts, Pollution problems of groundwater resources (arsenic, fluoride, nitrate, pesticides), Sources of contamination and management issues.

Unit II

Pollutants: Sewage, pesticides, hydrocarbons, nutrients, Metals, Radioactive wastes, Biomedical wastes, hazardous chemicals, Microplastics, Nanoparticles; Dispersal and fate of pollutants.

Unit III

Air and soil pollution: Smoke, Smog, Photochemical smog and SPM, Impact of air and soil pollution on the aquatic environment.

Unit IV

Methods of waste disposal, water quality criteria: National and International standards; ISO-14000(EMS), EIA, Management strategies, Emerging issues in aquatic environment.

Unit V

Waste waters: Their nutrient potentials, Scope and limitations, Treatment methods; Recovery of nutrients from liquid and solid wastes, Ecological sanitation, closing the loop.

Unit VI

Integrated water management: Water conservation measures, Water use and reuse in aquaculture, Water use efficiency, Restoration ecology and rehabilitation

VI. Practical

Determination of total dissolved and suspended solids, Determination of BOD, Determination of COD, Determination of NH_3–N, Determination of Nitrate/Nitrite-N, Determination of Phosphate-P, Determination of metals and pesticides, Visit to a sewage treatment plant/fish processing unit/industries.

VII. Suggested Reading

I. Course Title : Eco-toxicology

II. Course Code : AEM 506

III. Credit Hours : 1+1

IV. Aim of the course

To impart knowledge on toxicological aspects of various pollutants

- To impart the knowledge on emergent toxicants, their fate in aquatic environment and risk assessment
- To impart knowledge on the effects of toxic chemicals on populations, communities and aquatic ecosystems

V. Theory

Unit I

Toxicity: Factors influencing toxicity, Environmental, genetic and nutritional, Ecological effects of toxicants, Genotoxicity, Neurotoxicity, Toxicology of emerging contaminants, PBDE, New generation pesticides and antibiotics, Antibiotic resistance.

Unit II

Toxicity evaluation: Toxicity Testing, Microcosm and mesocosm Tests, Dose-Response Relationships, Bioassay, Physiological and molecular evaluation

Unit III

Metabolism: Metabolism of toxic substances by aquatic microbes and other organisms consequences, synergistic and antagonistic effects, Acute poisons and accumulative poisons, Biomonitoring and biosensors.

Unit IV

Bioaccumulation, Bioconcentration and Biomagnification, Systemic effects of toxic metals, Pesticides and Herbicides; Effect of select toxicants on aquatic life and detoxification mechanisms, Interrelationship of xenobiotics with other environmental variables, biofilter organisms.

VI. Practical

Toxicity evaluation of heavy metals on selected organisms by bioassay techniques, Toxicity testing methods, Toxicity assessment of pesticides and other contaminants on selected organisms.

VII. Suggested Reading

I. Course Title : Coastal Ecology and Management

II. Course Code : AEM 507

III. Credit Hours : 2+1

IV. Aim of the course

- To impart theoretical and practical knowledge about fundamental and advanced aspects of marine ecology.
- To acquaint the students with the recent approaches for coastal resources management.

V. Theory

Unit I

Coastal resources: Characteristics of coastal ecosystems (flora and fauna, trophic relationship, nutrient production, cycle and transport).

Unit II

Mangrove ecosystem: Species diversity, distribution and importance; Other inter-tidal systems - Seagrass, Sandy beach, Lagoon and estuary.

Unit III

Developmental activities and biodiversity loss: Human settlements, Industries, Shore protection works, Ports, transport systems and Waste disposal.

Unit IV

Ecological issues, Impacts of environment changes, Threats to biodiversity, Habitat destruction; Depletion of fisheries resources.

Unit V

Coastal Zone Management: Integrated Coastal Zone Management (ICZM) - its benefits, Principles, Goals and objectives, scope, zonation.

Unit VI

National and international policies and planning for coastal resource management: Natural hazards and disasters -protection and management; Socioeconomic impacts and its assessment.

VI. Practical

- Analysis of soil and water characteristics of coastal areas and determination of different factors.
- Collection, preservation and identification of coastal biological communities
- Survey of different coastal zones.

VII. Suggested Reading

I. Course Title : Aquatic Microbiology

II. Course Code : AEM 508

III. Credit Hours : 1 +1

IV. Aim of the course

- To impart knowledge on aquatic microorganisms with reference to their role in the aquatic environment and bioprospecting.
- To impart knowledge and skill on culture and culture independent techniques for microbial studies.

V. Theory

Unit I

Distribution and classification: Microbial community in freshwater; Estuarine and marine environment (types and abundance); Factors affecting microbial growth and abundance; Extremophiles and their significance.

Unit II

Microbial interaction: interrelationships, Microbial degradation of persistent organic pollutants (POPs); Microorganisms and public health: Water-borne pathogens of public health importance - Protozoans, bacteria, enteroviruses; Microbial toxins; Algal toxins; Disinfection methods; Microbial standards for different water uses.

Unit III

Principles and applications of bioprocesses: Bioremediation, Biofertilization, Biofilms, Biofloc, Probiotics, Bio-leaching, Bio-corrosion, Bio-fouling; Microorganisms as Bioindicators and Biosensors.

Unit IV

Methods of assessing microbial biomass production; Bioprospecting: Current practices in bioprospecting and biopiracy; Microbial metabolites and its industrial application.

VI. Practical

- Isolation, identification and enumeration of algae and bacteria from polluted aquatic habitats
- Maintenance of algal and bacterial cultures
- Microbial sensitivity testing
- Bio-activity testing
- Disinfection methods

VII. Suggested Reading

I .Course Title : Aquatic Environment and Biodiversity

II. Course Code : AEM 509

III. Credit Hours : 1+1

IV. Aim of the course

- To acquaint the students with the theoretical and practical aspects of the aquatic environment and biodiversity concept.
- To impart knowledge on biodiversity conservation and ecosystem approach to resource management.

V. Theory

Unit I

Basic ecological concepts - Habitat ecology, systems ecology, Synecology, Autecology; Characteristic features of different biomes; Concept of community, Continuum, Community attributes, Community development, Ecological succession, Changes in ecosystem production, Concept of climax.

Unit II

Biodiversity – Definition and concept; Categories of biodiversity - Species diversity, Genetic Diversity; Habitat Diversity; Ecosystem services and Economic appraisal of biodiversity

Unit III

Biodiversity indices and their significance; Concepts of Index of Biotic Integrity (IBI).

Unit IV

Biodiversity Conservation - Global diversity patterns and loss of biodiversity; Conservation measures; Biodiversity hotspots, Biosphere reserves; National parks, sanctuaries; Marine protected areas; Convention on Biological Diversity; IUCN; CITES; WWF; Ramsar Convention; Man and Biosphere Programme; Indian legislations to biodiversity conservation, Ecological Sensitive Areas (ESAs)

VI. Practical

- Collection and identification of flora and fauna from different ecosystems.
- Calculation of biodiversity indices – Shannon-Wiener index; Simpson index, Hill index etc.
- Visit to biodiversity hotspots and ESAs.

VII. Suggested Reading

- Barnes RSK and Mann KH. eds. 2009. *Fundamentals of aquatic ecology*. John Wiley and Sons.

I. Course Title : Plankton Ecology and Trophic Dynamics

II. Course Code : AEM 510

III. Credit Hours : 1+1

IV. Aim of the course

- To impart theoretical knowledge about the ecology of plankton in diverse aquatic environment with a reference to their ecological role in trophic dynamics.
- To improve the technical skills for sampling, identification and effects of different ecological conditions on plankters.

V. Theory

Unit I

Plankton diversity and productivity: Definition, Classifications and functions in aquatic ecosystem; Primary and secondary production - Production - Biomass (P/B ratio), factors affecting production.

Unit II

Sampling and preservation techniques- Plankton nets and recorders, Cryopreservation methods and their significance, Indices of diversity.

Unit III

Ecology of phytoplankton: Freshwater and marine, Spatial and temporal variations, succession; Contribution of nanoplankton to primary production; Algal blooms and algal toxins; Nutrient manipulation for algal growth and control; Biological control of algal blooms; Mass culture of phytoplankton as ~~a~~ live-feed; Role of microalgae in carbon sequestration.

Unit IV

Ecology of zooplankton: Freshwater and marine –Feeding behavior, Reproduction of important zooplankters; Swarms; Indicator species; Predator-prey relationship; Impact of grazing on the aquatic ecosystem; Vertical migration of zooplankton in relation to fish catch; Importance of zooplankton in the larval rearing of fish; Environmental manipulation for live-feed production; Mass culture of zooplankton as ~~a~~ live-feed.

VI. Practical

- Collection, preservation and estimation of phytoplankton and zooplankton
- Periphyton estimation.
- Identification and classification of various phytoplankton and zooplankton.
- Mass culture of Phytoplankton and zooplankton.
- Preparation of permanent slide and sectioning.

VII. Suggested Reading

I. Course Title : Environmental Biotechnology

II. Course Code : AEM 511

III. Credit Hours : 1+1

IV. Aim of the course

- To impart basic knowledge on biological methods for environmental management
- To impart basic knowledge on isolation of bacteria implicated in bioremediation and demonstration of their potential for environmental management
- To impart basic knowledge on Application of Molecular techniques in environmental management

V. Theory

Unit I

Fundamentals of environmental biotechnology: Environmental biotechnology-Concepts and Scope; Conventional and Modern approaches; IPR issues related to environmental biotechnology.

Unit II

Environmental monitoring: Cellular and molecular markers of environmental pollution monitoring; Bioindicators; Biosensors and nano-sensors.

Unit III

Remediation: Bioremediation; Genetically-improved/engineered organisms - Basic concepts; Applications in remediation of metals, Pesticides and hydrocarbons.

Unit IV

Consortia of microbes for environmental protection – Concept, Scope and Feasibility, Recombinant DNA technology, Culture intendent nucleic acid-based techniques.

VI. Practical

- Genomic, Metagenomic and plasmid DNA isolation.
- Case studies on wastewater treatment using biotechnological tools.
- PCR amplification of 16S rRNA gene as a tool for biomonitoring.
- PCR application of functional gene implicated in bioremediation.
- Screening of microbes for biodegradation properties.

VII. Suggested Reading

I. Course Title : Fisheries Oceanography

II. Course Code : AEM 512

III. Credit Hours : 1+1

IV. Aim of the course

- To educate the students on the oceanographic concepts related to fisheries and impart skill to operate oceanographic equipment.
- To understand the role of different oceanographic parameters on fisheries production.

V. Theory

Unit I

Oceanographic factors in fisheries: Effects of physio-chemical and biological oceanographic factors on adaptation, Behaviour, Abundance and distribution of aquatic organisms; Primary and secondary productivity in ocean, Productivity changes in the ocean.

Unit II

Synoptic oceanographic analysis: El Nino and Southern Oscillation; Stratification; Mud banks, Upwelling and circulation patterns.

Unit III

Forecasting systems: Fisheries forecasts – Interpretation and use of ocean thermal structure; Fisheries forecasting system in India and other countries – Remote sensing; GIS, Application in fisheries; Application of echo-sounders and SONAR; Potential fishing zones.

Unit IV

Factors affecting marine fisheries: Environmental factors influencing the seasonal variations in fish catch in the Arabian Sea and the Bay of Bengal.

VI. Practical

- Use of tide tables.
- Oceanographic data analysis – water temperature, salinity, pH, nutrients, benthos and sediment characteristics.
- Fisheries forecasting systems.
- Oceanographic equipment and fish finding devices.

VII. Suggested Reading

- Grasshoff K, Ehrhardt M and Kremling V. 1983. *Methods of Seawater Analysis*. Verlag Chemie, Weinheim.

I. Course Title : Utilization and Management of Aquatic Algal Resources

II. Course Code : AEM 513

III. Credit Hours : 2+1

IV. Aim of the course

- To provide a holistic knowledge about the aquatic algal resources and their utilization for alternate livelihood
- To convey the information about the strategies and protocols for the management of aquatic algal resources

V. Theory

Unit I

Role of algae in fisheries and aquaculture, Batch and mass cultivation, Selection of culture medium, Isolation and maintenance of algal cultures; Water quality for algal culture, Algal culture as a livelihood option

Unit II

Bio-prospecting of algal resources for value-added compounds/products-pigments, Agar agar, Carrageenan, Single cell protein, Nutraceuticals and pharmaceuticals

Unit III

Production of nanoparticles; Biofuels, Food and Feed, Algal compounds in cosmetics and Natural colourants, Polar algal resources and their applications.

Unit IV

Value addition through food chain; Enhancement of productivity of phytoplankton - Use of thermal energy, Artificial upwelling, Wastewater utilization for algal cultivation.

Unit V

Role of algae in global warming mitigation; Nutrient supplementation of sea for productivity enhancement, Exotic algal species source and Preventive measures.

Unit VI

International regulations for discharge of ballast water, Algal blooms and control measures.

VI. Practical

- Techniques for algal cultivation
- Maintenance of pure cultures
- *Spirulina* and *Chlorella* cultivation – indoor and outdoor
- Extraction of pigments from algae (Carotenoids and Phycocyanin)

VII. Suggested Reading

- Borowitzka MA. 1988. *Micro-algal Biotechnology*, Cambridge University Press, U.K.

I. Course Title : Restoration Ecology

II. Course Code : AEM 514

III. Credit Hours : 1+1

IV. Aim of the course

- To update and widen the knowledge about basic principles and recent concepts in ecology.
- To equip the students with an updated theoretical and practical knowledge and skills about restoration of aquatic ecosystems.

V. Theory

Unit I

Ecological restoration; Ecological processes and structures, Regional and Historical contexts, and sustainable culture practices; Ecosystem integrity; Community ecological principles; Disturbance, Succession, Fragmentation; Ecosystem function and Services.

Unit II

Emerging concepts-Assembly, Stable states; Environmental flows and cultural interactions; Application of theory-Invasion, Competitive dominance and resource use.

Unit III

Restoration planning; Wetland Assessment, Delineation, and Regulation; Recovery process, Mitigation, Rehabilitation, and Reclamation; Ecological Engineering – Ecosystem approach for restoration; Dynamics and restoration of degraded wetlands; Removal of threats to the health and integrity of the restored ecosystem, Use of constructed wetlands to eco-restoration.

Unit IV

Ecosystem modeling; Ecosystem auditing; Socioeconomics of recovery process; Ecosystem Health Cards

VI. Practical

- Collection and segregation of native and non-native species from a degraded environment
- Making list of historical and cultural interactions, status of assemblages
- Calculation of Index of Biotic Integrity
- Listing of the threats to the integrity of the ecosystem
- Organizing different participatory programs
- Designing a sustainable ecosystem

VII. Suggested Reading

AEM 699	Doctoral Research (Semester VI)	0+15
	Total Ph.D. Program Credit Hours	**100 credits**

Course Contents
Ph.D. in Aquatic Environment Management

I. Course Title : Techniques in Aquatic Environmental Studies
II. Course Code : AEM 601
III. Credit Hours : 0+2

IV. Aim of the course

To impart skill on various techniques in aquatic environment studies

V. Practical

- Analysis of ions
- Calculation of shoreline development index and other indices of lake productivity
- Eutrophication studies in natural waters-tanks and ponds
- Estimation of bio-indicator organisms in polluted waters
- Bioremediation experiments using different bio-agents
- Use of MS-GC in analysis of pesticide and other volatile and semi volatile organic substances
- Water quality improvement evaluation trials
- Field visits
- Visits to different institutes to learn the other techniques

VI. Suggested Reading

- APHA (American Public Health Association). 2017. *Standard Methods for the Examination of Water and Wastewater*. 23rd Edition Edition. American Public Health Association, Washington, D.C.
- Cheremisinoff NP. 2002. *Handbook of Water and Waste Water Treatment Technologies*. Butterworth – Heinemann, Woburn.
- Cairns JE. 2017. *Biological Monitoring in Water Pollution*. Elsevier.
- Sakhare VB. (Ed.). 2007. Advances in Aquatic Ecology Vol. 1. Daya Publishing House, New Delhi.

I. Course Title : Dispersal and Fate of Pollutants
II. Course Code : AEM 602
III. Credit Hours : 1+1

IV. Aim of the course

- To impart knowledge on dispersal of pollutants.
- To impart knowledge on fate of pollutants.

V. Theory

Unit I

Common transport processes of pollutants, Influence of winds, tides, waves and currents on the dispersal of pollutants.

Unit II

Pollutant dispersion in rivers, Coastal waters, estuaries and near outfall sites;

Pollutant dispersal, Dye diffusion studies.

Unit III

Mobility and speciation of pollutants; Nano particles; Recent advances in study of pollutants and their monitoring

Unit IV

Lifecycle analysis; Bio-concentration, Bioaccumulation and Bio-magnification

VI. Practical

- Techniques of computation of dispersion coefficients
- Calculation of Richardson number
- Numerical analysis of estuarine dispersion
- Simple plume experiments – designs of waste discharge and thermal systems

VII. Suggested Reading

- Ciambrone DF. 2018. *Environmental life cycle analysis*. CRC Press.
- John J, William R and Feiss GP. 1998. *People and the Earth: Basic Issues in the Sustainability of Resources*, Cambridge University Press.
- Laevastu T, Clancy M and Stroud A. 1974. *Computation of Tides, Currents and Dispersal of Pollutants in Lower Bay and Approaches to New York with Fine Medium Grid Size Hydrodynamical-Numerical Models*. Part 3. National Technical Information Service Springfield, Virginia.
- Roy MH. (Ed). 1982. *Pollution: Causes, Effects and Control*. The Royal Society of Chemistry, England.
- Rieuwerts J. 2017. *The elements of environmental pollution*. Routledge.
- Wlodzimierz C and Pawel R. 2005. *Water Quality Hazards and Dispersion of Pollutants*, Springer, USA.

I. Course Title : Water Issues: Challenges and Governance
II. Course Code : AEM 603
III. Credit Hours : 1+0

IV. Aim of the course

- To understand the current scenario and future challenges regarding water use.
- To understand different management measures for sustainable use of water.

I. Theory

Unit I

3R concept in water resource management, Best utilisation of water resources, Water as a global issue, Key challenges and needs, Policy option for water conservation and Sustainable use.

Unit II

Water availability in different regions of world, Factors affecting it and conservation; Role of society, Ancient wisdom.

Unit III

Conflicts in water resources utilisation and management, Social and religious importance of water resources.

Unit IV

National and international regulations for management and utilisation of water resources, Current scenario and future challenges of water resource management at National and International level.

II. Suggested Reading

- Cao G and Orrù R. eds. 2014. *Current environmental issues and challenges* (Vol. 31). New York: Springer.
- Costa-Pierce BA. 2002. *Ecological aquaculture*. Oxford, UK.: Blackwell Science.
- Giupponi C, Jakeman AJ, Karssenberg D and Hare MP. 2006. *Sustainable management of water resources*. Edward Elgar Publishing.

I. Course Title : Management and Utilization of Waste And Wastewater
II. Course Code : AEM 604
III. Credit Hours : 2+1

IV. Aim of the course

To impart theoretical and practical knowledge on management and utilization of waste and wastewater.

V. Theory

Unit I

Industrial and domestic wastewater characteristic; Conventional and advanced treatment methods for wastewater, Use of Nanotechnology in treatment; Nano-structured material.

Unit II

Waste recycling and utilisation (including solid waste) in aquaculture, Plant assisted bioremediation.

Unit III

Urban Drainage Sewage System; Theoretical principles and design - Screens, Equalization basin, Grit chamber, Primary and secondary settling tanks, Advanced Wastewater Treatment – Need and technologies used, Nitrification and Denitrification Processes, Phosphorous removal, Wastewater disinfection, The management of residuals from water and wastewater treatment.

Unit IV

Hazardous waste disposal (by incineration), Required minimum incineration temperature, The thermal treatment of halogenated waste, Present-day waste incinerators, Waste minimization, Role of human behavior in waste managment

Unit V

Production of Biogas and bio-fuel from waste; Wastewater-fed aquaculture, Integrated wastewater management, Green water technology, IMTA.

Unit VI

Wastewater disposal criteria - National and international standards; Monitoring-Role of Central and state pollution control boards and other agencies.

VI. Practical

- Estimation of physicochemical characteristics of wastewater (BOD, COD).

- Estimation of nutrients and contaminant of wastewaters.
- Analysis of living communities associated with treatment processes.
- Demonstration of liquid waste treatments (ozonization, chlorination, aeration, precipitation, coagulation etc.).
- Synthesis of nanostructured materials for wastewater treatment.

VII. Suggested Reading

I. Course Title : Environmental Impact Assessment

II. Course Code : AEM 605

III. Credit Hours : 1+1

IV. Aim of the course

- To impart theoretical and practical knowledge of environment impact assessment for sustainable development.
- To give exposure of Environment Impact Assessment report preparation.

V. Theory

Unit I

Environmental legislations; Concepts and approaches to Environmental Impact Assessment (EIA), EIA with reference to aquaculture projects, Coastal industries and Other developmental activities.

Unit II

Social Impact Assessment (SIA), Process, Scope and Significance, Social auditing.

Unit III

Ecosystem services; Environmental economics; Analysis and computation, Environmental auditing, Importance in planning.

Unit IV

International and national environmental protection standards; Environmental quality monitoring; ISO-14000.

VI. Practical

- Field visits for EIA and SIA of certain aquacultural projects.
- Case study and EIA report preparation.
- Setting of the environmental audit programme.

VII. Suggested Reading

I. Course Title : Ecology of Plankton and Benthos
II. Course Code : AEM 606
III. Credit Hours : 1+1

IV. Aim of the course

- To impart and enrich the theoretical and practical knowledge of the students about ecology of plankton and benthos.
- To develop the competence for analysis of plankton diversity.

V. Theory

Unit I

Plankton- Predator-Prey relationship; Role of plankters in food chain, Trophic level and food-webs; Factors affecting plankton distribution.

Unit II

Characterization of benthic habitats; Benthic resources; Role of benthos in bio-turbation and reclamation, Detrital food chain; Factors affecting benthos distribution.

Unit III

Spatial and temporal variation of plankton and benthos; Assessment methods for plankton and benthos, Modern tools.

Unit IV

Plankters and Benthos as pollution indicators; Biofilters and Bio-monitors.

VI. Practical

- Collection and analysis of soil and water in relation to plankton and benthic ecology.
- Collectionand preservation of plankton and benthos; Identification of plankters, benthos.
- Experiment to explore the role of benthos in nutrient transformation.

I. Course Title : Estuarine and Coastal Oceanography

II. Course Code : AEM 607

III. Credit Hours : 1+1

IV. Aim of the course

- To strengthen the knowledge base of the students about the characteristics of estuarine ecosystems.
- To enhance the practical skills for the study of estuarine and coastal oceanography.

V. Theory

Unit I

Estuary; significance, Zonation, characteristics; Buoyancy input as freshwater; Biodiversity, Mangroves.

Unit II

Esturine and Coastal dynamics, Flow and circulation; productivity, Fish and fisheries of estuaries, World famous estuaries and their ecological significance

Unit III

Salinity distribution; Freshwater fraction; Flushing time of an estuary and methods of determination; Sediment transport in estuarine ecosystem

Unit IV

Waves in shallow waters, Transformation, Refraction and reflection; Mass transport, Return flow, Momentum balance

VI. Practical

- Analysis of tidal heights – Net flow and residence time computations
- Computation of salt and nutrient flux
- Construction of wave refraction diagrams
- Visit to coastal and mangrove areas
- Study of coastal profiles

VII. Suggested Reading

I. Course Title : Biotechnology in Aquatic Environment Management

II. Course Code : AEM 608

III. Credit Hours : 1+2

IV. Aim of the course

- To educate about the application of biotechnology in aquatic environment management.
- To impart practical knowledge about various biotechnological tools used in aquatic environment management.

V. Theory

Unit I

Bioremediation: Microbial and Phyto-remediation of contaminated water and pollutants, Biotechnological approaches for bio-energy

Unit II

Biosensor, Bioreactor, Bioreactor for single cell protein, Microbial enzymes and bio-molecules, Industrial application.

Unit III

Molecular tools for biotechnological applications-it's use toxic studies- Pollution bio-indicators and biomarkers; Culture-independent techniques.

Unit IV

Application of biotechnology in aquaculture; Aquatic organisms in industrial/medical biotechnology.

VI. Practical

- Isolation of prospective bacteria as bio-remediators
- Isolation of prospective bacteria as bio-fertilizers
- Enzyme assays
- Mass culture of bacteria
- Gel electrophoresis
- DNA isolation and amplification
- RFLP analysis
- Meta-genomics
- Genomic libraries

I. Course Title : Aquatic Plant Resources and its Management

II. Course Code : AEM 609

III. Credit Hours : 1+1

IV. Aim of the course

- To broaden the knowledge base of the students about aquatic plant resources and their significance.
- To improve the capacity of the students for better management of ecosystem.

V. Theory

Unit I

Aquatic plant resources- Definition and concept; Species diversity of aquatic plants in diverse habitats, Bio-prospecting- definition and concept, Bio-prospecting of aquatic plants.

Unit II

Economic importance of aquatic plants in fisheries and aquaculture, Environmental factors affecting aquatic plant resources, Role of aquatic plants as bio-filter in decontamination and Management of wastewater.

Unit III

Management of aquatic plant resources, Methods for increasing productivity of water bodies through thermal energy and Artificial upwelling, Artificial sea ranching, Plants as FAD's.

Unit IV

Utilization of aquatic plants for environmental management, Algae and angiosperms as bio-indicators, Global warming mitigation through algal biomass and biofuel production; Cultivation of economically important aquatic vegetation *viz.* Trapa and makhana.

VI. Practical

- Documentation of economically important plants from freshwater and marine habitats.
- Techniques for algal cultivation and maintenance of pure cultures, Spirulina and Chlorella cultivation – indoor and outdoor.
- Extraction and analysis of pigments from algae (Carotenoids and Phycocyanin)
- Heavy metal and dye removal by algae and macrophytes.

I. Course Title : Application of Remote Sensing and GIS in Aquatic Environmental Studies

II. Course Code : AEM 610

III. Credit Hours : 1+1

IV. Aim of the course

- To impart knowledge and skill on application of Remote sensing and GIS in Oceanographic studies and aquatic environment management planning.
- To impart knowledge on use of modern RS tools in ecosystem management.

V. Theory

Unit I

General consideration, Survey planning, Position fixing; Sampling frequency and duration, Data storage and transmission, Sensors for temperature and salinity (*via* conductivity); Measurement of depth (via pressure); CTD units for estuarine and open ocean work; Sensor calibration techniques; Sensors for measuring flow; Tracking of drogue buoys, Acoustic Doppler current measurements.

Unit II

In situ determination of pigment concentration; Remote sensing optical methods; Satellite measurements of temperature (*via* thermal IR), Interpretation of Microwave (geotropic currents, waves, surface winds), Optical measurements; transmittance and subsurface reflectance.

Unit III

Geographical Information System (GIS): Definition, Concepts, Spatial data management, Database management system, Data Capture, Digitization, Data integration, Projection and Registration, Data Structure, Data Modeling, Visual Image Interpretation; Applications of GIS in Aquatic Environment Management; Digital Image Processing (DIP), Different Methods and Approaches.

Unit IV

Recent advances in RS technologies and its applications in different studies, use of Artificial Intelligence, etc.

VI. Practical

- Position fixing techniques
- Various types of current meters and measurement of currents
- Wave recorders and measurements
- Determination of pigment concentrations
- Remote sensors – interpretation of data

- Practical on visual interpretation of data from map
- Digital Image Processing (DIP)
- Field practical on the Application of GPS
- Mapping of aquatic environment resources through GIS softwares (ARCVIEW, MAPINFO etc.)

VII. Suggested Reading

Suggested Broad Areas for Master's and Doctoral Research

- Prospecting algae as source of biofuel
- Isolation and characterization of microbes
- Interactive effect of warming and eutrophication on microbial CH_4 and N_2O conversions
- Utilization of agricultural waste in aquaculture as nutrient input
- Interventions for productivity enhancement in aquatic ecosystems
- Utilization of wastewater for mass cultivation of algae
- Bioactive compounds from aquatic organisms
- Ecotoxicity studies of industrial pollutants
- Role of aquatic macrophytes in biological treatment of wastewater
- Genetic improvement of microbes for pollution management
- Soil – water – nutrient interaction
- Nutrients in fish productivity
- Pollutant cycling in aquatic environment
- Coastal pollution assessment
- Conservation of ecologically important species
- Impact of coastal zone regulations and policies on coastal zone
- Resource assessment through remote sensing and GIS
- Bioaccumulation of toxicant
- Effects of toxicant on aquatic biota
- Development of methods for efficient and rapid analysis
- Comparison of different analytical techniques
- Documentation of plankton in diverse aquatic habitats
- Diversity analysis and algal indices of pollution load
- Evaluation of plankton for fish food
- Marine pollution and fisheries production
- Seasonality of fish catch and meteorological factors
- Application of GPS and remote sensing in marine fisheries
- Microbial pollution indicators
- Biomonitoring of aquatic environment
- Microbial indicators of pollution
- Use of microbes for improving soil fertility
- Factors affecting benthic population
- Abundance and distribution of benthic communities
- Benthic organisms as pollution indicators and biomonitors
- Measurement of tidal currents in estuaries
- Dynamics of estuarine circulation
- Measurement of rates of production from changes in phytoplankton biomass
- Application of remote sensing in studies on chlorophyll and other pigments
- Principles and practices of EIA
- Preparation of environmental audit
- Removal of nitrogen and phosphorus from wastewater
- Effect of selected toxicants on aquatic life and detoxification mechanism
- Toxicity assessment of pesticides and oil on selected organisms
- Applications of GIS in aquatic resource identification
- Application of remote sensing and GIS in oceanographic studies
- Computation of dispersion coefficients
- Analysis of estuarine dispersion
- Design of marine waste disposal systems
- Dynamics and restoration of degraded wetlands
- Removal of threats to the health and integrity of the restored ecosystem
- Environmental modeling

Fisheries Science
– Fish Genetics and Breeding

Preamble
(Fish Genetics and Breeding)

In India, there was tremendous growth in fish production post-independence era. In 1950–51, fish production in India was 0.752 million tonnes, which comprised 0.534 million tonnes and 0.218 million tonnes from marine and inland sectors, respectively. In 2018–19, the provisional fish production in India was 13.421 million tonnes, which comprised 3.712 million tonnes and 9.709 million tonnes from marine and inland sectors, respectively. India has achieved a 17-fold increase in fish production in just six decades (indiastat.com). Currently, the country aims for the Blue Revolution and is investing massively in the fisheries sector through PMMSSY Scheme. However, an essential part of increasing the future aquaculture production is to improve the biological productivity of farmed species of fish, shellfish (crustacean and mollusks), and seaweeds.

Animal genetics and breeding have played an essential role in increasing the production efficiency of animals in a cumulative way. Similarly, the applications of the principles of animal genetics and breeding in aquaculture species, viz., salmon, tilapia, rohu, vannamei, and other species have helped improve the overall performance of these species. An increase in the global demand for food of animal origin is expected. Aquaculture production, however, faces many challenges, including the impact of climate change on fish and agricultural production systems and the impact of aquaculture on the environment and climate. There are further challenges concerned with the increasing scarcity of natural resources and feed, or concerns about animal welfare, anti-microbial resistance, and genetic diversity. The role of genetics is immense in this regard. Genetic technologies can be utilized in aquaculture for a variety of reasons. The primary use is to improve production, develop disease resistance, alter body shape, color, and conserve natural resources.

Investments in well planned and managed breeding programs are unique because genetic gains obtained in such programs are eternal and cumulative. They are never 'used up' and never 'wear out.' Genetic improvement programs can be used to provide short-term or long-term gains. Linking the use of genetic technologies in fishing and aquaculture will increase the efficiency and efficacy of the technologies. However, it should be noted that many of these technologies require specialized equipment and highly skilled staff. In this background, it is essential to develop well trained human resources to apply principles of genetics and breeding in boosting aquaculture production. The postgraduate and doctoral courses offered in Fish Genetics and Breeding are meticulously designed and meet the international standards. The students passing these courses will be well trained human resources for hatcheries, national and international breeding companies, data analysts, scientists, breeders, and entrepreneurs. They shall play a significant role and bring a paradigm shift in aquaculture production based on genetically improved stocks.

The salient features of revised syllabi indicating major changes made including new courses/topics/aspects added

Revising the syllabus is an exercise towards developing a human resource to meet society's demand for the 21st century. Determining what these needs are, how to address them, and how to revise the established curriculum is a challenging job. In the present exercise, the syllabus of the Masters' and Doctoral program of Fish Genetics and Breeding program was revised to meet the challenges of the sector and bring it to an international standard. To change and develop a new syllabus, the approved syllabus of the ICAR-Central Institute of Fisheries Education, Mumbai was taken as the base. Further, this syllabus was compared with the courses offered at Six European universities and with the ICAR approved Animal Genetics and Breeding syllabus. Discussion with the FGB Master's and Doctoral scholars was held, and also the feedback was obtained from the former Students. The revised syllabus was sent to Faculty, Scientist, s and present and past students, Fish, Plant, and Animal Geneticists in India and abroad. We received the suggestions/comments from 13 eminent geneticists.

Based on the suggestions and comments, the following exercise was carried.

- One New Course Microbial Genetics FGB511 (1+1) was added to MFSc Syllabus. Microbial genetics is the fundamental requirement in the biotechnology and fermentation industry. Moreover, this course is an independent course, and students from various disciplines like biotechnology, aquatic animal health, post-harvest technology, fish physiology, and biochemistry course can opt for this.
- The nanotechnology course was dropped as it was found not directly related to the Fish Genetics and Breeding program but was more appropriate to be taught to the Biotechnology students.
- In the recent past, the Cytogenetic has moved from the traditional banding and karyotyping to the molecular aspects. Hence, there is a need to add new developments in molecular elements into the existing syllabus of the cytogenetic course. It was also essential to avoid duplicity in the earlier courses of cytogenetic ad molecular genetic. Hence, by merging the relevant syllabus from both these courses, a new course, Molecular and Cytogenetic, with 2+1 credit was formed. The course also includes recent developments in both cyto and molecular genetics. This further helps the students more opportunity to choose the courses and also reduce the burden of the exams.
- The shellfish and ornamental fish culture are gaining more popularity and are contributing to aquaculture production. The selective breeding of these species is in progress in many countries. However, it is not so in India. To meet the demand of the industry, and develop new strains, attention to developing the breeding programs of these species is essential. They need to be studied separately as their breeding, and the inheritance of economic traits is different. To meet the above-mentioned requirements, the course Fish breeding Plan was modified, and from 1+1 credit, it was made into 2+1 course by incorporating the breeding plans for shellfish and ornamental fish.
- Major changes were made to course, FGB 505, FGB 507, and FGB 509. Conservation of aquatic biodiversity is essential. Similarly, the preservation of genetic variation in the hatchery population is equally important. The changes made to the syllabus of Conservation Of Fish Genetic Resources FGB 505 will help students gain in-depth knowledge about genetic resource conservation. The advent of genotyping of the individuals has opened up new tools for genetic selection. The use of molecular markers in genetic selection is the latest trend, and to impart this knowledge, the course on Molecular breeding was revised by adding topics related to QTL and MAS, molecular pedigree assigning GWAS.
- A new course, Fish Genome and Genomic Selection (2+1), was added to the Ph.D.

syllabus. This course is in tune with the developments in whole genome sequencing and incorporating the related technologies into genetic selection programs.

- Based on the feedback from the students and others and a detailed comparative study, it was observed that the syllabus of Genetics in commercial aquaculture, Advances in Cytogenetic, and Transgenic production and GMOs is not much different from the similar courses offered in the Masters' program. Further, their use in the field is minimal hence, these courses were dropped. However, the care was taken to add the relevant topics from these courses to the syllabus of other proposed courses.
- Courses merged: The courses 'Linear models (1+1) and Experimental designs in fish genetics (1+1)' were merged in to 'Linear models and experimental designs in fish genetics' (1+2).
- Significant changes were made to courses, FGB 601 and FGB 602, by adding the new developments in fish genetic selection and breeding, emphasizing case studies, and solving the industry problems.
- The advisory committee should decide the minor courses and optional courses considering the students' research topics.

Course Title with Credit Load
M.F.Sc. in Fish Genetics and Breeding

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FGB 501*	Principles of Genetics and Breeding*	2+1
FGB 502*	Population and Quantitative Genetics*	2+2
FGB 503*	Principles of Selection and Selection Methods*	2+1
FGB 504*	Fish Breeding Plans*	2+1
FGB 505	Conservation of Fish Genetic Resources	2+1
FGB 506	Bioinformatics and Computer Applications in Fish Genetics	0+2
FGB 507	Molecular and Cytogenetics@	2+1
FGB 508	Cell and Tissue Culture#@	1+1
FGB 509	Molecular Breeding	1+1
FGB 510	Microbial Genetics#@	2+0
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
FBT 501	Fundamentals of Molecular Biology	2+1
AQC 504	Aquaculture Policy and Planning	1+1
AQC 512	Commercial Ornamental Fish Breeding and Culture	1+1
FBT 509	Molecular Markers	2+1
FGB 510	Microbial Genetics#@	2+0
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
FBT 501	Fundamentals of Molecular Biology	2+1
AQC 504	Aquaculture Policy and Planning	1+1
AQC 512	Commercial Ornamental Fish Breeding and Culture	1+1
FBT 509	Molecular Markers	2+1
	Supporting Courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	

Course Code	Course Title	Credit Hours

	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**
	Masters' Seminar	**1 Credit**
FGB 591	Master's Seminar	0+1
	Masters' Thesis Research	**30 Credits**
FGB 599	Master's Research (Semester III)	0+15
FGB 599	Master's Research (Semester IV)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

*Major compulsory courses

Course Contents
M.F.Sc. in Fish Genetics and Breeding

I. Course Title : Principles of Genetics and Breeding
II. Course Code : FGB 501
III. Credit Hours : 2+1

IV. Aim of the course

To understand the basic principles of genetics and breeding and their application to fisheries management and aquaculture

V. Theory

Unit I

Historical development of genetics and breeding; Aim and scope of genetics and breeding; Domestication; Society and Genetics-Ethical issues; Basic statistical parameters-Probability concepts; Mean, Variance, Coefficient of variation, Correlation, Regression and Analysis of Variance.

Unit II

Cell structure, cell division and physical basis of heredity; Mendel's Principles: Scope, Limitation; Modifications to Mendel's ratios: Multiple alleles, Epistasis; Chromosomal theory of inheritance; Genetic variation: Causes and measurement; Linkage and crossing over, Recombination, Interference, Linkage disequilibrium.

Unit III

Modern concept of gene; DNA as genetic material, Replication of DNA; Genetic code and protein synthesis, Transfer and regulation of genetic information; Introduction to bioinformatics in fish genetics and breeding; Fish Genome: Zebrafish genome, Fish as genetic model.

Unit IV

Cytogenetics; Cytogenetics and evolution; Karyotyping and chromosome banding; Genetic basis of sex determination; Sex-linked, Sex-limited, and Sex-influenced traits, Y-linked inheritance; Chromosome manipulation: Ploidy induction, Sex reversal, Gynogenesis and Androgenesis; Chromosomal aberrations; Mutations-Natural and Induced, Mutagens.

Unit V

Basic concepts of Population Genetics: Individual vs population; Gene and Genotype frequency; Hardy-Weinberg Principles and factors affecting them; Mutation; Fate of mutant allele in the population; Genetic drift; Concept of inbreeding and its management; Application of population genetics in fish resource conservation, preservation of gametes.

Unit VI

Basic Concepts of Quantitative Genetics; Polygenic inheritance; Basis of genetic selection; Qualitative vs Quantitative traits; Pleiotropy; Penetrance; Natural Vs

Artificial Selection, Aim of genetic selection and breeding, Present status of selective breeding in aquaculture; Economic traits of fishPedigree and its importance in fish breeding; Methods and aid to genetic selectionApplication of selection for performance improvement Cross breeding and Hybridization.

VI. Practical

- Probability in genetics
- Exercises on Mendel's principles, Multiple alleles, Epistasis, Linkage and crossing over
- Exercises on Hardy-Weinberg principles Estimation of gene and genotype frequencies
- Karyotyping; Nucleic Acid isolation
- Quantification of Inbreeding; Estimation of kinship coefficient
- Record keeping in fish breeding
- Estimation of genetic parameters

I. Course Title : Population and Quantitative Genetics

II. Course Code : FGB 502

III. Credit Hours : 2+2

IV. Aim of the course

Understanding the concepts of genetic structure of the population and inheritance of quantitative traits

V. Theory

Unit I

Historical developments; Review of basic concepts of genetics and statistics; Scope and applications Biometrical techniques: Introduction to matrix algebra, Determinants, ANOVA, Regression and Correlations Basic concepts of General Linear Mixed Models (GLMM)

Unit II

Definition of population, Individual vs. population, quantitative vs. qualitative characters Genetic structure of random mating populations. Polygenic inheritance: Limitation of single gene model; Polygenes and major genes; Polygenic model-importance and limitations; Polygenic segregation and linkage

Unit III

Hardy -Weinberg principles; Test, application and properties of equilibrium populations –Systematic and dispersive forces changing gene and genotype frequencies, Concept of Mutation, Balance between mutation and selection Genetic bottleneck; Genetic drift, Drift equilibrium, Effect on population structure –Intensity of selection, Fisher's theorem of natural selection; Wahlund effect

Unit IV

Coefficient of genetic differentiation – F_{ST}, R_{ST}, Q_{ST}, G_{ST} - their relative merits and demerits, Genetic similarity, distance and population divergence, Null alleles – Path coefficient; theory, analysis and applications –Basis of relationships; Independent and correlated causes –Idealized population and its properties, Effective population size. Concept of inbreeding- Calculating coefficient of kinship, Relationship, Inbreeding and Population size; Types and Methods of estimation and consequences-Change of mean and variance –Mechanisms of evolution and speciation; Delineation of species and/or stocks.

Unit V

Quantitative variation: Gene effects; Mode of inheritance and continuous variation; Population mean; Components of phenotypic value, Genotypic value, Average effect of gene and Gene substitution Estimation, tools for population genetic parameters – Variance component estimation with complex pedigree –Genetic parameters; heritability- Concept of heritability, Effective heritability, Different methods of estimation, Variance of heritability, Properties and applications of heritability; Repeatability, Maternal effects; Correlation between traits- Composition of genetic and Phenotypic covariance genetic, Phenotypic and Environment correlations and their standard errors, Concept of co-heritability

Unit VI

Breeding value: Biometrical relationship among relatives; Estimating fixed factors and Predicting random effects-BLUE and BLUP; Models for EBV –Selection: Aids and methods; genetic gain and correlated response; Recurrent and reciprocal recurrent selection Heterosis; Theories and estimation, Combining ability-GCA, SCA; Utilization of non-additive genetic variance –Genomics and Phenomics

VI. Practical

- Exercise on various statistical procedures and matrix algebra- Components of Variance, Covariance, Correlation and Regression, ANOVA in genetic parameter estimation
- Estimation of gene and genotype frequencies and factors affecting them, Equilibrium in sex linked genes
- Genetic stock structure analysis with dominant and co-dominant markers- Type I and Type II markers; Pedigree construction through Molecular marker information
- Path coefficient
- Estimation of effective population size, Rate of inbreeding, in breeding co-efficient,
- Estimation of Heritability and Repeatability and their accuracies;
- Building of pedigree files and construction of relationship matrix and its inverse;
- Estimation of breeding values-EBV, BLUE and BLUP
- Genetic gain

VII. Suggested Reading

- https://www.jmp.com/en_us/academic/jmpg-course-materials.html

I. Course Title : Principles of Selection and Selection Methods

II. Course Code : FGB 503

III. Credit Hours : 2+1

IV. Aim of the course

To learn the application of genetic tools for genetic improvement of aquatic species

V. Theory

Unit I

Genetic Selection and Breeding: Scope, Application, Role of genetics in fish selection and breeding National and International scenario of selective breeding programmes in aquaculture.

Unit II

Selection: Basis of selectionIntroduction to variance components –Estimation of selection differential, intensity of selection, response to selection –Identification of animals with high genetic merit –Estimation of breeding values- variance and accuracy of predicted breeding value; Various sources of information- Individual, information from relatives; Least squares and BLUP methods; Accuracy of selection

Unit III

Combined selection: Combined selection –Selection index-selection Objective and criterion, selection criterion coefficients –Methods of selection –Realized heritability, Repeatability, Genetic, Phenotypic and Environmental correlations.

Unit IV

Factors affecting rate of genetic improvement –Short term response to selection-Variance in response-Bidirectional selection, Selection limits Renewed selection gain –Threshold characters- Heritability of threshold traits, genetic correlation among threshold traits, selection for threshold traits –Scale effects

Unit V

Formulation of breeding plans: Stock improvement plans for different population sizes and environments, Control population and experimental design –Development of new strains/synthetic population; Crossbreeding and hybridization. Domestication and inadvertent selection –Selection and mating designs for select traits: Mating systems and genetic consequences; Small stock and inbreeding effects, Inbreeding Depression; causes and methods to overcome; Out breeding; Crossbreeding, Utilization of heterotic effects, Selection and mating designs for growth, Disease resistance, color enhancement, Genotype×Environment interaction and its role in fish/shellfish breeding.

Unit VI

Major genes and QTLs- Major and minor genes, Tests for detecting major genes, Application of markers in selection programmes, Status and their relevance; QTL and its application in selection, Marker Assisted Selection in Fisheries; Genomic selection.

VI. Practical

- Estimation of genetic parameters: heritability, repeatability and genetic correlation; Estimation of phenotypic and environmental correlations Estimation of Breeding Values from various sources of information and their accuracies
- Construction of selection indices
- Designing and conducting challenge test for disease resistance
- Selection: basis of selection, genetic gain
- Response to selection and factors affecting response
- Aids to selection; Methods of selection
- QTL and MAS

- *Journal of Fish Biology*
- *The Journal of heredity*

I. Course Title : Fish Breeding Plans

II. Course Code : FGB 504

III. Credit Hours : 2+1

IV. Aim of the course

To learn the applications of genetic techniques for stock improvement

V. Theory

Unit I

Historical development of fish breeding and domestication, Current status of aquaculture in world and India Maintaining pedigree, Physical and molecular tagging and maintaining breeding records

Unit II

Economic traits in cultured species-Performance- Growth, Disease resistance, productive and reproductive traits, Recapture frequency, Behavior, Quality traits and their inheritance, Recording economic traits, Study of growth curves and their components, Influence of non-genetic factors on economic traits

Unit III

Formation of base population, Designing mating plans, Effect of breeding programme on genetic diversity of farmed animals, Present status of breeding, Cross breeding in aquaculture; Broodstock management –Inbreeding depression and heterosisin various economic characters –Role of Breeders' associations in national breeding programmes Fish breeding guidelines, Policies, Programs and economic analyses of breeding programmes, Their present status in India and World, Prospectus and challenges.

Unit IV

Reproductive cycle, Factors affecting sexual maturation, Adapatability and reproduction, Age at maturity, Gonadal development stages in fin/shellfish and levels of hormonal intervention; Sex determination, Cryopreservation of gametes, Live feed development for larvae, Larval feeding and maintenance, Packaging and transport of fish; Nursery systems and their operation; Biosecurity.

Unit V

Application of recent technologies in stock improvement –Biosafety issues involved with genetically modified organisms, Release and registration of new varieties, Quality seed; Classes, production practices and maintenance of pure seed, Seed purity standards; Seed quality and fish seed certification.

Unit VI

Shellfish breeding: Reproductive cycle of the shellfish; controlled mating of the shellfish; Economic traits and their recording. Ornamental fish breeding: Introduction to ornamentation and their inheritance Selection and mating systems, Inbred strains, transgenic strains, Production of gene knock-out fish, Genetic control and monitoring, Record keeping and ethics.

VI. Practical

- Tagging methods
- Construction of growth curves

- Record keeping of stock; Standardization of the performance records for genetic parameters estimations
- Breeding plan and design of breeding programme from successful case studies
- Morphometric analysis- Truss analysis
- Practical on synchronization of spawning, Closed lifecycle and controlled mating- Hormone induced ovulation; Collection of fish gametes, Assessing gamete quality
- Cryopreservation

I. Course Title : Conservation of Fish Genetic Resources

II. Course Code : FGB 505

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on application of genetic principles in conservation and management of aquatic resources.

V. Theory

Unit I

Fish genetic resources; Sample survey and distribution, Threatened aquatic species of India and world, Assessing threats to species and populations, Conflicts between nature conservation and other goals of the society.

Unit II

Evolutionary Genetics- Genetic diversity, Importance, Influencing factors, Characterizing Genetic diversity, Evolution in large and small population, Maintenance of genetic diversity, Conservation and preservation of aquatic species;

Effect of population size, Loss of genetic diversity in small population, Inbreeding, Population fragmentation, Issues and strategies, Risk status/population viability analysis and classification, Breeding strategies of threatened species for restocking and live gene bank.

Unit III

Importance of mutation, Migration and their interaction with selection in conservation Application of molecular genetic tools for management of small population for conservation.

Unit IV

Gene bank: Concepts, Objectives, Resources, Uses Institutes and Societies associated with conservation, Impact of inbreeding on genetic diversity and conservation; Evolutionary potential and heritability; Genetics and management of wild and captive populations, Introduction, domestication and acclimatization, Genetic management for reintroduction; *In situ* and *ex-situ* conservation; Gene pool concept - Primary, Secondary and Tertiary gene pool, and Gene introgression, Cryopreservation of sperm, Eggs and embryos.

Unit V

Effective population size and population structure; Factors threatening indigenous species; IPR issues of genetic resources; Regulations regarding introduction of exotic germplasm; Export import rules and regulations on conservation of aquatic genetic resources; Fish quarantine – status, procedures, scope and significance – Convention on Biodiversity and National Biodiversity Authority of India

Unit VI

Taxonomy and related issues, DNA barcoding, Characterization and identification of stock; Identification of farm escapees, Interaction between farmed and wild population Application of nanobiosensor for tracking of fish –Genomics in Conservation: Effect of climatic change on biodiversity.

VI. Practical

- Tagging methods for population
- Estimation of gene and genotypic frequencies
- Estimation of genetic diversity and relatedness using morphometric and molecular information
- Application of molecular genetic markers for estimation of effective population size, rate of inbreeding and genetic bottleneck Analysis of genetic variance in population
- Morphometric analysis of stocks Visit to Gene Bank/National/Regional Research Centres
- Studies on Domestic and international quarantine process; its weaknesses and measures for its strengthening
- Case studies on rescue and release of animals

I. Course Title : Bioinformatics and Computer Applications in Fish Genetics

II. Course Code : FGB 506

III. Credit Hours : 0+2

IV. Aim of the course

To learn the application of information technology and software packages for the Fish Genetics and Breeding studies

V. Practical

Unit I

File Transfer Protocols; Work stations Application of spreadsheets in maintaining fish breeding records and breeding data management –Fish breeding data bases – Data input, Import, export, Modification; Data cleaning, manipulation and transformations; Data normalization, Graphical analysis and representation of breeding data.

Unit II

Introduction to basic matrix algebra, Definition, Addition, Multiplication, Determinants, Inverse of matrix.

Unit III

Usage of various computer packages for genetic analyses: SAS, R, AsReml and others, Analysis of variance, Variance component estimations, Estimation of genetic parameters; Inbreeding estimation.

Unit IV

Software for molecular genetics data analysis (SAS Genetics, SAS Genomics, R), Estimation of population parameters, Estimation of 'F' Statistics.

Unit V

Introduction to Bioinformatics and various operating systems employed, Exposure to various open source online bioinformatics tools and applications, Use of Perl and R-Bio conductor packages, Introduction to Bioinformatics databases, Information retrieval from various sequence and structure databases and mock sequence submission, Database searching, Sequence formats and alignments; BLAST, Conversion and handling of various sequence formats, Usage of online sequence alignment tools.

Unit VI

Sequence analysis; Annotation, Sequence conversion and translation, Sequence comparison, Phylogenetic analysis, Protein structure analysis and its analysis; analysis of amino acids sequence, NGS data formats and data cleaning, Use of bioinformatics tools for identifying QTL and selection of elite germplasm.

I. Course Title : Molecular And Cytogenetics

II. Course Code : FGB 507

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on different tools of molecular and cytogenetic

V. Theory

Unit I

Introduction, Historical background, Importance, Chromosome theory of inheritance; Chromosomal models and their ultra-structure, Chromosomal movements and position effect –Cytogenetic and evolution.

Unit II

DNA and RNA as genetic material; Chemistry and structure of DNA, Fine structure of gene, Split genes, Pseudogenes, Overlapping genes and Multigene families, Mechanisms of DNA replication, Extra Chromosomal Inheritance / Cytoplasmic Inheritance; Mitochondrial DNA.

Unit III

Biochemical markers: Allozyme polymorphism and its application in estimating population genetic parameters, Genetic basis of immunity.

Unit IV

Molecular markers; RAPD, RFLP, AFLP, EST, SNP, Minisatellites and Microsatellites and application in population genetic analysis and gene mapping, FISH–principle and application, Maternally and paternally inherited genetic markers, Molecular pedigree, Major genes, Poly genes and QTLS, Application of molecular markers in genetic selection, QTL and MAS, Association studies, Genomic selection.

Unit V

Genetics of Sex determination and differentiation; Genotypic sex determination (GSD); Environmental Sex determination (ESD); Sex manipulation, Production of monosex population, Sex chromatin and Lyon's hypothesis; Chromosome numbers in fish and karyotyping, Chromosome banding techniques Molecular Cytogenetics; Fluroscence *In Situ* Hybridisation (FISH) –Application of nanotechnology in chromosome and genome mapping, Mitochondria and Y chromosome.

Unit VI

Genotoxicity and mutagenicity –Chromosomal aberrations; Single cell gel electrophoresis, MNT, SCE; Genetic and evolutionary implications.

VI. Practical

- Biochemical markers and Molecular markers
- DNA sequence polymorphism and related software for alignment and analysis
- Genomic DNA isolation from prokaryotes and eukaryotes
- Interpretation of gels and data analysis using various software
- Isolation of RNA and RT-PCR, Agarose gel electrophoresis of DNA and RNAPCR, primer designing, PCR-RFLP, extraction of DNA from agarose gels
- Preparation of chromosome spreads; Karyotyping; Banding techniques; MNT, SCE, Comet Assay.

I. Course Title : Cell and Tissue Culture

II. Course Code : FGB 508

III. Credit Hours : 1+1

IV. Aim of the course

To impart knowledge on cell and tissue culture techniques and their application in gene banking, genetic characterization and health management.

V. Theory

Unit I

Introduction: Structure and Organization of animal cell; Equipment and materials for animal cell culture technology, Cell lines and media; Primary and established cell line cultures; Media supplements, their metabolic functions; serum and protein free defined media and their application.

Unit II

Cell culture: Basic techniques of cell culture *in vitro*; Development of primary cultures, Cell separation, Maintenance of cell lines; Biology of cultured cells, Transformation and differentiation of cell cultures, Characterization of cell lines; Measurement of viability and cytotoxicity assays; Measuring parameters of growth; Karyotyping, Isozyme assays, Cryopreservation, Assessment of contaminants.

Unit III

Cell cloning: Micromanipulation, cell transformation, application of fish cell culture, 3D cell culture, Scaling-up of cell culture, Cell hybridization; Somatic cell fusion, hybridoma technology, Production and Application of monoclonal antibodies.

Unit IV

Stem cell culture and its application, Bio-products from cell culture, Cryopreservation of embryos and cells.

VI. Practical

- Principles of sterile techniques and cell propagation
- Preparation of different cell culture media
- Primary cell culture techniques; Establishing cell lines: isolation, characterization identification of cell lines
- Pure culture techniques; Maintenance and preservation of cell lines
- Propagation of cells in suspension cultures
- Hybridoma technology: strategy and techniques
- Production of monoclonal antibodies
- Cryopreservation of cell lines

I. Course Title : Molecular Breeding

II. Course Code : FGB 509

III. Credit Hours : 1+1

IV. Aim of the course

To apply basic concepts of molecular genetics in fish breeding

V. Theory

Unit I

Introduction to Molecular Breeding; Molecular mechanism of genetic recombination, Molecular taxonomy and its application in Fisheries; Phylogenetics and its application –Genetics of Sex determination; Genotypic sex determination (GSD); Environmental Sex determination (ESD); Sex manipulation, production of monosex population.

Unit II

Single genes in fish breeding; Mapping and Identifying single genes; Types of DNA sequence responsible for alterations to create single gene effect –QTL and MAS identification; Marker assisted selection with markers in linkage disequilibrium with QTL –Molecular pedigree Assigning.

Unit III

Major genes, Poly genes and QTLS, Tests for detecting major genes, Complex segregation analysis, Genetic maps and candidate genes, Genome-wide association studies (GWAS) in pedigreed population, Methods and tools for GWAS.

Unit IV

Introduction to genomic selection; Methodologies for genomic selection; Estimation of Genomic breeding value, Factors affecting the accuracy of genomic selection, Genomic selection with low marker density; Genomic selection across populations and strains, Re-estimation of the chromosome segments, Designing breeding programs with genomic information.

VI. Practical

- LD Analysis
- Molecular pedigree construction
- Power of association studies; Building the IDB matrix from linkage disequilibrium information; marker assisted selection with linkage disequilibrium
- Genomic Relationships and GBLUP
- Realized Genomic Relationships; Calculation of G Matrices; Genomic BLUP; Genomic selection using BLUP; Genomic selection using a Bayesian approach; Bayesian Approach using a prior for chromosome segment variances with a large weight at zero (Bayesian)

I. Course Title : Microbial Genetics

II. Course Code : FGB 510

III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge of genetics applicable to microbes

V. Theory

Unit I

Basic of microbial existence: Why study the prokaryotic genetics History of Microbiology –Bacterial genetics, Conjugation, Sex factors; High frequency recombination; Transduction (generalized and specialized), Bacterial transformation; Mutation types, Repair mechanism, Selection of mutants, Genetics of Bacteriophage-Bacteriophage classification, Types, PhageT4-Structure, Gene expression and genome organization, Lamda phage replication, Lytic and lysogeneic cycles, Mechanisms of repressor synthesis and its control, Auto regulation, One step growth curve; Importance of bacteriophages, Coalescent of bacterial population, Population reproduction models, Time and effective population size, Demography – Recombination and gene conversion.

Unit II

Linkage, Selection and the clonal complex- Recombination, Linkage and substructure, Neutrality versus Selection, Clustering Techniques; Sequence based population structure analysis.

Unit III

Population Genetics-Natural Selection, Methods for detecting presence of natural selection, Measure of genetic diversity, The concept of Effective population size, Population sub division, Population Genomics, Population structure and genetic evolution, Similarities and differences, Bacterial Population genomics, MLVA and SNP for analysis in population genetic study, Phylogenetic resolution, Phylogeographic resolution.

Unit IV

Gene Maps, Tools and protocols World Wide Web Databases, Genetically modified organisms (GMOs) Technological advances Controls and cautions.

Unit V

Transposable Elements: IS elements, Tn3 family and medical significance, The Genetic and evolutionary significance of transposable elements; Use in genetic analysis and evolutionary issues.

Unit VI

Microbial strain improvement techniques; Identification of ideal microorganisms for bioprocess, Microbial strain improvement, Genetic engineering and evolutionary engineering, Bioprocess optimization and applications in industry, Agriculture and health.

Course Contents
Ph.D. in Fish Genetics and Breeding

I. Course Title : Design of Breeding Programs

II. Course Code : FGB 601

III. Credit Hours : 2+1

IV. Aim of the course

To learn the recent advances and development of breeding plans

V. Theory

Unit I

Genetics in Broodstock management of commercially important fish and shellfish, Assembling base population, Choosing selection objectives and criterion, Pedigree identification, Physical and molecular tagging; Maintaining breeding records.

Unit II

Genetic parameters, Heritability, Repeatability, Genetic, Phenotypic and Environmental correlations Factors influencing genetic progress, Comparison of Selection Systems, Criteria and procedure for comparison, Long term program, Short term program, Single population program; Open Nucleus Breeding System (ONBS), Case study of national and international genetic improvement programs viz., Jayanti Rohu, *Clarias magur*, GIFT Tilapia, Norwegian Salmon, Pacific White Shrimp *L.vannamei* and others.

Unit III

Important reproductive tools for implementation of breeding plan; Captive maturation, Synchronization of spawning Cryopreservation of gametes Application of Hybridization, Ploidy manipulation, Monosex culture, Genetic engineering, Transgenesis for commercial purpose.

Unit IV

Designing mating plans Inbreeding, Types of inbreeding, Genetic and Phenotypic effect of Inbreeding; Consequences of inbreeding and management of genetic variation in fish breeding program Genetic selection and its impact on natural stock Outbreeding, Forms of outbreeding, Effects of Outbreeding, Breeding plans to exploit additive and non-additive genetic variation, Maternal influence and its estimation, Genetic mechanisms in adaptation, measurement and adaptability indices, G x E interaction.

Unit V

Breeding plans for shellfish improvement, Controlled mating in shellfish Developing new ornamental strains of fishes: Inheritance of ornamentation traits; Sex linked inheritance of ornamentation; Recording ornamentation traits; Molecular genetics of body pigmentation.

Unit VI

Genetics of developing SPR strain; Immune system in fish and shell fish and genetics of immune system Genetics of disease susceptibility; application of genetic tools to predict disease susceptibility; Developing plans for genetic selection of threshold traits Fish genetics and welfare; A continued need for genetic selection scientific, regulatory and public acceptance issues Ethical, moral and fish welfare issues Ownership of genetically improved strain through public sector funding.

VI. Practical

- Developing Growth curves and their components
- Estimation of Genetic Parameters; Selection and genetic gains
- Path coefficient and calculation of inbreeding coefficient and relationship
- Designing breeding programs for threshold traits, Estimation of heritability of threshold traits
- Preservation of gametes; Synchronization of spawning
- Developing the protocols for evaluating the various genetic improvement programs and their impacts
- Survey on impact of the program on farmers and consumers
- Impact of climate change on fish germplasm
- The focus will be on critical review of contemporary applied breeding programs and journal articles - students are also expected to prepare a term paper for submission at the end of the semester

I. Course Title : Genetic Selection Of Complex Traits

II. Course Code : FGB 602

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on the efficiency of different selection methods

V. Theory

Unit I

Introduction: Past and present status of fish breeding, Complex traits and their inheritance, Recording complex traits.

Unit II

Strain comparison, Factors affecting the rate of genetic improvement, Performance testing; Estimation of genetic gain under different selection program.

Unit III

Influence of non-genetic factors on growth, Factors influencing production and reproductive traits, Correction and standardization of animal breeding data, Simultaneous prediction of breeding values for several traits, Recurrent and Reciprocal Recurrent Selection –Crossbreeding and hybridization.

Unit IV

QTL and MAS; Breeding values for binary traits, Threshold characters and their selection procedure, Selection and breeding for disease resistance and survival analysis –Diallel analysis; Selection for single trait and multiple traits.

Unit V

Organizing breeding programs, Structure of breeding programs, Breeding for optimum production, Economic value of each animal, Cost of broodstock production, Organizing field trial –Farmers cooperatives, breeding companies, National or local breeding programs

Unit VI

Dissemination procedures and issues, Breeding nucleus, Multiplier centers –Socio-economic impact, Technological adoption, Increased production –Economic Evaluation of Genetic Breeding Programs, Criteria for Economic Evaluation; Profit Horizon, Interest Rate, and Return on Investment, Environmental impact of improved varieties/strains.

VI. Practical

- Application of various computer software for genetic analyses: SAS, R, AsReml etc.
- Application of Mixed models for estimation of genetic parameters-Heritability, Correlations;
- Construction of selection index
- Diallele crossing
- Developing and evaluating the dissemination programs of genetically improved strain
- Estimation of breeding values EBV, BLUE, BLUP
- QTL parameter estimation; Analysis of QTL as random effect

I. Course Title : Fish Genome and Genomic Selection

II. Course Code : FGB 603

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on understanding genomes, application of genomic tools and strategies for enhancing production performances and conservation of fish genetic resources

V. Theory

Unit I

Organisation of genomes: Genome, Genomics, Transcriptomics, and Proteomics, Genome size estimation, Genome size in model organisms, C-value paradox, Genome diversity, Taxonomy and significance of genomes, Classification of genomics, Vertebrate genome evolution –Establishing phylogeny on the basis of genomics, Comparative genomics, Population genomics, Limitation and application of genomics, Structural genomics; Linkage maps and QTL, Haplotype structure of genome; Genetic, physical and transcription maps, Fluorescent *in situ* hybridisation, Radiation hybrid mapping, Sequence tagged site mapping, Restriction mapping.

Unit II

Functional genomics: NGS data analysis, Sequence assembly, Gene identification, Gene prediction rules, Gene annotation and pathway analysis genome databases and browsers, Gene ontology assignment, Mining of transcriptome data for protein coding genes, Differentially expressed genes, Short and long non coding RNA and their target genes –Next generation sequencing; Second and third generation sequencing platforms, NGS platforms such as Illumina, Roche 454, SOLiD, Ion torrent, PacBio, Oxford, Nanopore Technologies, Principles, Applications and Limitations.

Unit III

Genome projects: The human genome project, HapMap project, The 100 genome project, Encode project, Ethical, legal and social issues of human genome project, Fish genome projects: Fugu, Tetraodon, Elephant shark, Atlantic salmon, Zebra fish, Common carp, Rainbow trout, Channel catfish, Fishes in Genome 10 K project, Status of fish genomics research in India, IPR issues; Patent at one place and not in another, Access to fish genetic resources.

Unit IV

Genomic tools: Genome wide association studies, Custom microarray technologies, DNA microarray, SNP array, Subtractive hybridization, Comparative genomic hybridization.

Unit V

Application of markers in fish breeding, Genomic resources: ESTs, RFLPs, Microsatellite markers, SNPs, BAC library, Molecular pedigree assigning, Molecular, kinship estimation, Experimental designs to detect QTL, Generation of linkage disequilibrium –Limits to response via MAS; Implementing MAS in breeding programs.

Unit VI

Genomic Selection- Overview of Implementation and Benefits of Genomic Selection Genomic Best Linear Unbiased Prediction (GBLUP); Two Equivalent Mixed Models for GBLUP of Breeding Values; GBLUP for Individuals without Phenotypic Observations, Genomic Estimation of Variance Components; Genomic Estimation of Heritabilities; Genomic Relationship and Correlation.

VI. Practical

- Tools for NGS data analysis
- QTL Analysis, Hapalotype based QTL analysis
- Genomic approaches to selection for disease resistance
- Genomic tools: Genome wide association studies, custom microarray technologies, DNA microarray, SNP array, Subtractive hybridization comparative genomic hybridization
- Estimation of GBLUP; Genomic Estimation of Variance Components; Genomic Estimation of Heritabilities; Genomic Relationship and Correlation

I. Course Title : Linear Models and Experimental Designs in Fish Genetics

II. Course Code : FGB 604

III. Credit Hours : 1+2

IV. Aim of the course

To learn the application of different statistical models in breeding data.

V. Theory

Unit I

The Binomial, Poisson, Normal models; ANOVA, Multiple regression and correlation Testing of genetic hypothesis, Test of hypothesis, Hierarchical classification, Variance Components, Linear Mixed Models (LMMs) an overview, Clustered data, Repeated measures, Longitudinal data; Levels of Data; Types of factors and their related effects in LMM, Fixed effects, Random effects.

Unit II

Matrix operations: Determinants, Inverse of matrix, Linear equations, the matrix algebra of regression analysis.

Unit III

Specification of LMM: General specification for an individual observation General matrix specification-Covariance structure for the D and R matrix, Mixed models: Predicting Random effects, Best Linear Unbiased Predictors (BLUP), their application in estimation of genetic variance components and parameters, BLUP Under the Animal Model; BLUP with Repeated Records; Analysis of non-orthogonal and multivariate data.

Unit IV

Maximum likelihood (ML) estimation of variance-covariance components, Structure of Variance, Covariance Matrix as a Function of Partial Derivatives, ML Estimation of Variance, Covariance Components, Restricted maximum likelihood estimation (REML) of Variance-covariance components, General REML Equations; REML Using the CE and the MME methods of BLUP.

Unit V

ANOVA –Challenge Test-Designing the challenge tests, Data collection protocols

Unit VI

Model building and simulations; Simulation of phenotypes; Simulation of fish breeding in different conditions

VI. Practical

- Matrix operation, matrix inversion, matrix algebra of regression analysis
- Least Squares analysis in one way classification
- Use of various statistical packages for genetic parameter estimations: SAS, R, AsReml, PEST, SelAction
- One way classification with regression and covariance
- Two way classification with and without interactions
- Multiple and nested classification
- Predicting Random effects- Best Linear Unbiased Predictors (BLUP)
- Maximum likelihood estimation of genetic parameters, Analysis of non-orthogonal and multivariate data
- Genomic Best Linear Unbiased Prediction (GBLUP)
- Genomic Estimation of Variance Components
- Genomic Estimation of Heritability
- Survival analysis- commonly used survival functions, Kaplan-Meier estimate of survival function, Cox regression method, Hazard ratio and survival

Suggested Broad Areas for Master's and Doctoral Research

- Cryopreservation of gametes of species of commercial importance
- Estimation of gene and genotype frequencies using various population genetic tools (markers)
- Estimation of effective population size, inbreeding accumulation rate in a breeding population
- Genetic stock structure analysis; genetic variability studies of species o commercial importance
- Estimation of genetic parameters in species of commercial importance
- Developing breeding plans for different commercial fish and prawn species
- Estimation of genetic parameters in species of commercial importance
- Estimation of heterosis and Inbreeding depression in breeding population
- Construction of growth curves for different commercial fish and prawn species Developing breeding plans for different commercial fish and prawn species
- Cryopreservation of gametes of species of commercial importance
- Application of molecular genetic markers for estimation of effective population size, rate of inbreeding
- Estimation of genetic diversity and relatedness using molecular information
- Morphometric analysis of stocks

- Milt quality analysis and cryopreservation of milt
- Estimation of linkage disequilibrium using molecular genetic data
- Application of molecular genetic markers for estimation of effective population size, rate of inbreeding
- Estimation of genetic diversity and relatedness using molecular information
- QTL Analysis and application in selective breeding
- Estimation of linkage disequilibrium using molecular genetic data
- Application of molecular genetic markers for estimation of effective population
- size, rate of inbreeding
- Estimation of genetic diversity and relatedness using molecular information
- QTL Analysis and application in selective breeding
- Chromosome mapping for different commercial fish and prawn species
- Karyotyping and chromosome spread preparation for different commercial fish and prawn species
- Estimation of genetic parameters using various statistical packages like SAS, AsREML, PEST
- Molecular data analysis using softwares like GENEPOP
- Establishing cell lines
- Construction of growth curves for different commercial fish and prawn species
- Estimation of genetic and non-genetic parameters
- Developing breeding plans for different commercial fish and prawn species
- Cryopreservation of gametes of species of commercial importance
- Developing breeding plans for different commercial fish and prawn species
- Estimation of genetic parameters in species of commercial importance
- Estimation of genotype-environment Interaction
- Estimation of heterosis and Inbreeding depression in breeding population
- Socio-economic impact studies for genetically improved varieties
- Evaluation of International genetic improvement programmes
- Chromosome mapping for different commercial fish and prawn species
- Karyotyping and chromosome spread preparation for different commercial fish and prawn species
- Pedigree assigning using molecular data
- Estimation of genetic parameters using molecular data
- Estimation of genetic and non-genetic parameters using various statistical packageslike SAS, AsREML, PEST

Fisheries Science
– Fish Nutrition and Feed Technology

Preamble

(Fish Nutrition And Feed Technology)

Over the last decade, spectacular growth has taken place in aqua farming with deployment of formulated feeds. The bulk of high-value freshwater and marine carnivorous finfish/ shellfish is produced by intensive farming systems using high-cost nutrient inputs in the form of "nutritionally-complete formulated diets".

Thus, nutrition and feeding will continue to play an essential role in the sustained development of aquaculture which however, must take into account and ensure that the needs of competing users are met, and that environmental integrity is protected by formulating eco-friendly feeds

Growth, health and reproduction of fish and other aquatic animals are primarily dependent upon an adequate supply of nutrient, both in terms of quantity and quality, irrespective of the culture system in which they are grown. Supply of inputs (feeds, fertilizers etc.) has to be ensured so that the nutrients and energy requirements of the species under cultivation are met and the production goals of the system are achieved.

Thus, good nutrition is of paramount importance for economic production of healthy and high quality product. In fish farming, nutrition of fish is critical because feed represents 40-50% of the production costs. Fish nutrition research has advanced in recent years with the development of commercial diets that promote fish growth and health. Development of species-specific feed formulations support the aquaculture (fish farming) industry as it expands to satisfy increasing demand for affordable, safe, and high-quality fish and seafood products.

Culturing fish in captivity, nothing is more important than sound nutrition and adequate feeding. Hence growth is affected either due to less intake of feed or under utilization of feeds. An under nourished animal cannot maintain its health and be productive, regardless of the quality of its environment.

Thus, the production of nutritionally balanced feed for fish requires efforts in research, quality control, and biological evaluation. Faulty nutrition obviously impairs fish productivity and result in a deterioration of health until recognizable diseases ensues. The borderlines between reduced growth and diminished health, on the one hand, and the apparent disease, on the other, are very difficult to define. However, the problem of recognizing a deterioration of performance in its initial stages and taking corrective action will remain an essential part of the skill of fish culturist.

Like any other terrestrial animal, fish also needs the same type of nutrients for their growth. However, the amount of these nutrients varies due to variation of metabolic rate. Hence, supply of these nutrients is warranted in fish feed. Unlike animals, the availability of these nutrients to fish is different due to their surrounding environment. Some nutrients are available form water, which needs to be considered critically while formulating feed for fish.

Finfish require around 40 nutrients for optimal growth and wellbeing. The proteins, lipids/fats and carbohydrates are considered as "macro nutrients", while vitamins and minerals put together constitute "micronutrients" required for the healthy growth in fish.

Thus, careful attention has to be paid in understanding the nutritional requirements and formulating a nutritionally balanced feed.

Fish feed technology is one of the developing sectors of aquaculture, particularly in the third world countries. Commercial formulations of feeds are generally proprietary secrets, and the ingredients used are often too expensive to be used in fish farming. The need for developing suitable feeds based on locally available inexpensive ingredients has therefore, been widely recognized.

The technology of feed processing has undergone substantial improvement in recent years. It was only sixty years ago that feeds stuffs were mixed on the warehouse floor by the use of a shovel. Feed processing has progressed from the simple mixing of several ingredients by hand to mechanical mixing, to continuous mixing, and now to computer controlled mixing and pelleting. However, the basic concept of mixing ingredients together to result in a nutritionally balanced feed has remained unchanged.

To accomplish the mixing of different ingredients, grinding these ingredients to similar particle sizes, and then putting them together in a single unit, requires a considerable amount of specialized equipment and technical expertise. Some feed plants are versatile and designed for multitasking of producing different feeds for several animals such as poultry feeds, canine feeds etc. including fish feeds.

Whatever good quality feed may be produced but the manner in which it is offered to fish becomes prime important. Considerable innovations have been made the world over in production of feed broadcasting equipment to manage feeding and feeding schedules to prevent overfeeding or underfeeding to maximise growth.

The intensive aqua farming practices to raise high production per unit area has resulted in emergence several of the diseases driving the farmer to economic losses. Thus, the farming industry has focused its attention in enhancing immunity of aquatic animals through functional feeds. Though lot of research was generated on the use of probiotics and prebiotics, but yet find their place as commercially viable technologies.

It is with this background that the members of the BSMA committee and the invited experts from farm and feed industry reviewed the existing PG and Ph.D. course syllabus critically several times, incorporated the recent content learning both in theory and practical to bring it in this elevated format to groom the fish nutrition and feed technology specialists and professionals to the industry, R and D and academics. The committee took note of several considerations like relevance of course title, objectives and unit contents, merging of units to bring uniformity in avoiding content repetition in units while ensuring uniform distribution of units as far as possible to 6-7 units in 2+1 course and minimum 3-4 units in 1+1 courses.

Under M.F.Sc. program major changes in title and contents of as many as 6 courses has been made with minor changes in other 6 courses. In Ph.D. program, only one course was subjected to major changes and upgraded to include feed mill management as new content of learning for feed industry needs while in other 7 courses only minor modifications were made. A new course "Introduction to Biomolecules" has been introduced in Ph.D. program to expose the students to an emerging science on feed biomolecules in fish biosystem.

Course Title with Credit Load
M.F.Sc. in Fish Nutrition and Feed Technology

Course Code	Course Title	Credit Hours
	Major courses	**20 Credits**
FNT 501	Principles of Fish Nutrition	2+1
FNT 502	Nutrient Digestion and Growth	2+1
FNT 503	Feeds and Feed Technology	2+1
FNT 504	Nutritional Energetics	2+1
FNT 505	Nutritional Requirement and Feeding Management	2+1
FNT 506	Feed Ingredients and Additives	2+1
FNT 512	Nutraceuticals	1+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a student's major subject)	
FNT 507	Shellfish Nutrition and Feeding	2+1
FNT 508	Protein Nutrition	1+1
FNT 509	Lipid Nutrition	1+1
FNT 510	Carbohydrate Nutrition	1+1
FNT 511	Vitamins and Minerals Nutrition	1+1
	Supporting courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 credits**
	(The following courses, one credit each will be offered) 1. Library and Information Services 2. Technical Writing and Communication Skills 3. Intellectual Property and its management in Agriculture 4. Basic concepts in Laboratory Techniques 5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**

Course Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
FNT 591	Master's Seminar I	0+1
	Masters' Thesis Research	**30 Credits**
FNT 599	Master's Research (Semester III)	0+15
FNT 599	Master's Research (Semester IV)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fish Nutrition and Feed Technology

I. Course Title : Principles of Fish Nutrition
II. Course Code : FNT 501
III. Credit Hours : 2+1

IV. Aim of the course

To understand the basic principles of fish nutrition and the role of different nutrients.

V. Theory

Unit I

Protein nutrition: Protein and amino acids, Their specific functions, Classification and evaluation criteria of dietary protein (nutrient gain, nutrient efficiency, TGC, PER, NPU, BV, EAAI, chemical score), Protein deficiency symptoms.

Unit II

Lipid nutrition: Lipids and fatty acids, Their specific functions, Classification and evaluation of lipid quality, Lipid deficiency symptoms.

Unit III

Carbohydrate nutrition: Carbohydrates, Functions, Classification and Utilization of carbohydrate in fish diets.

Unit IV

Vitamin and mineral nutrition: Specific functions, Classification, Sources of vitamins and minerals and their deficiency symptoms.

Unit V

Nutritional energetics: Definition, Different forms of energy and energy value of feed (gross energy, digestible energy, metabolizable energy, net energy), Importance of protein-energy ratio in fish diets.

Unit VI

Larval and Brood stock nutrition: Larval gut morphology, importance of live feed and formulated feeds in larval nutrition, Nutrients required for egg and sperm quality and reproductive efficiency.

VI. Practical

Proximate analysis: Moisture, Crude protein, Crude lipid, Gross energy, ash, acid insoluble ash, crude fibre, nitrogen free extract of feed and fish tissue, analysis of fatty acids and amino acids, calcium, phosphorus, vitamin C content of feed.

VII. Suggested Reading

I. Course Title : Nutrient Digestion and Growth

II. Course Code : FNT 502

III. Credit Hours : 2+1

IV. Aim of the course

To understand digestion, absorption and transportation of nutrients and nutrient induced growth in fish and shell fish

V. Theory

Unit I

Digestive system of fish: Digestive organs and their roles, Anatomy and histology, Feed ingestion, Feeding mechanism, Gastro-intestinal motility.

Unit II

Digestive system of shellfish: Digestive organs and their roles, Anatomy and histology, Feed ingestion, Feeding mechanism, Gastro-intestinal motility.

Unit III

Digestion: Digestion of proteins, Lipids and carbohydrates, Methods of determining digestibility; Direct and indirect methods, Advantages and disadvantages of methods, Digestibility value of feed ingredients and Factors affecting digestibility, Role of gut micro flora in digestion.

Unit IV

Absorption and Transportation: Active, passive and facilitated absorption of nutrients, Transport of nutrients and cellular uptake.

Unit V

Regulation of digestion: Appetite and satiation, Factors influencing appetite and satiation, Hormonal regulation and Factors affecting digestion.

Unit VI

Growth: Concept of growth, Growth curve, Biotic and abiotic factors affecting growth, Correlation of growth with body weight and length.

VI. Practical

Dissection and examination of digestive organs; Histological preparation of digestive organs; Assays of enzyme activity of amylase, proteases and lipases; *In vivo - in vitro* digestibility studies.

I. Course Title : Feeds and Feed Technology

II. Course Code : FNT 503

III. Credit Hours : 2+1

IV. Aim of the course

To learn basic concept of feed formulation and different feed processing techniques

V. Theory

Unit I

Feed formulation: General principles and criterions, Different methods of feed formulation; Pearson's square method and least cost formulation (quadratic equation, solver function, Graphic solution, Linear programming and software assisted formulations), Limitations of formulation methods.

Unit II

Types of feed: Wet, Moist and Dry (pellets – steam compressed, extruded and crumbled, flakes, powdered/ mash, micro-encapsulated, micro-bound and micro-coated diets). Farm made feeds, Experimental diets; Reference diet, purified and semi-purified diet, Compact pellet, Floating and slow sinking pellet feeds; Starter, grower, Finisher and broodstock feeds, High energy eco-friendly and medicated feed.

Unit III

Feed processing technology: Receiving of raw materials, Equipments used in feed manufacture and processing; Grinder/pulverizer, Mixer, Pelletizer/extruder, Crumbler, Drier, Vacuum coater/ fat sprayer, automatic bagging and sealing, Role of pre-conditioning in feed preparation, Effects of processing on the nutritional value and availability of nutrients.

Unit IV

Feed storage: Hydro-stability of feed and their storage; Prevention of spoilage from rancidity, Fungus and associated toxins; Vectors of fish disease in feed and quality control; Nutritional value in relation to feed storage.

Unit V

Feed additives and supplements: Binders, carotenoids, Attractants, Antioxidants, Probiotics, Prebiotics, Synbiotics, Immunostimulants, Nutraceuticals, Acidifiers and Preservatives, Bile acids, Herbal additives and Vitamins, minerals, Limiting amino acids, Essential fatty acids, Phospholipids, and Cholesterol.

Unit VI

Quality control in fish feed manufacturing: Quality control procedures, Raw materials, Finished products; Safety of farm fish products, Harmful residues (pesticides, antibiotics, and pollutants).; Geometrical, and physical feature; Mechanical characteristics in air, Behavioural characteristics in water, Feed economics and evaluation.

VI. Practical

Feed formulation, Preparation of mineral and vitamin premix, Feed additives, binders, water stability test, and available lysine, Determination of feed particle size, Development of feed dispensers both for laboratory and pond feeding as part of project assignment, Visit to feed processing industries.

I. Course Title : Nutritional Energetics

II. Course Code : FNT 504

III. Credit Hours : 2+1

IV. Aim of the course

Nutritional energetics of different macromolecules and energy producing pathways.

V. Theory

Unit I

Concepts of nutritional energetics: Energy budget equation; Energetic efficiencies and energy flow/partitioning in biological systems; Gross energy, Digestible energy, Metabolizable energy, Net energy, Heat increment of feeding (specific dynamic action, SDA); Factors influencing energy metabolism.

Unit II

Energy requirement: Energy requirement of fish and shellfish, Factors influencing energy requirements; Energetics of maintenance and methodology of estimating the maintenance requirement.

Unit III

Energy estimation: Direct and indirect methods of estimation of energy of feed and feed components based on chemical compositions.

Unit IV

Energetics of growth: Relationship between feeding and growth; Energy exchange in biological systems; Growth and maturation

Unit V

Energetics of reproduction: Gonadal maturation and reproduction in relation to feeding

Unit VI

Energetics of intermediary metabolic pathways: Aerobic and anaerobic glycolysis, TCA cycle, Glycogenolysis, Beta oxidation, Electron transport chain, Effect of biotic and Abiotic factors on energy metabolism.

VI. Practical

Estimation of gross and digestive energy of feed and feed ingredients; Estimation of digestibility of nutrients, Bomb- calorimetry; Energy budget equation based on experimental data; Determination of standard metabolism in fish; Assay of metabolic enzymes.

I. Course Title : Nutritional Requirement and Feeding Management

II. Course Code : FNT 505

III. Credit Hours : 2+1

IV. Aim of the course

To learn nutritional requirements, feeding methods and feed management of commercially important fish and shellfish.

V. Theory

Unit I

Nutritional requirements of finfish and shell fish: Nutritional requirements of larvae, growout and broodstock of commercially important finfish and shellfish. Methods of studying nutritional requirements; Qualitative and quantitative methods; Nutrients deficiency symptoms.

Unit II

Nutritive value of live food: Algae, Artemia, Cladocerans, Ostracods, Rotifers and copepods, Bio enrichment of artemia and zooplankton, Experimental diets; Reference diet, Purified and Semi-purified diet.

Unit III

Response indices for nutrient requirement studies: Weight gain, Specific growth rate (SGR)/ daily growth coefficient (DGC), Thermal growth coefficient (TGC) and, feed conversion ratio (FCR), Protein efficiency ratio (PER), Net protein utilization (NPU), Physiometabolic parameters, Dose response curves, Gonadosomatic index (GSI)

Unit IV

Body composition of fish and shellfish: Influence of nutrients on body composition and flesh quality; Effect of rations on fecundity and egg quality.

Unit V

Feeding methods and devices: Broadcasting, Bag feeding, Tray feeding, Raft feeding, demand feeder, Mechanical automatic feeder, Blower feeder. Check tray feed monitoring, Ration size/ feeding rate and feeding frequency, Restricted feeding and mixed feeding.

Unit VI

Feeding management: Application of research findings to farming situations, Record keeping, Growth prediction and Feeding management.

VI. Practical

Determination of feed intake in fry and fingerlings; Determination of nutrient requirements of fish/prawn using purified diet; Analysis of experimental data from growth study; Measures of protein quality (PER, NPU, BV); Exercise on feeding.

I. Course Title : Shellfish Nutrition and Feeding

II. Course Code : FNT 507

III. Credit Hours : 2+1

IV. Aim of the course

To study the nutritional requirements of shellfish, feed formulation and feeding strategy

V. Theory

Unit I

Nutritional requirements: Protein, carbohydrate, Lipid, Vitamin, Mineral, Essential amino acid, Fatty acid at various life stages, Methods for determining nutrient requirements, Factors affecting nutritional requirements.

Unit II

Energy requirements: Protein-energy ratio, Protein sparing and methods for determining energy requirement and factors affecting energy requirements.

Unit III

Food and feeding: Food and feeding habits, Natural food organisms, Micro-particulate diets (MBD, MCD, MED, MEM, PARA) for hatcheries; Grow-out and finisher feeds; Broodstock feeds for conditioning, Maturation and reproduction.

Unit IV

Digestion, absorption and metabolism: Feed ingestion and feeding mechanism, Digestion, Absorption and Assimilation of nutrients, Gastro-intestinal motility, Factors affecting digestibility; Importance of microbial digestion.

Unit V

Feeding management: Ration size/feeding rate and feeding frequency; Feed dispensing methods and devices.

Unit VI

Feed Additives and health: Role of feed additives in shellfish nutrition, Immunity and health, Nutrient deficiency diseases in shellfish.

VI.Practical

Study of digestive system of shrimps, prawns, lobsters, crabs; Formulation and preparation of diet with specific additives; nutrient requirement study in crustacean; water stability test

VII. Suggested Reading

I. Course Title : Feed Ingredients and Additives

II. Course Code : FNT 506

III. Credit Hours : 2+1

IV. Aim of the course

To learn the requirement and availability of ingredients for aqua-feed and different types of additives used.

V. Theory

Unit I

National and international scenario: Present production trend and future requirements of feed ingredients, International coding of feed ingredients.

Unit II

Ingredient classification: Conventional and unconventional feed ingredients, Plant (protein and energy-carbohydrate and lipid) and Animal (protein and energy-lipid) sources.

Unit III

Quality evaluation of feed ingredients: Physical, Chemical (proximate composition, amino acids, EAAI, chemical score, fatty acids, vitamins and minerals profile and energy estimation, Anti- Nutritional Factors (ANFs) and other adventitious toxins) and Biological methods, Classification, Mode of action and Methods of detoxification of ANFs, Adulterants in feed ingredients.

Unit IV

Feed additives and supplements: Classification, Function; Gustatory stimulants and feed attractants; Nutraceuticals, Non-nutrient feed components.

Unit V

Feed raw material storage and spoilage: Grain storage, Liquid storage, Meal storage and Vitamin storage methods and practices, Prevention and management of raw material spoilage**,** Factors responsible for spoilage, Design criteria of storage shed, Silos, Bins, Roof ventilation and Aeration management etc., Temperature Monitoring, Silo Aeration system management and fumigation system to prevent spoilage.

Unit VI

Enhancing nutrient status of feed raw material: Application of genetic engineering and production of genetically modified plant ingredients. Amino acids deficient in plant ingredients. Manipulating biosynthesis pathways to enhance essential amino acids in plant ingredients.

VI. Practical

Identification of feed ingredients; Amino acid analysis of feed ingredients; Estimation of gross energy; Estimation of ANFs (Tannin, gossypol, phytate, protease inhibitors, cyanogens) and aflatoxin

I. Course Title : Protein Nutrition

II. Course Code : FNT 508

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of protein in aquafeeds and relationship of protein with energy metabolism

V. Theory

Unit I

Protein requirement and their sources: Conventional and non-conventional, Plant and animal origin; Non-protein nitrogen; Protein requirement for maintenance, Growth and reproduction, Essential and non-essential amino acids, Amino acid antagonism, Protein and amino acid deficiency symptoms.

Unit II

Protein energy ratio: Factors affecting protein requirement, Importance of protein energy ratio (P/E Ratio).

Unit III

Digestion, absorption and metabolism: Digestion of protein, Absorption of amino acids and Their metabolism; Amino acid pool and Protein turnover.

Unit IV

Evaluation of protein quality: PER, NPU, BV, ANPU, Kjeldahl Nitrogen Conversion factors. Ideal protein concept.

VI. Practical

Extraction and purification of protein, Microkjeldahl method; Estimation of protein by methods of Biuret, Lowry and Bradford, total free amino acids; *In vivo* and *In* *vitro* protein digestibility.

I. Course Title : Lipid Nutrition

II. Course Code : FNT 509

III. Credit Hours : 1+1

IV. Aim of the course

To understand the importance of lipids in aqua feeds and the relationship of dietary lipid and tissue lipid

V. Theory

Unit I

Requirement of lipid and their sources: Terrestrial and aquatic origin; Optimum dietary lipid level; Essential fatty acid requirements for growth, Reproduction and health importance of other fat soluble substances (vitamins, carotenoids etc.). Interspecies differences in lipid requirement.

Unit II

Lipid metabolism: Lipid digestion, Absorption, Transportation/mobilization, Metabolism and storage, Protein sparing effect of lipids.

Unit III

Lipids and their fatty acids: Role of lipids and essential fatty acids, Their qualitative and quantitative requirement.

Unit IV

Lipids quality: Oxidation of fats/lipids, Antioxidants and evaluation of lipid quality, Deficiency symptoms.

VI. Practical

Estimation of total lipids, phospholipids and free fatty acids, peroxide value, saponification number, iodine value Separation and quantification of individual fatty acids by GCMS.

I. Course Title : Carbohydrate Nutrition

II. Course Code : FNT 510

III. Credit Hours : 1+1

IV. Aim of the course

To understand the importance of carbohydrate in aquafeed and their protein sparing effect

V. Theory

Unit I

Sources: Carbohydrate sources and digestible energy supply, Role of digestible and non-digestible carbohydrates; Dietary levels of carbohydrate for carps and catfishes.

Unit II

Digestibility and interactions with other nutrients: Carbohydrate digestibility, Factors affecting starch utilization, Carbohydrate and Interaction with other nutrients and protein sparing effect.

Unit III

Constraints and utilization: Constraints of carbohydrate utilization in fish, Non-starch polysaccharides, Strategy to enhance carbohydrate utilization; Gelatinization, Exogenous amylases, Glucose Intolerance; Carbohydrates and immunity.

Unit IV

Economic importance aquafeeds: Maximum and inclusion levels for different fish species, Uses of carbohydrates for low cost feed formulations.

VI. Practical

Estimation of starch gelatinization in different feed processing methods; Blood glucose estimation; Estimation of crude fibre and non-starch polysaccharides.

I. Course Title : Vitamin and Mineral Nutrition

II. Course Code : FNT 511

III. Credit Hours : 1+1

IV. Aim of the course

To learn the importance of vitamins and minerals in fish and crustacean nutrition

V. Theory

Unit I

Vitamins: Classification and sources, properties and functions of water and fat soluble vitamins; Vitamin as co-enzymes and prosthetic groups of enzymes.

Unit II

Vitamin requirements and sources: Vitamin requirements of different species; dietary sources of vitamins; factors affecting vitamin requirements; Loss of vitamins during feed processing and storage.

Unit III

Vitamin deficiency: Manifestation of vitamin deficiency; Vitamin –mineral interactions. Hypo- and hyper-vitaminosis.

Unit IV

Minerals: Classification and sources, macro, micro minerals and heavy metals toxicity. Minerals requirements for different aquaculture species, dietary sources of minerals, factors affecting mineral requirement; nutrient-minerals interaction; Mineral-Mineral interactions; manifestation of mineral deficiency

VI. Practical

Estimation of zinc, phosphorus, magnesium, iron and vitamin A; preparation of vitamin and mineral premix; estimation of vitamin and mineral losses due to leaching

VII. Suggested Reading

I. Course Title : Nutraceuticals

II. Course Code : FNT 512

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of nutraceuticals in the physiological wellbeing of fish and shellfish

V. Theory

Unit I

Nutraceuticals/functional foods: Definition, Classification and scope in aquaculture

Unit II

Benefits and modes of action of nutraceuticals: Immunomodulatory proteins, Peptides, Polysaccharides, Oligosaccharides, Herbal extracts/phytochemicals, Carotenoids, Nucleotides, Bioactive compounds from seaweeds etc.

Unit III

Minerals as nutraceuticals: Zinc, Copper, Chromium, Manganese, and Selinium

Unit IV

Role of nutraceuticals: Stress mitigation and Growth enhancement, Immunomodulation and disease prevention

VI. Practical

Estimation of immunomodulatory parameters (lysozyme, NBT, MPO, antibody titre), estimation of antioxidant enzymes (SOD, catalase, GPx), extraction of bioactive compounds, *in vitro* antioxidant assay.

	Total PhD Program Credit Hours	**100 Credits**

*Major compulsory subjects

Course Contents
Ph.D. in Fish Nutrition and Feed Technology

I. Course Title : Feed Technology and Feed Mill Mangement

II. Course Code : FNT 601

III. Credit Hours : 2+1

IV. Aim of the course

To study the feed formulation techniques; design of feed mill and feed manufacturing; feed quality assurance and regulations.

V. Theory

Unit I

National and global scenario of feed ingredients and feed industry: Availability demand and supply; Types of feeds, BIS and international standards for fish feed, Overview of feed mill business.

Unit II

Feed formulation: Different methods of feed formulation, Use of feed formulation softwares; Nutritional and physical quality of feed ingredients; Importance of additives formulation of nutritionally balanced diet (amino acid, micronutrients)

Unit III

Feed manufacturing process and control: Receiving of raw material, Grinding, Mixing, Conditioning, Pelleting /extrusion, Drying and cooling, Coating/top dressing, Packaging and labelling, Factors affecting feed manufacture and stability of nutrients, Effects of processing on the nutritional value of feeds, Processing methods for non-compacting feed; Economics of feed manufacturing.

Unit IV

Emerging new feed ingredients: Scope and exploration of new feed ingredients, Anti-nutritional factors and methods of detoxification (e-beam irradiation, solvent extractions, SSF, protein concentrates/isolates, genetic improvement of plants etc.).

Unit V

Storage and quality control: Ingredient quality assurance, Feed processing quality assurance and Processed feed quality assurance Miscellaneous adventitious toxins and Effect on feed safety; Storage of feed and quality deterioration, CGMPs and HACCP feed regulation, Feed transmitted bioterrorism and its implications.

Unit VI

Design of a feed mill unit: Layout, Feed mill design and safety of operation, Maintenance and record keeping.

VI. Practical

Analysis of anti-nutritional and toxic substances in feed ingredients and feed; Formulation of diets using software, Preparation of different types of feed and their quality evaluation; Effect of feed storage on nutritional value of feed, Preparation of farm made feeds.

I. Course Title : Nutrigenomics

II. Course Code : FNT 602

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of nutrients on gene expression

V. Theory

Unit I

Principles of nutrigenomics: Methodologies, Genomics, Transcriptomics, Proteomics, Metabolomics and Nutrigenomics, Gene structure and Regulation, Nutritionally Important genes, Nutrient-gene interaction and expression.

Unit II

m-RNA and cDNA: Extraction of m-RNA, reverse transcription and cDNA biosynthesis, Cloning techniques; Genomic and differential gene expression.

Unit III

Use of DNA probe: Blotting and hybridization, Microarray; Microarray nitrocellulose hybridization and labelling with P^{32} probes; Quantitative real time polymerase chain reaction (qRT PCR).

Unit IV

Bioinformatics: Gene expression software; BLASTIN, FASTA and PHYLIP etc.; Relative expression software tool (REST); Interpretation of microarray data; Cloning technique.

VI. Practical

Genomic DNA, plasmid DNA and RNA extraction and isolation, m-RNA purification; cDNA synthesis by reverse transcription from fish tissue; Elution of PCR product for gene sequencing; RT PCR, cloning, exploration of bioinformatics tools.

I. Course Title : Larval and Broodstock Nutrition

II. Course Code : FNT 603

III. Credit Hours : 2+1

IV. Aim of the course

To understand the role of nutrition in reproductive performance and larval development of fish and shellfish

V. Theory

Unit I

Embryonic and larval development: Nutritional profile of egg yolk and mechanism of egg yolk utilization, Degradation of egg yolk platelets and granules, Utilization of egg protein, Amino acid and lipid, Influence of abiotic factors on yolk absorption; Criteria for evaluation of early larval development

Unit II

Larval digestive system: Ontogenesis of digestive systems, Digestion and absorption of protein and lipid, Mechanism of transition from endogenous to exogenous nutrition.

Unit III

Larval nutrition: Importance of live foods, Weaning diets and their importance in larval nutrition, Nutritional requirements and deficiency symptom, Nutritional status of larvae.

Unit IV

Broodstock nutrition: Effect of nutrition on fecundity, Fertilization, Embryonic development and larval quality.

Unit V

Improving brood-stock performance: Special ingredients and specific nutrients for improving gonadal development and reproductive performance; Effective feeding periods for optimum brood-stock performance.

Unit VI

Feeding strategies: Manual, Mechanical and automatic feeding; Feeding devices and strategies, Larval feeding behaviour and feed management.

VI. Practical

Preparation of larval feed, Nutritional profiling of egg yolk and larvae, Nutritional analysis of live food organisms, Estimation of proteases in larvae, Estimation of gonado-somatic index and fecundity.

VII. Suggested Reading

I. Course Title : Introduction to Biomolecules

II. Course Code : FNT 604

III. Credit Hours : 2+1

IV. Aim of the course

To study the importance of different biomolecules and their biological functions in a biosystem.

V. Theory

Unit I

Definition, types, structure, properties of biomolecules: Protein, Lipids, Carbohydrates, Vitamins, Minerals, Nucleic acids and Water as biomolecules and its applications, Water: importance of water in biological systems with special reference to the maintenance of native structure of biological molecules, Water as a universal solvent, pH, buffers, buffer capacity and their importance in biological systems.

Unit II

Protein and amino acids: Protein and its classification, Structure of proteins, Primary, Secondary (helix and pleated sheet), Tertiary and Quaternary structures of protein and forces stabilizing it, Denaturation and renaturation of proteins, Ramachandran's plot, Amino acidsanditsstructural features, Stereoisomerism, R and S notations, Structure and classification of standard amino acids, pH titration curve, Isoelectric pH of amino acids and pKa value, Peptidesand structure of peptide bond.

Unit III

Lipids: Classification and their biological role, Fatty acids: nomenclature, structure and properties of saturated, Unsaturated, Essential fatty acids, Triacylglycerols; Nomenclature, Physical properties, Chemical properties (hydrolysis, esterification, Rancidity of fats, saponification value, iodine value, Acid value) and significance, Chemistry and biological function of eicosanoids, fats, waxes and phospholipids and cholesterol.

Unit IV

Carbohydrates: Classification and biological importance of carbohydrates, Structure of monosaccharides, stereochemistry, D and L, Epimers, Anomers, Diastereomers and Mutarotation, Disaccharide, Establishment of glycosidiclinkage in sucrose, Maltose, lactose, Deoxy ribose and ribose sugar, Polysaccharides: Types, partial structure, Occurrence and importance of starch, Glycogen, Insulin, Cellulose, Chitin, Pectin, Reactions of carbohydrates Molisch's, Benedicts / Fehlings, picric acid, Barford's, Bials, Seliwanoff's, Osazone test.

Unit V

Vitamins and minerals: Water soluble vitamins –B complex and Vitamin C: Structural formula, Co-enzyme forms, Biological role, Deficiency symptoms and dietary sources, Vitamin C as a redox reagent, Fat soluble vitamins**,** A, D, E, and K: structure, Dietary sources, Requirements, Deficiency symptoms and Biological role, Mineral macronutrients and micronutrients, Dietary sources, Physiological functions, Deficiency disorders, Absorption and excretion, Importance of selenium and fluorine, Metals in biological system: Fe, Co, Ca, Mb, Cu.

Unit VI

Nucleic acids and water: Nucleic acids, Nucleosides and Nucleotides; Structure and properties, Phosphodiester bonds, Chemical differences between DNA and RNA and its significance, Different class of RNAs - mRNA, rRNA, tRNA and snRNA. Primary, secondary and tertiary structure of tRNA, Determination of primary structure (sequencing) of DNA using Maxam-Gilbert method and Sangers method and limitations.

VI. Practical

Preparation of buffers, Qualitative estimation of carbohydrates, Quantitative estimation of glucose and maltose by DNS method and any other methods, Quantitative estimation of protein by Biuret and Folin Lowry's method, Estimation of lipid by Zak's method, Estimation of vitamin C.

VII. Suggested Reading

I. Course Title : Macro and Micronutrient Nutrition

II. Course Code : FNT 605

III. Credit Hours : 2+1

IV. Aim of the course

To understand recent developments in macro and micro nutrient nutrition for fish and shellfish

V. Theory

Unit I

Protein and aminoacids: Requirements, Functional roles of aminoacids, Ideal protein concept, Nitrogen excretion, Amino acid antagonism, Improving nitrogen Retention, dietary supply of synthetic amino acids in different forms.

Unit II

Lipid and essential fatty acids: Functions and deficiencies, Fatty acid oxidation, antioxidants, Role of phospholipids and steroids.

Unit III

Optimization of carbohydrates in diets: Strategies for improving carbohydrate utilization; Potential of exogenous enzymes, solid state fermentation (SSF).

Unit IV

Micronutrients: Physiological roles and functions of vitamins and minerals; Forms of supply of minerals and vitamins, Deficiency symptoms.

Unit V

Recent developments in energy nutrition and feed additives: Recent advances in nutritional energetics and feed additives, Medicated feeds (farm-made and commercial), Regulations and certification of feed additives.

Unit VI

Designer fish production: Tailoring flesh quality, food safety, Roles of nutrients and additives (fatty acids, antioxidants, drugs etc.), Flesh quality evaluation (colour, texture and sensory), Estimation of fatty acids, Amino acids and minerals in ingredients, feeds and flesh of fish and shrimp; Dietary effects on nitrogen excretion.

VI. Practical

Protein quality estimation (PER, NPU). Digestibility studies. Estimation of fatty acids and amino acids.

VII. Suggested Reading

I. Course Title : Bioenergetics

II. Course Code : FNT 606

III. Credit Hours : 2+1

IV. Aim of the course

To understand the principles of energetics, nutrient energy and its metabolic scope in larval, growout and broodstock fish

V. Theory

Unit I

Energy requirements of fish: Principles and methods; Factors affecting energy requirement; Energy budgeting, Metabolic rate and Factors affecting it.

Unit II

Metabolic scope: It's variation in herbivores, Omnivores and Carnivores.

Unit III

Larval energetics: Growth, metabolism and energy budget, Energy relationship between egg and hatchlings, Energy flow during early ontogenesis.

Unit IV

Energetics of growout and brood stock: Energetics of feeding and digestion, Energy requirements for growth and reproduction, Energetics of gonadal maturation and gamete production, Bioenergetics of spawning, Relationship between feeding and maturation.

Unit V

Lipids: Lipids as energy source, Net energy supply from lipids, Fatty acid biosynthesis and degradation, Transport and deposition of lipids in finfish and shellfish, Fatty acid bioconversion (elongation and desaturation) in different species, Importance of phospholipids and cholesterol.

Unit VI

Carbohydrates: Carbohydrates as energy source; Net energy supply from carbohydrates; Biosynthesis, Storage and Degradation, Interaction of carbohydrate with lipid and protein.

VI. Practical

Estimation of oxygen consumption; Estimation of energy flow, Estimation of gross energy and digestible energy of feed; Study of energy requirements of, herbivorous omnivorous and carnivorous fish; Estimation of total and free cholesterol; Estimation of metabolic rates.

I. Course Title : Nutraceuticals as Functional Foods

II. Course Code : FNT 607

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of nutraceuticals in the physiological wellbeing of fish and shellfish.

V. Theory

Unit I

Functional foods v/s Nutrceuticals: Definitions, concepts and beneficial roles, Application of functional foods in immune modulation and disease prevention.

Unit II

Characteristics of nutraceuticals and delivery systems: Nanotechnology of drug delivery system such as biocompatible polymers, Stimuli responsive polymers

Unit III

Modes of action and benefits: Probiotics, Prebiotics, Stanols and Sterols, Their immunomodulatory effects.

Unit IV

Stress mitigation and growth enhancement: Inter-relationships of stress and growth in fish, Functional feed additives and role of functional foods in stress mitigation and growth enhancement.

VI. Practical

Estimation of immunomodulatory parameters (lysozyme, NBT, MPO, antibody titre), Estimation of antioxidant enzymes (SOD, catalase, GPx), Extraction of bioactive compounds, *in vitro* antioxidant assay, Pro PO.

I. Course Title : Feed Intake and Feeding Behaviour

II. Course Code : FNT 608

III. Credit Hours : 1+2

IV. Aim of the course

To study the mechanism of feed intake and feeding behaviour.

V. Theory

Unit I

Gustation and feeding behaviour: Chemoreception, olfactory, Peripheral gustation sensation, Gustatory pathways in the Central Nervous System, Taste and feeding behavior.

Unit II

Feed intake: Techniques for the measurement of voluntary feed intake, Stomach content analysis, Chemical markers, Direct observation and video recording, Demand feeder, X-radiography, factors affecting voluntary feed intake, Effect of feeding time on feed intake and growth.

Unit III

Regulation of feed intake: Neuropeptides and hormones, Inhibitory peptides, Stimulatory peptides, Growth hormones, Nutrient receptors and transporters, Hormonal control of metabolism; Nutrients influencing feed intake gustatory feeding stimulants.

Unit IV

Physiological effects of feeding: Methods of feeding and short term effects of meal on post-prandial levels of nutrients; Tissue metabolic physiology; Feeding frequencies, Physiology of starvation and feed restriction.

VI. Practical

Measurement of feed intake by chemical marker, Feed intake measurement with respect to temperature, Experiment on feeding stimulant, Feed intake and blood glucose correlation, Comparative intake of natural vs artificial feed, Monitoring feeding behaviour in different species, Evaluation of fish response to feed in terms of feed detection and intake, Study of crustacean feeding behavior in different life stages, Study of digestive anatomy and morphology and their correlation with digestive physiology, Impact of feeding regimes on feed intake.

I. Course Title : Feed and Environment

II. Course Code : FNT 609

III. Credit Hours : 2+1

IV. Aim of the course

To understand the impact of nutrient utilization on environment

V. Theory

Unit I

Nutrient dynamics: Influence of nutrient cycles on food web/chain. Influence of detrital food web on nutrient distribution, Nutrient loading through feed and fertilizer.

Unit II

Stress and nutrition: Influence of stress on feed intake, Digestion and absorption, Stress indicator and nutritional strategies to mitigate stress.

Unit III

Eco-friendly feed: Use of high energy diets, Optimizing protein energy ratio, Ideal aminoacid profile, Improving nutrient utilization through exogenous phytase and acidifiers, Methods of enhancing feed digestibility, Biofloc and probiotics influences on nutrient utilization.

Unit IV

Impact of feed on environment: Judicious use of feed and nutrients; Nutrient build up on water quality; Nutrient management in different aquaculture systems (extensive, semi-intensive, intensive- recirculatory systems); Nutritional strategies to reduce the nutrient flow in aquaculture system, Contribution of feed waste to organic load of aquaculture production systems, Reducing environmental pollution (use of additives, weeds etc.).

Unit V

Productivity and fish production: Optimization of natural productivity for increasing fish production, Different food chains in aquatic ecosystem, Feeding behavior and feeding niche, Effect of environmental parameters on appetite of fish

Unit VI

Environmental impact assessment: Rules and Regulations on waste management in aquaculture (International and National)

VI. Practical

Assessment of water quality parameters (ammonia, nitrite, nitrate, chloride phosphate etc.) as affected by feeds; Levels of feeding and water quality; Stress enzymes (catalase, SOD, glutathione peroxidase), stress hormone (cortisol).

Suggested Broad Areas for Master's and Doctoral Research

- Study on essential aminoacids and vitamins requirement of fishes
- Accurate quantitative requirements of essential fatty acids particularly larval development and maturing broodstock
- Nutrient and energy budget in fed fish culture
- Optimization of inclusion level of non-conventional feed resources in fish feed
- Nutrient gene interaction studies in fish
- Feed additive for promotion of productivity and growth in fishes
- Development of appropriate feed processing technology for improving the feed and nutrient use efficiency
- Microbial nutrition
- Nutraceuticals and functional food acids
- Quantitative estimation of feed intake: natural vs artificial feed
- Digestibility of natural and artificial feed
- Energetics of utilization of natural and artificial feed
- Energetics of utilization of animal vs plant ingredients
- Energetics of growth vs reproduction
- Feeding standards for cultivable species
- Feeding strategy to eliminate waste
- Utilization of refinery waste as single cell protein
- Farmer friendly methods for detoxification of anti-nutritional factors
- Immunostimulants and growth promoters
- Redefining protein-energy ratio in shrimp diet with respect to salinity
- Digestibility due to plant to animal ingredient ratio
- Enhancement of digestibility of plant feed ingredients
- Reduction of dietary protein content through amino acid balance
- Optimizing protein to lipid, protein to carbohydrate content in fish and shrimp diets
- Dietary lipid source and flesh lipid quality
- Optimizing PUFA and HUFA content in individual species
- Impact of lipid peroxidation on growth and flesh quality
- Starch utilization and immunity status
- Optimization of gelatinized to non-gelatinized starch content in feed
- Source of carbohydrate and their utilization
- Study the key enzymes for carbohydrate metabolism
- Development of species specific vitamin and mineral premix

- Energy utilization from carbohydrate sources
- Enzyme coating and feed additives in pelleted feed
- Low cost microencapsulated, micro coated and micro bound diets
- Fortification of larval and broodstock diets
- Utilization of unconventional ingredients
- Nutritional contribution of natural food for growth
- Nutritional comparison of natural and artificial feed
- Biochemical mechanism of endocrine function
- Hormonal regulation of calcium and phosphorous metabolism
- Immunostimulants/Immunomodulators
- Gene regulation by lipids and carbohydrates
- Fasting, feed intake and nutrient utilization.

Fisheries Science
– Aquatic Animal Health Management

Preamble

(Aquatic Animal Health Management)

Aquatic animals play a significant role in our societies and ecosystems. Aquatic animals include not only fish but also a myriad of other animals, viz., amphibians, marine mammals, crustaceans, reptiles, molluscs, aquatic birds, aquatic insects, starfish and corals that live in water for most of their life. The global human population is increasing, so also the demand for aquatic food products. Aquaculture, the culture of aquatic animals for food, is one of the most lucrative economic activities and is considered as one of the means of assuring food and nutritional security for humans. It contributes about 50% of global fish food consumption and presents the fastest growing food-producing sector in the world. The annual growth rate for aquaculture is 8-10% compared to 3% for livestock and 1.6% for capture fisheries. Like humans and terrestrial animals, aquatic animals - both cultured and wild - can be affected by infectious pathogens such as viruses, bacteria, fungi, protozoa and parasites. The occurrence of disease in the aquatic animal was known before the 1900s but was of no practical significance. Over the years, this branch of science is developed separately from the health sciences of other animal groups. It also requires a much different approach than terrestrial animals. Infection and disease in aquatic animals are common but can become severe under certain conditions. It is particularly true in intensive aquaculture practices that tend to provide a platform for the emergence of pathogens. The risk of pathogen transfer is generally considered greater for movement of live aquatic animals. The global trade in aquatic animals and their products offer avenues for the trans-boundary spread of pathogens. Few diseases of aquatic animals are known to have implications for human health. Sustainable growth of aquaculture is threatened by both known diseases and new diseases, which may become pandemic. A disease outbreak can devastate farmed populations and severely impact the short-term profitability and even long-term viability of aquaculture businesses. Around the world, diseases caused serious economic losses to aquaculture. Globally, the economic loss due to diseases in aquaculture is estimated at US$ 1.05 - 9.58 billion/year. Aquatic animal health must, therefore, be managed effectively to protect the productivity of aquaculture industries, access to international markets and aquatic environments. Successful aquatic animal health management relies on the accurate and rapid diagnosis of various diseases. New assays from genetic engineering using nucleic acid probes, next-generation sequencing, etc. have come as a boon to the aquaculture industry. In all cases, a quick response is essential to enable correct diagnosis of the problem and to allow for appropriate measures to be taken.

Recent pandemics have shown that global production systems are epidemiologically connected and, consequently, aquatic animal diseases present a shared global threat that demands global solidarity. The world now depends on a sustainable future for aquaculture and improved aquatic animal health management is critical to its continued and growing contribution to global food security. The improved control of transboundary diseases requires the wider and more consistent implementation of OIE (Office International des Epizooties or World Organisation for Animal Health) standards, particularly on disease notification. For animal (including aquatic animal) health and zoonoses, the World Trade Organization (WTO) recognise the standards developed by the OIE as a reference within the Sanitary and

Phytosanitary Measures (SPS Agreement). The Aquatic Animal Health Code (AAHC) includes standard international trade in the welfare of cultured fish and utilisation of antimicrobial agents in aquatic animals and their merchandise. All members of the WTO, including India, must have an aquatic animal health program that meets the OIE standards. The FAO's Code of Conduct for Responsible Fisheries also provide a good base for the national and international cooperation in harmonizing aquatic animal health management activities. Further, the FAO's "One Health Program" aims for improved animal and public health, enhanced food safety and security, and improved livelihood while protecting the ecosystem.

The information on diseases of national importance may help developing national disease control strategies and to comply with regional and international disease reporting requirements. A national list of diseases would also allow the development of national strategies around some of these diseases. Recently, the Department of Fisheries, Government of India has formulated a Draft on "The Aquatic Animal Disease and Health Management Bill-2019", that justifies the importance of this branch of science. The draft Bill seeks to provide for prevention and control of diseases of aquatic animals, prevention of outbreak, transboundary ingress and inter-regional spread of aquatic animal diseases, regulation of quality usage of inputs in aquaculture, control of residues in aquatic animals and their products for the safety of human health and the environment in view to ensure sustainable production, minimization of economic losses and to meet international obligations of India and for the facilitation of import and export of aquatic animals and their products and matters connected therewith or incidental thereto.

Against these backgrounds, the revised Subject Matter Area under the Aquatic Animal Health Management discipline for the M.F.Sc. and Ph.D. programme aims to generate specialized human resources to benefit aquaculture and allied industries of the country and to understand and manage the aquatic animal diseases and related issues that affect the national and international trade. In this discipline, the conventional courses on bacterial, fungal, viral, parasitic and non-infectious diseases and their pathology have been updated in line with the recent advancements and national and international initiatives as enlightened above, and current subjects such as principles of aquatic animal health management, fish pharmacology and therapeutics, fish immunology, epidemiology and disease surveillance and aquatic wildlife health have been included at Masters level. At the Doctoral level, courses on biotechnological tools in fish health management, molecular virology, fish bacterial diseases mechanisms, pathobiology of fish parasitic infection, immunology and vaccination, cellular pathology, aquaculture medicine and techniques in toxicology have been incorporated in line with the recent developments in disease diagnosis and control as well as national and international regulations.

Course Title with Credit Load
M.F.Sc. in Aquatic Animal Health Management

Course Code	Course Title	Credit Hours
	Major Courses	
AAH 501	Principles of Aquatic Animal Health Management	2+1
AAH 502	Bacterial and Fungal Diseases of Finfish and Shellfish	2+1
AAH 503	Viral Diseases of Finfish and Shellfish	2+1
AAH 504	Parasitic Diseases of Finfish and Shellfish	2+1
AAH 505	Fish and Shellfish Pathology	2+1
AAH 506	Fish and Shellfish Immunology	2+1
AAH 507	Principles of Fish Pharmacology and Therapeutics	1+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
AAH 508	Non-Infectious Diseases and Disorders of Finfish and Shellfish	1+1
AAH 509	Epidemiology and Disease Surveillance	1+1
AAH 510	Aquatic Wildlife Health	2+0
AAH 511	Disease Diagnostic Techniques	2+1
	Supporting courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**

Course Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
AAH 591	Master's Seminar-I	0+1
	Masters' Thesis Research	**30 Credits**
AAH 599	Master's Research (Semester III)	0+15
AAH 599	Master's Research (Semester IV)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc in Aquatic Animal Health Management

I. Course Title : Principles of Aquatic Animal Health Management

II. Course Code : AAH 501

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on the principles of aquatic animal health management, biosecurity and specific issues associated with the system. It helps the graduates to methodically address the problems and to improve the production efficiency and reliability, and reduce economic loss due to diseases

V. Theory

Unit I

Introduction to aquatic animal health management: Introduction to various aspects of health management; Stress response; Definition of health and disease; Pathogen carriers; Simple fish disease models.

Unit II

Legislative framework: Principles of quarantine; Zoning and compartmentalization; Live fish transportation; Import risk analysis; Health certification, Principle, Procedure, The regulatory body for aquaculture health certification.

Unit III

One health concept of OIE: World animal health organization and importance for trading; One health concept of OIE.

Unit IV

Health management measures in an open system: Health management measures in cages, Pen, Reservoirs and open-water aquaculture; Interactions of farmed and Wild animals; Disease exchange with wild

Unit V

Management measures for host, environment and pathogen: Management measures for pathogen; Therapeutics and sanitizers; Management measures for the environment; Bioremediators, Biocontrol agents, Shrimp toilet; Management measures for the host; Specific pathogen-free (SPF), Specific pathogen-resistant (SPR) and Specific pathogen-tolerant (SPT); Probiotics; Immunomodulators; Concepts of vaccination.

Unit VI

Developing management practices and biosecurity principles: Health maintenance, Better management practices (BMP), Good aquaculture practices (GAP), Hazard analysis and Critical control point (HACCP) and Biosecurity principles in aquaculture.

VI. Practical

Case study; Disease risk analysis; Demonstration of different management measures; Demonstration of different diagnostic tools; Application of therapeutics; Application of sanitizers, Disinfectants; Visit to SPF shrimp larval production centres, Biosecure shrimp grow-out farms; Documentation and comparison of different management practices at farm/hatchery level.

I. Course Title : Bacterial and Fungal Diseases of Finfish and Shellfish

II. Course Code : AAH 502

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on the bacterial and fungal diseases of finfish and shellfish that affects the global aquaculture industry. It provides an exhaustive knowledge of bacterial and fungal infections, their virulence, pathogenesis, epidemiology, treatment and control. It also aims to train graduates to systematically diagnose the problems and evolve ways to manage bacterial and fungal diseases.

V. Theory

Unit I

Introduction to microbial infection: Pathogenesis, Virulence Mechanisms, Epidemiology, Prophylaxis, Therapeutic measures.

Unit II

Bacterial diseases of finfish: Aetiology, Epidemiology, Pathogenicity, Virulence, Prophylaxis, Treatment and control measures of bacterial diseases of finfish with emphasis on furunculosis, Aeromoniasis, columnaris disease, Bacterial kidney disease, Bacterial gill disease, Vibriosis, mycobacteriosis, Edwardsiellosis, Flavobacteriosis, Francisellosis, Enteric red mouth disease, Pasteurellosis, Piscirickettsiosis, Streptococcosis, Lactococcosis, pseudomonas septicaemia, Chryseobacteriosis, Clostridial disease, *Aerococcus viridans* infection.

Unit III

Bacterial diseases of shellfish: Aetiology, Epidemiology, Pathogenicity, Virulence, Prophylaxis, Treatment and control measures of bacterial diseases of shellfish with emphasis on Vibriosis, Acute Hepatopancreatic Necrosis Disease (AHPND), *Hepatobacter penaei* infection or Necrotizing Hepatopancreatitis (NHP), Rickettsial diseases, Mycobacteriosis.

Unit IV

Fungal diseases of finfish: Aphanomycosis, Epizootic Ulcerative Syndrome (EUS) in fish- Aetiology, Epidemiology, Pathogenesis diagnosis and management, Cotton wool disease, Branchiomycosis; Aspergillosis.

Unit V

Fungal diseases of shellfish *Lagenidium* spp., *Sirolpidium* spp., *Haliphthoros* spp., *Fusarium* spp., *Aphanomy cesastaci* infection.

Unit VI

Antimicrobial resistance Use and abuse of antibiotics in aquaculture; Antibiotic resistance; Multidrug resistance; Molecular mechanisms.

VI. Practical

Sampling techniques; Culture techniques; Case study; Examination of moribund fish for bacterial diseases; Isolation and identification of bacterial pathogens; Serological diagnostic techniques; Molecular diagnostic techniques; Antibiotic sensitivity assay; Identification of virulence factors; Isolation, culture and identification of fungal pathogens, Maintenance and preservation of microbial cultures

I. Course Title : Viral Diseases of Finfish and Shellfish
II. Course Code : AAH 503
III. Credit Hours : 2+1

IV. Aim of the course

To provide both basic and applied knowledge on viral diseases of finfish and shellfish that impacted the global aquaculture industry. It imparts an exhaustive knowledge of viral infections, their pathogenesis, epidemiology, treatment and control in fish and shellfish. It also aims to equip graduates to diagnose the problems and evolve ways to manage the diseases.

V. Theory

Unit I

Viral classification, infection and isolation: General biology of viral infections; Virus classification (ICTV); Virus replication; Virulence markers; Viral evasion; Principles of cell culture; Development of primary cell culture; Maintenance of cell lines; Scaling up of cell culture; Characterization and preservation of cell lines.

Unit II

OIE listed viral pathogens of finfish: Pathogenesis, Molecular biology, Epidemiology and control of OIE listed viral pathogens/ diseases of finfish: Epizootic Haematopoietic Necrosis (EHN), Infectious haematopoietic necrosis (IHN), Spring viraemia of carp (SVC), Viral Haemorrhagic Septicaemia (VHS), Infectious salmon anaemia (ISA), Salmonid Alphavirus (SAV) and Red Seabream Iridoviral Disease (RSIVD), Cyprinid Herpesvirus 3 (CyHV-3 or KHV).

Unit III

Non-OIE listed viral pathogens of finfish: Pathogenesis, molecular biology, Epidemiology, and control of non-OIE listed viral pathogens/ diseases of finfish; *Oncorhynchus masou* virus (OMV), Viral Encephalopathy and Retinopathy (VER), Channel Catfish Virus (CCV), Lymphocystis, Tilapia Lake virus (TiLV), Carp Edema Virus (CEV), Piscine orthoreovirus, Cyprinid Herpes Virus-2 (CyHV-2).

Unit IV

OIE listed viral pathogens of shrimp and prawn: Major viral pathogens of commercially important cultured crustaceans with special reference to shrimp and prawn; clinical signs, Pathogenesis, Molecular characterization, Diagnostic methods, Epidemiology and Control associated with white spot syndrome virus (WSSV), Infectious Hypodermal and Hematopoietic Necrosis Virus (IHHNV), Taura Syndrome Virus (TSV), Yellow Head Virus (YHV) genotype-1, Infectious Myonecrosis Virus (IMNV), *Macrobrachium rosenbergii* nodavirus (MrNV).

Unit V

Non-OIE listed viral pathogens of shrimp: Major viral pathogens of commercially important cultured crustaceans with special reference to shrimp and prawn; clinical signs, pathogenesis, molecular characterization, diagnostic methods, epidemiology and control associated with monodon baculovirus (MBV), hepatopancreatic parvo-like virus (HPV), baculovirus penaei (BP), baculovirus midgut gland necrosis virus (BMNV), Laem-Singh virus (LSNV), gill-associated virus (GAV), extra small virus (XSV), shrimp hemocyte iridescent virus (SHIV), reovirus, covert mortality nodavirus (CMNV).

Unit VI

Viral diseases of molluscans: Introduction to viral diseases of molluscans - Ostreid Herpesvirus 1 (OSHV-1), Abalone Herpes Virus (AbHV), Haemocytic Infection Virus disease (HIV), Oyster Velar Virus (OVV)

VI. Practical

Sampling techniques; Case study of viral diseases; Examination of shrimp; freshwater prawn and molluscs for viral infection; Examination of moribund fish for viral diseases, Preservation and processing of samples; Virus isolation and replication, bioassay methods, Serological and molecular diagnostic techniques, Plaque and neutralization assay; Development of primary cell cultures for virus studies, Maintenance of cell lines, Viral bioinformatics.

I. Course Title : Parasitic Diseases of Finfish and Shellfish

II. Course Code : AAH 504

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on the parasitic diseases of finfish and shellfish. It helps to comprehend the taxonomy, morphology, biology, pathology and host-parasite relation including control measures of important parasites of aquatic organisms and to understand the significance of parasites in fish health.

V. Theory

Unit I

Host-parasite relationship: Introduction and concepts of different animal associations; Important ecological terms used in parasitology; General introduction to the classification of protozoan and metazoan parasites; Life cycle; Host-parasite relationship.

Unit II

Protozoan parasitic diseases of finfish: Diseases of importance in aquaculture, Clinical signs, Etiology, pathology, Epidemiology, Host-parasite relationship, diagnosis, treatments and control of the disease caused by protozoan parasites; Amoeba- *Neoparamoeba perurans* (Amoebic gill disease-AGD); Ciliates- *Ichthyophthirius, Cryptocaryon*, *Trichodina*; Flagellates- *Ichthyobodo* (*Costia*) *necatrix, Cryptobia, Amyloodinium, Trypanosoma*, *Trypanoplasma*; Microsporidians- *Glugea, Pleistophora*etc.

Unit III

Metazoan parasitic diseases of finfish: Diseases of importance in aquaculture, Clinical signs, etiology, Pathology, epidemiology, Host-parasite relationship, Diagnosis, Treatments and control of the disease caused by metazoan parasites, Myxozoans- *Myxobolus cerebralis, Spaerospora arenicola; Kudoa thyrsites, Tetracapsuloides bryosalmonae,* etc., Monogeneans- *Dactylogyrus, Gyrodactylus, Diplectanum, Benedenia;* Digeneans- *Diplostomum, Sanguinicola, Neascuscuticola, Schistosoma* etc., Larval trematode infection (metacercaria); Cestodes: *Diphyllobothrium latum, Caryophyllaeus, Ligula*; Nematodes: *Capillaria, Camallanus*; Acanthocephala: *Neoechinorhynchus*

Unit IV

Crustacean parasitic diseases of finfish: Diseases of importance in aquaculture, Clinical signs, Etiology, Pathology, Epidemiology, Host-parasite relationship, Diagnosis, treatments and control of the disease caused by Crustacean parasites; Branchiurans- *Argulus;* Copepods- *Lernaea, Caligus*, *Lepeophtheirus, Ergasilus;* Isopods- *Cymothoa, Cirolina, Nerocila.*

Unit V

Protozoan parasitic diseases of shellfish: Diseases of importance in aquaculture, Clinical signs, Etiology, Pathology, Epidemiology, Host-parasite relationship, Diagnosis, treatments and control of the disease caused by protozoan parasites; Ciliates-*Zoothamnium, Vorticella, Epistylis*; Cephaline gregarines; Microsporidian: Cotton shrimp disease-causing microsporidians, *Enterocytozoon hepatopenaei* (EHP); Haplosporidian.Parasitic diseases of molluscans: *Bonamia, Perkinsus, Marteilia.*

Unit VI

Antiparasitic drugs and parasitic zoonoses: Common anti-protozoal and anti-metazoal drugs applied in aquaculture; Mode of application and their action; Definition and Classification of zoonoses and Approaches to their management; Parasitic zoonoses of fish/shellfish origin: Trematodes (*Heterophyes, Clonorchis, Opisthorchis, Paragonimus, Echinostoma*etc); Cestodes (*Diphyllobothrium, Spirometra*, *Ligula*); Nematodes (*Gnathostoma, Anisakis, Angiostrongylus, Capillaria*etc.).

VI. Practical

Case studies of different organs and tissues of finfish/shellfish infected with ecto- and endoparasites; Collection, preservation and fixation of suitable samples for laboratory examination; Preparation microscopic examination of tissue impression, blood/haemolymph smears; Wet-mount preparation of gill, mucus, skin scrapings etc; Collection of faecal, intestinal content and recovery of parasites; Collection and identification of parasites; Study of morphological characters of adults and developmental stages of the protozoan and metazoan parasites of importance in aquaculture; Preparation of permanent slides, micrometry and photomicrography; Histopathological analysis of parasite-infected tissues; Examination of intermediate host for larval stages; Microscopic examination of already prepared parasitic specimens (collection of permanent slides); Identification of parasites and histological lesions

I. Course Title : Fish and Shellfish Pathology

II. Course Code : AAH 505

III. Credit Hours : 2+1

IV. Aim of the course

To understand the structural and functional changes in cells, tissues and organs in relation to the development of various finfish diseases. It also imparts hands-on experience on the laboratory analyses using the tools of chemistry, biomarkers, clinical microbiology and pathology, haematology, etc.

V. Theory

Unit I

General pathology: Brief introduction to finfish and shellfish anatomy and histology; General pathology of finfish and shellfish

Unit II

Pathophysiology of fish: Pathophysiology of finfish and shellfish; Stress and stressors; General adaptation syndrome; Types of cellular adaptations; Hypertrophy, hyperplasia, Atrophy and metaplasia, Neoplasia.

Unit III

Inflammation and cellular pathology: Reversible cellular changes and accumulations; Fatty changes and pigments; Inflammation; Causes of inflammation; Cellular responses to inflammation; Mediators; various patterns of inflammation; The difference between acute and chronic inflammation; Tissue repair; Cell death; Necrosis, Apoptosis, Autophagy; Necroptosis; Their mechanisms and different morphological patterns.

Unit IV

Clinical pathology: Normal constituents of blood; Alterations in the haematological parameters and enzymes with reference to different pathological conditions in finfish; Haematology of shrimp and molluscans; Clotting mechanisms; other host defence mechanisms.

Unit V

Systemic pathology of finfish: Systemic pathology of finfish integumentary system, Respiratory system, Vascular system, Digestive system, Excretory system, Nervous system, Musculoskeletal and Endocrine system due to bacteria, Parasites and viruses.

Unit VI

Systemic pathology of shellfish: Major pathological changes due to infectious diseases in the integumentary system, Lymphoid organ, Gill, Hepatopancreas, Gut and other organs of crustaceans; Major pathological changes due to diseases in molluscans.

VI. Practical

Necropsy techniques; Collection and fixation of tissues; Complete histology and different staining techniques; Examination and interpretation of the pathological changes in fish tissues; Complete blood profile of finfish; Routes of blood collection from fish; Different staining techniques for blood cell visualization; Morphology of blood cells; Total leucocyte count; Differential leucocyte count.

I. Course Title : Fish and Shellfish Immunology

II. Course Code : AAH 506

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on basic principles of fish and shellfish immunology, to understand the immune responses to infection by various fish pathogens and to offer scope for the development of disease protective/prevention measures against bacteria, fungi, viruses and parasites of fish.

V. Theory

Unit I

Introduction to fish immunology: Phylogeny and ontogeny of the immune system; Lymphoid tissues and cellular components of the immune system; T and B cells; Mucosal immune system.

Unit II

Non-specific immune system of finfish: Phagocytosis; Mechanism of phagocytosis; Complement system: function, components; Complement activation.

Unit III

Specific immune system of finfish: Memory function and immunological tolerance; Antigens and antigenicity; Antigen processing; Superantigens; Haptens; Antibody: structure, types, Theories of antibody formation; Regulation of immune response.

Unit IV

Antibody-mediated and cell-mediated immunity: Cell-mediated immune response and its components; Antibody-mediated immune responses; Polyclonal and monoclonal antibody production and application; The basic concept of aptamers, Aptabodies and Edible antibodies.

Unit V

Defence mechanisms of shellfish: Invertebrate defence mechanisms; Quasi immune response

Unit VI

Immunoprophylaxis: Immunomodulation, probiotics; Aquaculture vaccines: History, concept, Development of vaccines; Advances in DNA vaccines, Recombinant vaccines, vectored vaccines, etc; Routes of administration; Adjuvants and ligands; Efficacy and Limitation of vaccines; Immune genes and their regulation.

VI. Practical

Serum separation; Preparation of antigen; Raising of antibodies; Antigen-antibody reactions: Agglutination tests, Precipitation tests: gel diffusion; ELISA; Antibody titration; Western blotting; Isolation of lymphocytes; Non-specific immune response: NBT assay, lysozyme assay; Prophenoloxidase in shrimp; Preparation of a simple vaccine and administration

I. Course Title : Principles of Fish Pharmacology and Therapeutics

II. Course Code : AAH 507

III. Credit Hours : 1+1

IV. Aim of the course

To learn the principles and protocols of therapeutics in aquaculture, their absorption and elimination. It offers greater knowledge of drugs for the prevention and/or treatment of diseases, and the economic husbandry of fish. It also inculcates the graduates on the legislative framework of chemotherapy for responsible use of aqua-drugs and responsible aquaculture.

V. Theory

Unit I

Therapeutics in aquaculture: Common therapeutants used in aquaculture; Their mode of action, Dose and dosage, Methods of application; Phytotherapy, Phage-therapy, Nanoparticle-based drugs, Antimicrobial peptides, etc.

Unit II

Pharmacology principles: Pharmacokinetics and pharmaco-dynamics; Residual effect and withdrawal period of various chemotherapeutants.

Unit III

Application: Pharmacovigilance; Immunopharmacology; Pharmacogenetics; OECD guidelines.

Unit IV

Impacts of aquadrugs: Drug toxicity and poisoning, Antimicrobial resistance; Antibiotic resistance and its impact on the environment and human health; Legislative framework of chemotherapy in aquaculture; Drug regulation acts and other legal aspects.

VI. Practical

On-farm practical sampling sessions; Case studies; Dose determination; Application of therapeutants; Different methods of delivery of therapeutants in aquaculture; Demonstration of phytotherapy; Determination of MIC of drugs; Determination of MCC of drugs. Extraction of compounds from plants, Methods to identify the active compounds (HPLC).

I. Course Title : Non-infectious Diseases and Disorders of Finfish and Shellfish

II. Course Code : AAH 508

III. Credit Hours : 1+1

IV. Aim of the course

To comprehend the etiology and management of different non-infectious diseases and various disorders.

V. Theory

Unit I

Importance of water and sediment quality: Impact of water and sediment parameters on finfish and shellfish health

Unit II

Nutritional imbalance: Studies on the causes, Pathogenesis, Pathology, Diagnosis and differential diagnosis of various diseases due to nutritional imbalance and anorexia; Vitamin deficiencies and mineral deficiencies and their toxicity.

Unit III

Disorders: Metabolic disorders; Skeletal deformities; White faecal syndrome (WHS) in shrimp.

Unit IV

Impact of toxicants on fish health: Algal blooms, Important mycotoxins, Icthyotoxins, Chemical toxins, and Other toxicants and their effects on fish health.

VI. Practical

Case study; Study of gross changes in different tissues inflicted due to various nutritional deficiency; Study of histopathological changes in different tissues inflicted due to various nutritional deficiency; Study of histopathological changes in different tissues inflicted due to various toxicants

I. Course Title : Epidemiology and Disease Surveillance

II. Course Code : AAH 509

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of epidemiology and surveillance of fish diseases. It aids in the collection of rapid and reliable high-quality information about aquatic animal diseases and production. It also instils the graduates on the collection of fish disease data using inexpensive techniques that are more suitable for Indian aquaculture.

VI. Theory

Unit I

Introduction to epidemiology and concepts: Epidemiological terms; Epidemiological concepts and types; The importance of aquatic animal diseases; patterns of disease-epidemic curves; Epidemiological view of causality; Epidemiological association; Diagnosing disease, levels of diagnosis.

Unit II

Disease surveillance: Disease surveillance; Purpose and objectives of surveillance; Approaches to surveillance, Principles of active and passive surveillance; Sampling Principles and applications; Principles of data and specimen collection; Collection of information from people; Survey design and planning; Prevalence, Production and Incidence rate surveys.

Unit III

Surveillance data management: Principles and data processing, Computerized and manual data management; Epidemiological software for data analysis.

Unit IV

Strategic plan for aquatic animal health: Aquatic animal health information systems; National and regional strategic plan for aquatic animal health; National and international disease reporting: Role of NBFGR, NACA, FAO, OIE, AQUAPLAN, etc., in disease reporting; Emergency disease preparedness.

VII. Practical

Development of questionnaire; Farm survey; Collection of active and passive data on fish diseases; Data entry and data processing; Use of epidemiological software for data analysis.

I. Course Title : Aquatic Wildlife Health

II. Course Code : AAH 510

III. Credit Hours : 2+0

IV. Aim of the course

To understand the health issues of aquatic wildlife and enhancing their health and protection. It helps the graduates to appreciate the impact of global climate change on the health of aquatic and marine wildlife populations and be aware of the rehabilitation and handling of dead aquatic animals.

V. Theory

Unit I

Introduction to aquatic wildlife: Introduction to aquatic wildlife: Definition, diversity: cetaceans, Crocodilians, Sea turtles, Frogs, Sea lions, Seals, Sea otters, Insects, Birds; Principles on 'one world and one health'.

Unit II

Aquatic wildlife habitats: Aquatic wildlife habitats; Ecosystem health; Aquatic ecosystem health indicators; Aquatic wildlife-related recreations; recognizing and preventing the impacts of principal stressors.

Unit III

Aquatic invasive species: Examples and role of aquatic invasive species in the transfer of exotic pathogens; prevention and spread of invasive species.

Unit IV

Aquatic wildlife diseases: Diseases of amphibians; Infections with non-hyphal parasitic chytrid fungi *Batrachochytrium detrobatidis* and *B. salamandrivorans*, and ranavirus species; Disease issues in aquatic wildlife; Monitoring of diseases in aquatic wildlife; Infectious (viral, parasitic, bacterial) and non-infectious diseases (malnutrition, toxic algae poisoning, gunshots, boat strikes, shark bites) of aquatic wildlife; Entanglement in ocean trash; Disease reporting in dead aquatic wildlife; Aquatic wildlife die-offs; Fish kills and the causes; Handling of dead aquatic animals; Clean up; Carcass disposal and disinfection procedure; zoo and aquaria medicine.

Unit V

Anthropogenic factors and contaminants on aquatic wildlife: Effect of anthropogenic factors and contaminants on aquatic wildlife; The zoonotic potential of aquatic wildlife diseases; Aquatic wildlife rehabilitations.

Unit VI

Health management issues: Health management issues in game fish, Fish ranging, etc; Health management of free-ranging aquatic wildlife populations; The impact of global climate change on the health of aquatic and marine wildlife populations.

VI.. Suggested Reading

- Biradar RS. 2010. *Aquatic Resources and Health Management*. Narendra Pub. House, Delhi.

I. Course Title : Disease Diagnostic Techniques

II. Course Code : AAH 511

III. Credit Hours : 2+1

IV. Aim of the course

To comprehend theoretical and practical aspects of different disease diagnostic techniques used in aquaculture and to take appropriate decisions on fish health management and appropriate choice of treatment.

V. Theory

Unit I

Introduction to fish disease diagnosis: Introduction to disease diagnosis; different roles and levels of diagnosis in aquaculture; The evolution of diagnostic techniques in aquaculture; A brief introduction to diagnostic features of important diseases of finfish and shellfish.

Unit II

Microbiological techniques: Safety in microbiology laboratory; Bio-safety levels and risk groups; Techniques in sterilization; Preparation of microbiological media; Culture techniques; Purification, Preservation and maintenance of bacterial and fungal cultures.

Unit III

Microscopic techniques: Bright field, Darkfield, Phase contrast, Fluorescence and electron microscopy.

Unit IV

Cell culture-based diagnostic methods: Introduction to cell culture techniques; Different cells used for virus isolation; CPE.

Unit V

Protein-based diagnostic methods: Antibody-based diagnostic methods (immunohistochemistry, ELISA, western blotting, lateral flow assay etc), Hybridoma technology and monoclonal-antibody-based diagnosis

Unit VI

Nucleic-acid based diagnostic methods: Nucleic acid amplification methods; Types of PCR: Reverse transcriptase-PCR, Real-time PCR and Other variants of PCR; *In situ* hybridization; Dot blot assay; LAMP etc.

VI. Practical

Sample collection and preparation for microscopic, microbiological, virological and histopathological analysis; Culture of microorganisms using conventional methods; Antibiotic sensitivity testing; Serological techniques in disease diagnosis: SDS-PAGE, Western blotting, ELISA, etc; Cell culture techniques; Molecular techniques in disease diagnosis, Nucleic acid extraction, estimation and different PCR-based diagnosis; Familiarisation of some of the commercially available diagnostic kits used in aquatic animal disease diagnosis.

Course Title with Credit Load
Ph.D. in Aquatic Animal Health Management

Course Code	Course Title	Credit Hours
	Major Courses	**12 Credits**
AAH 601	Biotechnological Tools in Fish Health Management	2+1
AAH 602	Molecular Virology of Finfish and Shellfish	1+1
AAH 603	Fish Bacterial Diseases Mechanisms	1+1
AAH 604	Pathobiology of Fish Parasitic Infection	1+1
AAH 605	Immunology and Vaccination of Fish	2+1
	Minor Courses	**6 Credits**
	(From the subjects closely related to a students major subject)	
AAH 606	Cellular Pathology	1+1
AAH 607	Aquaculture Medicine	1+1
AAH 608	Techniques In Toxicology	1+1
	Supporting Courses	**5 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence).	
	Total Course Work Credits	**23 Credits**
	Doctoral Seminar	**2 Credits**
AAH 691	Doctoral Seminar – I	0+1
AAH 692	Doctoral Seminar –II	0+1
	Doctoral Research	**75 Credits**
AAH 699	Doctoral Research (Semester II)	0+15
AAH 699	Doctoral Research (Semester III)	0+15
AAH 699	Doctoral Research (Semester IV)	0+15
AAH 699	Doctoral Research (Semester V)	0+15
AAH 699	Doctoral Research (Semester VI)	0+15
	Total Ph.D. Program Credit Hours	**100 Credits**

Course Contents
PhD. Aquatic Animal Health Management

I. Course Title : Biotechnological Tools in Fish Health Management

II. Course Code : AAH 601

III. Credit Hours : 2+1

IV. Aim of the course

To understand the advanced biotechnological tools used for fish disease diagnosis. It promises to improve the health of cultured fish and shellfish, and aquaculture production.

V. Theory

Unit I

Molecular diagnostic methods: Molecular diagnostic methods; *in situ* hybridization; Nucleic acid probe-based diagnosis; choice and characteristics of the probe; Probe labelling; Hybridization: Hybridization strategies; Factors affecting the rate of hybridization; Immobilization of nucleic acid on filters; Types of hybridization; Southern, Northern, Dot/Slot blot hybridization; DNA Microarrays: DNA chips, Preparations of DNA arrays; Label and applications; Other related molecular techniques.

Unit II

Proteomic tools: Proteomic tools: Protein structure prediction and determination using NMR, MS/MS, MALDI-TOF.

Unit III

Antibody-based diagnostics: Antibody-based diagnostics; Variants of and advances in ELISA; Hybridoma technology.

Unit IV

Advanced biotechnology tools: eDNA technology; Metagenomics; Next-generation sequencing.

Unit V

Recent advances in biotechnological applications: CRISPER technology; Digital pathology; RNAi technology; Nanotechnological tool in drug and vaccine development.

Unit VI

Safety and regulatory requirements: Environmental concerns of vaccine and other biological products; Vaccination failure and adverse effects; Biosafety and regulatory requirements for fish diagnostics, diagnostic kits, vaccines, etc.

VI. Practical

Nucleic acid extraction; Real-time PCR; Protein profiling; DNA fingerprinting; DNA damage assay; Bioinformatics approaches for recombinant DNA technology; Gene cloning and transformation.

I. Course Title : Molecular Virology of Finfish and Shellfish

II. Course Code : AAH 602

III. Credit Hours : 1+1

IV. Aim of the course

To provide the knowledge on recent advances in the field of finfish and shellfish virology and their management. It imparts a comprehensive knowledge of select viral infections of finfish and shellfish and their management.

V. Theory

Unit I

Viral phylodynamics: Host-virus interactions; viral phylo-dynamics; Phylo-dynamic variation; viral adaptation; Virus-virus interaction (VVI); Emerging viruses; The evolution of new viruses.

Unit II

Molecular virology of finfish: Molecular virology and pathogenesis of selected viruses infecting finfish with special reference to Nervous Necrosis Virus (NNV), Tilapia Lake Virus (TiLV), Cyprinid Herpes virus-2 (CyHV-2) and Iinfectious Pancreatic Necrosis virus (IPNV);

Unit III

Molecular virology of shellfish: Molecular virology and pathogenesis of viruses infecting shellfish with special reference to White Spot Syndrome Virus (WSSV), Infectious Hypodermal and Hematopoietic Necrosis Virus (IHHNV), Infectious Myonecrosis Virus (IMNV) and *Macrobrachium rosenbergii* nodavirus (MrNV).

Unit IV

Viral management: Antiviral drugs and viral vaccines; Bioinformatics on vaccine design and development, Bioinformatics on viral drug design and development

VI. Practical

Cell culture media preparation; Explant culture and suspension culture; Primary cell culture and passaging; Characterization of cell lines (Viable cell counts, karyotyping, counting, staining); Preservation and revival of cells; Virus isolation using cell culture; Transfection techniques; Molecular detection and sequence analysis of finfish viruses; Molecular detection and sequence analysis of shellfish viruses; Collection and analysis of molecular information of various viruses using sequence information available on public domain

I. Course Title : Fish Bacterial Diseases Mechanisms

II. Course Code : AAH 603

III. Credit Hours : 1+1

IV. Aim of the course

To understand the intracellular and extracellular life cycle of bacterial pathogens, disease mechanisms and mechanisms of survival in host cells.

V. Theory

Unit I

Mechanisms of survival in host cells: Intracellular and extracellular pathogens; Adherence of bacteria to host cells, Molecular mechanisms, Factors involving adherence; Invasion of host cells; Life in phagosome; Resistance to intracellular bactericidal molecules.

Unit II

Mechanisms of survival in the environment: Mechanisms of survival; Survival of bacteria under extreme climate or environment; Viable but non-culturable bacteria (VBNC); Examples of VBNC fish pathogens.

Unit III

Bacterial virulence factors: Bacterial endotoxins and enterotoxins, their molecular structures and mode of action; Host response to bacterial virulence factors, Response to intracellular and extracellular pathogens; Genes involved and regulation of their expression.

Unit IV

Host immune responses to bacterial infection: Immune responses; Cytokines, interleukins, Antibodies and other immunological molecules; Immune evasion mechanism.

VI. Practical

Study of interaction of bacteria with host cells; Estimation of adherence and invasion; Use of erythrocytes to study the interaction of bacteria with host cells; Assay of hemolytic activity; Hemagglutination and its inhibition by mannose, antibodies; Phagocytosis by macrophages and resistance to phagocytosis by pathogens; Assay virulence – LD_{50}; Virulence associated enzyme assay – protease, esterase, chitinase; Specific examples of pathogens: *Edwardsiella tarda* purification of OMPs

I. Course title : Pathobiology of Fish Parasitic Infections

II. Course code : AAH 604

III. Credit Hours : 1+1

IV. Aim of the course

To understand the recent advances in the pathobiology of parasitic infection in fish and other aquatic organisms. It also aims at acquiring in-depth knowledge of host-parasite interaction, the role of parasites in ecosystem functioning and parasite evolution.

V. Theory

Unit I

Environmental parasitology: Macro-environmental and micro-environmental influence on parasite incidence; Relevancy of parasites as bio-indicators.

Unit II

Ecological parasitology: Role of parasites in ecosystem functioning; Manipulative parasites; Parasites as ecosystem engineers; Parasites as biological tags; The evolution of parasites; Hyperparasitism; Parasitic adaptation.

Unit III

Molecular parasitology: Host-parasite communication and cell to cell interaction; The interaction between parasites and microbiome; Molecular characterization of parasites; DNA taxonomy and barcoding of parasites.

Unit IV

Immune responses against parasites: Fish immunity and parasitic infection (Immune responses against parasites – monogenean, flagellates, ciliates, myxozoans); Immune evasion strategies of parasites; Parasite vaccines; RNA interference and parasites; Pharmacokinetics of anti-parasitic drugs.

VI. Practical

Isolation and culture of parasites; Molecular characterization and diagnosis of parasites; Use of molecular probes for identification of parasites and tracking life stages of parasites; DNA barcoding of parasites; Parasitic survey of selected fishes (case study).

VII. Suggested Reading

I. Course Title : Immunology and Vaccination of Fish
II. Course Code : AAH 605
III. Credit Hours : 2+1

IV. Aim of the course

To learn the recent advances in fish and shellfish immunology and to understand the concepts of vaccination and the latest trends in fish vaccination

V. Theory

Unit I

Finfish immune mechanisms: Molecular players in mucosal immunity; Major histocompatibility complex; Pattern recognition receptors and immune pathways; Antigen processing and presentation; T-cell activation and differentiation; B-cell activation and differentiation; Classical, alternate, Lectin pathways of complement; Their activation and regulation.

Unit II

Immune evasion: Evasion of the immune response by pathogens; Tumour evasion of the immune response

Unit III

Shellfish immune mechanisms: Immune mechanisms in crustaceans: Prophenoloxidase system; Phagocytosis; Encapsulation; Antimicrobial proteins.

Unit IV

Principles of fish vaccination: General principles of vaccination; Vaccination strategies in aquaculture; Vaccination against bacterial, Viral pathogens and parasites; the influence of environmental parameters on vaccination.

Unit V

Vaccine production and delivery: Types of vaccines, Killed, Live attenuated, Synthetic peptide, Recombinant, Anti-idiotype, DNA and RNAi based vaccines; monovalent and polyvalent vaccines; Nanoparticle-based vaccines; Vaccine production; Quality control; Vaccine composition; Superantigens; Cytokines and therapeutic uses of cytokines; Adjuvants and immunostimulants

Unit VI

Immune gene expression: Immunoglobulin genes; Regulation of immune gene expression; Use of gene-targeted knock-out in immunological research.

VI. Practical

Collection, separation and identification of fish leucocytes; Separation of mononuclear cells; Methods of vaccine preparation Vaccine quality control; Vaccine administration by different routes; Assessment of immune response to vaccination, agglutination test, ELISA, etc; Challenge studies; Designing of RNAi based vaccines; Methods for assessment of the efficacy of vaccines; Examination of hyaline, granular, semi-granular cells of shrimp; NBT assay, phagocytic index, ProPo.

I. Course Title : Cellular Pathology

II. Course Code : AAH-606

III. Credit Hours : 1+1

IV. Aim of the course

To understand the structural and functional changes in cells, tissues and organs and to gain in-depth knowledge of the cellular processes that contribute to the pathogenesis of the disease.

V. Theory

Unit I

Cell structure and function: The cell: types and structure; Parts of a cell; functions and organelles.

Unit II

Basics of cell cycle and regulation: Basics of cell cycle and regulation of cell to cell adhesion and dysregulation during disease; Mechanism of cell injury; Processes during acute and chronic injury.

Unit III

Pathology: Cellular pathological findings; Evaluating disease pathogenesis at the molecular, Cellular and tissue levels with particular reference to the diagnosis of diseases

Unit IV

Cell signalling processes: Introduction to cell signalling processes; Transcriptional and post-translational mechanisms to specific cell-signalling pathways responsible for controlling cell functions such as cell cycle, Cell differentiation, Cell death and Apoptosis.

VI. Practical

Knowledge and understanding of the pathological basis of disease and the use of techniques; Cytopathology; Flow cytometry; Confocal microscopy; Immuno-histochemistry to detect and diagnose diseases; Assays for cell survivability and apoptosis: COMET assay, MTT assay, TUNEL assay, LDH and NR.

I. Course Title : Aquaculture Medicine

II. Course Code : AAH-607

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role, application and impact of aquaculture drugs and chemicals

V. Theory

Unit I

Categorization of aquadrugs: Different chemicals and drugs used in aquaculture and dosages; Categories of aquadrugs: approved, unapproved and conditionally approved aquaculture drugs, Low regulatory priority aquaculture drugs, Investigational new animal drug exemptions for aquaculture drugs and unapproved drugs

Unit II

Pharmacodynamic agents: Anaesthetics and methods of anaesthetizing fish and shellfish; Breeding induction agents; Sex control agents; The action of different drugs in finfish and shellfish.

Unit III

Medicated feeds: Feed top-dressing; binders and stabilizers; Dose and dosage; Bioaccumulation and toxicity; Use of probiotics and immunostimulants in aquaculture

Unit IV

Development of antimicrobial-resistance: Antibiotics – use and misuse including the development of antibiotic-resistant bacteria; AMR, WHONET and ATLAS; Regulatory bodies: safety regulations at national and international levels.

VI. Practical

Demonstration of anaesthetizing fish; Prophylactic application of aquadrugs; Therapeutic application of aquadrugs; Antibiotic sensitivity test; Estimation of dose; Estimation of antibiotic residues; Detection of gut colonization by probiotic bacteria.

I. Course Title : Techniques in Toxicology

II. Course Code : AAH-608

III. Credit Hours : 1+1

IV. Aim of the course

To impart the knowledge of various toxicological methods of drugs used in aquaculture.

V. Theory

Unit I

Principles of toxicological methods: Principles of drug action and assay; regulatory phases of drug development; Dose-response curves and their analysis; Residual effects and withdrawal period of potential drugs.

Unit II

Mechanisms of action of drugs: Toxic indigenous drugs used as antimicrobials and anti-inflammatory agents; Drugs used in chemotherapy their mechanisms of action, Side effects and clinical signs

Unit III

Toxicity tests: Techniques for setting up isolated and intact preparations; Animal toxicity tests for acute, Sub-acute and chronic toxicity; Specific toxicity tests, Immunotoxicity, and carcinotoxicity; Use of cell culture for toxicity assays; Different assays for toxicity testing.

Unit IV

Naturally occurring poisons: Naturally occurring poisons: Mycotoxins, Bacterial toxins, Plant toxins, and animal toxins, Microalgal toxicity; Toxicology of mycotoxins; Types of toxicity and its measurement; Acute, sub-acute or chronic and its manifestations; acute toxicity; Mode of application, Administration, Exposure; *in vitro* tests; Dose-response relationship.

VI. Practical

Measurement of TD_{50}/TC_{50}; Measurement of LD_{50}/LC_{50}; Test for acute, sub-acute and chronic toxicity; Protocols and various specific toxicity tests; Calculation of EC_{50}; Determination of potency ratio, median effective, toxic or lethal doses; Bioassay techniques; Cell culture assay for chemical toxins; Cell culture assay for biological toxins

Fisheries Science
– Fish Biotechnology

Preamble
(Fish Biotechnology)

Biotechnology is undoubtedly the most rapidly advancing stream of biology today, and more and more researchers are applying cellular/ molecular approaches to find innovative solutions to myriad concerns and issues related to aquaculture and fisheries. The world today is faced with the challenges of climate change, rising water salinity, aquatic pollution, destruction of natural breeding grounds of aquatic animals, viral and bacterial pathogens, dwindling supply of ingredients for fish feed. In this scenario, India needs to create human resource capable of designing and executing genetic improvement/ germplasm management and conservation programs, all of which rely heavily on an understanding of molecular markers and genetics. Further, biotechnology is applied to management of aquatic environment, fish disease, and nutrition; captive maturation and induced breeding. India needs to diversify and expand the number of cultivated fish and shrimp species and biotechnology is most likely to provide a breakthrough once a critical mass of researchers is created in the country to work in this sector. The world now has its first transgenic fish – AquAdvantage salmon. India's policy is not averse to transgenics for high growth and disease resistance and the country has to still develop capability and human resource in this area. Indian education institutions must move quickly to harness the power of modern tools like genomics, nanotechnology and bioinformatics through trained human resource to achieve rapid advancements in sustainable and profitable fish/shrimp productions systems.

Globally, researchers are turning to new approaches based on molecular biology, biotechnology, genomics and bioinformatics in order to address various issues and concerns related to fisheries and aquaculture. In India, the need for human resource capable of innovative research and teaching is felt acutely in this fast emerging area, particularly as the most rapid advances are being made in this field, and institutions are eager to apply modern tools to keep up with the global standards. In addition, there is plenty scope for start-ups in the area of biotechnology, and hence the current syllabus is designed to encourage students to identify entrepreneurial opportunities and also services required in the national and international biotech industry. For example Biotech entrepreneurs will be required to certify genetically improved fish/ shrimp seed, to certify specific pathogen free seed, to confirm frozen / processed fish and shrimp meat labelling for Indian exports and national consumption, to provide genomics and bioinformatics services; to run disease diagnostic labs. In addition, ICAR, SAUs and international research institutions also need human resource trained in this area to develop new technologies for improvement of domesticated germplasms and conservation of biodiversity to deal with the anticipated challenges of climate change, rising salinity and shortage of freshwater.

Researchers/ Scientists in national and international labs; Assistant Professors in Universities/ Colleges; Private Sector (Research/ Marketing/ Technical Analysts for Biotech, Bioinformatics, Genomics, DNA Sequencing, etc.Companies); Entrepreneurs.

Course Title with Credit Load M.F.Sc. in Fish Biotechnology

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FBT 501	Fundamentals of Molecular Biology	2+1
FBT 502	Concepts of Cell Biology	2+1
FBT 503	Gene Structure and Regulation of Expression	2+1
FBT 504	Genetic Engineering	2+1
FBT 505	Bioinformatics Tools for Fisheries	1+1
FBT 506	Fish Cell Culture	2+1
FBT 507	Aquaculture Biotechnology	2+1
	Minor Courses	**08 Credits**
	(From the subjects closely related to a student's major subject)	
FBT 508	Marine Biotechnology	1+1
FBT 509	Molecular Markers	2+1
FBT 510	Molecular Taxonomy and Phylogenetics	2+1
	Supporting Courses	**06 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common Courses	**05 Credits**
	(The following courses, one credit each will be offered) 1. Library and Information Services 2. Technical Writing and Communication Skills 3. Intellectual Property and its management in Agriculture 4. Basic concepts in Laboratory Techniques 5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**
	Masters' Seminar	1 Credit
FBT 591	Master's Seminar	0+1

Course Code	Course Title	Credit Hours
	Masters' Thesis Research	**30 Credits**
FBT 599	Master's Research (III semester)	0+15
FBT 599	Master's Research (IV semester)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fish Biotechnology

I. Course Title : Fundamentals of Molecular Biology
II. Course Code : FBT 501
III. Credit Hours : 2+1

IV. Aim of the course

- To acquaint the students about the structure and organisation of genome.
- To provide knowledge of basic molecular processes involving nucleic acids and protein synthesis and maintenance within a living cell.

V. Theory

Unit I

Structure and properties of genome: Genetic material, Content of the Genome, Structures of DNA and RNA; Stereochemistry of bases and secondary structures; Alternative forms of DNA structure; Organisation of bacterial, viral and eukaryotic genome; Physico-chemical properties of DNA (Tm, Hyper-chromaticity, Kinetic Classes, Buoyant Density etc.).

Unit II

DNA replication: Models of DNA replication in prokaryotes, Eukaryotes and viruses; Molecular events during DNA replication; The Replisome: *E. coli* and eukaryotes; Structure and function of DNA polymerases and types; Importance of Telomere and Telomerase in replication of chromosome termini.

Unit III

Transcription: Transcription in Prokaryotes – Bacterial RNA polymerase, Initiation, elongation and termination; Transcription in Eukaryotes – RNA polymerases and mechanism; Post transcriptional modifications; Structure and synthesis of rRNA and tRNA.

Unit IV

Translation: Genetic code, Codon bias, Types and structures and active centre of ribosomes, tRNA structure, Wobble hypothesis, Mechanisms of translation and post-translational modifications in prokaryotes and eukaryotes and the factors involved in various steps, Concept of polysomes and protein structure.

Unit V

DNA recombination: Homologous and site-specific recombination; Crossing over; Holliday junction; Transposition

Unit VI

Mutations: Types, mutagens. Molecular basis of mutation, Mutations induced by chemicals, radiation, transposable elements; DNA Repair: DNA repair enzymes; Types and mechanisms; Methods for detection of DNA damage.

VI. Practical

Good Laboratory Practices – Biosafety and disposal of hazardous material. Preparation of buffers and reagents. Tissue sampling techniques for isolation of DNA and RNA. Isolation of Genomic DNA by Phenol Chloroform Method. Isolation of Genomic DNA by Salting-out method. Isolation of Genomic DNA by CTAB method. Preparation of Media for cultivation of *E.coli*. Isolation of Plasmid DNA from *E.coli* by alkaline lysis method. Isolation of RNA by TRIzol method. Quality analysis of Nucleic acids by Agarose Gel Electrophoresis. Nucleic acid quantification by spectrophotometer/nanodrop. Protein Purification. Separation of proteins by SDS-PAGE. Separation of proteins by Native PAGE. Detection of mutation by Comet Assay.

I. Course Title : Concepts of Cell Biology

II. Course Code : FBT 502

III. Credit Hours : 2+1

IV. Aim of the course

To outline the basic structure growth and differentiation of prokaryotic and eukaryotic cell To describe the structure and function of biological membranes To discuss the various sub-cellular components and their functions so as to impart an overall understanding of cellular organisation and evolutionary changes

V. Theory

Unit I

Basics of cell biology: Basic concept and evolution of cells, Cells to tissues; Prokaryotic and eukaryotic cell architecture, Cell theory, Diversity of cell size and shape.

Unit II

Organization of cellular organelles: Organization and function of sub-cellular organelles – Cell surface, Cell membrane and types; Cytoplasm; Endoplasmic reticulum; Golgi apparatus; Lysosomes; Mitochondria; Ribosome, Nucleolus; Peroxisomes and Sub-nuclear structures.

Unit III

Membrane transport mechanism: Overview of membrane transport, Active/ passive membrane transport (Case study - Osmoregulation in freshwater and marine fishes) ion channels; carrier proteins.

Unit IV

Cell signalling: Signalling molecules, Cell surface receptors, Secondary messengers and Intracellular signal transduction.

Unit V

Cell division: Cell cycle, Mechanism of cell division, Growth factors; Cell growth and differentiation; Cytoskeletal systems: Microtubules, Microfilaments, and intermediate filaments; Cell motility; Actin-Myosin filaments; Flagella; Cilia; Cell adhesions, Cell junctions and the extra cellular matrix.

Unit VI

Protein sorting: Secretion and targeting; Vesicular traffic; Endocytosis; Exocytosis; Protein translocation and secretary pathways.

VI. Practical

E. coli growth curve. Gram's staining. Bright-field microscopy. Phase contrast microscopy. Fluorescent microscopy. Electron microscopy. Sample preparation for light microscope. Sample preparation for electron microscope. Microtomy. Isolation of organelles. Sub-cellular fractionation. Chromosome preparation. Histochemical techniques

- ISBN-13: 978-8121924429
- https://www.ncbi.nlm.nih.gov/books/

I. Course Title : Gene Structure And Regulation of Expression

II. Course Code : FBT 503

III. Credit Hours : 2+1

IV. Aim of the course

To understand the general principles of gene organization and expression in both prokaryotic and eukaryotic organisms.To explain various levels of gene regulation and to discuss the possibilities of manipulating gene function for the good of mankind in general and fisheries in particular.

V. Theory

Unit I

Gene components: Genes, Types of genes; Gene structure: Promoters, UTRs, ORFs, exons, Introns, Termination signal, Mono- and polycistronic genes, Gene clustering; Overlapping genes (Phi X174 virus).

Unit II

Regulation of gene expression in Prokaryotes: Operon concept: Types of operons, Lactose and tryptophan operons (Lac/Trp), Their structure and mode of regulation; Induction of transcriptional factors by environmental and biological factors (SOS response), Bidirectional promoters.

Unit III

Regulation of gene expression in Eukaryotes: DNA protein interactions (concept of DNA foot printing, EMSA, zinc fingers, leucine zippers, helix turn helix, Z-DNA); Transcription factors, Promoters, Enhancers, Repressors, Insulators, Attenuators, IRES, Alternative splicing.

Unit IV

RNA in gene regulation: Antisense RNA, MicroRNA, Ribozymes, RNA interference. Expression Profiling: Micro array and Real time PCR, RNA seq.

Unit V

Epigenetics: DNA methylation, Genetic imprinting, Histone modifications, Chromatin remodeling.

Unit VI

Mutagenesis: Site-directed mutagenesis and its applications, Transposon induced mutagenesis.

I. Practical

Total RNA extraction. Quality checking of RNA by Agarose Gel Electrophoresis. cDNA synthesis by RT-PCR. Retrieval of Gene information from NCBI/ENSEMBL. BLAST analysis. *In-silico* identification and analysis of promoters, transcription factors and other regulatory elements. Primer designing. Polymerase Chain Reaction. DNA purification from agarose gel. T/A cloning. Screening of recombinant clones by blue white selection. RACE-PCR. Real time PCR for absolute quantification of genes. Real time PCR for relative quantification of genes.

II. Suggested Reading

- Boyer R. 2005. *Concepts in Biochemistry* (3rd Edition). Wiley, NJ, US, 736 pp.

- ISBN-10: 0471661791.Lewin, B. 2005 *Essential Genes*. Benjamin Cummings, 672pp.
- Primrose SB. 1987. *Modern Biotechnology*. Blackwell Scientific Pub., London, UK, 184 pp.
- Rastogi VB. 2010. *Fundamentals of Molecular Biology*. Ane Books Pvt Ltd, New Delhi, 462pp.

I. Course title : Genetic Engineering

II. Course code : FBT 504

III. Credit Hours : 2+1

IV. Aim of the course

To familiarize the students with the basic concepts in recombinant DNA technology. To acquaint the students to versatile tools and techniques employed in genetic engineering and its application in fisheries and aquaculture.

V. Theory

Unit I

Enzymes used in recombinant DNA technology: DNA modifying enzymes - types of restriction endonucleases (Type I, II and III), Alkaline phosphatases, Kinases, Exonucleases, Ligases, Terminal transferases.

Unit II

Vectors in genetic engineering: Plasmids (replication, copy number control and compatibility), Bacteriophages, Phagemids, Cosmids, M13 vectors, High capacity vectors (eg. BAC, YAC, PAC, HAC), Shuttle vectors; Adapters, linkers, ligation, Transformation and selection.

Unit III

Host organisms: Prokaryotic (selected *E. coli* strains) and Eukaryotic (selected yeast strains).

Unit IV

Principle and applications of PCR: Principle of DNA amplification by PCR and applications, Optimization, Prevention of mispriming; Hot Start, Touchdown, Gradient PCR; T/A cloning of amplified products; Characteristics and types of thermostable DNA polymerases.

Unit V

Cloning strategies: Cloning strategies for prokaryotic and eukaryotic constructs, Promoter systems for high expression in *E. coli*; Cloning for in vitro transcription; Expression optimization and affinity purification strategies for recombinant proteins.

Unit VI

Genomic and cDNA library: Shotgun cloning, Construction in high capacity vectors, Screening, and Applications; Chromosome walking. cDNA library: Construction and screening; and Clone characterization.

VI. Practical

In silico DNA sequence analysis for cloning. Insert and vector preparation. Ligation. Preparation of competent cells. Transformation. Selection of transformed cells.

Primer designing. Clone confirmation by colony PCR. Clone confirmation by Horizontal cell lysis. Southern blotting. Western blotting. Labeled probe preparation by nick translation. Random primer labeling of probe

I. Course title : Bioinformatics Tools for Fisheries

II. Course code : FBT 505

III. Credit Hours : 1+1

IV. Aim of the course

To familiarize the students with the use of biological databases To provide practical knowledge on DNA and protein sequence retrieval and Phylogenetic analysis using softwares

V. Theory

Unit I

Basics of Bioinformatics: Overview of Bioinformatic resources, and applications. Platforms (Linux and Windows) and available software; Databases: Primary databases: nucleotide sequence databases, Protein sequence databases; Secondary databases; Structure databases; Analysis packages.

Unit II

Sequence Alignment: Dot Matrix, PAM, BLOSSUM Matrix, Sequence retrieval from online database, Simple pairwise alignment (BLAST) and Multiple sequence alignment.

Unit III

Sequence analysis: Retrieval of sequences, Sequence quality, Assembly and annotation of Sanger sequencing reads, Identification of cis acting regulatory elements, ORF finding, signal sequences in DNA and proteins, Data analysis tools for SNP and ESTs.

Unit IV

Phylogeny and evolution: Evolution of genome, Basic force of evolution, Variation and divergence of populations, Estimation of divergence time; Phylogenetic species concept, Phylogenetic trees, Clasdistics, Concept of monophyly, Paraphyly and polyphyly, Phylogenetic reconstruction using distance-based methods (UPGMA, Neighbour-Joining), Phylogenetic reconstruction using character-based methods, Maximum Parsimony, Maximum Likelihood and Bayesian Inferences, Principle, methodology, Tree comparisons and statistical tests, Parametric bootstrapping, interpretation of results and limitations.

VI. Practical

Sequence retrieval from databases. Refining the search criteria by modifying different parameters. Sequence submission to databases (NCBI GenBank/BOLD). Pairwise sequence alignment (BLAST). Multiple sequence alignment by ClustalW. Identification of Open Reading Frame (ORF). Primer designing. Restriction site identification. Plasmid map drawing. Protein structure prediction using softwares. Construction of phylogenetic tree using MEGA/MrBayes/Phylip/PAUP. Analysis of results of phylogenetic tree.

I. Course Title : Fish Cell Culture

II. Course Code : FBT 506

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on basic cell and tissue culture techniques To acquaint the students with the applications of fish cell culture

V. Theory

Unit I

Basic of fish cell culture: Introduction, History, Development and importance of fish cell culture; Structure and Organization of animal cells; Biology of cultured cells.

Unit II

Primary Cell culture: Basic requirements for fish cell culture: Equipment, Media and supplements, basic aseptic techniques.

Unit III

Cell culture techniques: Establishment and maintenance of fish cell lines; Organ and histotypic cultures; Scaling-up of cell culture; Applications of fish cell culture /cell lines, Overview of methods used for characterization of primary culture / cell lines

Unit IV

Quality control: Quality control of fish cell lines, Prevention, Assessment of contaminants; Detection and cure of contamination, *In vitro* assays for cytotoxicity and genotoxicity assessment, Stem cells; Stem cell cultures, Embryonic stem cells and their applications; Induced Pluripotent Stem Cells and its applications.

Unit V

Applications of fish cell culture: Hybridoma Technology and its applications in fisheries, Overview of three dimensional culture and tissue engineering.

Unit VI

Cryopreservation: Cryopreservation and storage of fish Cell lines, cell repositories.

VI. Practical

General instructions to be followed in cell culture laboratory. Design and layout of a cell culture laboratory. Preparation of cell culture medium and medium filtration. Preparation of primary cell culture from selected fish tissues. Sub culturing by tripsinisation. Cell counting. Maintenance of fish cell lines. Cryopreservation and revival of cells. Measurement of doubling time. Characterisation of cells using cytogenic and molecular markers. Cytotoxicity assessment. Transfection of fish cells.

I. Course Title : Aquaculture Biotechnology

II. Course Code : FBT 507

III. Credit Hours : 2+1

IV. Aim of the course

To provide an overview of genetic manipulation techniques for improvement of aquaculture production.
To understand the application of biotechnological tools in fish breeding, feed health, processing and other issues in fisheries.

V. Theory

Unit I

Chromosome manipulation: Ploidy manipulation, Sex reversal, Androgenesis, Gynogenesis and applications, Transgenesis in fish: Methods of gene transfer in fishes, Screening, Applications of transgenic fishes, GMOs: Biosafety regulations, ethics and IPR.

Unit II

Molecular markers for aquaculture: Sources and significance of genetic variation, Biochemical and molecular markers, Development and applications of Allozymes, mtDNA markers, RFLP, RAPD, AFLP, Minisatellites, Microsatellites and SNPs; DNA barcoding of fishes, FISH-BOL.

Unit III

Reproductive biotechnology: Overview of broodstock management and seed production, Induced breeding hormones and analogues; Seed certification through molecular techniques; Applications of nanotechnology in fish breeding.

Unit IV

Microalgae culture methods: Indoor, Mass culture, Raceway system; Enrichment of micro algae with micronutrients; Fuel production from microalgae using biotechnological approaches; Pharmaceutical products from microalgae; Macroalage cultivation and propagation.

Unit V

Biotechnological tools in aquatic animal health management: Concept and techniques for the production of SPF and SPR stocks in crustacean aquaculture; Disease diagnostic techniques(PCR, RT-PCR, LAMP) and therapeutics – DNA vaccines and RNAi vaccines.

Unit VI

Biotechnological tools in fish nutrition: Probiotics, and its role in aquaculture; Microbial flocs as feed for aquatic animals; Biofilms, Biofloc, Single cell protein, Bio-encapsulated feeds; Detection of contaminants in fish feed by biotechnology tools; Nutraceuticals, Nutrigenomics.

VI. Practical

Fish Chromosomal manipulation – Androgenesis, Gynogenesis, Triploidy. Allozyme variation by PAGE, Gel imaging and scoring. RAPD and interpretation of results. PCR-RFLP and interpretation of results. AFLP and interpretation of results. Development and validation of microsatellite marker. Disease diagnosis of shrimp/ fish seeds using PCR/RT-PCR. Synthesis and characterisation of nanoparticles. Delivery of nanoparticle conjugated hormones/drugs to fish. Isolation and screening of probiotic bacteria isolated from fish. Identification and culture of spirulina. Culture of live food organisms (Artemia/Rotifer/Moina). Different methods of gene transfer. Development of biofloc.

I. Course Title : Marine Biotechnology

II. Course Code : FBT 508

III. Credit Hours : (1+1)

IV. Aim of the course

To know and to understand the essential facts and concepts related to marine biotechnology. To give the students an overview of the potential marine resources and their uses.

V. Theory

Unit I

Marine bioresources: Historical background, Overview of the present status of marine biotechnology, Commercially important and potential species, Micro and macro-algae, Their culture and application in aquaculture.

Unit II

Bio-prospecting: Bio-prospecting of genes and allele mining for novel compounds, Methods of bio-prospecting from marine environment; Marine derived pharmaceuticals; Marine bio-resources, Secondary metabolites, Marine proteins and lipids; Marine actinobacterial metabolites, Potential bioactive compounds from soft and hard corals, Marine sponges etc., Marine biotoxins and their pharmacological potential.

Unit III

Marine Enzymes and Polysaccharides: Biotechnological application of Marine Enzymes- amylase, Protease, Lipase, Cellulases and Chitinase from micro algae, bacteria, fungi, actinomycetes, Marine Polysaccharides- alginic acid, agar, Fucoidan and carrageenan from marine seaweeds.

Unit IV

Environmental Biotechnology: Bio-film, Biofuel, Bio-remediation, Phytoremediation; Genetically engineered microbes for marine pollution control, Biofouling and prevention, Antifouling properties of marine organisms (algae, seagrass, marine microbes); Metagenomics; Concepts and applications.

VI. Practical

Identification of microalgae. Isolation and culture of microalgae. Identification of seaweeds. Micro-propagation of seaweeds. Isolation and culture of planktons. Isolation of aerobic microbes from sea. Isolation of anaerobic microbes from sea. Extraction of bioactive compounds from seaweeds. Extraction of bioactive compounds from microalgae. Extraction of bioactive compounds from sponges. Screening of bioactive compounds.

I. Course title : Molecular Markers

II. Course code : FBT 509

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with techniques used to estimate genetic variation among individuals and populations for applications in selective breeding and conservation.

V. Theory

Unit I

Genetic variation: Sources and significance of genetic variation; Statistical methods to estimate genetic variation.

Unit II

Biochemical and molecular markers: Type I and Type II markers; Development and applications of Allozymes, mtDNA markers, RFLP, RAPD, AFLP, Minisatellites, Microsatellites and SNPs.

Unit III

Sequencing technologies and applications: Chemical sequencing, Chain termination and NGS.

Unit IV

Genome and transcriptomic sequencing: Whole genome (Nuclear and Mitochondrial) and transcriptome sequencing and their applications.

Unit V

Marker Assisted Selection (MAS): Overview of linkage maps; FISH, QTL and genomic selection, Population genomics and applications.

Unit VI

Application of Molecular Markers in Taxonomy: DNA Barcoding; Metabarcoding.

VI. Practical

Allozyme variation by PAGE. Gel imaging and scoring of allozyme. RAPD. Interpretation of RAPD Gel and data analysis. PCR-RFLP. Interpretation of PCR-RFLP Gel and data analysis. AFLP. Interpretation of AFLP Gel and data analysis. Development and validation of microsatellite marker. Genotyping of SSR markers. Genotyping of SNPs.

VII. Suggested Reading

I. Course Title : Molecular Taxonomy and Phylogenetics

II. Course Code : FBT 510

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with techniques used to delimit species using DNA / Protein sequence data for application in molecular taxonomy and conservation.

V. Theory

Unit I

Molecular Basis of Evolution: Overview of genome structure; Sources of genetic variation (Recombination, Mutations, Indels, Gene duplication); fast and slow-evolving sequences; Homologous, Paralogous and Orthologous genes, Concept of Neutral theory of molecular evolution.

Unit II

Evolution and Speciation: Allopatric, Sympatric and Parapatric speciation, Factors responsible for speciation Phylogenetic species concept, Phylogenetic trees, Concept of monophyly, paraphyly and polyphyly, Species delimitation, Gene trees and species trees DNA barcoding and concept, BOLD SYSTEMs and WORMS; Principle, Methodology, Application and limitations.

Unit III

Genetic distance measures: Observed and expected distances, Pair-wise distances, inter and intra specific distances;

Unit IV

Concepts in phylogeny: Phylogenetic species concept, Phylogenetic trees, Concept of monophyly, Paraphyly and polyphyly.

Unit V

Phylogenetic tree construction: Phylogenetic reconstruction using distance-based methods (UPGMA, Neighbour-Joining), Principle, Methodology, Interpretation of results and limitations.

Unit VI

Phylogenetic analyses: Phylogenetic reconstruction using character, Based methods, Maximum Parsimony, Maximum Likelihood and Bayesian Inferences, Mesquites, Genepops, Phylogenetic tree importances.

VI. Practical

DNA sequence analysis. Genomic databases. Genbank search and dataset download. Blast tools. EMBOSS tools. Sequence alignment, and editing, Data partition, Selection of the best substitution model. Use of Neighbour-Joining, Maximum Likelihood and Bayesian inference. Re-analysis and interpretation of reference data. Bioinformatic tools (MEGA, Phylip, PAUP, Mr Bayes and Fig Tree) for phylogenetic tree reconstruction.

Course Contents
Ph.D. in Fish Biotechnology

I. Course Title : Genetic Engineering of Bacteria and Viruses

II. Course Code : FBT 601

III. Credit Hours : 2+1

IV. Aim of the course

To provide knowledge on various techniques available to produce genetically engineered microbes and their application, design of viral vectors for efficient gene delivery.

V. Theory

Unit I

Genetic engineering of bacteria: Recombinant protein expression in Bacteria, Optimization of expression; Fusion proteins, Purification of recombinant proteins – inclusion bodies, Extracellular targeting, Engineering of signal sequences, Electroporation.

Unit II

Molecular biology of fish DNA/RNA viruses: Major groups of DNA/RNA viruses; Their Cis acting genetic elements and Regulation of protein expression.

Unit III

Genetic engineering of virus: Use of animal viruses like vaccinia, Herpes, Retrovirus, Baculovirus and Adenovirus as cloning vectors, Design of viral vectors – Special features, Cis acting regulatory elements; Strategies to optimize recombinant protein production.

Unit IV

Vectors: Pros and cons of using viral vectors as gene delivery vehicles; Vectors based on bacteriophage lambda, P1 and M13, special features and their application in optimizing recombinant protein production.

Unit V

Scope and application of genetic engineering in virus: Efficient gene delivery strategies, Host-pathogen interaction, Antigenic proteins, Vaccination approaches, DNA vaccines, Diagnostics; non-antibiotic selectable markers for live vaccines and gene therapy, Methods for detection of viral infection, Estimation of viral load by Real Time PCR, etc.

Unit VI

IPR issues in Biotechnology: Patent laws; Global scenario of genetically modified organisms, Intellectual Property Rights (IPR), Patent laws at institutional, national and international level.

VI. Practical

Transformation of bacteria by electroporation, Southern and dot-blot transfer techniques; Restriction mapping of DNA; labelling of DNA probes; PAGE analysis for recombinant proteins. Preparation of primary and secondary monolayer cell culture, use of cell culture in virus cultivation and assay; Viral DNA isolation and restriction analysis; Culture and maintenance of bacteriophages; qRT-PCR. Bacterial mass culture through fermentation technique.

VII. Suggested Reading

I. Course Title : Genetic Engineering of Higher Eukaryotes

II. Course Code : FBT 602

III. Credit Hours : 2+1

IV. Aim of the course

To provide in-depth knowledge on the techniques available for genetic engineering of higher eukaryotes To describe strategies to optimize recombinant protein production in eukaryotic expression systems

V. Theory

Unit I

Eukaryotic expression systems: Overview of recombinant DNA technology and applications in fisheries and aquaculture, Eukaryotic expression systems; Yeast expression system – Host strains, Special features, Types of vectors (yeast episomal vectors, Integrating vectors and YACs), Yeast two hybrid system.

Unit II

Insect cell expression system: Cell expression system- Special features, Types, baculoviral expression vectors, Polyhedron promoters.

Unit III

Mammalian cell expression system: Special features, Selectable markers; Transfection: Principle, types, Selection; Transduction by viral vectors, Construct design (strong and constitutive promoters, inclusion of introns).

Unit IV

Fish cell expression system: Tissue specific promoters, Constitutive promoters and applications, Strategies for optimizing recombinant gene protein expression in eukaryotic systems; Downstream processing of recombinant proteins.

Unit V

Fish as a model organism: Gene function analysis – Gene knockouts, RNAi, etc; Site directed and transposon mediated mutagenesis, CRISPR (Clustered Regularly Interspaced Short Palindromic Repeats) knockdown technology.

Unit VI

Transgenesis: Methods of gene transfer, Integration and detection techniques, *In situ* hybridization; Strategies for gene targeting (homologous sites/cre-lox recombination system) Biosafety regulation, Case studies: AquAdvantageTM salmon and GLoFishTM; fish as bio-factories.

VI. Practical

Gene transfer experiments (electroporation, microinjection). Western blotting for confirming integration and expression of transgene. Southern blotting for confirming integration and expression of transgene. Inverse PCR - Partial RE digestion, designing of primers and interpretation of results. Construction of cDNA library. Screening of cDNA library: Probe designing. Screening of cDNA library using colony hybridization. *in-silico* designing of guide RNA for CRISPR vector.

I. Course Title : Functional Genomics

II. Course Code : FBT 603

III. Credit Hours : 2+1

IV. Aim of the course

To give an introduction to application of modern techniques for functional genome analysis

V. Theory

Unit I

Basics of functional genomics: Genome size estimation; High throughput sequencing platforms for whole genome sequencing; Principles, applications, limitations, Data analysis; Gap filling and linkage groups; Gene annotation; Genome mining for various applications.

Unit II

Transcriptomics: Transcriptome sequencing by RNAseq and NGS, Data analysis, sequence assembly, Annotation, Gene ontology assignment, KEGG pathway analysis.

Unit III

Non-coding RNA: Structure, Processing and analysis of miRNA and Long noncoding RNA.

Unit IV

Global gene expression analysis: DNA Microarray, Subtractive hybridization and differential display for the identification of differentially expressed genes, Identifying candidate genes for various traits of fish species.

Unit V

Proteomics and metabolomics: Overview of proteomics and metabolomics, Bioinformatics tools used in proteomics; Protein databases and interfaces; Principles and Applications of metabolomics and system biology.

Unit VI

Functional genomics in aquaculture: Genomic resources in aquaculture species, Gene expression pattern during fish larvae development, Genomic responses to stress challenges in fish, Functional genomics in fish/shrimp disease control.

VI. Practical

Processing of high throughput sequence data for assembling contigs. Gene annotation and pathway analysis. Mining of transcriptome data for protein coding genes, differentially expressed genes. Mining of data for short and long non coding RNA and their target genes. Ensembl genome browser. DNA microarray. Software for allele mining. Ontology and identification of metabolic pathways. Investigation of aquatic animal pathogens using DNA microarray.

I. Course Title : Genome Markers in Aquaculture

II. Course Code : FBT 604

III. Credit Hours : 2+1

IV. Aim of the course

To learn development and application of genomic tools in aquaculture species

V. Theory

Unit I

Molecular markers: Molecular markers in aquaculture (Microsatellites, AFLP, SNPs etc.), and their application; Transcriptome associated markers - Type I markers.

Unit II

Genetic analysis using DNA markers: SNPs: Discovery, Array development, genotyping and Data analysis and applications.

Unit III

DNA marker maps: Radiation hybrid mapping and integrated maps, Genome analysis; Preparation of ordered cosmid libraries, BAC libraries, Shotgun libraries: Construction and characterisation.

Unit IV

DNA sequencing technologies: Conventional and automated sequencing, Metagenomics, NGS platforms – Principles and applications.

Unit V

Case studies: Genotype based sequencing, Case studies of linkage maps (Rohu, Tilapia, European seabass, Channel catfish, *Litopenaeusvannamei*).

Unit VI

Applications: QTL and Maker assisted selection in aquaculture species, Genomic selection in aquaculture breeding programmes, DNA chips, phenomics and association studies.

VI. Practical

Microsattelite development and validation. AFLP and data analysis. Construction of genomic library. Screening of library by colony hybridization. Screening of library by probe labelling techniques. Software related to linkage mapping. SNP discovery and analysis.

VII. Suggested Reading

- Avise JC. 1994. *Molecular Markers, Natural History and Evolution*, Springer, US, 516 pp.
- Caetano-anolles G and Gresshoff PM. 1998. *DNA Markers: Protocols, Applications and Overviews*. Wiley-VCH, NY: 364 pp.

- MacKenzie S and Jentoft S. 2016. *Genomics in Aquaculture*. Academic Press, 304 pp.
- Overturf K. 2009. *Molecular Research in Aquaculture*. Blackwell Publishing, 395 pp.

I. Course title : Biotechnological Applications in Aquaculture

II. Course code : FBT 605

III. Credit Hours : 2+0

IV. Aim of the course

To acquire knowledge on the latest development in aquaculture biotechnology

V. Theory

Unit I

Reproductive biotechnology: Gonadal steroids, Endocrine control of oogenesis and spermatogenesis, Pituitary and gonadotropins; Fish recombinant gonadotropins – Structure, Synthesis, Evolution, Regulation of gonadotropins and promoters; Pheromones – Types, Evolution, Role in breeding and population management.

Unit II

Neofemale technology: Differential growth pattern in prawns, Androgenic gland ablation, Mating design, Advantages and challenges; Artificial insemination in crustaceans – Definition, Types of thelycum, Insemination methods, Purpose and difficulties.

Unit III

Surrogate broodstock technology: Mechanism of gonad development, Germ cell transplantation (GCT), Primordial germ cells (PGCs), Spermatogonial stem cells (SSCs), GCs transplantation techniques for various developmental stages of fishes; Problems and Future developments.

Unit IV

Biosecurity and Bioremediation: Specific Pathogen Free (SPF) shrimp, Quarantine, Mating design, Nucleus Breeding Centre (NBC), Broodstock Multiplication Centre (BMC) and advantages of SPF stocks; Biosecurity in SPF shrimp hatcheries, Biotechnological approaches for fish pond management through bioremediation; Meta barcoding and its application in aquaculture.

Unit V

Nutrigenomics: Nutrient-gene interactions; Nutraceuticals; Nanotechnology for nutrient delivery in fish; Biotechnologically improved plant protein feed ingredients to replace fish meal in aqua feed.

Unit VI

Seaweed micropropagation: Methods of seaweed cultivation, Propagation methods (Vegetative and Reproduction), Clonal propagation and selection of strains with superior traits; Seaweed tissue and callus culture; Growth regulators and callus induction; Production of micropropagules from callus culture; Cell suspension cultures from seaweed callus; Bioprocess engineering of tissue culture of seaweeds and future prospects.

I. Course Yitle : Nano Biotechnology

II. Course Code : FBT 606

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint students with the practical knowledge on synthesis and characterisation of nanoparticles.

To explain the importance and applications of nano-biotechnology in fisheries and aquaculture.

V. Theory

Unit I

Introduction to nano biotechnology: Overview of nanoscale materials and nanostructures, Applications in fisheries and aquaculture.

Unit II

Synthesis of different types of nanomaterials: Chemical, Physical and Biological methods, Functionalization of nanoparticles for biological applications.

Unit III

Characterization of nanostructures: Scanning probe microscopy; Electron microscopy; NMR; AFM.

Unit IV

Applications: Biomolecules as nanostructures and their application in nanotechnology viz., Biosensor, Separation of cell and cell organelles, Gene therapy and chromosome/genome mapping, Nanoparticle based genotyping, Nano delivery of bio molecules, Nano-fertilizers, Nanotechnology in Packaging, Nanobarcode Technology, Biobarcode Assay; Nanotoxicity; Environmental behaviour of nanoparticles, Green nanotechnology, Ethical and IPR Issues in Nanotechnology.

VI. Practical

Chemical synthesis of nanoparticles. Green synthesis of nanoparticles. Characterization of nanoparticles by zetasizer. Characterization of nanoparticles by SEM. Nano-conjugation of DNA/protein. Confirmation of nano-conjugation by gel retardation assay. Nanodelivery of various biomolecules. Toxicity assessment of nanoparticles. Patent search on nanotechnology. Field trip to Nanotechnology institutes/labs.

I. Course Title : Bioprocess Technology

II. Course Code : FBT 607

III. Credit Hours : (2+0)

IV. Aim of the course

To learn the techniques for bulk processing, production and purification of biologicals.

V. Theory

Unit I

Bioprocessing: Raw materials for bioprocessing, Comparison of chemical and Biochemical processing based on energetics and Environmental issues.

Unit II

Bioprocessing requirements: Development of inocula, Kinetics of enzymatic and

Microbial processes, Optimisation studies, Sterilization of media, Air and equipment, Modes of cell cultivation.

Unit III

Bioreactors: General principles of bioreactor design and their operation, Downstream processing, Separation and Purification techniques, Quality assurance testing; Representative examples of microbial products, Vaccines and vaccine development.

Unit IV

Methods in processing: Immobilization of cells and enzymes: Principles, Methodology and applications, Disintegration of cells, Separation of solid and liquid phases.

Unit V

Isolation and purification: Isolation and purification techniques for proteins and other products based on different physico-chemical properties, e.g., precipitation, adsorption, chromatographic separations, bio-affinity based methods

Unit VI

Post-processing: Principles of bioprocess control, bioprocess automation and Application of computers in bioprocessing, Recombinant products with representative examples.

Suggested Broad Areas for Masters and Doctoral Research

- DNA marker development for species/hybrid identification, stock characterization, MAS/ genomic selection, etc.
- Cytogenetics: genotoxicity assessment; FISH for DNA marker localization
- Molecular interventions for captive maturation and induced breeding
- Chromosome manipulation: androgenesis, gynogenesis and triploidy, monosex populations
- Development of molecular diagnostics and vaccines
- Nanotechnology: Nanoparticle synthesis, functional derivatization for delivery of bio-active molecules, toxicity assessment and mitigation
- Genomics/transcriptomics/proteomics: high-throughput data for mining novel genes and markers for various applications including climate/environment resilient traits
- Cell line tissue culture/ stem cells for various applications

- Transgenesis/gene editing for trait improvement, producing mutants/ model organisms for drug screening
- Epigenetics: Mechanisms and gene expression modulation for various applications
- Cryopreservation for germplasm conservation
- Bio-prospecting of marine organisms for drug development
- Computational approaches in fish genomics and drug designing

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 5

Fisheries Science
– Fish Processing Technology

Preamble
(Fish Processing Technology)

The syllabi for postgraduate programmes in Fish Processing Technology (M.F.Sc., and Ph.D.) were revised with the prime objective of coping up with the developments that have taken place in the field of fish processing sub-sector at national and international levels in recent years and to suit with the developments that would take place in the next five years. Although we have taken the base as the common syllabus revised and adopted by the ICAR BSMA in 2009, the syllabi followed at CIFE Mumbai for M.F.Sc. and Ph.D in Post-Harvest Technology was very much consulted as the syllabi was relooked with the changing scenario in the field and improved. The major changes in revision of the syllabi for the M.F.Sc and Ph.D. programmes in Fish Processing Technology from BSMA 2009 are discussed as under:

M.F.Sc. in Fish Processing Technology

- FPT 501 Low Temperature Preservation of Fish and Shell-fish: The title and content of this course was changed from the earlier course title, Technology of fish freezing and frozen storage without alteration in the credit load. The contents were updated and recent developments in technology and analytical methods included.
- FPT 502: Thermal Processing of Fish and Fishery Products - Unit wise distribution of contents rearranged and aspects on thermal process calculations included.
- FPT 503: Applied Fish Microbiology - Title changed from Techniques in Microbiology incorporating not only the techniques but also basic and applied aspects of fisheries microbiology
- FPT 504 Fish Quality Assurance and Certification – Details of HACCP added
- FPT 505: Applied Fish Biochemistry - Topics on “Pigments” and “Electrophoresis” added
- FPT 506: Value Added Fishery products - With the changes that have taken place in the field of fish processing and value addition both in domestic and export markets it was decided have this new course. However, some of the contents of FPT 508 Technology of Mince based Fish Products (1+1) and a few aspects from the course FPT 506 Cured, dehydrated and Smoked Fishery products (1+1) are included
- FPT 507 Trade Regulations, Certification and Documentation in Export of Fish and Fishery Products – This is a new course with the credit load of 1+1, considering the importance of export trade of fish and fishery products and the need to develop entrepreneurs. Topics on Import regulations, SPS-TBT agreement, Traceability issues for farm reared and wild aquatic products; dealing with returned consignments; Foreign trade regulations in India; Practical on “Preparation of BOL, LC; Preparation of documents for seafood export to different destinations; Study of documents on customs and port procedures for seafood export and import” included.
- FPT 508: Design, Maintenance of Fish Processing Plants and Instrumentation - Topics on “Plant design as pre-requisite for quality management” and “Designing of ETP systems” added. Minor changes in contents of practical also made.
- FPT 509: Microorganisms of Public Health Significance - Topics on “Algal toxins” and “Antibiotic resistance in microbes” added to the contents.
- FPT 510: Molecular Techniques in Seafood Quality Analysis - – This is a new course

with the credit load of 1+1. Considerable developments in molecular analysis have taken place over the past decade and contents of this course reflect all recent developments in seafood analysis.

- FPT 511: Packaging of Fish and Fishery Products - Topics on "Packaging requirements for transportation of live fish and shellfish", "FSSAI requirements and BIS guidelines", "Intelligent packaging; edible packaging", "Disposal and recycling of packaging materials" added
- FPT 512: Fish Byproducts and Waste Utilization – Title changed from Fish Byproducts and Utilization of Fishery Waste with addition of topics on biopeptides, chitooligo- saccharides and chitosan based nanoparticles and also the units rearranged
- FPT 513: Multivariate Analysis in Food Processing and Product Development – This is a new course with the credit load of 0+1, designed for students who take up research on product development.

Ph.D. in Fish Processing Technology

- FPT 601 Principles and Techniques in Seafood Analysis – Title changed from Biochemical Techniques in Fish Analysis (2+1) with additional topics on GCMS, GC MSMS, SEM, TEM introduced
- FPT 602 Functional Properties of Fish and Shellfish Proteins. Rephrasing of the tile carried out. Units rearranged for better coherence.
- FPT 603 Biotechnological Applications in Fish Processing, A new course with a credit load of 2+1. Recombinant DNA technology, Molecular biological and Immunological tools in bacterial detection in foods and molecular techniques in detection seafood adulteration are the novel topics introduced.
- FPT 604 Quality Management Sysems – In addition to the original contents accreditation of analytical laboratories introduced.
- FPT 605 Emerging Trends in seafood Processing, A new course introduced with the credit load of 1+1 to keep abreast of the developments in modern techniques in food processing. Types of novel processing technologies and their applications such as Supercritical Fluid extraction- SCFX, High-Pressure Processing (HPP); pulsed electrical fields (PEF) as a pasteurization technology, Ultrasound processing, Ozone/ CO_2 Processing, Hurdle Technology and Automation in Processing are the topics given focus.
- FPT 606 Nutraceuticals of Aquatic Origin – A new course with a credit load of 1+1 with units of Nutraceuticals and functional foods, Marine bioactive compounds and Delivery of nutraceuticals included
- FPT 607 Toxins and Contaminants – Topics on Antibiotic residues in seafood, micro-plastics, PAHs, Toxicity and accumulation studies added along with other changes made.
- FPT 608: Additives in fish Processing – A new course (1+1) taken from the original syllabus of M.F.Sc. programme updating contents and rearrangements of units.
- FPT 609: Sensory and Physical Analyses – A new course (2+1) with units on basics of sensory and physical analysis, Measuring responses, Physical and mechanical properties of food, and Guidelines for analysis and reporting.
- FPT 610: Environmental Impact of Fishery Industries – Contents updated and units rearranged
- FPT 611: Food Labeling – Title changed from Nutritional Aspects and Nutritional Labeling (2+1) and credit load reduced to 1+1. Contents revised with focus on legislation and labeling requirements.

- FPT 612: Water Quality Management in Seafood Processing – A new course with a credit load of 2+1 giving focus on units including Sources and types of water, Quality criteria, Quality Standards, Water budgeting for processing and treatment. Considering the Union Government's Blue Revolution initiatives in promoting fisheries sector, the syllabi for postgraduate programmes in Fish Processing Technology are framed in such a way that our graduates would be able to man higher positions in fisheries management with skill sets for effective entrepreneurship.

Course Title with Credit Load
M.F.Sc. in Fish Processing Technology

Course Code	Course Title	Course Hours
	Major Courses	**20 credits**
FPT 501	Low Temperature Preservation of Fish and Shell Fish	2+1
FPT 502	Thermal Processing of Fish and Fishery Products	2+1
FPT 503	Applied Fisheries Microbiology	2+1
FPT 504	Fish Quality Assurance, Management and Certification	2+1
FPT 505	Applied Fisheries Biochemistry	2+1
FPT 506	Value Added Fishery Products	2+1
FPT 507	Trade Regulations, Certification and Documentation in Export of Fish and Fishery Products	1+1
	Minor Courses	8 credits
	(From the subjects closely related to a student's major subject)	
FPT 508	Design, Maintenance of Fish Processing Plants and Instrumentation	1+1
FPT 509	Microorganisms of Public Health Significance	1+1
FPT 510	Molecular Techniques In Seafood Quality Analysis	1+1
FPT 511	Packaging of Fish and Fishery Products	1+1
FPT 512	Fish Byproducts and Waste Utilization	1+1
FPT 513	Multivariate Analysis In Food Processing and Product Development	0+1
	Optional courses from other disciplines or MOOC	4
	Supporting courses	**6 credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common courses	**5 credits**
	(The following courses, one credit each will be offered)	

- Library and Information Services
- Technical Writing and Communication Skills
- Intellectual Property and its management in Agriculture
- Basic concepts in Laboratory Techniques
- Agricultural Research, Research ethics and Rural Development Programmes

Course Code	Course Title	Course Hours
	Seminar	**1 Credit**
FPT 591	Seminar I	0+1
	Masters Thesis Research	**30 Credits**
FPT 599	Master's Research (Semester III)	0+15
FPT 599	Master's Research (Semester IV)	0+15
	Total Credit load of M.F.Sc. Program	**70 Credits**

Course Contents
M.F.Sc in Fish Processing Technology

I. Course Title : Low Temperature Preservation of Fish and Shellfish
II. Course Code : FPT 501
III. Credit Hours : 2+1

IV. Aim of the course

Chilling and Freezing are the most common methods of fish preservation and most trade are happening at this form of preservation. A thorough knowledge on the mechanism of action of these methods is essential for any graduate student.

V. Theory

Unit I

Postmortem changes: Structural and chemical features of fish and shellfish as raw material for processing, Factors affecting quality of fresh fish, intrinsic and extrinsic factors, Handling of fish onboard, Landing centres and farm sites-different types of chilling methods, Depuration of bivalves, Assessment of post-harvest loss.

Unit II

Chilled storage and transportation of fish: Heat load calculation, Storage methods- insulated boxes and insulation thickness, Different types of ice, Physical, Chemical, Microbiological and Sensory changes during chill storage, Melanosis and its prevention, Iced storage shelf life, Cold shock, Transportation- live fish/shell fish, transportation of raw fish to local markets and processing centres, Improvements needed in transportation, Refrigerated transport systems, Classification of transport vehicles, cold chain.

Unit III

Freezing of fish and shellfish: Structure of water and ice, Influence of solutes on the structure of water and ice, Phase equilibria and freezing curves of pure water and binary solutions, freezing curves for fish, Determination of freezing points from time-temperature plots, Calculation of freezing time; Crystallization, Nucleation- homogeneous and Heterogeneous nucleation; Super cooling, Crystal growth, Eutectic point, Location of ice crystals in tissue, Changes during freezing.

Unit IV

Freezing methods: Technological aspects of freezing-methods of freezing (plate freezing, IQF, etc), Selection of a freezing method, Product processing and packaging, packing of fresh and frozen fish for consumers, Modified atmosphere packaging, Controlled packaging, Cold storage management-arrangements within a cold storage, handling and stacking systems.

Unit V

Changes in frozen storage: Physical changes, freezer burn and recrystallisation, Different types of recrystallisation, Chemical changes in lipids, Proteins and nucleotides, Freeze denaturation and theories on denaturation, Changes in pH, Bacterial changes, Sensory changes, texture, taste, odour, effect of post-mortem condition on sensory qualities.

Unit VI

Prevention of quality loss during frozen storage: Treatments prior to freezing, Antioxidants, Cryoprotectants and other additives, Theories of cryoprotection, Glazing- importance and methods.

VI. Practical

Handling of fish, crustaceans and mollusks, Evaluation of freshness of fish, crustaceans and molluscs, freezing curve, determination of freezing point, Filleting of fish, treatments, glazing, packaging, freezing, Processing of shrimp, lobster, squid, cuttle fish, crab etc. in different styles, Depuration-treatment with chemicals, Packaging and Freezing, Chemical tests (Histamine, k value) on frozen products and Studies on physical and sensory changes for determination of shelf life.

I. Course Title : Thermal Processing of Fish and Fishery Products

II. Course Code : FPT 502

III. Credit Hours : 2+1

IV. Aim of the course

To provide information on various aspects of thermal / heat processing.

To impart knowledge on various types of packaging techniques and materials used in thermal processing.

V. Theory

Unit I

Principles of thermal processing and classification of foods: Mechanisms of heat transfer; Unsteady state of transfer; conduction, convection, radiation; Dielectric and microwave heating, Heat penetration, cold point; Low acid, medium acid and acid foods, Absolute sterility, Statistical sterility, Commercial sterility, Pasteurization and Sterilization, sous-vide.

Unit II

Canning process: Steps involved, Process flow, Additives, Principles and process details, Canning machinery and equipment, Canning process for fish/shellfish, Value added canned products; Spoilage of canned food, physical, Chemical and microbial, Examination of cans and seams, Effect of canning on nutrient profile.

Unit III

Basis of Thermal Process: Heat resistance of bacteria and spores, Decimal reduction time, Thermal death time, "D", "Z" and "F0" values, 12 D value, Significance of survivor curve and Thermal death curve.

Unit IV

Thermal process calculations: Determination of process time and F value; Graphical, formula, Nomogram methods.

Unit V

Emerging trends in containers and heat treatment processes: HTST, UHT processing and aseptic canning, Flexible packing, Retort pouch processing of fish and fishery products principles and techniques; Combination and synergistic effects.

Unit VI

Canning plant location: Practical considerations, Canning plant facilities, Layout and design, Automation in canning lines.

VI. Practical

Operation of over pressure retort for canning, Canning operations for commercial important finfishes, Canning of shrimp and Cephalopods, Retort pouch processing of table fishes, bivalves, crustaceans, Examination of canned fishery products, Sensory evaluation of canned foods, Examination of can seams, Sterility test of canned products, Isolation of Clostridium spp, from canned foods, Heat Penetration Curve and Calculation of F0 Value, Z value, process time.

I. Course Title : Applied Fisheries Microbiology

II. Course Code : FPT 503

III. Credit Hours : 2+1

IV. Aim of the course

To teach nature and activity of microbes in fish and fishery products, microbiological spoilage and preservation, various aspects of Industrial microbiology, importance of fermentation.

V. Theory

Unit I

Introductory microbiology: Classification, nature and activity of microbes in fish and fishery products; Microbiology of marine, Brackish and freshwater fish/ shell fish, Microbiology of spoilage and preservation.

Unit II

Intrinsic and extrinsic parameters of fish and fishery products that influence growth and survival of microorganisms

Unit III

Pathogenic organisms of public health significance in seafood: The etiology of diseases; Conditions for outbreak and prevention, Food infections by *Salmonella, Vibrio parahaemolyticus*, *V. vulnificus,* pathogenic *E. coli*, *Listeria monocytogenes, Campylobacter*; Virulence mechanisms, Their sources, Incidences, Foods involved and Prevention measures.

Unit IV

Fermentation: Batch wise and continuous; Important fermented products and methods of production; Screening of microorganisms, Detection and assay of products of fermentation, Preparation and use of fermentation media, Starter culture, Preparation and maintenance of stock cultures.

Unit V

Microbial injury, Microbial biofilms, Inactive physiological states (spores and VBNC), Unculturable and Uncultured bacteria, Identification of unculturable groups.

Unit VI

Advancement in diagnostic protocols: Molecular methods for detection of microbes in fish and fishery products

VI. Practical

Isolation and characterization of spoilage and pathogenic microorganisms, Sampling for TPC from fresh, iced and frozen fish, Selection of bacterial groups in iced fish, Isolation of fish spoilage bacteria, Enumeration of halophilic bacteria from salted fish, Fermentation by selected microbes, Assay of products formed; microbial composition of fermented fish and Conventional and molecular detection of pathogens.

I. Course Title : Fish Quality Assurance, Management and Certification

II. Course Code : FPT 504

III. Credit Hours : 2+1

IV. Aim of the course

To teach various aspects of quality assurance systems, quality management and national / international certification system.

To teach factory sanitation and hygiene, water quality and standardsTo teach quality affecting parameters

V. Theory

Unit I

Hazards in fish and fishery product: Physical, Chemical, Biological, Quality management, Total quality concept and application in fish trade.

Unit II

Quality assessment of fish and fishery products: Physical, Chemical, Organoleptic and Microbiological quality standards.

Unit III

Inspection and quality assurance: Fish inspection in India, Traceability and authenticity; Factory sanitation and hygienization: National and international requirements, SSOP.

I. Course Title : Applied Fisheries Biochemistry

II. Course Code : FPT 505

III. Credit Hours : 2+1

IV. Aim of the course

- To impart knowledge on macro and trace constituents and nutritive value of fish.
- To create basic understanding about toxins and toxic substances and their toxic effects.
- To give a detailed insight into experimental techniques used in food analysis.

V. Theory

Unit I

Proteins: Classification; structural proteins (actin, myosin, tropomyosin, actomyosin, paramyosin), Sarcoplasmic proteins (myoalbumin, globulin, hydrolases, oxidoreductases); Connective tissue proteins (collagen); Pigments, heme proteins, hemocyanins, Antifreeze proteins, Functional properties of seafood proteins, Solubility, Emulsification, Viscosity, Water holding capacity, Gelation, Denaturation of proteins, Dissociation, Aggregation, Coagulation, Reversibility and their significance to processing and quality.

Unit II

Lipids: Composition and nutritive value, Lipid types and their variations, Fatty acid composition of fish liver and body oils, Lipid fractionation, triglycerides, Phospholipids, Polyunsaturated fatty acids and their beneficial effects on human health, Auto-oxidation of fatty acids, pro- and anti-oxidants, Oxidation indices, lipid protein interactions, Oxidized lipids-protein interactions and their impact on quality, Rancidity, Lipases and phospholipases.

Unit III

Carbohydrates: Classification and biological significance of carbohydrates, Structure and properties of monosaccharides, Disaccharides and polysaccharides, Uses of modified starch and other carbohydrates as food additives (as thickening and binding agents), Changes in Carbohydrates during processing and relationship of carbohydrates to food stability, Gelatinization.

Unit IV

Vitamins: Water soluble and Fat soluble, Heat labile vitamins, Process effecting on vitamins, Minerals; Major, Miner and Trace elements and their health benefits.

Unit V

Seafood flavours and pigments: Flavour, Taste and Odour, Chemical basis of flavour perception, Volatile fatty acids, Influence of processing on flavour, Non-protein nitrogenous compounds; Free amino acids, Peptides, Nucleotides, Guanidines, Urea, Quaternary ammonium compounds.

Unit VI

Fundamental techniques in food analysis: Basic principles of electrophoresis, Chromatography, TLC, Paper and Liquid Chromatography, HPLC, GC and GC-MS. Principle and applications of Spectrophotometry.

VI. Practical

Protein purification based on solubility, Separation of protein based on size and charge in PAGE, Separation of amino acids by TLC and paper chromatography; Enzyme assay by spectrophotometer; Amino acid analysis by HPLC, Determination of protein carbonyls, Extraction of lipids by different methods, Fractionation of lipids by TLC, Analysis of fatty acid composition by GC, Texture profile analysis and Estimation of unsaponifiable compounds in fish oil

I. Course Title : Value Added Fishery Products

II. Course Code : FPT 506

III. Credit Hours : 2+1

IV. Aim of the course

To make the students understand the concepts of value addition and to explain the preparation of products from low cost fish.

V. Theory

Unit I

Significance of value addition: Protein deficiency and need for fortification of food, Digestibility and nutritive value of fish meat, Overview of value-added products; Present market trends, Scope of value addition, Types of value addition, important value-added products.

Unit II

Minced fish meat: Equipment for mince preparation, Effect of mincing on physical and chemical properties; Different types of mince-based products, Surimi.

Unit III

Surimi: Basic concepts, Different unit operations, Cryoprotectants in surimi-hypothesis and mechanisms, Packaging, freezing and storage, Quality evaluation of surimi, Kamaboko and analogue products.

Unit IV

Battered and breaded products: Ingredients for batter and breading systems and their functionalities, Freeze dried products, Shelf life and specialties of AFD products, Machinery and equipment for freeze drying.

Unit V

Ready-to-eat and ready-to-cook products: Extruded fish products; Mechanism of extrusion, Types of extruders; Single screw, Twin screw, Mechanical and chemical changes during extrusion, Parameters affecting quality of extruded product, Cook-chill products.

Unit VI

Seaweeds: Resources, global and Indian scenario, Biochemical components in Seaweeds, Edible seaweeds – Nutritive value of seaweeds, Products from seaweeds.

VI. Practical

Preparation of Surimi from low value fish; Evaluation of Surimi gel strength; Evaluation of ATPase activity of actomyosin based products; Preparation of analog products from surimi, battered and breaded products, extruded products, cook-chill products and seaweed-based product.

I. Course Title : Trade Regulations, Certification and Documentation in Export of Fish and Fishery Products

II. Course Code : FPT 507

III. Credit Hours : 1+1

IV. Aim of the course

To create basic understanding about Trade Regulations, Certification and documentation in export of fish and fishery products

V. Theory

Unit I

Trade policy and Legislation on labeling and other standards: Foreign Trade Policy of Fish and Fishery Products in Indian context and world context, Labeling requirements of Fish and Fishery products stipulated by National and International Organizations.

Unit II

Regulations: Export documentation- certificates of origin, Other certificates for Shipment of specific goods, Export licenses; Import regulations, SPS-TBT agreement.

Unit III

Labeling: Legislation on labeling; Labeling requirements for Traceability, Legislation on National and International standard requirements of seafood in export trade.

Unit IV

Export Certification systems: Consignment-wise, In process Quality, Self-Certification, Food safety management system, Pre-shipment inspection, Voluntary food certification scheme, Certificate for export (CFE), Health certificate, Other certification, Traceability issues for farm reared and wild aquatic products; Dealing with returned consignments; Foreign trade regulations in India.

VI. Practical

Documentation protocol for approval of fishing vessel, processing unit and technologist in processing plants. Labeling codes for Traceability of products in Export trade; Preparation of BOL and LC. Preparation of documents for seafood export to different destinations. Study of documents on customs and port procedures for seafood export and import.

VII. Suggested Reading

Minor Courses

I. Course Title : Design, Maintenance of Fish Processing Plants and Instrumentation

II. Course Code : FPT 508

III. Credit Hours : 1+1

IV. Aim of the course

To expose the students to design, maintenance of fish processing plant, machinery and the instruments used in fish processing plants.

V. Theory

Unit I

Plant design: Fundamentals of processing plant design, Site selection, Design and preparation of layout of processing plants, Freezing plant, Cold storage, Canning plant, dryers, etc., Plant design as pre-requisite for quality management, Functions and construction of refrigeration system; Tests and inspection, Operation and handling, Pressure-enthalpy (P-H) diagram and basic calculation, Application of P-H diagram, Size and required power of compressor.

Unit II

Maintenance: Maintenance of refrigerating machine, Troubles and causes, Preventive maintenance of machinery and equipment of fish processing plants, IOF, Canning plant, Sausage plant, Artificial dryers, Smoking chambers, etc., Safety controls for freezing and canning plant, Boilers: classification and selection, Boiler mounting and accessories; Boiler maintenance.

Unit III

Affluent water treatment and chlorination: Effluent treatment; Legislation and standards of effluent discharge, Water pollution control measures in the food industry, Waste water treatment process; Dissolved air floatation, Sedimentation, Chemical treatment, Biological treatment, Aeration, Carbon adsorption, Granular media filtration and sludge handling.

Unit IV

Measurement techniques: Sensors, active and passive sensors, Characteristic of sensors for the measurement of temperature, Relative humidity, a_w value, gel strength; Moisture, Freshness, pH, Conductivity, DO, Redox potential, Salinity, Air velocity, Solar energy and Brine concentration.

VI. Practical

Operation and maintenance of machinery and equipment for cold storage plant, freezing plant and canning plant. Operation and maintenance of dryers and boilers. Assembly of a refrigeration unit and charging of refrigerant. Measurement of temperature inside cold storage/freezer, Measurement of temperature in fish during freezing and thawing. Measurement of solar radiation. Designing of ETP systems.

I. Course Title : Microorganisms of Public Health Significance

II. Course Code : FPT 509

III. Credit Hours : 1+1

IV. Aim of the course

To teach in detail about food-borne microorganisms of human health significance, food-borne diseases and their prevention.

V. Theory

Unit I

Pathogens in seafood: Sources of pathogens in seafood, Infection and intoxication; Bacteria of public health significance in fish *I* fishery products *I* environments, Epidemiology, Clostridial and staphylococcal food poisoning, Organism responsible and their origin, Growth and toxin production, Nature of toxins, Incidence of poisoning, Foods involved.

Unit II

The etiology of diseases: Conditions for outbreak and prevention, Food infections by *Salmonella, Vibrio parahaemolyticus, V. vulnificus,* pathogenic *E. coli*, *Listeria monocytogenes, Campylobacter, Arcobacter*; virulence mechanisms, Their sources, Incidences, Foods involved and prevention measures.

Unit III

Toxins: Histamine poisoning, Aflatoxins, patulin, Ochratoxin and other fungal toxins found in food, Toxin producer, source, Nature of toxin, Toxicity and significance in foods.

Unit IV

Virus and parasites in fish; Algal toxins; Antibiotic resistance in microbes; Significance of AMR.

VI. Practical

Laboratory techniques to detect and identify pathogens in fish - *E. coli, Staphylococcus aureus, Streptococus faecalis, Clostridium perfringens* and *Clostridium botulinum, Salmonella, Listeria, Vibrio cholere, Vibrio parabaemolyticus* and *V. vulnificus*. Animal bioassay of bacterial toxins.

I. Course Title : Molecular Techniques in Seafood Quality Analysis

II. Course Code : FPT 510

III. Credit Hours : 1+1

IV. Aim of the course

To teach basic concepts and techniques in molecular biology and immunology

V. Theory

Unit I

Introduction to molecular biology: Nucleic acids, Structure, Replication, Transcription and translation, Genes, ORF, Organization of genes, Operons, Plasmids. Vectors used in cloning and their structures.

Unit II

Enzymes in molecular biology: Polymerases, Ligases, Restriction Enzymes, Topoisomerases.

Unit III

Molecular methods: Molecular methods and their principles, PCR, RT-PCR, Hybridization, Microarray, AFLP, RFLP.

Unit IV

Immunological techniques in pathogen detection: Antigen-antibody reactions, Immunoassays-ELISA, FAT; Authenticity testing

VI. Practical

Conventional DNA extraction, Application of PCR for pathogen detection, Probe labeling and Southern hybridization, Primer designing, Tm determination, Agarose and protein gel electrophoresis, Cloning of genes, transformation techniques, Bioinformatic analysis of DNA and proteins, In-silico DNA and protein analysis, Restriction digestion, primer and probe designing, Protein structure prediction and Genome comparisons.

I. Course Title : Packaging of Fish and Fishery Products

II. Course Code : FPT 511

III. Credit Hours : 1+1

IV. Aim of the course

To learn about different packaging materials, their appropriate use and benefits.

V. Theory

Unit I

Food packaging: Purposes and procedures; Technological aspects of packaging fishery products; Packaging for transport, Shipping and Institutional supplies; Packaging materials; Basic films and laminates, Their manufacture and Identification; Resistance of packaging materials; Development of protective packaging for fishery products.

Unit II

Transportation: Packaging requirements for transportation of live fish and shellfish, Methods of testing for packaging materials for their physical properties; Containers and their testing and evaluation; Package designs; Resistance of packages to hazards in handling; Transport and storage.

Unit III

Standards: Packaging standards for domestic and international trade.

Unit IV

Labeling and printing of packaging materials: FSSAI requirements and BIS guidelines, Intelligent packaging; Edible packaging; Disposal and recycling of packaging materials.

VI. Practical

Determination of grammage of paper and board, bursting strength and burst factor, punctures resistance, water proofness, stiffness of the board, ring stiffness of paper and board, flat crush, tensile strength and elongation at break of plastic films, density of plastic films, breaking length, impact strength of plastic films, tearing strength of paper and plastic films, water vapour transmission rate, oxygen transmission rate, heat seal strength, suitability of plastic films for food contact applications and Identification of plastic films.

I. Course Title : Fish By-products and Waste Utilization

II. Course Code : FPT 512

III. Credit Hours : 1+1

IV. Aim of the course

To teach concepts of utilizing seafood wastes and byproducts from fish and shellfish

V. Theory

Unit I

Fish processing wastes and utilization: Overview of fish processing wastes, by catch and its composition, Liquid and solid wastes in fish processing, Bioremediation, Anaerobic treatment, Production of animal feed, Biodiesel.

Unit II

Fish meal, silage and oils: Fish meal production (dry and wet process), Nutritional importance and Quality requirements, Specifications, Packaging and storage, Fish silage; Acid silage and Fermented silage, Advantages over fish meal, Nutritional value of silage; Fish Oil; Fish body and liver oils, Extraction, Purification, Preservation and storage, Industrial and Nutritional applications of fish oils; Production of concentrates of polyunsaturated fatty acids, Preparation of fatty alcohol and amides, Extraction of shark liver oil, squalene, shark cartilage; ambergris.

Unit III

Fish wastes and utilization: Protein recovery - collagen, gelatin, extraction of enzymes; Shellfish Waste; sources and composition, Conventional uses, Chitin, Chitosan, Glucosamine hydrochloride, Carotenoids from Fish protein hydrolysates-Production and utilization, Biochemical composition and importance in food and nutrition, Functional properties of bioactive peptides; Shellfish waste and its applications, Biogas production from fish waste.

Unit IV

Novel products from fish waste and uses: Uses of Gelatin, Collagen, Shark cartilage, Glucosamine, Carotenoids, Astaxanthin, Bioactive peptides.

VI. Practical

Extraction of collagen from fish waste, gelatin from fish waste and enzymes from fish waste. Preparation of hydrolysates from fish and shellfish wastes. Extraction of chitosan and glucosamine from shrimp shell waste, Recovery of fish oil from fish waste

I. Course Title : Multivariate Analysis in Food Processing and Product Development

II. Course Code : FPT 513

III. Credit Hours : 0+1

IV. Aim of the course

To create practical knowledge about Multivariate Analysis in Food Processing and product development.

V. Practical

Importance of multivariate analysis in optimization of different variables to achieve desired traits in food processing, product development and sensory evaluation; Design and analysis of controlled experiments: Full factorial, Factorial, Central composite and Box-Behnken Designs. Exercises to develop suitable designs for extruded products and antioxidant extractions by using Unscrambler software; Response surface analysis: Selection of variables, design variables and response variables, selection of samples, modeling the response data using Unscrambler software, checking the predictive ability, response surface plots; Principal Component Analysis (PCA): Principal components, Bi-linear modeling of one single data matrix X, Score plot, Loading plot and Correlation Loadings; Regression: Principal component regression (PCR), Multiple linear regression (MLR), Partial Least Squares Regression (PLSR): Modeling Y from the essence of X data set, Calibration and Prediction Models.

Course Title with Credit Load
Ph.D. in Fish Processing Technology

Course Code	Course Title	Credit Hours
	Major Courses	**12 Credits**
FPT 601	Principles and Techniques of Seafood Analysis	2+1
FPT 602	Functional Properties of Fish and Shell-fish Proteins	2+1
FPT 603	Biotechnological Applications in Fish Processing	2+1
FPT 604	Quality Management Systems	2+1
	Minor Courses	**6 Credits**
	(From the subjects closely related to a students major subject)	
FPT 605	Emerging Trends in Seafood Processing	1+1
FPT 606	Nutraceuticals of Aquatic Origin	1+1
FPT 607	Toxins and Contaminants	2+1
FPT 608	Additives in Fish Processing	1+1
FPT 609	Sensory and Physical Analyses	1+1
FPT 610	Environmental Impact of Fishery Industries	2+1
FPT 611	Food Labeling	1+1
FPT 612	Water Quality Management in Seafood Processing	2+1
	Supporting Courses	**5 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence).	
FST 601	Advanced Statistical Methods	2+1
FST 602	Software for Fisheries Data Analysis and Management	0+2
RPE 601	Research and Publication Ethics	1+1
	Total Course Work Credit load	**23**
	Seminar	**2 Credits**
FPT 691	Seminar I	0+1
FPT 692	Seminar II	0+1
	Thesis Research	**75 Credits**
FPT 699	Doctoral Research (Semester II)	0+15
FPT 699	Doctoral Research (Semester III)	0+15
FPT 699	Doctoral Research (Semester IV)	0+15

Course Code	Course Title	Credit Hours
FPT 699	Doctoral Research (Semester V)	0+15
FPT 699	Doctoral Research (Semester VI)	0+15
	Total Credit load for Ph.D. Program	**100**

Course Contents
Ph.D in Fish Processing Technology

I. Course Title : Principles and Techniques of Seafood Analysis
II. Course Code : FPT 601
III. Credit Hours : 2+1

IV. Aim of the course

To provide knowledge on various instrumental techniques in seafood analysis.

V. Theory

Unit I

Separation of molecules: General principles of separation of micro and macro molecules, Selection of appropriate tools for analysis of fish samples, Outlines of common techniques involved in biochemical analysis.

Unit II

Filtration and centrifugation techniques: Different types of filtration, Types of filters and means of using them; Types of centrifugation (preparative and analytical), concept of Svedberg unit, Selecting appropriate rotor, Relative centrifugal force.

Unit III

Viscoelastic properties, Rheology, Tribology, TPA; IR and FTIR spectrophotometry, Spectrofluorimetry, ICP, Atomic absorption mass spectrometry, Tandem MS/MS.

Unit IV

Microscopy: Fluorescence microscopy, SEM, TEM, XRD.

Unit V

Electrophoresis: General principles, types (native, denatured PAGE, 2D) Chromatographic techniques; General principle, Types of chromatography (adsorption, partition, ion-exchange, molecular sieve, affinity, liquid and gas chromatography, thin layer chromatography).

Unit VI

Chromatography: Partition coefficient, Retention, Resolution, Capacity factor, Theoretical plate, Vandeemter curve, Gel filtration chromatography, Ion exchange chromatography, Affinity chromatography, Hydrophobic interaction chromatography, Paper chromatography, Thin layer chromatography, Reversed-phase chromatography, GC, HPLC, GCMS, LCMSMS

VI. Practical

Characterization of proteins based on solubility: sarcoplasmic, myofibrillar, and stroma; Estimation of proteins- Biuret techniques, Lowry techniques, Dye binding technique and electrophoretic techniques. Amino acid analysis by HPLC. Fatty acid analysis by GC MS, Minerals and heavy metals by Atomic Absorption spectroscopy. Texture analysis by TPA. HPLC- determination of histamine, Demonstration of GC-MS-MS.

I. Course Title : Functional Properties of Fish and Shell Fish Proteins

II. Course Code : FPT 602

III. Credit Hours : 2+1

IV. Aim of the course

To provide knowledge on the functional properties known to affect product property.

V. Theory

Unit I

Protein properties: Functional properties of fish and shellfish proteins and their importance in food systems, Denaturation and functionality; Changes in functional properties of proteins as affected by icing, Freezing, Drying, Salting and Heating. Modification of proteins for improving functionality- Succinylation and acetylation procedures.

Unit II

Protein structure and function: Protein folding and non-covalent forces stabilizing protein structure; Free energy and entropy, Surface hydrophobicity and its relation to functional properties.

Unit III

Solubility and water sorption of proteins: Factors affecting protein hydration, Viscosity in relation to protein hydration; Methods of estimating viscosity.

Unit IV

Gelation: Definition of gel, Mechanism of formation of gel, Factors affecting the gel formation, Evaluation of gelling capacity- Thermal, Rheological and microscopy.

Unit V

Emulsifying: Theoretical concept of emulsion capacity and stability, Emulsion instability; Creaming, Sedimentation, aggregation vs Brownian aggregation. DLVO theory, microemulsions.

Unit VI

Foaming: Foaming ability of different protein systems with case studies, Foam stability in relation to proteins structure.

VI. Practical

Evaluation of water absorption properties of fish protein, fat absorption properties of fish protein, gelling properties of fish protein, emulsification capacity of fish protein and foam stability of fish/shell fish proteins. Determination of effect of pH on fish protein, temperature on functional properties fish protein and ionic strength on functional properties fish protein. Prediction of functional properties using model compounds. Estimation of surface hydrophobicity and total hydrophobicity.

I. Course Title : Biotechnological Applications in Fish Processing

II. Course Code : FPT 603

III. Credit Hours : 2+1

IV. Aim of the course

To understand the recent trends in microbiology and biotechnology research that could be applied in fish processing

V. Theory

Unit I

Basic Concepts: Microbial interactions and their applications in foods; Natural preservatives, Quorum sensing and its inhibitors, Phage therapy, Basic concepts of fermentations, Bioremediation and probiotics; Concepts of biotechnological approaches to product improvement.

Unit II

Microbial genomics: Genomics of bacteria, micro RNA, Microbiome and health, Metagenomics and its applications; Application of bioinformatics.

Unit III

Recombinant DNA technology: Application in food microorganisms, Engineering of microorganisms to produce useful metabolites, Enzymes, Vaccines.

Unit IV

Molecular biological tools: RT-PCR, microarray, Hybridization techniques, Next generation sequencing techniques, biosensors.

Unit V

Immunology: Immunoglobulins, Monoclonal antibodies, Application of antigen and antibody reactions, Immune-magnetic separation, proteomics.

Unit VI

Techniques involved in seafood adulteration: AFLP, RFLP, RAPD, DNA finger printing

VI. Practical

Molecular biological assays for aquatic food borne pathogenic bacteria. Molecular Immunological assays for aquatic foodborne pathogenic bacteria. Molecular Immunological assays for aquatic foodborne pathogenic viruses. Construction of recombinant plasmid. Recombinant protein expression and purification. Transformation. Gene knockout techniques. Construction of gene library. Microbiome studies. Tools used in metagenome analysis.

I. Course Title : Quality Management Systems

II. Course Code : FPT 604

III. Credit Hours : 2+1

IV. Aim of the course

To familiarize students with different aspects of quality management systems and evaluation techniques for seafood.
To teach Seafood Quality Assurance and Quality Management Systems.

V. Theory

Unit I

The concept of total quality management: The principles of TQM, Zero defect planning, Quality circle, Quality link, Quality culture, Statistical quality control, Quality evaluation techniques for seafood; Effect of preprocess handling, Transport and storage on quality; Quality costs and evaluation.

Unit II

Good Manufacturing Practices (GMP) and Good Hygiene Practices (GHP): Codex guidelines, Concept of HACCP in seafood safety, Risk assessment; HACCP team management role and CCPs and implementation procedure for HACCP, ISO 9000 series of standards.

Unit III

Accreditation of laboratories: Validation requirements; Method of selection, Method of validation, Methods to control accuracy and precision, Primary standards, Reference standards, Reference material (RM), Certified Reference Material (CRM) and Standard Reference Material (SRM).

Unit IV

Sampling: Uncertainty and calculation of uncertainty measurements, Sample accountability; Sampling plan; Probability sampling and non- probability sampling.

Unit V

Proficiency and check samples: Intra and inter laboratory test programme, Proficiency testing programme; Predictive modeling in quality and safety assurance of fishery products.

Unit VI

Traceability, Product Recall, Equipment and machineries calibration

VI. Practical

Developing flow charts and indented use of different frozen and pasteurized fishery products. Preparation of HACCP work sheet for identification of hazards in frozen, canned and pasteurized products. Preparation of HACCP plan form for identified hazards in frozen and canned fishery products. Developing flow charts and indented use of different canned products. Study of correction and corrective action. Detection of important toxic chemicals in seafood.

Minor courses

I. Course Title : Emerging Trends in Seafood Prcoessing
II. Course Code : FPT 605
III. Credit Hours : 1+1

IV. Aim of the course

To give a detailed insight into various advancements in seafood processing technologies

V. Theory

Unit I

Types of novel processing technologies and their applications: Supercritical Fluid extraction- SCFX, High-Pressure Processing (HPP); Pulsed electrical fields (PEF) as a pasteurization technology**,** Ultrasound processing, Ozone/CO_2 Processing.

Unit II

Hurdle technology: Principle and application of hurdle technology, Sous-vide technology, Other applications – Microwave processing, Accelerated Freeze Drying, Ohmic Heating.

Unit III

Trends in packaging: Active and Intelligent Packaging; Application of nanotechnology and Nano biotechnology in fisheries.

Unit IV

Automation in processing: Automation in fish process lines; Efficient process lines; Bionic noses; Machine vision; Robotics

VI. Practical

Effect of microwave cooking on proximate composition, lipid oxidation and texture profile. Formulation of different mince and surimi-based products. Preparation of battered and breaded products from prawns, fish and bivalves. Preparation of MAP products and comparison with chilled products. Super critical fluid extraction principles and procedure. Preparation of High Pressurized Product from fish

I. Course Title : Nutraceuticals of Aquatic Origin

II. Course Code : FPT 606

III. Credit Hours : 1+1

IV. Aim of the course

To teach about compounds of nutraceutical importance from the sea

V. Theory

Unit I

Nutraceuticals: An overview; Nutritional and functional value of marine proteins, Lipids and health benefits of omega-3 fatty acids.

Unit II

Functional foods: Functional components from fish processing waste: Extraction and applications of collagen, Collagen peptides, Gelatin and gelatin hydrolysates, Chitosan and glucosamine hydrochloride, Squalene and its clinical significance, carotenoids and their utility.

Unit III

Marine bioactive compounds: Antimicrobial, Cytotoxic substances; Antiviral and antitumor compositions; Secondary metabolites of corals with therapeutic value; Antioxidants from marine sources and antioxidant capacity assays-Ferric Reducing Antioxidant Power Assay, â-carotene bleaching assay, ABTS and DPPH assays.

Unit IV

Delivery of nutraceuticals: Fortification and encapsulation with marine nutraceuticals, Encapsulating methods (spray drying, freeze drying and liposome entrapment), Macromolecules of marine origin used as biopackaging, Edible films and coatings and drug delivery systems.

VI. Practical

Extraction of gelatin and collagen from fish waste. Extraction of fish protein hydrolysate and evaluation of their functional properties. Preparation of Chitin and chitosan from shrimp shell waste. Emulsification of fish oil with different emulsifiers. Preparation of omega-3 fatty acid by urea crystallization method. Encapsulation of omega-3 fatty acids by spray drying and freeze drying. Extraction of carotenoids and determination of their antioxidant capacity by Ferric Reducing Antioxidant Power, β-carotene bleaching and ABTS and DPPH assays. Determination of antimicrobial assays.

I. Course title : Toxins and Contaminants

II. Course code : FPT 607

III. Credit Hours : 2+1

IV. Aim of the course

To understand various types of toxins and contaminants in seafood, their impact on human health, and the analytical methods to estimate toxins and contaminants in foods.

V. Theory

Unit I

Food borne pathogens: Status of food borne diseases, Epidemiology; Public health significance of food borne toxins, Pathogens.

Unit II

Marine bio-toxin: Ciguatoxin, Paralytic shellfish toxins, Diarrhoetic shell fish toxins, Scomberotoxins, Brevi toxins, etc., Symptoms, treatment, Pharmacology and detection;.

Unit III

Bacterial toxins: Types, Structure, Mechanisms; Food allergens.

Unit IV

Chemical contaminants of the aquatic environment: Heavy metals (Hg, Cd, Pb, Cr, Ni, As etc.), Pesticides.

Unit V

Antibiotic residues in fish, Microplastics, PAHs; Toxicity and accumulation.

Unit VI

Analytical methods: For different types of marine toxins and tolerance limits, Stability, Bioassays, Pharmacology assays, Immunoassays, Instrumental methods, Persistent pollutants, Toxicity evaluation, Measurement of LC_{50} and factors affecting LC_{50}, Animal tissue analysis.

VI. Practical

Detection of bacterial toxins by assay. Analysis of heavy metals, pesticides and antibiotic residues by ELISA method Estimation of LC50 vale of important pesticides. Quantification of antibiotic residue by LCMSMS.

I. Course Title : Additives in Fish Processing

II. Course Code : FPT 608

III. Credit Hours : 1+1

IV. Aim of the course

To familiarize with the use of different additives, their effects, levels and detection

V. Theory

Unit I

Food additives in fish processing: Importance of food additives, Classification of additives- Antioxidants, preservatives, Emulsifiers and stabilizers, Food colors, Flavours, Sequestrants, Anticaking agents, Acids-buffers-bases, Humectants, Firming and Crisping agents, Sweeteners, Enzymes, Nutritive additives, Flour and Bread additives, Cryoprotectants.

Unit II

Food additives and hypersensitivity: Risks and benefits of food additives, Health considerations and safety evaluation; Toxicity, and toxico-kinetics, Genotoxicity, Reproductive toxicity, Sub-acute toxicity, Sub-chronic toxicity, Chronic toxicity, Carcinogenicity, Allergenic effect, Allowable daily intake.

Unit III

Proteins as food additives: Natural antimicrobials- Bacteriocins, Natural antioxidants, Changes in properties of food due to different food additives.

Unit IV

Legal issues in additives: Laws related to additives, Methods of demonstrating safety, GRAS (Generally Recognized as Safe) additives, Problem of adulteration and solution.

VI. Practical

Analysis of processed seafood for TPP residues, citric acid, meta bi-sulphate residues. Analysis of food for presence of undesirable residues of food additives Antibiotics, Antioxidants, Antifungal agents and Colouring agents.

I. Course Title : Sensory and Physical Analyses

II. Course Code : FPT 609

III. Credit Hours : 2+1

IV. Aim of the course

To obtain expertise in sensory and physical analyses of food products

V. Theory

Unit I

Basics of Sensory and Physical analysis: Development of sensory testing, Human subjects as instruments, Conducting a sensory study, Sensory attributes and their perception.

Unit II

Requirements of Sensory evaluation: Controls for test room, Product and panel, Factors influencing sensory verdicts.

Unit III

Measuring responses: Difference tests, Triangle test, Duo-trio and other tests, attribute difference tests, Concepts of RSM.

Unit IV

Physical and Mechanical properties of foods: Colour, Dielectric properties, Rheology, Viscosity of fluid foods, Viscoelastic behaviour, Texture measurements.

Unit V

Determining thresholds, Selection and training of panel members.

Unit VI

Guidelines for analysis and Reporting: Descriptive analysis techniques, Spectrum descriptive analysis method, Affective tests, Statistical methods and procedures, Guidelines for choice of techniques, Guidelines for reporting results.

VI. Practical

Assessment of taste panelists. Use of different decision-making aids. Determining threshold for different additives, colour and dielectric properties of fish muscle. Evaluation of rheology properties of gel prepared from fish protein. Estimation of Viscosity of fluid foods. Determination of Viscoelastic behavior fish-based products. Texture profile analysis of fish products.

I. Course Title : Environmental Impact of Fishery Industries

II. Course Code : FPT 610

III. Credit Hours : 1+1

IV. Aim of the course

To provide theoretical and practical exposure on Environmental Management Systems in fisheries industry

V. Theory

Unit I

Environmental management systems: Environmental issues (ozone depletion, global warming, etc.), Pollution, Long term ecosystem degradation, Environmental aspects of fisheries industries, Their assessment, Impact and control.

Unit II

Sources of environmental concerns (physical, chemical and microbiological); Environmental review of fisheries industry.

Unit III

Techniques for the identification of environmental aspects; Remediation of environmental pollution, IS/ISO 14000 and its relevance to environmental management system in fisheries industry; Background, policy and planning, Implementation, Checking and review.

Unit IV

Legal issues: International and European laws for environmental protection; National environmental laws.

VI. Practical

Composition analysis of fish processing solid and liquid wastes. Treatment effect on solid waste. Treatment effect on liquid waste. Resident time analysis for processing waste at the site of disposal. Estimation of nutritional composition of dried sludge. Effect of probiotic on effluent treatment system.

I. Course Title : Food Labeling

II. Course Code : FPT 611

III. Credit Hours : 1+1

IV. Aim of the course

To create basic understanding about labeling of different products, guidelines and enforcement

V. Theory

Unit I

Labeling requirements: National and international; Legislation on labeling.

Unit II

Labeling and Traceability: Labeling for product traceability, Components of traceability code – nutrition facts and nutrition labeling, Specific requirements of nutrition labeling.

Unit III

Label design specification: Size, Colour, Barcoding types, Types of labeling for organic foods, GM foods, Irradiated foods, Meat and non-meat foods, Major nutrients Minor nutrients, Essential nutrients, Function of nutrients - providing energy, Tissue building.

Unit IV

Food meant for specific age groups and convalescing people, Serving size, Calculation of nutrition facts based on nutrient composition and serving size, Energy value of foods, EC number.

VI. Practical

Analysis of major and minor nutrients. Calculation of nutrition facts. Preparation of labels for typical food items. Analysis for total calorific value of fish fats, protein and carbohydrates.Estimation of PER, BV and NPU value of fish products.

I. Course Title : Water Quality Management in Seafood Processing

II. Course Code : FPT 612

III. Credit Hours : 2+1

IV. Aim of the course

To obtain enough knowledge in all aspects of water quality and its management for processing and drinking purpose.

V. Theory

Unit I

Sources and types of water: Type I, Type II, Type III, their characteristics; Reagent grade water specifications, Sources of contamination of drinking water, Ground water contamination, Chemical threats to drinking water quality; Primary water quality criteria; Point source and non-point source of contamination.

Unit II

Water quality criteria: Physical factors (hardness, colour, odour, taste, turbidity, conductivity, pH and Eh), Chemical parameters (physico-chemical parameters in relation to water's natural structure), Microbiological parameters, Important pathogenic organisms and their sources, Salmonella, Pathogenic Staphylococcus, Fecal bacteria, Enteroviruses, Algae, other organisms.

Unit III

Undesirable substances in drinking water: Parameters concerning toxic substances; Toxic metals/metalloids, Cyanides, Pesticides and related products and polycyclic aromatic hydrocarbons; Organic compounds and their tolerances; Polychlorinated biphenyls, pentachlorophenol, 2, 4, 6 trichlorophenol, chlororesorcinol, total nitramine and haloforms in potable water.

Unit IV

Water quality standards: Indian standard, US PHS, EEC, WHO standards. Examination of water; Microbiological examination; frequency, public supply with intermediate storage and without intermediate storage; Examination for undesirable and toxic substances; Method of analysis, sampling, etc.

Unit V

Water budgeting and treatment: Budgeting of water for different processing methods; Affluent water treatment and disinfection methods: purification and treatment of water, Chlorination of water, Use of chlorine dioxide ($Cl0_2$) ozonization, UV radiation and reverse osmosis; Implications of chlorination and trihalomethane compounds in drinking water.

Unit VI

Effluent Water treatment and disinfection methods: Primary treatment, Secondary treatment, Methods of waste water treatment in seafood industries.

VI. Practical

Estimation of available chlorine, undesirable physical and chemical objects present in the fish processing water. Examination of microbiological quality of water used in fish processing industry. Estimation of BOD and COD of effluent water. Effect of ozonation and chlorinationon water quality.

Suggested Broad Areas for Master's and Doctoral Research

- Changes in muscle during freezing
- Technology to improve shelf-life of seafood
- Novel packaging and transportation methods of seafood
- Prevention of nutrient loss during frozen storage
- Molecular markers development for identifying adulteration
- Nutritional changes during frozen storage
- Development of new value-added fishery products
- Effective utilization of fish wastes
- Development of product from discarded fish
- Development low cost tools to detect pathogens in seafood
- Occurrence and virulence characteristics of emerging pathogens in seafood
- Evaluation and prevention of anthropogenic contaminants during processing seafood
- Effect of different processing methods on quality and shelf-life of fish
- Assessment of algal, fungal and biological toxins in seafood
- Effective methods for treatment of waste water from processing industries
- Water budgeting for various seafood processes
- Development of new ready to eat fish products
- Assessment and monitoring method for quality standards of processing plants
- Development of sensors for quality detection
- Designing of instruments used in fish processing plants
- Development of low cost and sustainable packaging materials
- Utilization of nanotechnology in fish processing industry
- Automation in seafood processing and quality determination
- Application of AI in seafood processing and quality evaluation

Fisheries Science
– Fishing Technology and Engineering

Preamble
(Fishing Technology and Engineering)

India has 8,118 kms coastline, 2.02 million sq. km Exclusive Economic Zone, 0.530 million sq. km Continental Shelf, 1,95,210 km of Rivers and Canals and 7.892 million ha of inland water bodies which results in capture fish production of over 7.0 million metric tonnes. Fisheries sector in India has shown impressive growth with an average annual growth rate of 10.88% during the year from 2014-15 to 2018-19. Fish production reached an estimated/ level of 11.6 million tonnes in 2017. In that year, the estimated production for capture fisheries was of almost 5.4 million tonnes (3.8 million tonnes from marine and 1.6 million tonnes from inland water). There are 2.39 lakh fishing crafts (58,911 mechanized, 75,591 motorized, 104,270 Non-motorized) operating various types of fishing gears along the coast, with 7 major fishing harbours, 75 minor fishing harbours and 1,537 landing centres are functioning to cater to the needs of over 4.0 million fisher folk engaged in capture fisheries.

To provide sustained and holistic development of fisheries in the country both the state and central governments recently offers various scheme namely, Blue revolution, Scheme for empowerment of traditional fishermen in Deep Sea fishing, Fisheries and Aquaculture Infra structure Development project. Hence, it is the need of the hour to increase the quality of syllabus in Master's degree and Doctoral program in 'Fishing Technology and Engineering encompasses mainly fishing gear and craft technology for responsible and sustainable capture fisheries, Fishing harbors and fishing fleet management, advanced fish processing machineries and refrigeration systems subjects apart from newly added courses like Deep sea fishing, GIS and Remote sensing to meet the demand of the industry.

The following topics namely Aimed fishing using the modern electronic devices like echo sounder, Sonar and trawl eye, Refrigeration in deep sea fishing vessels- design and working of RSW and CSW, Power transmission in fishing vessels, Sea Laws, Deep sea fishery resources, Weather and warning, Familiarization of meteorological equipments onboard, Weather forecasting and weather prediction at sea, Basics of sound in water-Ultra sonic sound and its characteristics, Recent advances in fishing vessel navigation, Aerial Photography, Remote Sensing, Digital image processing, Image rectification and Image enhancement - Filtering - band rationing, Image classification - supervised and unsupervised classification, Remote sensing application in soil and water conservation, **GIS** - types - raster - vector, Data base management systems - Data types - spatial - non-spatial, Spatial data models, Spatial referencing, Map projections, Data input, Editing, Encoding, Raster data analysis, Vector data analysis, NOAA and IRS- Satellites for Ocean and Fisheries studies- Digital image processing and interpretation, Application of remote sensing and GIS to fisheries and aquaculture planning and development, **PFZ-**Basics and application- Validation of PFZ data- INCOIS- Data Dissemination-Fishermen knowledge in PFZ were added.

By considering the vast opportunity and requirements in the field of fishing industry Doctoral program in 'Fishing Technology and Engineering is a must and this programme mostly deals with modern fishing technology to meet the global standards. Subjects like Mechanization in Fishing, Advanced Fishing Gear Designing and Construction, Fishing

Gear Selectivity, Deep Sea Fishing, Sustainable Fishing Methods, Fishing Harbour Planning, Construction and Management, Electronic Navigation and Sea Safety for Fishing Vessels were dealt in the programme.

The above new additions and updates will scale up the knowledge of the students to face the challenges of the competitive global fishing industry.

Course Title with Credit Load
M.F.Sc. in Fishing Technology and Engineering

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FET 501	Advanced Fishing Gear Technology	2+1
FET 502	Advanced Fishing Craft Technology	2+1
FET 503	Responsible Fishing	1+1
FET 504	Refrigeration and Electrical Engineering	2+1
FET 505	Marine Engineering	1+1
FET 506	Introduction to Deep sea Fishing	1+1
FET 507	Fishing Harbour and Fleet Management	1+1
FET 508	Acoustics, Navigation and Seamanship	2+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
FET 509	Engineering Graphics	0+1
FET 510	GIS And Remote Sensing in Fisheries	2+1
FET 512	Sea Safety and Disaster Management	1+1
FET 513	Fish Processing Machinery	1+1
	Supporting Courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common Courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**

Course Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
FET 591	Master's Seminar I	0+1
	Masters' Thesis Research	**30 Credits**
FET 599	Master's Research (Semester III)	0+15
FET 599	Master's Research (Semester IV)	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fishing Technology and Engineering

I. **Course Title : Advanced Fishing Gear Technology**

II. **Course Code : FET 501**

III. **Credit Hours : 2+1**

IV. **Aim of the course**

To teach advanced fishing gear technology, To learn design modification of existing fishing gears, To learn selectivity of various fishing gears.

V. **Theory**

Unit I

Fishing gear design drawings: Survey of various fishing gears; Conventional and current practice for the representation of fishing gear by FAO specifications for scale drawing; The use of computers in the scale drawing of fishing gear to determine the defects in gear, design to develop new gears.

Unit II

Fishing gear selection: Use of fishing gear materials and their comparison; Selection of fishing gear, Analysis of the parameters of specific fishing gears and the derivation of empirical relationships for use in the design process.

Unit III

Fishing gear design and construction: Factors responsible for the choice of fishing gears; Design and construction of bottom, Mid-water and surface trawl; Gill nets and tangle nets; Types of gill nets – Simple gill net, vertical lines gill net, Framed gill nets, tangle nets and their technical characteristics, Two and three walled trammel nets, Combined gill nets; Purse seines and their classification, Longlines, Pole and Lines, Trolling line, Traps – Their classification and general principles of construction.

Unit IV

Light and electricity in fishing: Attraction of fish – fishing with electricity and application in various fishing methods, Light fishing, Fish pumps; Operation and mechanization of long lining and jigging.

Unit V

Gear Selectivity: The selectivity of trawl fishing gears, Gill nets, Purse seine and longline, Design of otter boards for various types of trawl fishing; Factors to be considered in gill netting in selection of meshes for the different fishes; Aimed fishing using the modern electronic devices like echo sounder, Sonar and Net sonde.

Unit VI

Testing fishing gear: Case studies relating to towed, surrounding and static fishing gear and their energy consumption, Fishing gear testing – full scale and model testing in flume tanks, methods of testing a fishing gear, External forces acting on fishing gears, The influence of design features on the overall economic performance of fishing gears.

VI. Practical

Exercises on scale drawing of different types of fishing gears. Use of computer software's programme in the design of trawl gears. Model net calculations, Calculations of energy requirements of different gears. Onboard experience of different fishing methods. Use of net monitoring instruments. Study of fishing gears through models of nets and field study. Making sketches. Reading of gear designs. – Trawl nets, Purse seines, Gill net and Long line. Familiarization with design drawing software. Design of otter boards and other accessories. Survey of gears and preparation of designs according to scale by taking measurements from a net.

I. Course Title : Advanced Fishing Craft Technology

II. Course Code : FET 502

III. Credit Hours : 2+1

IV. Aim of the course

To teach advanced aspects of fishing craft design, To learn about modification of existing craft layout, To learn about fishing craft stability.

V. Theory

Unit I

Fishing craft: Different types of fishing crafts – trawler, stern and side trawler, Purse seiner, Long liner, Gill netter, troller etc; Main differences in the method of construction and design; Consideration regarding the speed and other fishing requirements, Deck layout and deck equipments of fishing vessels based on the fishing method; Planning internal capacities of fish hold, Engine room, Crew accommodation, Fuel tanks and Freshwater tanks.

Unit II

Boat materials: Choice of the construction materials; Comparison of materials used in fishing boat construction; Bio-deterioration of wood – marine fouling and boring organisms, Preventive measures, Raw materials, properties, Merits and demerits of FRP, Steel, Aluminium and Ferro-cement, Corrosion – types, Fundamentals, measurement and preventive measures.

Unit III

Steering gear and Hull: Principles of operating steering arrangement; Remote control; Rudder – principles – types; Steering gear – Principle and operation – Mechanical and Hydraulic; Principal dimensions of boat, Importance of shape of underwater hull, Classification and description of hull forms based on shape; Form coefficients and proportionality coefficient for different types of vessels; Various ship motions at sea; Hull resistance; Behaviour of boats to waves from different sides.

Unit IV

Stability aspects of fishing vessels: Factors affecting stability; Longitudinal stability – Trim, Moment of change of trim by 1 cm; Transverse stability – List, heel, LOLL, Meta centric height and meta centric radius, GZ curve, Degree of vanishing stability, Free surface effect, Hydrostatic curves, Dynamic stability, Stability criteria, Safety measures to restore stability in fishing vessels; Inclining experiment.

Unit V

Propellers and Power: Powering of fishing boats; power transmission system in fishing vessels; Effects of wetted surfaces on speed; Types of propellers; Designing principle power requirements of various types of fishing boats, Auxiliary power, Propulsive efficiency, Use of kort nozzle.

Unit VI

Construction of fishing boat: Layout of a typical boat building yard, Various stages of construction, Description of various machines and tools used in boat building yard, Stages of wooden boat building – Sheathing of wooden hull – Steel boat construction and FRP boat construction, Inspection of fishing boat under construction, Care and maintenance of fishing boats – Factors causing damage, Hull protection methods and maintenance schedule, Inspection of damaged fishing vessels, Regulation of fishing vessels and classification of societies in various countries.

VI. Practical

Basic principles of drawing, drawing of fishing vessels – line drawing – sectional view of the boat and keel assembly – half breadth & body. Visit to boat building yards for on – the – spot study of different stages of wooden boat construction and to study the layout. Identification of various tools and machines used in boat building. Study of various stages of boat construction with the help of boat models and making their sketches. Calculation of various dimensions; Study of deck lay outs of different types of fishing vessels and preparation of sketches; Visit to dry dock

I. Course Title : Responsible Fishing

II. Course Code : FET 503

III. Credit Hours : 1+1

IV. Aim of the course

To teach various responsible fishing techniques, To learn about damage to the environment & biodiversity by existing fishing methods, To learn about methods of reducing by catch in trawl net.

V. Theory

Unit I

CCRF: Scope and objectives of FAO Code of conduct for Responsible Fisheries, Articles of CCRF – Description of the code, Analysis of marine catch data (present & past); analysis of CCRF concept.

Unit II

By-catch: Elaboration of Article 8 – Fishing operations; By-catch and discards – Definitions, By-catch estimation methods, by-catch reduction devices, turtle excluder devices, Finfish and shrimp excluder devices. Selective fishing gear and practices: Selectivity of trawls, gill nets and lines – Environmentally friendly fishing methods and fishing gears – Energy conservation and resource enhancement.

Unit III

Fish Aggregation Devices (FADs and Artificial reefs): Objectives, Types of FADs and artificial reefs; Design and construction of FADs and artificial reefs; Energy optimization in fisheries – Methods of energy conservation in fish harvesting. Remote Sensing and PFZ: Application of Remote sensing, PFZ and GIS in fisheries.

Unit IV

IUU - Illegal, Unregulated and Unreported fishing methods; Destructive and prohibited fishing systems and practices. Effect of fishing on non-target species: Effect of bottom trawl and gill nets on benthic fauna and habitats; Conservation methods issues and implications for biodiversity.

VI. Practical

Study of design and operation of BRDs and TEDs; Preparation of document listing and prohibited fishing practices; compilation of package of practices for energy conservation; interpretation of SST and Ocean colour charts, Study of Potential Fishing Zone (PFZ) maps; problems on fishing gear selectivity; studies on impact of various fishing gears on environment and biodiversity.

I. Course Title : Refrigeration and Electrical Engineering

II. Course Code : FET 504

III. Credit Hours : 2+1

IV. Aim of the course

To teach engineering aspects about refrigerators, freezers, To learn about heat-load calculation and COP, To teach electrical aspects of fishing vessel.

V. Theory

Unit I

Principles of refrigeration: Refrigeration cycle; Vapour Compression system, Vapour absorption system, Steam Jet Refrigeration System, Solar energy based refrigeration systems; Application of Refrigeration in fisheries, Refrigeration in sea food processing plant – Refrigeration in deep sea fishing vessels – design and working of RSW and CSW – Coefficient of Performance (CoP) – ton of refrigeration – Refrigerator efficiency calculations.

Unit II

Heat load and efficiency: Heat load calculations – Insulations in freezers and cold stores – Frosting and defrosting in freezers and cold stores; Refrigeration in factory Trawlers; Types of Refrigerated transport.

Unit III

Refrigerants: Types and properties, Use of different refrigerants in seafood processing industry; Brine solution and dry ice refrigeration.

Unit IV

General structure of electrical power systems: Power transmission and distribution via overhead lines and underground cables, Steam, Hydel, Gas and Nuclear power generation, Principal and application of DC Networks, Single phase AC Circuits, Three phase AC circuits, Magnetic Transformers, Induction motor, DC Motors etc.

Unit V

Electrical Measuring Instruments: DC PMMC instruments shunt and multipliers, multi-meters, Moving iron ammeters and voltmeters, Dynamometer, Wattmeter, AC watt-hour meter, Extension of instrument ranges.

Unit VI

Principles and working of electronic components: Audio, R.F. circuits; Electron tubes, Transistors; Principles of electronic circuits; Amplifiers, Oscillators, Rectifier, Tuned circuits – Transmission of reception.

VI. Practical

Practical Visit to refrigeration plants, heat load calculations. Handling and operation of refrigeration equipments – compressor, condenser, evaporator, liquid return system, gas purging, oil drain, oil charging, refrigerant charging, defrosting; Ice making and harvesting; study of various automatic control devices; expansion valves, L.P. and H.P. switches, solenoid valves. Study of various types of fish processing machineries; electrical motors, transformers, GPS, SONAR etc.

I. Course Title : Marine Engineering

II. Course Code : FET 505

III. Credit Hours : 1+1

IV. Aim of the course

To teach engineering aspects of marine engines, To learn about effective utilization engine powers during fishing and propulsion, To study about system of fishing vessels.

V. Theory

Unit I

Engine characteristics: Capacity of cylinders, IHP, BHP, FHP, BMEP, Torque determinations; SFC values, IC engines – Working cycles – Indicator diagrams – Performance number – Supercharging – Engine performance curves – Duel-fuel engines, Handling of IC engine and maintenances – Engine and boiler room arrangements – Steering gears – auxiliary engines – Heat exchangers – Propeller Shaft driver steam generators.

Unit II

Efficiency of engines: Compression ratio and thermal efficiency; Volumetric efficiency; Mechanical efficiency different ratings – continuous, peak, intermittent, Feel and lubricant – Strokes – Cooling method – Running characteristics – Size weight – Power requirement; Propulsion system – Combinations of engine, power transmission and propeller.

Unit III

Function of main engine: Friction, Clutch, Hydraulic coupling, Gearbox, Thrust; Bearing, Shafting, Propeller, Auxiliary machinery systems – Requirements of a winch, windlass, line and net hauler – estimation of their driving torque and power; Operation of a hydraulic steering gear; Rudder torque.

Unit IV

Engineering structure; Floating offshore structures –Diving – Underwater vehicles, Estimation grower requirement for various types of fishing – Efficiency group of fishing techniques – Resistance group of fishing methods – Computation of engine power.

VI. Practical

Study of basic machine parts, shafts, keys, couplings, levers, joints, pulleys, belts, gears and bearings. Study of Engine parts, engine testing, dissembling and assembling a running condition marine engine; study of marine diesel engines, fuel consumption testing with load; Propeller calculations using the computers; calculations related to engine power- Power transmission in fishing vessels.

VII. Suggested Reading

I. Course Title : Introduction to Deep Sea Fishing

II. Course Code : FET 506

III. Credit Hours : 1+1

IV. Aim of the course

To learn international law of the sea, To learn about deep sea fishing policies, To learn deep sea techniques.

V. Theory

Unit I

Sea Laws: UNCLOS – Law of the sea, Base line -territorial waters, Contagious zones, EEZ and High Seas, Basics of Deep-sea Fishing-National deep-sea policies

Unit II

Deep sea fishery resources: Oceanic Tuna and tuna like fishes, Oceanic Squids.

Unit III

Deep sea fishing gears and accessories – Tune long lining, Gill netting and squid jigging, Deckequipments in deep sea fishing vessel, Mother boat concept and factory vessels in deep sea fishing.

Unit IV

Weather and warning: Wind, Wave, Current, Cyclones, Squally weathers, Doldrums, Weather forecasting and weather prediction at sea – Weather equipment and storm signals, Preparation and management of deep-sea fishing vessels.

VI. Practical

Familiarization of meteorological equipments onboards. Storm signals and visit to signalling stations. Visit to deep sea fishing vessels to study the layout, manpower, facilities for deep-sea navigation and fishing, instruments and fleet management. Study on deck equipments in deep sea fishing vessels. Visit to fisheries departments and MPEDA to know about the initiatives on deep-sea fishing.

I. Course Title : Fishing Harbour and Fleet Management

II. Course Code : FET 507

III. Credit Hours : 1+1

IV. Aim of the course

To teach fishing harbour design and construction, To learn about fishing fleet that management and manning regulations in fishing harbour.

V. Theory

Unit I

Fishing vessel: FAO classification of fishing vessels, Indigenous fishing boats of India – fishing boats of maritime states of India, Fishing boats used in the inland and brackish waters, Account of mechanized boats introduced in India.

Unit II

Rules and Management: Personnel management, Planning of fishing cruises, Fishing fleet capacity, Fleet registration, fleet insurance, Seaworthiness assessment, Tonnage measurements Statutory rules and regulations under MSA, Classified societies, Manning regulations and requirements; Regulations to prevent collisions at sea.

Unit III

Classification and functions of fishing harbour: Facilities – waterside and landside facilities, Services and utilities provided, Layout of a modern fishing harbour, Stages in the planning of fishing harbours, Dredging.

Unit IV

Economic evaluation: On fishing harbour project, Dry docks and slipway – Fishing harbour management and maintenance.

VI. Practical

Visit to dry dock; Visit to Fishing harbour, Study of boats with the help of boat models and making sketches; Visit to various vessel types of fishing vessel.

VII. Suggested Reading

- FAO. 1960. *Report to Government of India on Fishing Harbours Based on the Work of Carl GB Juke and CRB Juke*. FAO Report No. 1242 ETAP, pp.147.
- FAO. 1962. *Second Report to Government of India on Fishing Harbour Based on the Work of BW Johnson*. FAO Report No. 1538 EPTA, pp. 99.

I. Course Title : Acoustics, Navigation and Seamanship

II. Course Code : FET 508

III. Credit Hours : 2+1

IV. Aim of the course

To learn engineering aspects of fish acoustic equipments, To learn navigation and seamanship for fishing vessel safety.

V. Theory

Unit I

Basics of acoustic fish detection: Basics of sound in water-Ultra sonic sound and its characteristics-Acoustic surveys in fish population studies- Acoustic equipments used in fishing.

Unit II

Acoustic Equipments: Advanced models of Echo sounder – Major components, specifications and uses; Sonar – specifications, types; Instruments used for evaluation of underwater gear performance, Acoustic trawl monitoring system.

Unit III

Navigation: Fishing vessel navigation – Recent advances in fishing vessel navigation – Methods of signalling in fishing vessels- Fixing of vessel position, Navigational charts- Rules of the road.

Unit IV

Electronic Equipments: Global positioning system (GPS); Vessel monitoring systems (VMS) and AIS (Automatic Identification System) Navigation – Types, Navigational equipments, RADAR, Autopilot, Chat plotter.

Unit V

Seamanship: Handling of fishing vessels under all conditions at sea- Ropes and rope works– Their types, Handling; strength and preservation; Knots and splices; Anchoring mooring; Steering; Rolling and pitching.

Unit VI

Accidents at sea: Accidents- causes- Preventive measures- Preparedness for Fishing vessels.

VI. Practical

Chart work and navigational equipment, chart reading, position fixing, direction and distance in navigation -calculations; Operation of echo sounder, Sonar, GPS, Radar identification and study of navigation and fishing lights and day signals, distress signals and navigational equipments like compass, chronometer, aneroid barometer, sextant and logs

VII. Suggested Reading

I. Course Title : Engineering Graphics

II. Course Code : FET 509

III. Credit Hours : 0+1

IV. Aim of the course

To teach practical aspects of computer aided engineering graphic.

V. Practical

- Introduction to Engineering Graphics – Drawing instruments and their use – Different types of lines – Lettering & dimensioning – Familiarization with current India Standard Code of Practice for Engineering Drawing. Introduction to scales. Introduction to orthographic projections – Horizontal, vertical and profile planes – First angle and third angle projections – Projection of points in different coordinates – Projections of lines inclined to one of the reference planes.
- Projections of lines inclined to both the planes – True lengths of the lines and their angles of inclination with the reference planes – Traces of lines. Projection of plane laminae of geometric shapes inclined one of the reference planes – inclined to both the planes – auxiliary projections.
- Projections of polyhedral and solids of revolution – Frustum – projection of solids with axis parallel to one of the planes and parallel or perpendicular to the other plane – Projections with the axis inclined to one of the planes. Projections of solids with axis inclined to both the planes – Projection of spheres. Sections of solids by planes perpendicular to at least one of the reference planes – True shapes of sections, Developments.

VI. Suggested Reading

- Bhatt ND. *Elementary Engineering Drawing*, Charter Publishing House, Anand, 2002.

I. Course Title : GIS and Remote Sensing in Fisheries

II. Course Code : FET 510

III. Credit Hours : 2+1

IV. Aim of the course

To learn to use GIS and Remote sensing to foster the sustainable use of natural fisheries resources

V. Theory

Unit I

Aerial Photography: Basics of photography- terminologies- Photogrammetry - Stereoscopy - Principal points - Parallax and its measurement, Colours - Composite colour images.

Unit II

Remote Sensing - Electromagnetic Spectrum - Radiation laws - Interaction with atmosphere and surfaces, Spectral reflectance of earth materials and vegetation, Satellite Remote Sensing - Resolution - Scanning - Sensors, Land Observation Satellites - Visual image interpretation

Unit III

Image and Data: Digital image processing, Image rectification and Image enhancement - Filtering - Band rationing, Image classification - Supervised & unsupervised classification, Remote sensing application in soil & water conservation.

Unit IV

GIS - Types, raster, vector, Data base management systems, Data types, Spatial - non-spatial, Spatial data models, Spatial referencing, Map projections, Data input, Editing, Encoding, Raster data analysis, Vector data analysis.

Unit V

Satellite Application: NOAA and IRS- Satellites for Ocean and Fisheries studies- Digital image processing and interpretation, Application of remote sensing and GIS to fisheries and aquaculture planning and development.

Unit VI

PFZ- Basics and application- Validation of PFZ data- INCOIS- Data Dissemination- Fishermen knowledge in PFZ

VI. Practical

Study of satellite information, interpretation of satellite pictures for resource management, case studies on remote sensing and GIS applications. Development of GIS with local parameters related to fisheries- INCOIS data processing and interpretation- Collection and Validation of INCOIS PFZ data. INCOIS data dissemination methods among coastal fishermen. Survey of effectiveness and usefulness of PFZ data.

I. Course Title : Sea Safety and Disaster Management

II. Course Code : FET 512

III. Credit Hours : 1+1

IV. Aim of the course

To teach theoretical aspects of sea safety and disaster management, To learn about bad weather preparation and situation handling. Crew management during disaster.

V. Theory

Unit I

Introduction to sea safety: Safe navigation procedures for fishing vessels; Distress Signals and DAT (Distress Alert Transmitter), and communication systems like VHF, SSB and INMARSAT; Familiarization with safety devices like SART, EPIRB and GMDSS.

Unit II

Accidents: Accidents associated with marine environment-crossing surf, Bad weather, Poor visibility storms, Loss of power at sea, Loss of way, Grounding, Collisions. Injuries from fish, Animals and machinery, Man, overboard and capsizing. **Signals for fishing vessel safety:** Agencies involved in fishing vessel rescue operations, Keeping watch at sea – Preventing collusions – Heavy weather preparations -Crew management.

Unit III

Fire onboard and Firefighting equipment: Fir accidents at sea- Types and causes for fire accidents-Firefighting methods- fire extinguishers-First aid at sea; **Weather warning:** Weather warning signals and weather reporting system for fishing vessels; Bad weather preparations for fishing vessels. Stranding and beaching of fishing vessels and refloatation procedures; Measures to enhance sea safety; International conventions related to sea safety

Unit IV

Types of natural and man-made hazards in fisheries: Cyclone, Tsunami etc., Characteristics and impact of various disasters, Preparedness for disasters at sea, Mass evacuation, storm shelters and survival platforms.

VI. Practical

Study on various Distress Signals, Study on communication systems like VHF, SSB and INMARSAT; Familiarization with safety devices, study of fire fighting equipments used in fishing vessels, study of impact of various disasters, Disaster preparedness at sea. Weather warning signals. Sea safety equipments, Crew management during disaster.

I. Course Title : Fish Processing Machinery

II. Course Code : FET 513

III. Credit Hours : 1+1

IV. Aim of the course

To teach engineering aspects of various equipments related to fish processing, To learn about design and layout of factory vessels and Processing factory designs

V. Theory

Unit I

Machines: Theory of machines; Transmission of power; Friction wheels; Toothed gears; Belt drive and drivers- Importance and need for the use of machineries in fish processing, Advancements in fish processing machineries.

Unit II

Graders and Deskinners: Conveyers-types and working, Graders-basic principles and types, Washers and Slime removing in fishes- Deskinners-types and working principles, **Descaling and filleting machines:** Descaling – machineries-types and working, Filleting machines, types and working, Gutting machines and Deheaders, Types and working, Quick freezers.

Unit III

Slicers and filleting machines: Fish slicing machines-types and working, Fish filleting machines-types and working, Deboners, Types and working, Advanced Thermal processing machineries, High pressure processing equipments, Advanced canning machineries

Unit IV

Boilers and extruders: Boilers -types and working. Extruders-types and working-Twin screw extruders, Various Packaging machines. Machineries for fish meal plants. **Maintenance:** Fish processing Equipment Maintenance- Daily, weekly, monthly and annual Maintenance. Safety aspects of machineries and workers.

VI. Practical

Study of various types fish processing machineries-washer, grader, deheader, filleting machine, retorts; calculation of power requirements and power transmission. Study of boilers and its operation, canning equipments, Twin screw extruders. RSW and CSW in fishing vessel- design and capacity calculations. Implements required for sushmi grade tuna processing onboard of the vessel. Packing machineries, Maintenance of various fish processing machineries

*Major compulsory courses

Course Contents
Ph.D. in Fishing Technology and Engineering

I. Course Title : Mechanization in Fishing

II. Course Code : FET 601

III. Credit Hours : 1+1

IV. Aim of the course

To learn various mechanized systems used in the fishing industry, To study the power requirements of fishing vessels, To study about deck equipment's of fishing.

V. Theory

Unit I

Resources: Marine fisheries resources of India, Types and history of fish harvesting systems, History of mechanization of fishing craft in India.

Engines for fishing boat: Advances in marine engines, Selection of marine engines, Turbo engines, Installation and engine handling, Estimation of power requirements- Powering of fishing vessels, BHP, IHP, SHP, EHP, QPC. Propellers- Types, Construction, Selection, Factors involved in propeller performance, Propeller nozzle.

Unit II

Deck fittings: Mast, Derrick, Pulley, Fair leads, Gallows, Gantries, Trawl winch, Try net winch, Pumps, Triplex roller, Power block, Capstan, Purse winch, Purse davit, Guide roller, Rail roller.

Unit III

Fishing Systems: Line hauler, Net hauler, Trap hauler, Rudder, working principle, Types, Quadrant assembly, Mechanized trawl system, Mechanized purse seine system, Mechanized gillnetting system, Automatic and semi-automatic long lining system, Mechanization in trap fishing.

Unit IV

Hydraulic system: Principle, Components, Application of hydraulic systems in fishing equipments, Trawl winches, Net hauler, Line hauler, Power block etc., Maintenance of marine engine and equipments

Fish Processing Methods onboard: Design and fabrication of insulated fish holds, CSW and RSW systems, Chill Storage onboard a vessel, Fish Processing Equipments on board a vessel.

VI. Practical

Marine engine types, working, starting system, fuel system, cooling system, lubrication system, power transmission, Propellers types and working, visit to mechanized boat building yards- construction aspects of trawler, gill netter, long liner, purse seiner etc. to study the on-board deck layout and equipments. Basic calculations for hydraulic system and marine engine power ratings, IHP, BHP, SHP. Design of fish holds CSW, RSW systems and Fish Processing Equipments. Estimation and optimization of energy in fishing.

I. Course Title : Advanced Fishing Gear Designing and Construction

II. Course Code : FET 602

III. Credit Hours : 2+1

IV. Aim of the course

To learn advanced fishing gear designing, To study the construction of various fishing gears, To learn fishing gear survey techniques.

V. Theory

Unit I

Fishing gear design: Principle of mechanism of fish catching, Fishing gear design process, Traditional and modern techniques used for net designing, Computer aided fishing gear designing.

Unit II

Net fabrication: Design drawings and specifications of fishing gears, Reading of fishing gear design; General scheme of presentation, Conventions adopted on the specific drawings trawl net, gill net, Surrounding net, Dredges, Pots, and lines, Estimation of weight of netting, Indian standard conventions adopted for netting panels, Lines and ropes, accessories, Method of representation on drawing.

Unit III

Fishing gear construction: Forms of fibre; Natural, synthetic and their properties; Construction of yarn, Twine, Rope, Advancement in fishing gear materials, Fishing gear construction – Shaping of netting, mounting of netting, Hanging, assembly of netting, Mending-Taper ratio, Hanging coefficient, Take up ratio.

Unit IV

Factors affecting fishing gear design: Design consideration of gill net, Bottom trawl, Mid water trawl, Purse seine and long line, Trap, Cast net, Surrounding gear, Designing of square mesh cod-end, TED, BRD, Recent advancement in the construction of passive fishing gear; Gill nets, Trammel net, Traps, Non-return devices in traps and barriers, Hook and line, long line; Barriers.

Unit V

Recent advancements in the construction of active fishing gears: Trawl net, Purse seine, Cast net, Surrounding nets.

Unit VI

The influence of design features on the overall economic performance of fishing gears, Technical flaws of fishing gear designs and their impact on fuel efficiency, Modelling principle, Trawl net-based flume tank tests.

VI. Practical

Designing and construction of eco-friendly gill net, trawl net, trammel net, trap, long line, purse seine. Calculation on cutting rate, shaping, twine surface area, hanging ratio, buoyant and sinking force. Estimation of twin surface area, drag of the trawl, horizontal spread between otter board. Practice on scale drawing of different types of fishing nets, computer software application in designing of fishing gears. Construction of square mesh cod-end, Construction of Bycatch Reduction Device and Turtle Excluder Device. Estimation of quantity of netting materials for long line, gill net and trawl. Designing of model nets

I. Course Title : Fishing Gear Selectivity
II. Course Code : FET 603
III. Credit Hours : 1+1

IV. Aim of the course

To learn trawl net selectivity, To learn gill net selectivity, To learn fishing hook selectivity.

V. Theory

Unit I

Selectivity: Terminologies related to selectivity, Bycatch, Discard, Ghost fishing, Catch quality, Significance of fishing gear selectivity, size selective fishing gears, species selective fishing gears.

Unit II

Selectivity of trawl: Introduction, Trawl selectivity parameters, Selection factor, L25, L50, L75, Trawl selection curve, Factors affecting the selectivity of trawls, Method of measuring selectivity of trawls, Covered cod-end method, Trouser trawl cod-end method, Twin trawl method, Alternate hauls, Parallel hauls; Limitations of trawl net selectivity-square-mesh code end- spatial temporal variation in availability of stock on selectivity – TED, BRD.

Unit III

Selectivity of gill net: Introduction, Estimation of gill net selection, Length at first capture (Lb), Mean selection length (Lc), Length of escapement (Ld) selectivity curves, Factors influencing the selectivity of gill net, Methods of measuring selectivity - Direct estimate, indirect estimate, Girth measurements, Fishing mortality, Selectivity of hook and line – introduction, estimation of hook and line selection, selectivity curves, factors influencing the selectivity of hook and line, Methods of measuring selectivity, Size selectivity of hook, Effect of Hook and Bait Size, Estimation of the size selectivity of hooks, Impact of hook shape on hook selectivity.

Unit IV

Fisheries management – Impact of selective fishing on ecosystem, Impact of selective capture of top carnivorous- Recruitment over fishing, Growth over fishing, Fishing holidays, FADs, ARS as management tools.

VI. Practical

Optimum mesh size estimation for gill net. Lb – Length at first capture, Lc – mean selection length and Ld- escapement length. Gill net selection factor. Selectivity curves for trawl. Trawl selection range and trawl net selection factor. L25, L50 and L75. Fishing hook selectivity.

I. Course Title : Deepsea Fishing

II. Course Code : FET 604

III. Credit Hours : 2+1

IV. Aim of the course

Familiarization of deck equipment's on deep sea fishing vessel, Familiarization of bridge equipment's, Familiarization of engine room equipment's of deep-sea vessel.

V. Theory

Unit I

Deep sea fishing vessels: History of Deep-Sea Fishing, History of deep-sea fishing in India, Deep sea fishing initiatives, Committee on Deep sea fishing, Fishing Vessels and Deep-Sea Fishing, Types of fishing vessel, Mother vessel, Factory trawler, Thoothoor model, Design features of fishing vessels, Medium and large vessels.

Unit II

Deep sea resources: Fin Fishes, Shell fishes and other fishery resources of deep sea, Deep Sea Fishing Potential, Deep sea fishing resources of India, Exploitation of resources, FSI initiatives, Depth wise abundance.

Unit III

Fishing surveys: The Deep-Sea Prawn Fishery, Exploratory Surveys, The Trawling Grounds, Operations and the Catches, Area-wise Catch Distribution, Exploratory Surveys by FORV Sagar Sampada.

Unit IV

Details of Fishing - Catches and the Catch Rate, Species Composition, Biological Observations, Studies by Fishery Survey of India, Operations of Chartered Trawlers, Distribution and Abundance of Deep-Sea Prawns, Fishing Grounds, Catch Per Unit of Effort, Seasonality in Fishing Effort, Seasonal Variation in Catch Rate.

Unit V

Deep sea fishing gears: Fishing gears for deep sea fishing, Modification to the Gear, Area of Fishing Commercial Operations, Operations of Large Trawlers,Operations of Medium Trawlers, Estimation of Resource Potential Management Measures, Eco-friendly deep-sea fishing.

Unit VI

Govt. initiatives and sea safety: Various schemes of central and state governments to promote deep sea fishing in India and Tamilnadu, Sea safety aspects of deep-sea fishing vessels, Modern electronic equipments for deep fishing and navigation.

VI. Practical

Familiarization of deck equipment's on deep sea fishing vessel, net hauler and line hauler, Familiarization of bridge equipment's, Familiarization of engine room equipment's of deep-sea vessel. Illustration of boat, gears used in deep sea fishing. Fishing trips.

I. Course Title : Sustainable Fishing Methods

II. Course Code : FET 605

III. Credit Hours : 1+1

IV. Aim of the course

To learn various fishing methods and gears for the sustainable exploitation of aquatic resources

V. Theory

Unit I

Sustainable fishery: Definition of sustainability, Rules and regulations for sustainable fishing, FAO- code of conduct for responsible fisheries, Properties of a sustainable fishery, Present scenario and problems of sustainable fishing, Trends in global and Indian fishery, Environmental defects.

Unit II

Impacts of unsustainable fishing: Habitat degradation due to trawling, purse seining, Habitat modification, changing the ecosystem balance, Climate change, Ocean pollution, Disease and toxins, Remediation for sustainable fishery, Fisheries management, Ecosystem based fisheries, Marine protected area, Laws and treaties, Awareness campaigns, Sustainable fishing gears and devices, Designing of eco-friendly long line, Eco-friendly gillnet, Eco-friendly trawl net, Techniques reducing the risk of unsustainability, IUU fishing, Eco-friendly fishing methods and gears.

Unit III

Application of advanced methods: GIS, Remote sensing, PFZ, The Sustainability Challenges for Fisheries-Environmental challenges, Economic challenges, Social challenges, Organizational challenges.

Unit IV

Issues related to the sustainability: Environmental, Economic, Governance arrangements, Monitoring and enforcement, Legislation and policy, Endangered fish species of India, Government regulations, Present fishing policies adopted in developed nations for sustainable fishing.

VI. Practical

Visit to fishing harbour and landing centre to study technical draw basics of fishing gear with respect to their eco friendliness. Study designing of eco-friendly fishing devices, square mesh cod end, traps with escape vents, designing of longline with circular hooks. PFZ maps and table, GIS, remote sensing application in fisheries.

I. Course Title : Fishing Harbour, Planning, Construction and Management

II. Course Code : FET 606

III. Credit Hours : 2+1

IV. Aim of the course

To learn Fishing Harbour Planning, To learn Planning Construction and Management of Fishing Harbour, To learn advanced methods for preventing sea erosion.

V. Theory

Unit I

Classification and functions of fishing harbour and Fish Landing Centre: Water side and land side facilities, Site selection for fishing port, Planning and construction, Environmental impact assessment, Indian Standard codes.

Unit II

Hydrographic surveys- Vertical depth measurements, Horizontal position fixing; Specifying hydrographic surveys, Outline design and project formulation, Preliminary design, Final design, Construction phase of a port, Maintenance dredging and reclamation construction cost estimation.

Unit III

Harbour management: Structures, Size and composition, Artisanal landing, Management body, Best management practices, Port operations, Boatyard operations, Prevention of pollution.

Unit IV

Requirements for dredging - Volume estimates, Dredging techniques, Disposal of dredged sediments, Environmental impacts of dredging, Dredging of fairways, Minimum width, Minimum depth.

Unit V

Breakwater: Parameters for the construction of a breakwater; Construction methods; Floating breakwaters; Quays, Jetties, Slipways, Construction materials for fishing harbour.

Unit VI

Dry docks; Fishing harbour management and maintenance; Shore-based infrastructure, Advanced methods for preventing sea erosion, Dreading of fishing harbours.

VI. Suggested Reading

I. Course title : Electronic Navigation and Sea Safety for Fishing Vessels

II. Course code : FET 607

III. Credit Hours : 2+1

IV. Aim of the course

To learn electronic navigational equipment's, To learn sea safety practices followed in the fishing vessels, To learn position plotting and chart work.

V. Theory

Unit I

Electronic navigation-I: Introduction, Terminologies and definitions related to electronic navigation, Global Positioning System, Echo sounder, Speed log, Electronic chart display and information system.

Unit II

Electronic navigation-II: Automatic Identification System (AIS), Voyage data recorder, Gyro-Compass, Auto Pilot and Course Recorder, Radio Direction Finder, VHF, Marine radio.

Unit III

Signalling: Introduction, Terminologies and definitions, Flag signalling, International code of signals, Single letter and two letter signals, Morse code, Flash light signals, Arm signals

Unit IV

Safety: Conventions on sea safety, Global Maritime Distress and Safety System (GMDSS).

Unit V

Lifesaving appliances for fishing vessels: Life buoy, Life jacket, Buoyant apparatus etc., Ship handling, Equipment, Manoeuvring and Mooring operations, Preventing Collisions at sea, Accident hazards.

Unit VI

Communication during emergencies: Danger message, Distress and rescue procedure, Distress signals Fire fighting and checking and data recording of the safety instruments in boats, Emergencies at sea, Disaster management at sea for fishing vessel.

VI. Practical

Chart work; operation of navigational equipment viz., echo sounder, Sonar, GPS, Radar and communication systems like VHF, familiarization with sea safety devices like Chart Plotter, AIS, DAT, SART, EPIRB and GMDSS; navigational and fishing lights and shapes, distress signals and navigational equipment's compass, chronometer, aneroid barometer, sextant and speed logs. Visit to fishing vessel for familiarization of navigational equipment's.

Suggested broad areas for Master's and Doctoral research

- Design upgradation of existing fishing gears for sustainable catch.
- Selectivity studies of fishing gears.
- Development of new fishing gear design and efficiency studies
- Catch Per Unit Effort(CPU) studies for different fishing gears
- Design upgradation of fishing crafts.
- Fouling effects on fishing crafts and Prevention methods.
- Problems of Wooden crafts with boring organisms.
- Efficiency of modern fishing gear materials under different conditions
- Abrasion studies for fishing gear materials
- Energy Optimization of fishing crafts
- Design and efficiency studies of Bycatch Reduction Devices
- Design and efficiency studies of Turtle Excluding Device(TED)

- Bycatch studies.
- Studies on ap[plication of remote sensing in fishing
- PFZ validation studies.
- Studies on FADs.
- Effect of fishing on non-target species
- Heat load calculations Design and layout upgradation of Processing Plants.
- Marine engine power ratings under various load conditions
- Energy efficient fishing methods
- Dry docking efficiency studies
- Anti-fouling studies in fishing vessels
- Design and functions of fishing harbours
- Modern tools for navigation/Electronic navigation
- Application of electronics in fishing
- Application eco-sounder in location fish shoals
- Low cost waste treatment systems and their Design
- Management options for ballast water
- Disaster management strategies
- Use if ICT in disaster preparedness
- Study of power requirements for different processing machinery
- Factors determining the selection of processing machinery

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 5

Fisheries Science
– Fisheries Economics

Preamble
(Fisheries Economics)

Though fisheries economics is an integral part of Fisheries Science, the PG and Ph.D. programmes are offered in few campuses for strengthening sustainability, development and welfare of fisherfolk. Desired information on fish and fisheries need to be collected, inform and convince the people about the value of new and better technology packages, make further refinement to suit them and motivate them to adopt it and draw benefit from it. The research in various thrust areas of fisheries economics provides information to planners and policy makers for the fisheries development in India by offering the PG programmes and technical man power development in colleges and research institutes. The syllabus is designed to introduce doctoral and graduate students of fisheries economics to the process of scientific research in social sciences considering development taking place in allied subjects. Accordingly the syllabus is revised to take care of the changes in the data collection and processing and dissemination in developing data based fisheries management, market-led fisheries management and fisheries advisory services. New courses introduces is based on the emerging trend requirements for the graduating students. There are new and interesting contents are added in the subjects from socioeconomics to econometric tools which require continuous updation.

Course Insides

The economics principles and concepts could be applied to study the individual fisherman, households and firms' behavior in decision making, allocation of resources and understanding the fundamental relationships in the aggregate, macroeconomic activity, public policy goals and alternative policy proposals regarding inflation, economic growth, unemployment, and scarcity affecting fisheries. The purpose of the course is to give students a thorough understanding of the principles of economics that apply to the decisions of individuals-both consumers and producers-within the larger economic system. It is a subdivision of economics that studies how people, firms and households decide on how to allocate their limited resources taking fishermen as an example. The socioeconomics of fisherfolk means and ways of their welfare. Marine capture fisheries and aquaculture are important sources of food and livelihoods for fishermen. Climate change is the change of climate which is attributed directly or indirectly to fisheries activities that alters the composition of fish production and which is in addition to natural climate variability observed over comparable time periods. Fisheries is one of the important sectors which has been most exposed to vulnerability affected by climate change. The measure of livelihood status of fishermen warrants welfare schemes for their socioeconomic development. To make the students understand about the socioeconomic conditions of the fisherfolk and to assess their standard of living to draft various means of welfare schemes and its economic impact on the productivity of fisheries and livelihood and to study about the various policies and regulations to cope up with the climate change. Economic valuation provides a means for measuring and comparing the various benefits of fisheries resources and their ecosystems, and can be a powerful tool to aid and improve their wise use and management. The current limitations to valuing the services provided by inland fish and fisheries make comparison with other water resource users extremely difficult. This list can serve to demonstrate the importance of inland fish and fisheries, a necessary first step to better incorporating them into agriculture, land-use, and water resource planning, where they are currently often underappreciated or ignored. It also aims to provide an overview of the concept and methods for payment for ecosystem services and their policy implications. This course is aimed at providing a rigorous and application-oriented treatment of different valuation techniques for measuring the value of aquatic environmental goods and services. R & D Management is the discipline of designing and leading R & D processes, managing R & D organisations and ensuring smooth transfer of new know-how and technology to other groups or departments involved in innovation. To move towards innovation in fisheries and aquaculture, priorities for policy makers can set out the basis for a comprehensive and action-oriented approach. Technology diffusion with the number of inventions that seek patent protection through national, regional or international routes in a given jurisdiction. It shows the extent to which firms and individuals seek to "protect" the relevant markets for their inventions.

The international and domestic markets play a very important role in the development of fisheries sector in the country. Apart from ensuring the nutritional and food security, it also helps in minimising the post – harvest losses, increases revenue and enhance employment opportunities. Marketing intelligence is the everyday information relevant to a company's markets, gathered and analysed specifically for the purpose of accurate and confident decision- making in determining market opportunity, market penetration strategy and market development metrics. The main purpose is to give an idea about the marketing intelligence and business analysis applied in the fisheries sector. The trade of the fish and fisheries products are an important means of income particularly in India. This course gives an insight to the various aspects of the fisheries trade at a global level. The importance of small-scale fishers and developing countries at a global level in producing and supplying fish and fishery products put them at the forefront in facing specific trade measures. At the consumer level, increasing awareness is driving demand for traceability systems and certification schemes intended to guarantee the sustainability and quality of a growing array of fish and fishery products. In order to level the playing field and provide clarity to the market, FAO supported the development of a common benchmark tool for fishery certification schemes. The main purpose is to familiarize students with basic concepts and principles of economics applied to international trade with reference to fisheries. Finance and project management provides an insight knowledge about investing in sustainable fisheries to support thriving oceans and communities. The accounting of cost input in different phases of project, complete ledgering of inventories and the financial inflow in a production system in an integral part of management. The profitability of any production system is derived by financial control in projects. Econometric is the application of statistical methods to economic data in order to give empirical content to economic relations. Econometrics uses statistical methods after adapting them to the problems of economic life. These adopted statistical methods are usually termed as econometric methods. Such methods are adjusted so that they become appropriate for the measurement of stochastic relationships. These adjustments basically attempt to specify attempts to the stochastic element which operate in real world data and enters into the determination of observed data. To make acquainted students with econometric tools applied to social sciences. This course on quantitative and econometric analysis focuses on practical applications that are relevant in fields such as economics, finance, public policy, business, and marketing

Learning upshots

To apply economic concepts and techniques to a range of specific issues in the management of aquatic fisheries resources; to analyse markets and industries and the economic challenges facing private business, public institutions and international organizations and to know the relevant markets for fish and aquaculture products, how these markets work, and how they affect production. Most of the courses are compulsory and demands active participation from the students. Emphasis to be placed on direct student participation, in the form of literature search and data retrieval, oral presentations, record fieldwork, assignments and computer labs. The examination form varies between courses and includes: written examinations, record, presentations of report using data science and analytics. The final examination is based on the thesis and an open oral examination

Course Title with Credit Load
M.F.Sc. in Fisheries Economics

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FEC 501	Microeconomics	2+0
FEC 502	Macroeconomics	2+0
FEC 503	Socioeconomics, Vulnerability and Fisherfolk welfare	2+1
FEC 504	Fishery Regulations and Ecosystem Valuation	2+1
FEC 505	Marketing Intelligence and Business Analysis	2+1
FEC 506	International Fisheries Trade	1+1
FEC 507	Fisheries Finance, Accounting and Control	2+1
FEC 508	Introduction to Econometric Tools	1+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
FEC 510	Management of R & D Innovations and Policy	1+1
FEC 511	Economics of Fisheries Enterprises	1+1
FEC 512	Fisheries Development Planning and Policy	2+0
FEC 513	Fisheries Project Management	1+1
	Supporting Courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common Courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	

Course Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
FEC 591	Masters' Seminar	0+1
	Total Course Work Credits	**40 Credits**
	Masters' Thesis Research	**30 Credits**
FEC 599	Masters' Research (Semester III)	0+15
FEC 599	Masters' Research (Semester IV)	0+15
	Total M.F.Sc Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fisheries Economics

I. Course Title : Microeconomics

II. Course Code : FEC 501

III. Credit Hours : 2+0

IV. Aim of the course

To teach economics theories that apply to the decisions of individual consumers and producers and also firms.

V. Theory

Unit I

Consumer theory: Theory of Demand, Consumer Behaviour, Cardinal Utility theory, Indifference Curves theory, Income and Substitution effect, Derivation of demand curve, Consumer surplus, Equilibrium of the consumer, Elasticity of demand, Market demand, Constant elasticity demand function

Unit II

Production economics: Basic theory of the firm, Concepts, Production functions, Isoquants derivations and applications, optimization behaviour, Alternative models, Short run and long run cost functions; Total price effect, Substitution effect, Output effect and Profit maximization effect decomposition analysis, Analytical approaches, joint products, Concepts and constrained optimization.

Unit III

Production theory: Theory of production and costs, Production functions, Returns to scale, Long run analysis of production, Law of variable proportions, Technological progress, Equilibrium of the firm, Choice of optimal combination of factors of production, Derivation of cost function from production function, Production function of a multiproduct firm, Iso-revenue curve of the multiproduct firm, Linear production functions, Linear programming.

Unit IV

Theory of costs: Theory of costs, Cost curves, Traditional theory of costs, Modern theory of costs, Short and Long run costs, Marginal cost, Minimum Average Total Costs, Analysis of Economies of Scale, Social and Private costs.

Unit V

Factor pricing: Theory of Price in Perfectly Competitive markets, The supply curve of the firm and industry, Short run equilibrium of the firm and industry, Equilibrium of firm and industry in long run, Optimal Resource Allocation, The stability of equilibrium, Dynamic equilibrium with lagged adjustment, Futures market- Hedging/ risk assumption.

Unit VI

Welfare economics: General Equilibrium theory- Two commodity exchange-

Production and exchange, Multimarket equilibrium, General equilibrium and allocation of resources, Factor ownership and income distribution, Welfare economics, Pareto optimality, Maximization of social welfare, Welfare maximizing state.

I. Course Title : Macroeconomics

II. Course Code : FEC 502

III. Credit Hours : 2+0

IV. Aim of the course

To understand the basic concepts and principles of macroeconomics including the analytical tools used for them.

V. Theory

Unit I

Basic concepts: Nature and Scope of Macroeconomics, Methodology and Keynesian Concepts National income, Concepts and measurement (GNP, NNP, PI & DI), methods for measuring national income, Importance of NI analysis, Nominal and Real GDP, Balance of Payments (BoP), Meaning, Structure, Deficit and surplus, Disequilibrium, control measures.

Unit II

Theory of income and employment: Classical theory of Employment and Say's Law, Modern theory of Employment and Effective Demand, Consumption function, Investment and savings; Consumption function, Average propensity to consume and marginal propensity to consume, Measure of propensity to consumption, Keynes's theory of consumption and The determinants of consumption, Importance of consumption function.

Unit III

Investment and Saving: Saving function, Average propensity to save and marginal propensity to save; Investment function, Meaning, Types of investment, Determinants of the levels of investment, Marginal efficiency of investment, Induced investment.

Unit IV

Multiplier and accelerator: Concept of Multiplier and Accelerator, Output and Employment, Rate of interest-Classical, Neo classical and Keynesian version, Theory of Multiplier, Concepts of investment multiplier, derivation of investment Multiplier, Importance of multiplier; Aggregate demand and supply; Unemployment, Meaning, types; Full employment.

Unit V

Monetary and fiscal policy: Inflation-meaning, types, Inflationary gap, Cause and effect of inflation, Control measures for inflation; Monetary policy – Meaning, Objective, instruments, Fiscal policy – Meaning, Objective, Fiscal policy for economic growth, merits and Demerits of the fiscal policy.

Unit VI

Public finance and expenditure: Public finance and Public expenditure – Concepts, types of public expenditure, Growth of public expenditure, Effects of public expenditure on production and distribution; Government expenditure (Taxation) – Government budget constraints; Tax- meaning, Classification, Characteristics of good tax system, Problems of equity in taxation.

I. **Course Title** : **Socioeconomics, Vulnerability and Fisherfolk Welfare**

II. **Course Code** : **FEC 503**

III. **Credit Hours** : **2+1**

IV. **Aim of the course**

To make the students understand about the socioeconomic conditions of the fisherfolk and the impact of climate change over it to assess their standard of living to draft various means of welfare schemes to them.

V. **Theory**

Unit I

Factors affecting socioeconomic status: An over view of socioeconomic status of fisherfolk in India, Livelihood and Income, Indebtedness, Poverty, Inequality and unemployment in fisheries, Regional disparities in wage, work and livelihood security, Equity theory; Risk and uncertainty in fisheries, Standard of living of fisherfolk, Saving, Income, Consumption, poverty, Health status.

Unit II

Socioeconomic analysis: Concepts in socioeconomics, Gender discrimination, Income inequality, Gini coefficient and Lorenz curve, Theil index, Livelihood Index, Engel's curve, Duncan Socioeconomic Index (SEI), Occupational Status Score (OSS), Household prestige (HHP) score, Recent measurement of economic development NEW (New Economic Welfare), MRW (Measurement of Economic Welfare), PQLI (Physical Quality Living Index), HDI (Human Development Index)- Green GNP Index.

Unit III

Fisheries and climate change: Fisheries and climate change, Fisheries policy, Issues for future impact and adaptation, Socio economic condition and Fisheries policy, Fisheries and sustainability, Biodiversity of climate change, Indian fisheries current scenario in climate change, climate change threat, Impact of climate change in fisheries, Dynamics of climate change, Futuristic endeavour.

Unit IV

Climate change impact analysis: Economic impact on climate changes, Climate change mitigation and adaptation, Ongoing initiatives and future strategies for fisheries sector, Methods and tools for climate change adaptation- Impacts of climate driven extreme events and disasters in fishermen communities, Social impact on climate change, Vulnerability assessment, Top down and Bottom up approaches, Socio-economic vulnerability, Criteria and indicators, Vulnerability assessment framework and methods, Exposure, Sensitivity and Adaptive Capacity, Vulnerability Index– SeVI

Unit V

Legal instruments to mitigate climate change: An overview of international legal and policy framework to address climate change developed over time and points out some of the key issues under negotiation, History of international climate change negotiations and Nations Framework Convention on Climate Change (UNFCCC), Key provisions of the UNFCCC, Its organisational structure, and different Party groups under the Convention, Kyoto Protocol and its associated bodies, as well as key commitments by Parties, An overview of main negotiation issues, Highlights some of the key issues relevant for a future climate change regime.

Unit VI

Welfare economics: Fundamental theorems of welfare economics, Promising features of welfare economics, Welfare Schemes for fisherfolk in India, Women empowerment in Fisheries, Overview of fisherfolk welfare schemes, Fisheries Cooperatives, Corporations and NGOs in fisherfolk welfare development.

VI. Practical

Assessment of socioeconomic parameters of fisherfolk in marine fisheries sector; Assessment of socioeconomic parameters of fisherfolk in inland fisheries sector; Consumption and savings behaviour of fisherfolk; Nutrition and Health analysis of fisherfolk; Case studies on effects on climate change in world fisheries with special emphasis to Indian fisheries; Climate change impact on coastal fisheries and aquaculture in India; Case studies on sustainability of fisheries sector in India; Case studies on climate change driven disasters affecting the fishermen communities in India; Effectiveness of fisherfolk welfare schemes; Impact of welfare schemes on fisherfolk

I. Course Title : Fishery Regulations and Ecosystem Valuation

II. Course Code : FEC 504

III. Credit Hours : 2+1

IV. Aim of the course

To provide an overview of the concept and methods for payment for ecosystem services and their policy implications. This course is aimed at providing a rigorous and application-oriented treatment of different valuation techniques for measuring the value of aquatic environmental goods and services.

V. Theory

Unit I

Fisheries regulations: Fisheries Regulations, Imperative needs for the regulation of marine fisheries in India, Types of fishery regulations, Possible objectives of fisheries regulations; Fisheries regulations followed in the maritime states of India.

Unit II

Aquaculture guidelines: Aquaculture; Guidelines under CRZ notification of 1991 and its Amendments, Land leasing policies, Regulations on use of chemicals and antibiotics, Features of Aquaculture Seed (Quality Control) Relevant Central/state legislative provisions of Environment, Wildlife, Water, Biodiversity: (riverine, reservoir and aquaculture), Processing in different States.

Unit III

Ecosystem valuation: Environmental and ecosystem valuation, The concept of value and valuation –Theoretical basis of valuation – Consumer surplus, Compensating variation and equivalent variation, Cost-benefit analysis of a conservation project, Ecosystem valuation, Payment for ecosystem services, Ethical issues in valuation, choice of discount rate.

Unit IV

Methods of valuation - Revealed preference methods: Taxonomy of ecosystem values, Use value, non-use value, Direct and indirect use value, Existence value, Bequest value and option value, Revealed preference methods, Change in productivity method – Averting behavior and substitutable private, and Environmental goods, Models for bundled attribute goods, Hedonic of differentiated commodities, Discrete choice model of differentiated commodities, Hedonic property value model, Replacement cost approach, Substitute goods approach, Travel cost methods.

Unit V

Methods of valuation –Stated preference methods: Stated preference methods, Contingent behavior, contingent valuation techniques, Willingness to accept and willingness to pay, Bidding games, Choice experiment approach, Combining revealed preference and stated preference methods, Discrete choice models for stated preference data, Validity of stated preference data, Other methods, Benefit transfer.

Unit VI

Risk valuation and assessment: Morbidity and Mortality Risk Valuation, Risk assessment and the environment, Conceptual models, Health production model, Endogenous mortality risk, Measuring the value of a statistical life, Wage hedonics, Valuing health changes, Defensive expenditures and cost of illness, Economic valuation of biodiversity, Measurement of carbon sequestration benefits, Measurement of climate change impact, Agronomic vs. economic methods, Ricardian model, Just-Pope model.

VI. Practical

Contemporary global environmental issues, movement, policies, programmes, laws and other regulatory mechanisms; Fishery regulation in India; Criteria for evaluating the environment related projects and review of Environmental Impact Assessment (EIA) techniques; Recreation demand models of environmental valuation – Contingent valuation techniques – Environmental Resource Accounting Techniques; Practical considerations and comparison of instruments of environmental policy; Non-Point source pollution control methodologies - economic valuation and environmental economics; Exercises on change in productivity method; Replacement cost method with examples and insights from literature; Exercises on hedonic pricing. Travel cost method – design and application with example, Stated preference approaches – Contingent valuation methods; Measuring WTP and WTA – Empirical exercises

I. **Course Title : Marketing Intelligence and Business Analysis**

II. **Course Code : FEC 505**

III. **Credit Hours : 2+1**

IV. **Aim of the course**

To give an idea about the marketing intelligence and business analysis applied in the fisheries sector.

V. **Theory**

Unit I

Research methodology: The role of marketing intelligence in the firm, The process of marketing research, The difference between exploratory and confirmatory research, Secondary and primary data, Qualitative and quantitative research methodologies, Sampling theory.

Unit II

Requirements in business analysis: Requirements in Business Analysis, Management, Communication, Tracing, Configuration and change management, quality assurance, Development, Elicitation including stakeholders and/or product requirements development, Specification.

Unit III

Business analytics: Business Analysis, Internal analysis, External analysis, Business need definition, Gap analysis, Solution proposal (including feasibility analysis), Solution delivery or maintenance program/project initiation- Business process definition, Business goals, Business needs, Business requirements, Limitations and assumptions.

Unit IV

Modelling and forecasting: Solution modelling, validation and verification, Solution evaluation and optimization, Assessing the solution options (proposals), Evaluating performance of the solution, Solution/business process optimization, Model Volatility with ARCH and GARCH for Time Series Forecasting.

Unit V

Marketing research: Definitions of the various methodological concepts -Various steps involved in designing a research plan, Data collection methods; Characteristics, Structure, Sources, Value, and use of Big Data, The relationship between digital analytics and inbound marketing strategies, Consumer information and measurement services, Rules for designing a questionnaire.

Unit VI

Data analysis in marketing research: Data sources for assessing consumer preferences, firm performance, and market condition and competition- analyze enterprise data, especially for purposes of segmentation, targeting, positioning, and evaluating consumer value- process of organizing, writing, framing, and refining analytics reports- delivering effective presentations, and aligning analytic results with stakeholder needs and preferences

VI. **Practical**

Marketing Research – ethics, standards and issues; Utilisation of Secondary Data Resources for Customer Segmentation Pricing and Elasticity; Linear Regression

Basics; Using Linear Regression to Forecast; Conjoint Analysis; Digital Marketing Metrics Customer Lifetime Value; Cluster Analysis; Finding and interpreting secondary data; Suggesting a methodology for fisheries marketing research; Tools and concepts of data visualization

I. Course Title : International Fisheries Trade

II. Course Code : FEC 506

III. Credit Hours : 1+1

IV. Aim of the course

To familiarize students with basic concepts and principles of economics applied to international trade with reference to fisheries.

V. Theory

Unit I

Introduction to international economics: International Economics, Concepts and scope, Nature of international trade, Difference between domestic and Foreign trade; Theories of international trade, Absolute and comparative advantage, Modern theories of international trade, Hecksher Ohlin theorem.

Unit II

Concepts in trade: Concepts of terms of trade, Free trade, Protection, Tariffs, Quantitative restrictions and other non-tariff measures; Exchange rate; Devaluation and depreciation; Balance of payments, EXIM policy of India in relation to fish and fishery products.

Unit III

Export- Import procedures: Export- Import procedures, and certification, Growth of marine product exports – MPEDA and its development programmes.

Unit IV

Institutions and trade policies: GATT and WTO, transition from GATT to WTO, WTO provision and its agreements; Agreement on Agriculture (AoA), Agreement on SPS measures and its salient features, Role of Codex Alimentarius Commission

(CAC) and Agreement in Trade Related Intellectual Property rights (TRIPs) WTO in dispute settlement.

VI. Practical

Pattern and performance of India's seafood exports; Product and market diversification; Competitiveness of Indian fish and fish products; Exports of value added seafood products; Case study of a seafood export firm; Use of SPS / TBT measure; Non-tariff barriers in fisheries trade; Dumping and anti-dumping measures in seafood trade.

I. Course Title : Fisheries Finance, Accounting and Control

II. Course code : FEC 507

III. Credit Hours : 2+1

IV. Aim of the course

To make aware about the innovations in the fisheries finance and accounting.

V. Theory

Unit I

Principles of finance: Importance of fisheries finance; Principles of fisheries financial management, Rural credit structure, Demand and supply, Sources and forms; Estimation of credit requirement; Cost of Credit/capital; Credit appraisal. The concept of 3C's, 7P's and 3R's of credit, District Credit Plan and lending to agriculture/priority sector Micro-Financing.

Unit II

Reforms in policies and institutions: Reforms in fisheries credit policy; Innovations in fisheries financing, Micro Finance, Role of institutions in fisheries, Finance, Public and Private sector banks; Cooperatives, Micro-finance institutions (MFIs), SHGs; Financing through Co-operatives, NABARD and Commercial Banks and RRBs International Financial Institutions; Successes and failures of co-operative sector in India; Role of co-operatives under emerging economic scenario.

Unit III

Capital and cost concepts: Sources of long-term finance and cost of capital; Concepts of components of working capital, Managing working capital, Cash management, Dividend decision; Capital budgeting, Appraisal criteria; Fish business financing system in India-money and capital markets, National, regional and global financial institutions; Insurance; Risk management; Micro-credit.

Unit IV

Project formulation and appraisal: Elements of project cycle; Identification, Preparation, appraisal, Financing and implementation of projects, Project Appraisal techniques; Undiscounted measures, ranking by inspection, Pay-back period, Average annual proceeds per unit of outlay, Time value of money, Use of discounted measures, Derivation of incremental net benefit; B-C ratio, NPV and IRR, Project management Net-work Techniques – PERT and CPM.

Unit V

Accounting types: Branches of Accounting, Internal and External Users of Accounting, Financial Accounting, Meaning, Need, Concepts and Conventions; Advantages and Limitations, Accounting Standards, The Double Entry System, Its Meaning and Scope, The Journal, Cash Book, Ledger, Trial Balance, Trading Account, Profit and Loss Account, Balance Sheet, Entries and Adjustments of different heads in different Books and Accounts, Introduction of Company Accounts.

Unit VI

Accounting management: Management Accounting, Meaning, Functions, Scope, Utility Limitations and Tools of Management Accounting, Cost Accounting, Basics, Significance, Objectives, Classification of Costs, Marginal Costing. Responsibility Accounting, meaning and significance, Budgets and Budgetary Control-Types of Budgets.

VI. Practical

Rural Lending Programmes of Commercial Banks; Lead Bank Scheme-Preparation of District Credit Plan; Preparation of financial statements using farm/firm level data; Farm credit appraisal techniques and farm financial analysis through financial statements; Different case studies on fisheries cooperative societies and their performance (marine and inland sector); Practical exercise on PERT and CPM; Ratio analysis; Valuation of project inventories; Project appraisal techniques– undiscounted and discounted measures; Company accounts format and formatting

I. Course title : Introduction to Econometric Tools

II. Course code : FEC 508

III. Credit Hours : 1+1

IV. Aim of the course

To make students acquainted with econometric tools applied to social sciences. This course on quantitative and econometric analysis focuses on practical applications that are relevant in fields such as economics, finance, public policy, business and marketing.

V. Theory

Unit I

Nature and scope of econometrics: Definition and Scope of Econometrics; Methodology of econometrics, The nature of the econometrics Approaches, Simple regression estimation and testing procedures, Stochastic and Non-Stochastic relations, Statistical properties of least squares estimators, Confidence interval and Hypothesis testing, Goodness of fit, Reporting the results of regression Analysis; Matrix Algebra.

Unit II

Introduction to classic linear regression analysis: Two variable regression model, The basic assumptions; Application of regression model, The covariance and covariance estimator, Functional forms of regression models and methods of estimation; Cobb-Douglas Production Model, Multiple regression model, Relationship between simple and multiple regression coefficients; Auto correlation-Heteroscedasticity; Multicollinearity; Meaning and problem, Autoregressive models for univariate time series stationary data (AR), Trend (ARIMA), and Seasonal component (SARIMA).

Unit III

Regression models and forecasting techniques: Simultaneous – Equation

Models; Problems of Simultaneous equation model; Multinomial regression models Ordinal – Regression models.

Unit IV

Forecasting with regression model: Panel data regression models, Survival analysis, Parametric and non-parametric tests in Social Sciences; Adhoc procedures in Regression analysis, Estimation of Probit, Logit and Tobit Probability Models.

VI. Practical

Analysis on fitting classical linear regression models; Detection of multicollinearity; Forecasting models; Heteroscedasticity and autocorrelation for the given data sets in fisheries; Parametric and non-parametric tests; Data analysis in MS excel, SPSS and STATA; Forecasting models that can be developed for univariate time series data.

I. Course Title : Management of R&D Innovations and Policy

II. Course Code : FEC 510

III. Credit Hours : 1+1

IV. Aim of the course

To give an idea about the R & D Management and fisheries policy analysis.

V. Theory

Unit I

Innovation and technology: Innovation, productivity and economic growth; Nature, process and importance of technological innovation, Role of fisheries in economic and rural development.

Unit II

Fisheries in economic development theories: Growth stage theories, Structural transportation leading sectors and dual economy models, Technology adoption, Diffusion and transfer, Theoretical models and case studies, Technology, Resources and environment.

Unit III

Fisheries research systems: Fisheries research systems, Evolution and growth, Selected case studies of major countries, Investment trends, International comparisons, Institutional details; Changing public-private roles in technology development, Institutions and fisheries development; Collective actions, property rights, Transaction cost economics.

Unit IV

Theories and policies: Need for separate/sound fisheries policy, Resource polices, Credit policies, Input and product marketing policies, Price policies, Theories of fisheries development, Conservation, Urban industrial impact and Diffusion, High-pay-off input, Science and technology policy, Regulation, Incentives; Technology and Intellectual Property Rights, selected case studies.

VI. Practical

Measurement of productivity growth; Exercise on total factor productivity; Using frontier production function; Institutional structures and national and international fisheries research systems; Ex-ante and ex-post methods of estimation of R & D impacts in fisheries.

I. Course title : Economics of Fisheries Enterprises

II. Course code : FEC 511

III. Credit Hours : 1+1

IV. Aim of the course

To make the students aware about the economics of the various culture fisheries and the post – harvest operations.

V. Theory

Unit I

Production economics: Aquaculture in economic development, Production concepts in aquaculture Production function, Cost and return concepts in aquaculture, Optimization of use of single resource, Cost of production, Short run production cost, Long run cost, Production function analysis in various aquaculture system, Preparation of financial statements-Balance Sheet, Cash Flow Statement and Profit and Loss Account, Ratio Analysis and Assessing the performance of farm/firm.

Unit II

Planning and budgeting: Farm income and budget analysis, Planning and budgeting, Aquaculture management decisions, Resource, labour and financial management, Managing risks and uncertainties, Economics of different aquaculture systems, Socio economic issues, Causes for aquaculture problems, Government support policies for inland, Coastal and marine aquaculture systems.

Unit III

Value Chain Management concept: Value Chain Management concepts, Value addition in fish marketing, Constraints and approaches to VCM in fisheries sector, Domestic and external markets for fisheries products, Export – Infrastructure development from landing to marketing.

Unit IV

Value chain analysis: Post-harvest operations in inland and marine fisheries including deep sea fishing, methodological issues in marine capture fisheries, needed measures for the constraints in post-harvest operations.

VI. Practical

Estimation of cost and returns of different aquaculture systems in India; Production trends of aquaculture in India for the past 10 years and the projected production estimates; Production function analysis; Planning and budgeting; Financial analysis in aquaculture production systems; Case studies of various aquaculture systems in India; Visit to various shrimp hatcheries or farms; Visit to various finfish farms and ornamental units; Visit to various craft and gear manufacturing units; Cost and returns of marketing establishments including export processing firms

II. Course Code : FEC 512

III. Credit Hours : 2+0

IV. Aim of the course

To understand fisheries policy of different states and plans for development

V. Theory

Unit I

Planning: Planning Commission era, Organisation, role and functions, Planning in India, Objectives, Strategy, Allocation, Achievements and Bottlenecks, Types of planning, Stages in planning process, Planning models. Impact of development plans, International co-operation programmes, NITI AYOG; Planning under NITI AYOG; Planning and development in China and Russia; Planning and Free Market economies.

Unit II

Fisheries development schemes and policies: Fisheries Development and policy under the plans, Fisheries schemes; NFDB; NABARD schemes, State and center sector schemes and centrally sponsored schemes, Central Department of Fisheries; Agriculture policies, Need for a separate fishery policy, National Marine Fisheries Policy; Leasing policies for inland and brackish water bodies in different states, National Mariculture Policy; National Inland Fisheries and Aquaculture policy, Inputs Policy, Financing and Credit Policy, marketing and pricing policy, Export -Import Policy.

Unit III

Importance of fisheries in rural and economic development: Importance of Fisheries in rural and economic development, Centre and state level policies for fisheries, Fisheries policy issues, Fisheries sector strategy, Various resource policies, Fisheries policy and Legislation, Development of Fisheries during the Five-Year Plans, Fisheries credit and marketing policies.

Unit IV

Planning and cooperation: Fisheries planning, Economic factors influencing development and co-operation in fisheries, Fisheries management, Role of fisheries in rural development and Policy initiatives, Economic planning in fisheries, Problems of development Planning, Fishing policies and economic growth, Panning and policy analysis, Fisheries project planning.

Unit V

Fisheries legislation: Fisheries legislation in India, background, Indian Fisheries Act of 1897 and Subsequent amendments; Marine capture fisheries, Comparative study of Marine Fishery Regulation, Acts of coastal Indian States – licensing/ registration of vessels and mechanization, Declaration of closed season, Protection of endangered species, Prohibition of destructive fishing methods, Regulation of mesh size, Filing of return on fish catch and income, Features of MPEDA Act and Rules, 1972.

Unit VI

Legislative policies: Guidelines for operation of Indian deep sea fishing vessels in Indian EEZ, Maritime Zone of India (regulation of fishing by foreign vessels) Act 1981, Aquatic exotics and quarantine regulations, Marine Fisheries Policy, 2004. Coastal Aquaculture authority; Aquaculture Guidelines under CRZ notification of 1991 and its Amendments, Land leasing policies, Regulations on use of chemicals and antibiotics, Features of Central/state legislative provisions of Environmental, Wildlife, Water, Biodiversity: (riverine, reservoir and aquaculture), Processing in different States.

I. Course Title : Fisheries Project Management
II. Course Code : FEC 513
III. Credit Hours : 1+1

IV. Aim of the course

To highlight the different institutions financing fisheries projects

V. Theory

Unit I

Finance and management: Sources of long term finance and cost of capital; Concepts of components of working capital, Managing working capital, Cash management, dividend decision; Capital budgeting, Appraisal criteria.

Unit II

Financing system in India: Financing system in India, Money and capital markets, national, Regional and global financial institutions; Insurance; Risk management; Micro-credit.

Unit III

Project formulation: Elements of project cycle, Identification, Preparation, Appraisal, Financing and implementation of projects, Project Appraisal techniques, Undiscounted measures, Ranking by inspection, Pay-back period, Average annual proceeds per unit of outlay, Time value of money.

Unit IV

Project Evaluation: Identification, Preparation, Appraisal, Financing and Implementation of projects, Project Appraisal technique, Undiscounted Measures, Time value of money, Use of discounted measures, B-C ratio, NPV and IRR, Agreements, Supervision, Monitoring and Evaluation phases in appraising fisheries investment projects, Net worth Techniques–PERT and CPM.

VI. Practical

Rural Lending Programmes of Commercial Banks, Lead Bank Scheme; Insight on District Credit Plan; Preparation of financial statements using farm/firm level data; Farm credit appraisal techniques and farm financial analysis through financial statements; Different case studies on fisheries cooperative societies in India; Visit to marine and inland cooperatives to analyse performance; Practical and Case studies: Ratio analysis, valuation of project inventories; Project appraisal techniques–undiscounted and discounted measures.

Course Title with Credit Load
Ph.D. in Fisheries Economics

Course Code	Course Title	Credit Hours
	Major Courses	**12 Credits**
FEC 601	Fisheries Production and Sustainability	1+1
FEC 602	Applied Econometrics	2+1
FEC 604	Fishery Resource Evaluation and Governance	1+1
FEC 605	Institutional and Legal Environment for Fish Business	2+0
FST 601	Advanced Statistical Methods	2+1
	Minor Courses	**6 Credits**
	(From the subjects closely related to a student's major subject)	
FEC 603	Economics of Development and Planning	2+0
FEC 606	Indian Fisheries Trade and International Scenario	1+1
FST 602	Software for Fisheries Data Analysis and Management	0+2
	Supporting courses	**5 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Total Course Work Credits	**23 Credits**
	Seminar	**2 Credits**
FEC 691	Seminar-I	0+1
FEC 692	Seminar-II	0+1
	Ph.D. Research	**75 Credits**
FEC 699	Doctoral Research (Semester II)	0+15
FEC 699	Doctoral Research (Semester III)	0+15
FEC 699	Doctoral Research (Semester IV)	0+15
FEC 699	Doctoral Research (Semester V)	0+15
FEC 699	Doctoral Research (Semester VI)	0+15
	Total Ph.D. Program Credit Hours	**100 Credits**

Course Contents
Ph.D. in Fisheries Economics

I. Course Title : Fisheries Production and Sustainability

II. Course Code : FEC 601

III. Credit Hours : 1+1

IV. Aim of the course

To impart skill of fish production and sustainability in the different culture systems

V. Theory

Unit I

Introduction: Fishery resources of India, Capture and culture fisheries- Status and prospects, Production function in culture and capture fisheries of India- Inland fisheries in India, Marine fisheries in India, Mariculture, Present status and future potential.

Unit II

Production economics: Fish catch and fishing effort, Catch per unit effort, Fishing costs and returns, Estimation of economics of fisheries, Dynamic economic models of fishing, Sustainable yield, Sustainable yield curves, Open access equilibrium, Maximum economic yield, Maximum sustainable yield, Change in open access equilibrium yield, Free and open access equilibrium, Total revenue, costs and sustainable yield with respect to effort.

Unit III

Fisheries management: Fisheries Management Theories, Objectives and techniques of fisheries management, Criteria for fisheries management, Need for management, Implementation of management Measures.

Unit IV

Fisheries regulations: Objectives of fisheries regulation, Need and types of regulation in Indian Fisheries, Overfishing- Problems of overfishing, Reasons for overfishing, Measures adopted to minimize overfishing.

VI. Practical

Production status of fishery resources in India; Analysis in the production of marine fisheries in India; Analysis in the production of maritime states in east coast of India; Analysis in the production of maritime states in west coast of India; Analysis in the production of inland fisheries in India; Analysis in the production of inland states in India; Catch and effort surveys; Estimation of cost and returns of different capture fisheries methods; Estimation of cost and returns of different culture fisheries methods; Case studies on various sectors of fisheries.

I. Course Title : Applied Econometrics

II. Course Code : FEC 602

III. Credit Hours : 2+1

IV. Aim of the course

To provide comprehensive knowledge of advanced econometric tools for better understanding of economic problems.

V. Theory

Unit I

Model specifications: Econometric model specification criteria, Specification errors, Measurement errors of dependent and explanatory variables, Different model specification criteria.

Unit II

Instrumental variables: Review of classical regression model, Hypothesis testing, Estimation subject to linear restriction, Mixed estimation, Use of instrumental variables in regression analysis.

Unit III

Qualitative regression tools: Use of Dummy variables, Models for qualitative dependent variable-LPM, Multinomial logit models.

Unit IV

Simultaneous equations: Simultaneous equation systems; Basic rationale, identification problems, Single equation methods of estimation, Indirect least squares, Two stage least squares and K-class estimators, Limited information maximum likelihood, Three-stage least squares and Full information maximum likelihood; Relative merits of these methods and their small and large sample properties, SURE estimates.

Unit V

Time series analysis: Introduction to time series analysis, Trend, cycle and seasonality, Time series models, Basic ideas in fitting non-linear regression models.

Unit VI

Time series modelling: Distributed lag models, Analysis of economic time series, Stationarity and unit root test, ARIMA, ARCH group of models and co-integration, Neural Network Models, Pooling of cross-section and time series data.

VI. Practical

Estimation of multiple regression model; Estimation of LPM; Logit and Probit models – comparing two regressions; Chow test - Indirect least squares 2SLS, SURE, 3SLS; Estimation of simultaneous equation models; unit root tests for stationarity, fitting of ARIMA and ARCH group of models; Co integration. Model selection; Hands on using econometric packages like SPSS and SAS.

I. Course Title : Economics of Development and Planning

II. Course Code : FEC 603

III. Credit Hours : 2+0

IV. Aim of the course

To provide orientation to the concepts and measures of economic development and planning.

V. Theory

Unit I

Economic development and growth: Development Economics, Scope and Importance, Economic development and economic growth, Divergence in concept and approach, Theories of development; Indicators and Measurement of Economic Development – GNP as a measure of economic growth – Green GNP, Criteria for under development, Obstacles to economic development, Economic and Non-Economic factors of economic growth.

Unit II

Theories of development: Role of fisheries in economic development, Characteristics of developing and developed economies; Theories of development; Role of economic, Technological, Social, Cultural, Political and Environmental factors; Interdependence between fisheries and industrial development.

Unit III

Growth models: Growth models – Harrod - Domar, Neo-classical, Von Neumann; Development strategies in India; Five-year plans and fisheries, Growth analysis, Determinants of growth and their measurements.

Unit IV

Planning: Planning models, Features of planning in capitalist, Socialist, Neosocialist and Mixed economies; Types of planning, micro level, Regional, Sectoral, Agro eco regional development.

Unit V

Institutions and policies: Role of Non-Government Organizations (NGOs) and Self-Help Groups (SHGs) in agriculture and fisheries development; Characterizing fisheries growth, Changes in fishing and farming pattern, Decomposition analysis and sources of output growth; Transfer of technology, Constraints to technology adoption, Yield gap analysis and research planning; Fisheries information system, Fisheries policy analysis and reforms.

Unit VI

Food and nutritional security: Concepts of food and nutritional security, Production oriented policies, Food price policies, Food subsidies, Food safety and Food quality, Measurement of poverty, Poverty alleviation programmes.

VI. Practical

VII. Suggested Reading

- Chakaravathi RM. 1986. *Under Development and Choices in Agriculture*. Heritage Publ., New Delhi.
- Dewett KK. 2002. *Modern Economic Theory*. S. Chand & Co.
- Dutta and Sundaram. *Indian Economy*

I. Course Title : Fishery Resource Evaluation and Governance

II. Course Code : FEC 604

III. Credit Hours : 1+1

IV. Aim of the course

The students will be exposed to economic evaluation techniques in the realm of resource governance in fisheries.

V. Theory

Unit I

Ecosystem valuation: Present status of Natural environmental ecosystems in India Economic Tools Markets for the Environment, Valuing the natural ecosystems in fisheries, Cost-Benefit analysis and Environmental risk, Problems in natural Fishery Resources management, Misuse of natural resources, Accountability and transparency.

Unit II

Environmental policies and tools: A History of Environmental 'Regulation, Environment, Security, Violence: The Malthusian Legacy, Problems of "Regulating" Nature, Introduction to Policy Analysis; A policy tool approach. Property Rights and Common Property Management, Payments for environmental services.

Unit III

International Environmental Agreements: Evolution in Environmental

Governance, Governance Strategies, Governance Tools, Analytical issues in assessing participation and devolution, Participatory approaches in natural resource management and policy.

Unit IV

Environmental Impact assessment: Concept and principles of EIA; Methodologies for EIA in fisheries and aquaculture sector; Institutional (International/National/Stale/Local) arrangements and strategies for estimation, Amelioration and compensation for impacts; Aquaculture Authority Bill and AAI, Environment related conflicts and dispute resolution; Coasian theorem and stakeholder decision making process.

VI. Practical

Environmental Policy Analysis; Developing Criteria for Evaluating Environmental Policies; Frameworks for environmental governance analysis; Common Property and Community-Based Resource Management; Case studies on environmental economics of shrimp farming (intensive/semi-intensive/extensive) and poly culture farms; Application of Extended Domestic Resource; Cost Ratio and Policy Analysis Matrix for aquaculture; Case studies on the sustainability of various capture fishery systems; Exercise on global warming and fisheries development concepts in valuing environment; Productivity change method, substitute cost method, Hedonic price method, Travel cost method, Contingent valuation methods.

I. Course Title : Institutional and Legal Environment for Fish Business

II. Course Code : FEC 605

III. Credit Hours : 2+0

IV. Aim of the course

To provide an insight into the legal and institutional aspects that impact the efficiency and performance of fish business organizations.

V. Theory

Unit I

Legal system and business: The Indian legal system an overview, The Indian Contract Act (1872); Meaning, nature, and scope; Types of contracts; Essentials of a valid contract, Offer and acceptance, capacity to contract, Free consent, Performance of contract, Issues in international business transactions; International Sale of Goods, The Sales Contract, Letters of Credit, Foreign Direct Investment, Protection of intellectual property, Dispute Resolution.

Unit II

Acts and laws: Companies Act (1956); Incorporation, Commencement of business, types of companies, Management, Winding up of companies; Negotiable Instruments Act, Factory Act, Labour laws, Industrial dispute Act.

Unit III

Management systems for food quality and safety: Management systems for food quality and safety; Regulatory provisions and acts; Essential Commodities Act, APMC Act, Consumer Protection Act, RTI Act, MRTP Act, Regulations related to food safety, Hygiene and quality; National FPO (1955).

Unit IV

Acts and laws for food quality and safety: Food Safety and Standards Act (2006), and other Acts related to fish, fruits, meat, milk, grading and standardization (AGMARK) and international (sanitary and phyto-sanitary requirements, Codex, ISO, HACCP, Good Manufacturing Practices (GMP) and Good Agricultural Practices (GAP)) (BMPs in Aquaculture and Fisheries).

Unit V

Institutional environment: Role of institutions in fish business; Ministry of Food Processing Industries, Ministry of Food and Consumer Affairs, Product Boards, Export Promotion Council, Food Safety and Standards Authority, India, etc. International institutions facilitating fish business, Provisions related to FDI in agriculture and food production and distribution.

Unit VI

Corporate social responsibility: Nature and importance of ethics and moral standards; Corporations and social responsibilities, Scope and Purpose of business ethics; Ethics in business functional areas; Industrial espionage; Solving ethical problems; governance mechanism.

VI. Suggested Reading

I. Course Title : Indian Fisheries Trade and International Scenario

II. Course Code : FEC 606

III. Credit Hours : 1+1

IV. Aim of the course

To familiarize the student with the evolution, growth and performance of Indian fisheries trade in international context.

V. Theory

Unit I

Evolution of Indian fisheries industry: Growth and evolution of Indian fisheries industry; Size, Organisation, structure, Export promotion measures in India, Duty draw back, Deemed exports –ASIDE-MDA-MAI-EPGC, Innovations and productivity in Indian fisheries industry.

Unit II

Trade theories and policies: International trade; Nature of international trade, Theories of international trade, Modern theories of international trade.

Unit III

Concepts of terms of trade: Free trade, Protection, Tariffs, Quantitative restrictions and other non-tariff measures, Globalisation and changing facets of global and Indian fisheries industry.

Unit IV

Institutional frame work: Growth of global fisheries industry, Fresh, Frozen, Cured, Canned and other types, Fisheries industry in US, Japan, European Union, Australia, Asian and African countries, Institutional frame work in India for foreign trade, Internalization of Indian fisheries trade.

VI. Practical

Pattern and Performance of India's Seafood Exports; Export Composition and destination of Indian seafood products; Product and market diversification; Competitiveness of Indian fish and fish products; Exports of value added seafood products; Case studies on non-tariff barriers in fisheries trade; Case studies on dumping and anti-dumping measures in seafood trade; Studies on world shrimp, tuna and cephalopod industries; Analysis of International price trends and volatility; WTO and trade dispute settlement.

Suggested Broad Areas for Master's and Doctoral Research

- Profitability and comparative performance of different aquaculture systems
- Investment pattern and capital flow in fisheries sector over the years
- Price spread/consumer surplus, and marketing efficiency of different marketing channels in fisheries marketing
- Opportunities and challenges for organised fish retail markets
- Impact of mechanization/modernization in coastal fisheries on productivity, sustainability and livelihood
- Cost benefit analysis of different aquaculture production systems
- Cost benefit analysis of advanced aquaculture production systems like RAS
- Capital formation and fisheries development in different plans
- Social and ecological impact of coastal aquaculture
- Conservation economics
- Social and ecological benefit of waste water based aquaculture systems
- Preparation of model commercial project proposals
- Economic and financial analysis of fisheries project proposals
- Export performance and potential of fish and fish products
- WTO and its implications on the fisheries trade
- Forecasting of the structure and pattern of Indian seafood trade
- Export competitiveness of Indian fish and fish products
- Status and performance of fisheries co-operatives in marine and inland fisheries sector
- Financial appraisal of the different co-operatives
- Estimation of credit requirement of Indian fishing community
- Economic evaluation of the fisheries cooperatives -case studies
- Contribution of agriculture and fisheries to Indian economy over the years
- Capital formation In Indian Agriculture and allied sectors
- Demand and supply projections for fish and fish products

- Consumer preference and market segmentation in domestic and export markets for fish products
- Policy gaps and anomalies in Indian fisheries and aquaculture
- Science and politics of monsoon ban in coastal fisheries
- Production constraints in different aquaculture production systems
- Yield gap analysis of the different aquaculture production systems
- Impact of trade and environment with respect to high value export oriented fisheries
- Analysing the MSY, MEY and SOY of the different marine resources
- Comparative advantage and competitiveness of Indian fish products in relation to major exporting countries
- Impact of anti-dumping and subsidies on Indian fish exports
- Comparative study of land leasing policies for fish/shrimp farming in different States
- Financial advantage of formation of exclusive ministry/council for fisheries

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 5

Fisheries Science
– Fisheries Extension

Preamble
(Fisheries Extension)

Fisheries Extension is the conscious provisions of information and communication support to fishermen and fish farmers who use marine, inland and backwaters. A great scope is seen in fisheries extension in various areas of fisheries sector like aquaculture, conservation, post-harvest technologies, fishery information and forecasting, community development, etc. Marine and Inland resources are yet to be exploited fully, which requires greater attention from the fisheries extension system. The Indian coastal zone is dynamic and diverse with a great potential for feeding the increasing human population. India has a coastal line of 8129 km with encouraging and massive infrastructure facilities such as 2.4 lakh fishing crafts operating along the coast, 7 major fishing harbours, 75 minor fishing harbours and 1,537 landing centres are functioning to cater to the needs of over 14.0 million fisherfolk. However, there are several problems facing the fishing industry today. The main consensus about the fishery industry is about the over exploitation of inshore fishery which is stagnating and heavy scope to exploit the offshore and deep sea fishery resources. Secondly, the socioeconomic status of fishermen, fish farmers is still substandard. About 25% of the population live in and around the coastal zone. Keeping all these in mind, the extension needs of the fishermen and fish farmers are the most serious concern in the fishing industry. The major task for extension, thus, becomes to collect the desired information, inform and convince the people about the value of new and better technology packages, make further refinement to suit them and motivate them to adopt it and draw benefit from it. The role of fisheries extension in the development of fisheries is, therefore, immense and considering this the Government of India has created a new Department of Fisheries under the Ministry of Fisheries, Animal Husbandry and Dairying.

Fisheries extension has to play a major role in exploiting offshore and deep-sea fishery opportunities with the help of government policies. Research in various thrust areas of fisheries extension, therefore, provides planners and policy makers with information for the growth of fisheries in India. Considering the vital part of the production of fisheries, the PG degree programme in the fisheries extension is important, and indeed unavoidable.

According to the National marine fisheries policy 2020, the Fisheries extension personnel with higher education on fisheries aspects focusing on fisheries extension only fulfil the mission and objectives of this policy.The unique human resources generated from the fisheries extension would also contribute to the creation of data-based fisheries management, market-led fisheries extension and fisheries advisory services that will be different from crops and livestock.

In view of the above, the present PG degree programme in Fisheries extension has been thoroughly updated and several new courses in M.F.Sc. and Ph.D. levels have been added. In the M.F.Sc. degree programme, courses such as Global Extension Landscape, Knowledge and Innovation Systems, Monitoring, Evaluation and Impact Assessment, Aquapreneurship Promotion and Value Chain Development, Risk Management and Climate Change Adaptation and Capacity Development have been introduced taking into account of the national and global scenario. Moreover, the existing courses are also updated to a great extent.

Courses such as Extension Service System Management, Technology Commercialization and Intellectual Property Management, Policy Engagement and Extension have been added as new courses in the Ph.D. degree programme. Considering the country's existing extension needs, the existing courses are also greatly modified.

Course Title with Credit Load
M.F.Sc. in Fisheries Extension

Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FEX 501	Global Extension Landscape	2+1
FEX 502	Communication and Journalism	2+1
FEX 503	Knowledge and Innovation Systems	2+1
FEX 504	Organizational Behaviour and Development	2+1
FEX 505	ICT for Development	2+1
FEX 506	Monitoring, Evaluation and Impact Assessment	2+1
FEX 507	Aquapreneurship Promotion and Value Chain Development	1+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a students major subject)	
FEX 508	Sociology, Psychology and Community Organisation	2+1
FEX 509	Risk Management and Climate Change Adaptation	2+1
FEX 510	Capacity Development	1+1
	Supporting Courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common Courses	**5 Credits**
	(The following courses, one credit each will be offered)	
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**

Code	Course Title	Credit Hours
	Masters' Seminar	**1 Credit**
FEX 591	Master's seminar	0+1
	Masters' Research	**30 Credits**
FEX 599	Master's Research	0+15
FEX 599	Master's Research	0+15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fisheries Extension

I. Course Title : Global Extension Landscape
II. Course Code : FEX 501
III. Credit Hours : 2+1

IV. Aim of the course

To help the students to appreciate the process and the impact of extension reforms implemented in many countries, the new approaches that are evolving globally in different regions and the policy challenges in managing a pluralistic extension system.

V. Theory

Unit I

Basics of extension & advisory services: Genesis and Evolution of Extension; Understanding education, Extension education, Extension research and Extension service; Formal, Informal and Non-formal education; Principles and Philosophy of Extension Education; Meaning and Importance of Extension and Advisory services (EAS); Core competencies of an extension professional beyond ToT, Performing new functions to deal with new challenges.

Unit II

Extension systems and approaches: Public Extension Systems in India, Historical as well as current systems at state (DoF), national (NAREES) and international levels (WF, NACA, FAO, ICSF, WAS, AFS); Extension systems in different regions: South Asia (Bangladesh and Sri Lanka), South East Asia (Japan, China, Thailand, Indonesia and Vietnam), USA, and Europe, Extension approaches (General extension approach, commodity specialized approach, T & V approach, Participatory approach, Project approach, Farming systems approach Cost-sharing Approach, Educational institution approach); Paradigms of agricultural extension (Technology transfer, advisory work, Human resource development, Facilitation for empowerment); RRA and PRA, Participatory Learning and Action (PLA), Participatory technology development (PTD); Fisheries Co-management; ATMA; Marianad model, BENFISH, Matsyafed model.

Unit III

Extension delivery: Pluralism in Extension Delivery, Private sector (input firms, aqua-business companies, consultants); Non-Governmental Organisations (National/ international)/Civil Society Organisations (CSOs)/SHGs in providing extension; Farmer Producer Organisations - Scope, Strength and Weaknesses-experiences; Media and ICT based extension services; Managing pluralism in EAS - challenges and experiences.

Unit IV

Extension programs and institutions development: Meaning, Concept and

Major paradigms / models; Agriculture and rural Development programs; Important pre-independent extension programs; Extension/ToT programs: NES, ND, ORP, KVK, LLP, FSR & E, TAR-IVLP, NATP, NAIP, NMAET; Fisheries policies and programs: FFDA, BFDA, Blue revolution schemes; Institutions: NFDB, MPEDA-NETFISH, NaCSA, CAA, ICAR-FIs, NITIAayog, MANAGE, EEI.

Unit V

Challenges before extension and advisory services (EAS): New Challenges before farmers/fishers and extension professionals; Supporting fishers/farmers to manage the declining aquatic resources/CPRs; Gender Mainstreaming, How extension can enhance access to knowledge/resources among women & men fishers/ farmers; Nutrition- Role of extension in promoting fish as healthy food; Linking fishers/farmers to markets; Adaptation to climate changes- How extension can contribute to up-scaling climate smart fisheries/aquaculture.

Unit VI

Supporting family farms: Doubling fishers/farmers income; In and out Migration in inland and marine fisheries; Attracting and Retaining Youth in Fisheries/ Aquaculture; Fisher/Farmer distress; Facilitating access to credit, Inputs and services; Networking and partnership development including GFRAS (Global Forum for Rural Advisory Services) and its regional networks; Extension and Sustainable Development Goals (SDGs); Financing Extension; Mobilizing resources for extension; Strengthening extension policy interface, Generating evidence on impact of extension and policy relevant communication.

VI. Practical

Visits to formal, informal and non-formal educational organization and familiarizes their functional activities, Technology of transfer, advisory work, and Human resource development in fisheries programmes, ToT models of ATMA, Marianad, BENFISH, Matsyafed, etc., Public and private extension services of aqua-business companies, consultants, SHGs, KVK, NATP, NAIP, FFDA, BFDA, MPEDA-NETFISH, NaCSA, CAA, etc., Global and national ICT based fisheries extension services, Gender Mainstreaming in fisheries for poverty reduction, Climate resilient fisheries/ aquaculture, Review of national, state and regional extension networks and policies.

I. Course Title : Communication and Journalism
II. Course Code : FEX 502
III. Credit Hours : 2+1

IV. Aim of the course

To orient the students towards the basics, approaches and applications of communication for facilitation and development.

V. Theory

Unit I

Communication: Meaning and importance, Perspectives, Characteristics, Elements, process, Types (Individual, group and mass communication), Directions(Upward, downward and horizontal) and Levels of communication; Verbal and non-verbal communication; Message - meaning and dimensions; Message distortion types; Barriers to Communication; Noise; Key Communicator, Homophily and Heterophily, Credibility, Fidelity, Empathy and feedback in communication; Communication skills & Competence, Communication effectiveness; Theories and Models of communication.

Unit II

Media and development communication: Audio Visual aids; Classification and selection; Traditional Media and Methods for communication and development programmes; Extension teaching methods; Extension & Development Communication- concept, importance and approaches; Organizational communication; Modularized communication, Business communication-concept, methods and processes; Use of social media in communication; Media mix.

Unit III

Understanding the structure and construction of news: Language and principles of writing; Basic differences between the print, electronic and online news, Organising a news story, 5W's and 1H, Inverted pyramid Criteria for news worthiness, Principles of news selection, Use of archives, Sources of news, Use of internet.

Unit IV

Journalism: Journalism – Meaning, scope and importance, principles, theories; Development journalism – meaning, scope and importance, principles, theories; Growth of and challenges for development/ farm journalism in India.

Unit V

Facets of Journalism: Basics of Writing – News stories, Feature articles, Magazine articles, Farm bulletins and folders; Art of clear writing: Readability and comprehension testing procedures; Script development and Story board preparation; Magazine journalism - profile and feature writing; Radio and television journalism - principles and practices of gathering, writing and producing news for radio and television; Photo journalism - visual language, skills and techniques; Photography; principles and use in extension; New media journalism – websites, blogs, social media; Responsible journalism - fairness and balance, libel, and the commercial nature of the media, Constructive criticism; Advertisements – principles and practice.

Unit VI

Media role: Role in democracy, Responsibility to society, Press and democracy, Contemporary debates and various issues relating to media, Ethics in journalism.

VI. Practicals

Communication skill development and public speaking; Developing extension materials: folders, leaflets, booklets, newsletters, popular and scientific articles, blogging, etc.; News writing and success stories writing; Digital photography and image editing; video production; Visit to news channels/ printing press/fishing villages; Organization of content - choice of media, categorization of photographs, queuing of audio and video clips, logical sequencing, text entry; Identification, articulation and analysis of major issues related to fisheries; Critical analysis of fisheries related news stories and feature articles from development magazines / newspapers; Designing, editing and publishing campus newsletters; Interface with editors of journals and magazines; Critical analysis of fisheries related radio news stories; Producing radio news items for broadcast; Digital photography and image editing; Study and practice of various kinds of video editing systems; Practice and use of digital photography.

I. Course Title : Knowledge and Innovation Systems

II. Course Code : FEX 503

III. Credit Hours : 2+1

IV. Aim of the course

To orient the students about the various knowledge and innovation systems in fisheries

V. Theory

Unit I

Knowledge systems: Knowledge- meaning, Epistemology, Sources and types; Origins of the innovation systems concept, Innovation vs Invention; Agricultural/ Fisheries Innovation System (AIS) and AKIS; Role of different actors in AIS; Importance of interaction and knowledge flows among different farming sectors.

Unit II

Innovation systems: Innovation – definition – innovation decision process, Role of Extension in AIS, Different views to analyse AIS, Structural view, Functional view, Process view and Capacity view.

Unit III

Diffusion and adoption process: Diffusion – meaning and elements; Diffusion research and its criticism; Generation of innovations in fisheries – Innovation development process; Concept and stages of Innovation-decision process; Diffusion process, Adoption process, Models of diffusion and adoption, Adopter categories and their characteristics; Factors influencing adoption and attributes of innovations.

Unit IV

Change agents in the adoption process: Change agent – meaning, roles, factors of success; Centralized and decentralized diffusion systems; Innovation in organizations; Consequences of innovations - model and classification; Opinion leader – Meaning, Characteristics, Types, Their measurement and Role Critical mass.

Unit V

Indigenous knowledge systems: Indigenous knowledge - meaning, scope and importance, Types and systems; Indigenous vis-a-vis Scientific knowledge; Indigenous-Information, Practices and technologies; Documentation, Validation, Conservation, and Dissemination of ITK and Grassroots level innovations in fisheries; Access and use of indigenous knowledge; Peoples' Biodiversity Register; Issues in protection of traditional knowledge / ITK - understanding Indian Biological Diversity Act and National Biodiversity Authority, Limits to benefit sharing – IPR, Prior Informed Consent, TRIPS vs. CBD; Integration of Indigenous knowledge and modern technologies.

Unit VI

Enabling and scaling up innovations: Role of enabling environment; Policies and institutions in enabling innovation; Methodologies for AIS Diagnosis; Typologies of existing methodologies, strengths and limitations; Scaling Up; Definitions, Changing views on scaling up, Approaches to Scaling Up: Push, Pull, Plant, Probe; Scaling up pathways; Drivers and spaces for scaling up; Framework and Tools for

Scaling up; Planning and implementing a scaling up pathways; Scalability assessment tools; Role of policies in scaling up: Influencing policies for scaling up; Innovation Management for scaling up knowledge and implications for Extension and Advisory Services.

VI. Practicals

Documentation of ITK in fisheries; Development of Case studies of ITK in fisheries; Institutions and NGOs involved in ITK collection and validation, testing appropriateness of ITKs; Concept mapping; describing fisheries technologies; explaining case study of the diffusion process of select fisheries innovations; Identify one fisheries activity and use AIS framework to diagnose actors and their roles, patterns of interaction, institutions determining interaction and the enabling policy environment and develop an AIS Diagnosis Report (Review and Key informant interviews); Undertake a case study on a successful case of scaling up knowledge and identify factors that contributed to its success; Identify one specific knowledge (a technology, an approach) that has been recently introduced and develop an Upscaling Strategy

I. Course Title : Organisational Behaviour and Development

II. Course Code : FEX 504

III. Credit Hours : 2+1

IV. Aim of the course

To orient students on the importance of knowledge and skills on various management functions, as applicable to extension organizations

V. Theory

Unit I

Basics of organizational behaviour: Introduction to organizations-Concept and Characteristics of organizations; Typology of organizations; Theories of organizations; Nature of organizational theory, Classical theories, Modern management theories, System Theory, Criticisms and lessons learnt/analysis; Organization Behaviour-Concepts, Scope, Importance, Models of OB.

Unit II

Group behaviour in organization (organizational system): Foundations of group, Group behaviour and Group dynamics, Group Development and Cohesiveness, Group Performance and Decision Making, Intergroup Relations; Teams in Organisations-Team building experiential exercises, Interpersonal Communication and Group; Leadership, Meaning, types, Theories and Perspectives on Effective Leadership, Power and Influence, Leadership styles; Motivation-Concept & Theories, Managing motivation in organizations.

Unit III

Organizational conflict management: Conflict Management and Negotiation skills, Problem-solving techniques; Job analysis, Job performance and Job- stress management; Occupational stress – Meaning, sources, Effects, Coping mechanism, Effects and management; Occupational stress in farming, Farmer groups/ organizations, research and Extension organizations, Organizations Structure- Need and Types, Line & staff, functional, Committee, Project structure organizations, Centralization & decentralization; Organizational Culture vs Climate; Organizational Change; Organizational Learning and Transformation.

Unit IV

Organizational development and interventions: Organizational development-Concept and process; Meaning, Importance, Characteristics and types of Organization development, Interventions; OD consultant Types of OD consultants and their advantages, Qualifications, Comparison of traditional consultants vs. OD consultants.

Unit V

Management in organizations: Concept and principles of administration and management, Classical and modern theories, Schools of management thoughts, Functions of management – Planning, Organizing, Staffing, Directing and Leading, Controlling, Coordinating, Reporting and Budgeting; Managerial skills, Concept of HRM and methods, Job satisfaction and morale; Performance appraisal – Meaning, Concept and Methods. Authority and responsibility, Delegation and decentralization, line and staff relations; Supervision – Meaning, Responsibilities, Qualities and functions of supervision, Essentials of effective supervision; Coordination at different levels of extension management, Methods of coordination.

Unit VI

Management techniques: Management by Objectives (MBO) and Total Quality Management (TQM); Time management; Critical analysis of organizational set up of extension administration at various levels; Management Information Systems (MIS): Concept, tools and techniques, MIS in extension organizations.

VI. Practicals

Simulated exercises on techniques of decision making / problem solving; Study the structure and function of fisheries enterprises, Designing organizational structure/ organograms; Group activity on leadership development skills, Field visit to extension organizations (MANAGE, ATARI, KVKs, ATMA, NGOs, etc.), FPOs, fisheries cooperatives to understand the functions of management, Study of organizational structure of development departments, study of departmentalization, span of control, delegation of authority, decision-making patterns; Exercise on OD interventions (Interpersonal, Team, Structural, Comprehensive) with its procedure to conduct in an organization, Case studies/ success stories on performance of SHGs in fisheries, Case Analysis of organization in terms of process – attitudes and values, motivation, leadership, Study of individual and group behaviour at work in an organization; Conflicts and their management in an organization, Documenting occupational stress in farming, farmer groups/ organizations, Exercises on stress management and time management; Exercises on team building and negotiation skill development Understanding organizational change process tools and techniques, Case analysis on organizational change process; Stakeholder analysis mapping.

II. Course Title : ICT for Development

I. Course Code : FEX 505

III. Credit Hours : 2+1

IV. Aim of the course

To orient students on advances in ICT initiatives, knowledge management process smart/ disruptive technologies and data analytics.

V. Theory

Unit I

ICTs - concepts, roles and initiatives: ICTs- meaning, concepts, basics of ICTs, Global and National status, Types and functions of ICTs, Meaning of e-Governance, e-learning, m-Learning, Advantages and Limitations of ICTs.

Unit II

Knowledge management: Meaning, Approaches and Tools, Role of ICTs in Agricultural Knowledge Management, e-Extension, overview on Global and national e-Extension initiatives, Inventory of e-Extension initiatives in Agriculture and allied sectors from Central and State governments, ICAR, SAUs, private sector and NGOs in India.

Unit III

ICT applications: Knowledge centres (tele centres), CSC, Digital kiosks, Web portals, Community radio, Internet radio, Kisan call centres, Mobile based applications, INCOIS-PFZ advisories; Self-learning CDs on Package of practices, Augmented Learning, Virtual Learning, social media, Market Intelligence and Information Systems-e-NAM, Agmarknet, etc. Expert System/ Decision Support System/ Management Information Systems, Farm Health Management & Intelligence System for Plant /Animal/ Soil Health, Fishery, Water, Weather, etc., National e-Governance Plan in Agriculture (NeGP-A).

Unit IV

Networks and policies: Global and regional knowledge networks, international information management systems, e-Learning platforms (MOOCS, Coursera, EduEx, etc.); Digital networks among extension personnel, Farmer Producers Organisations (FPOs) / SHGs/ Farmers Groups, Video conference, Live streaming and Webinars, types and functions of social media applications, Guidelines for preparing social media content, Engaging audience, Data- analytics and Info graphics.

Unit V

Smart technologies for extension: Open technology computing facilities, System for data analytics/ mining/ modelling/ Development of Agricultural simulations; Remote Sensing, GIS, GPS, Information Utility (AIU).

Unit VI

Disruptive technologies for extension: Disruptive technologies Analysis; Internet of Things (IoTs), Drones, Artificial intelligence (AI), Block chain technology, Social media and Big Data analytics for extension.

VI. Practical

Content and client engagement analysis
Case studies and exercises on ICT based interventions in fisheries and agriculture
Designing extension content for ICTs; Creating and designing web portals, blogs, social media pages
Development and use of online and offline e-learning modules in fisheries
Live streaming extension programmes and organizing webinars
Visit to KCC; Exercises on developing mobile based applications;
Developing social media pages for disseminating fisheries related information;
Writing for digital media
Developing video content related to fisheries
Conducting exercise on remote sensing and GIS.

I. Course Title : Monitoring, Evaluation and Impact Assessment

II. Course Code : FEX 506

III. Credit Hours : 2+1

IV. Aim of the course

To make students' understand the concepts of participatory development planning, monitoring, evaluation and impact assessment.

V. Theory

Unit I

Introduction to monitoring: Monitoring- Definition, Objectives, Tools, Methods and Approaches; Major Components of project Monitoring; Special Diagnostic studies, Project Completion report, Project sustainability, Monitoring Standards; Past quality or performance, The quality of other systems, Desired quality, Professional standards, The quality required, Planning targets and Optimal quality.

Unit II

Concept of evaluation: Meaning and concept in different contexts; Why Evaluation is Done and When? Purpose of Evaluation; Principles of Evaluation; Types of Evaluation; Objective Oriented, Management Oriented; Context Evaluation, Input evaluation, Process Evaluation, Product Evaluation, Consumer oriented evaluation, Expertise Oriented Evaluation, Adversary Oriented Evaluation, Naturalistic and Principal oriented evaluation, Goal free evaluation and meta evaluation; Process of Evaluation, Evaluation at the beginning, Evaluation during the programme, Evaluation at the end; Use of evaluation findings; Statistical Tools for evaluation; Evaluation theories, Three broad categories of theories that evaluators use in their works, Programme theory, Social science theory, and Evaluation theory (other theories/ approaches - Utilization-Focused Evaluation & Utilization-Focused Evaluation (U-FE) Checklist, Values Engaged Evaluation, Empowerment Evaluation, Theory-Driven Evaluation).

Unit III

Programme planning: Steps, Analyse programme effectiveness, AAccountability; Objectives, Types, Criteria and Approaches of programme evaluation; The context of program evaluation in agricultural extension; Competency and credibility of evaluator; Integration between theory and practice of evaluation; Evaluation forums, Workshops, Conferences and Apprenticeship / internship, Ten Steps in programme evaluation; SWOT Analysis; Bar Charts (Gantt Charts and Milestone Charts); Networks, Programme Evaluation and Review Technique (PERT) and Critical Path Method (CPM); Bennett's Hierarchy of Evaluation; LFA.

Unit IV

Impact assessment indicators and approaches: Meaning, Need, Features, Benefits, Concepts; Indicators for Impact Assessment, Direct indicators, Indirect or proxy indicators, Quantitative indicators, Qualitative indicators, Result chain/

hierarchy of indicators; Methods of Impact Evaluation, Learning retention of participants (KOSA), Impact on the job performance, Impact on organizational effectiveness, Impact on stakeholder's competency.

Unit V

Impact assessment framework: Meaning of inputs, Outputs, Outcomes, Impacts and their relation with monitoring, Evaluation and impact assessment; Indicators for impact assessment – meaning and concept; Selecting impact indicators; Types of impact indicators for technology and Extension advisory services, Social and behavioural indicators, Socio-cultural indicators, Technology level indicators, Environmental impact assessment indicators and Institutional impact assessment indicators; SDGs, Yield-related Public participation models; Crisis management, Conventional participation, Participation in project-cycle, Concurrent participation, dedicated participation framework; Social auditing: concept, elements, steps, potential problems, benefits.

Unit VI

Impact assessment approaches – Quantitative, Qualitative, Participatory and Mixed methods with their advantages and disadvantages; Quantitative Impact Assessment Types – Based on Time of Assessment (Ex-ante and ex-post), Based on Research Design (Experimental, quasi experimental, Non-experimental), Econometric Impact Assessment; (Partial Budgeting Technique, Net Present Value, Benefit Cost Ratio, Internal Rate of Return, Adoption Quotient etc.), Qualitative and Participatory Impact Assessment Methods, Quantitative and qualitative techniques for impact assessment, Social impact analysis; Economic impact analysis cost, Benefit analysis, Social-cost Benefit analysis, Partial budget analysis; Environmental impact analysis; Institutional impact analysis; Sustainability analysis, Human impact assessment methods.

VI. Practical

Search the literature using web / printed resources and identify evaluation indicators for the following: Utilization-Focused Evaluation, Values Engaged Evaluation, Empowerment Evaluation, Theory-Driven Evaluation, Visit to Directorate of Extension in anuniversity and enquire about extension programmes being implemented / coordinated by Directorate, Developing an evaluation proposal of any one programme using 'Ten Steps in Programme Evaluation', Field studies for identification and ranking of criteria/indicators for impact assessment, Identifying a fisheries development programmes and their objectives being implemented in your state, Strengths, Weaknesses, Opportunities and Threats related to the identified programme objectives in the SWOT grid, Visit a nearby KVKs / ATIC. Select any agriculture technology with package of practices and extension advisory services promoted by KVK / ATIC, Identifying impact assessment indicators for social and behavioural indicators, socio-cultural indicators, technology level indicators, environmental impact assessment indicators and institutional impact assessment indicators, Exercises on evaluation of fisheries development programmes using the techniques of evaluation; Exercises on CPM and PERT.

I. Course Title : Aquapreneurship Promotion and Value Chain Development

II. Course Code : FEX 507

III. Credit Hours : 1+1

IV. Aim of the course

To orient students on the importance of aquapreneurship, fish Markets, supply chains and value chain analysis

V. Theory

Unit I

Basics of aquapreneurship and Facilitation for entrepreneurship development: Entrepreneurship - Concept, Significance and Scope, Theories and models; Entrepreneurship Development Cycle and process; Aquapreneurship – Meaning, Drivers, Characteristics, Importance, Types of entrepreneurs; Startups, Small businesses, Startups group/ community-based entrepreneurship; Entrepreneur and Manager; Approaches for assessing characteristics of entrepreneurs, Enterprising tendency, Entrepreneurship intention, Entrepreneurship orientation; Critical competencies required for entrepreneur in managing the businesses, Technical, communication, Financial, Human; Entrepreneurial university approach. Approaches for developing agricultural enterprises through extension and advisory services, Individual, Group and Community based approaches; Specific roles of extension agents in creating agricultural entrepreneurships; Pluralistic extension and extension agents working with other agents; Free and fee for extension services for business upgrading for farmers/farmer groups; Competencies of extension professionals for creating entrepreneurships.

Unit II

Basics of business planning, entrepreneurial ecosystem and Infrastructure requirement: Feasibility report, Business plan, Bankable project and Detailed project report – Similarities and differences; Elements of business plan, The team and its competencies, Business idea, Gaps, Opportunities and risks, Key products and services, Target market and Consumer segments, Marketing plan, Financial plan, Intellectual property and others, Meaning, Elements; Government policy support and Schemes for development of agricultural and allied enterprises (Start-up India, Make in India, Digital India, Atal Innovation Mission and others; Entrepreneurship policy and schemes at different states of India); Sources of funding for agripreneurship/ aquapreneurship, Debt and equity capital, grants and subsidies, Angel investor, Venture capitalist, Bank lending, NABARD and others; Entrepreneurial culture, Mentoring and handholding incubators.

Unit III

Infrastructure for supporting agricultural entrepreneurship – Warehouse, Cold storage and Transportation and Other support systems, Technology development system, Education and training, Human capital and workforce, Systems for assessing capacity requirement and Capacity building, Local and global markets and Regulatory framework; Policy approaches for women entrepreneurship development, Organisations promoting entrepreneurship in India; Emerging perspectives, Focus on startups and support mechanisms, Climate-smart technology businesses; Block chains for value chain management.

Unit IV

Extension and value chain: Supply chains – Meaning, Structure, Value chains – Meaning, Importance, Types; Supply chains vs value chains; Value chain development and Value Chain extension; Steps in a value chain analysis; Three dimensions of the value chain process; Participatory tools used in a value chain analysis, Focus groups, Ranking and weighting, Historical calendars, Market mapping, Evaluation of Business development services, Market visits, Learning journeys, Semi-structured interview, Structured interviews, Direct observation; Extension toolkits and Approaches for value chain development; Value chain upgrading strategies on farmer and extension agent level.

VI. Practical

Field visit to any entrepreneurship promotion agency of Govt. of India (e.g. Small farmer agribusiness consortium, EDI etc.); Business plan preparation and presentation – covers all aspects of choosing the business idea, financial estimates, market planning and others and presentation; Assessing the entrepreneurship potential of a prospective entrepreneur – enterprising tendency, entrepreneurship intention and entrepreneurship orientation scales administration and explain the processes Field visit to market support system – warehouse, cold storage unit, regulatory market etc. Field visit to Banks and Venture capitalist/ angel investors or other private investing agencies; Value chain mapping using participatory approaches. Field visit to successful aquapreneurs –startup, Farmer Producer Organization, SHG business, large business to orient themselves with different types of aquapreneurship; Field visit to technology business incubator.

II. Course Title : Sociology, Psychology and Community Organisation

I. Course Code : FEX 508

III. Credit Hours : 2+1

IV. Aim of the course

To orient the students towards basics in sociology, psychology and cognitive processes.

V. Theory

Unit I

Overview of sociology: Basic Concepts in Sociology, Society, Understanding of basic rural institutions, Social structure, Community, Social institution, Culture, Social change, Cultural change, Social system, Social process, Social conflict, Social values, Norms, Folkways, Mores, Customs; Cultural relativism, Cultural integration, Cultural lag, Acculturation; Family, Kin and Clan – its relationship with group behaviour and rural development; Social Stratification, Class and caste system, Their impact on rural development; Social Process and Social Interaction – Concepts, types; Competition, Conflict, Cooperation Accommodation and Assimilation, and change in social process due to developmental programmes, Community Organization (CO): Meaning and Models.

Unit II

Dynamics of change: Concept, Types and importance in rural community; Typology of change, Planned, Indoctrinational, Technocratic, Coercive, Emulative, etc. Theories of social change, Immanency, Functionalism, Economic, Technological, Historical, Ideological, Evolutionary and Field Theory; Factors affecting change under rural settings; Stimulants and Barriers to change, Social Capital, Collectivism, Interdependence in larger groups, Conformity and functional analysis of roles.

Unit III

Preamble to Psychology: Psychology as a science and its importance in extension education, Perception- Nature, Selectivity & Laws, Importance of perception in extension work, Sensation vs Perception; Attitudes - Meaning, Characteristics, Assumptions, Types, Theories and Models of attitude formation; Methods of changing attitudes, Stereotypes and Prejudices, Factors in attitude change, Liking / affect – meaning, Types and theories; Attraction – meaning, Types and theories; Persuasion – Meaning, theories and techniques; Social influence and groups – Conformity, Compliance and Obedience.

Unit IV

Information processing: Meaning, Principles; Basic assumption, Models of information processing, Waugh and Norman model of primary and secondary memory; Atkinson and Shiffrin's stage model of memory; Sensory memory- Working, Short and Long term memory, Other models including blooms taxonomy and Sternberg's Information Processing Approach, Computer- mind analogy, Teaching-Learning process.

Unit V

Attention and perception: Meaning, types, Theories and models; Consciousness; Motivation, Nature, Characteristics and types of motives, Techniques of motivating farm people, Measuring motivation, TAT, Sentence completion, etc., Emotion- its nature, Types of emotional response, Theories of emotion, Self-motivation; Harnessing emotions productively, Empathy and its theories, Reading emotions, Role of emotion in regulating human behaviour, Psychosocial distress and coping mechanisms in farming situations, Personality, Individual differences and theories of personality, Multiple Intelligences- IQ, Emotional intelligence, Social intelligence, Managing emotions; Relationship between IQ and EQ, Handling relationships; Social skills, Defence mechanisms- types and importance.

Unit VI

Cognitive processes and learning: Cognitive processes, Attention, Perception, Remembering and Forgetting, Knowledge and Expertise, Ffoundations and Theories; Principles and processes of perception; Consciousness, Meaning, Types, Sleep and Dreams; Learning and Memory, meaning, Learning, Foundations, Approaches, Styles and theories; Cognitive approaches of learning – Meaning, Principles theories and models; Memory, Foundations, types; Behavioural approaches of learning, Foundations and theories, Classical conditioning, Operant conditioning, Applied behaviour analysis; Social cognitive and constructivist approaches to learning, Foundations and theories, Social cognitive theory, Self-regulated learning; Learning styles, Meaning, Types and applications in learning.

VI. Practical

Learning - Classical conditioning and operant conditioning; Assessment of emotional intelligence; Exercises in problem solving; Exercises in visual perception; Measuring self-concept using psychometric tools; Experiment on factors influencing information processing; Assessment of attitudes; Visit to a village to study rural institutions; Focus group discussions to identify stimulants and barriers to changes existing in rural community; Understanding perception - Attentional Blink and Repetition Blindness exercise; Understanding attention -Testing selective attention capacity and skills and processing speed ability through Stroop test; Hands-on experience in the techniques for assessing creative thinking – divergent and convergent thinking; Assessing learning styles through Barsch and Kolb inventories; Practical experience in building self-esteem; Hands on experience in methods of persuasion; Field experience in assessing social judgement; Simulation exercise to understand decision-making under different situations; Exercise in rational decision-making.

II. Course Title : Risk Management and Climate Change Adaptation

I. Course Code : FEX 509

III. Credit Hours : 2+1

IV. Aim of the course

To equip students to identify, evaluate and evolve ways to address (mitigate and manage) risks and climate change.

V. Theory

Unit I

Understanding risk and distress: Introduction to risk, Risk management, Uncertainty, Sensitivity and Distress, General risk theory, Risk analysis methods, Risk perception and decision making, Indicators of risk and distress in agriculture, Identification, Selection and Assessment, Understanding the agrarian distress in Indian agriculture, Sources of distress in Indian farming, Changing farm size, Land use, Cropping patterns, Pricing policy, Markets and terms of trade, Typology of crisis in agriculture; Droughts, Floods and Indian agriculture, Distress and farmer suicides, Causes and socio-economic consequences

Unit II

Managing risk and distress: Ways to reducing/managing risk and distress in Indian agriculture/fisheries; Crop and life insurance; Developing support systems; Planning, Implementation and evaluation of risk/distress management programs; Institutional frameworks for risk and disaster management – NDMA & SDMAs; Developing District Agriculture Contingency Plans; Risk management by diversification; Good practices and lessons from other countries; Responses of government, Non-government and extension system to agrarian crisis; National Farmers Policy.

Unit III

Extension professionals and risk management: Understanding social-Psychological and behavioural dimensions of farmers under risk/distress; Risk perception and communication; Helping farmers manage farm level risks, Mobilising resources, Linking with markets, Strengthening capacities; Working with village level risk management committees; Operational skills for preparing contingency and disaster management plans; Institutional and extension innovations in managing risk and distress; Policy and technological preferences for dealing with drought and flood.

Unit IV

Introduction to climate change science: Basic concepts of and terms in climate change science; Impacts of climate change; Anthropogenic drivers of climate change, Climate change and Indian agriculture; Climate adaptation vs. Disaster risk reduction; Anticipated costs of adaptation; Climate change and poor; Overview of UNFCCC framework and institutions, Kyoto Protocol and beyond; India's National Action Plan on Climate Change and National Mission on Strategic Knowledge on Climate Change; National Coastal Mission, Institutional arrangements for managing climate change agenda.

Unit V

Introduction to climate change adaptation and mitigation: Introduction to Climate Change Adaptation, Conducting a vulnerability assessment (CVI and SEVI frameworks), Identifying and selecting adaptation options; Global, national and state level initiatives and plans to support climate change adaptation, Private sector and civil society initiatives and activities; Mainstreaming climate change adaptation into development planning, Financing climate adaptation and budgetary allocations for programmes, Gender and climate change adaptation, Agricultural development programmes and strategies towards climate change adaptation and mitigation, Community based and Ecosystem based adaptation strategies, Preparing evidence based intervention plans for vulnerability reduction at micro and macro-levels.

Unit VI

Climate Smart Agriculture (CSA) and extension & advisory services: Climate smart agriculture; Developing climate smart and climate resilient villages; Stakeholders and determinants involved in climate smart agriculture; Climate smart agriculture and EAS; Innovative extension approaches used in CSA; Climate information services, Farmers perceptions about climate change; Farm and household level manifestations and adaptation strategies; Barriers and limits to adaptation; Farmers feedback on performance of extension methods; Skills, competencies and tools required for extension professionals at different levels and development departments in up scaling CSA.

VI. Practical

Hands-on practice in using risk assessment/analysis tools; Case studies on risk / distress assessment in agriculture -Indian and global lessons / Experiences from NICRA Project in agriculture and allied sectors; Developing criteria, indicators and indices for assessment of risk, vulnerability and resilience; Hands on practice on use of vulnerability and risk assessment tools and techniques; Case studies on success stories of climate change adaptation and community based initiatives; Developing district and village level intervention plans for climate change adaptation; Field Visits to State Disaster Management Authority; Case studies on climate smart agriculture / villages from India and world; Case studies on impact assessment of crop insurance programs, disaster management programs; Capstone project on documenting ITKs and local practices related to reducing risk / climate resilience agriculture

I. Course Title : Capacity Development

II. Course Code : FEX 510

III. Credit Hours : 1+1

IV. Aim of the course

To make students' understand the concepts of training, capacity building, capacity development and human resource development in the context of roles and responsibilities of extension professionals

V. Theory

Unit I

Capacity development- an overview: Training, Capacity building, Capacity development and HRD, Meaning and differences; Training principles and Phases of training; Need and principles of Capacity development; Types and levels of capacities, Institutional capacities (include the rules, regulations and practices that set the overarching contextual environment), Organizational capacities (how various actors come together to perform given tasks), Individual capacities (technical, functional and leadership skills)

Unit II

Capacity building: Types of capacity building, Based on structure (structured, semi-structured & unstructured), Based on context (orientation, induction and refresher), and other categories (online, Webinar, distance etc.); Components of capacity development; Capacity development cycle; Approaches in Capacity Development, Informative approach, Participatory approach, Experimental approach/ Experiential, Performance based approach Steps in Designing and Planning of Capacity Development- Step 1. Select the participants, Step 2. Determine the participants' needs, Step 3. Formulate goal and objectives, Step 4. Outline the content, Step 5. Develop instructional activities, Step 6. Prepare the design, Step 7. Prepare evaluation form, Step 8. Determine follow-up activities; Evaluation of training: types and techniques of training evaluation

Unit III

Capacity assessment and development methods: Concept of Need Assessment; Approaches in Need Analysis- Performance Analysis, Task Analysis, Competency Study; Needs Survey; Data Collection Methods in Identifying Needs, Rational Methods (Observation, Informal talks, Complaints, Comparison, Analysis of report, Opinion poll, Buzz session, Analysis of the new programme), Empirical Methods (Job analysis, Performance evaluation, Checklist or Questionnaire Method, Tests, Critical Incident Technique, Card Sort Method, Focus Group Discussion, Interview, SWOT Analysis); Information and Skills required in Need Analysis; Identification of Needs through Task Analysis, Task identification, Task Analysis, Gap Analysis.

Unit IV

Capacity development methods: Lecture, Discussion, Syndicate, Seminars, Conference, Symposium, Role Play, Case study, Programmed Instruction, T - group/ Laboratory methods, Brain storming; Delphi technique, Johari window; Factors Determining Selection of Methods, Capacity development objectives, Subject matter, Categories of participants, and the available resources like time, Location, Budget; Capacity Development Aids; Capacity Developer (Trainer), Meaning and concept;

Types of Capacity Developers (regular, *ad-hoc*, part time, guest and consultants); Roles of Capacity Developer (explainer, clarifier, supporter, confronter, role model, linker, motivator, translator/interpreter, change agent); Good Capacity Developer, Qualities, Skills and Roles. Human resource development; Meaning, Importance and Benefits; Types of HRD Systems & Sub-systems, Career system; Components of HRD System, Performance Appraisal, Potential Appraisal, Task System, Development System, Socialisation System, Governance; Functions of HRD-Organisational Development, Career Development, Capacity Development.

VI. Practical

Capacity development needs assessment exercise; Planning organizing and conducting an extension capacity development programme; Designing a programme; Writing learning objectives; Developing objectives into curriculum; Training plan; Organizing capacity development workshop; Evaluation with pre & post training tests; Exercise on business games, simulation exercises, in-basket exercise; Activities on programmed instruction, experiential learning techniques; Exercises on Transactional analysis and Fish bowl Technique; Preparing questionnaires using Delphi technique; Conducting brain storming and buzz sessions on topics related to fisheries; Organizing FGDs in fishing villages/institutions; Conducting SWOT analysis of any institutions or any fisheries technologies; Preparation of checklist/ questionnaires on capacity development related to fisheries department officers / fish farmers; Role plays on fisheries related problems; Conducting exercises on need assessment; Practicing facilitation techniques; Self-discovery exercises

Course Title with Credit Load
Ph.D. in Fisheries Extension

Course Code	Course Title	Credit Hours
	Major Courses	**12 Credits**
FEX 601	Methodologies in Extension Research	2+1
FEX 602	Educational Technology and Instructional Design	2+1
FEX 603	Gender Mainstreaming and Livelihood Development	2+1
FEX 604	Extension Service System Management	2+1
	Minor Courses	**6 Credits**
	(From the subjects closely related to a students major subject)	
FEX 605	Technology Commercialisation and Intellectual Property Management	2+1
FEX 606	Policy Engagement and Extension	2+1
FEX 607	Participatory Approaches in Fisheries Extension	1+1
	Supporting Courses	**5 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence).	
	Total Course Work Credits	**23 Credits**
	Doctorial Seminar	**2 Credits**
FEX 691	Doctoral Seminar-I	0+1
FEX 692	Doctoral Seminar-II	0+1
	Doctoral Research	**75 Credits**
FEX 699	Doctoral Research (Semester II)	0+15
FEX 699	Doctoral Research (Semester III)	0+15
FEX 699	Doctoral Research (Semester IV)	0+15
FEX 699	Doctoral Research (Semester V)	0+15
FEX 699	Doctoral Research (Semester VI)	0+15
	Total Ph.D. Program Credit Hours	**100 Credits**

Course Contents
Ph.D. in Fisheries Extension

I Course Title : Methodologies in Extension Research

II. Course Code : FEX 601

III. Credit Hours : 2+1

IV. Aim of the course

To cater the need of equipping the scholars with essential skills in conducting high quality research which helps them to design working strategies, processes and models for professional development.

V. Theory

Unit I

Measurement properties of research instruments: Measurement properties: Dimensionality, Reliability and Validity; Dimensionality – Unidimensionality and multidimensionality, Methods of assessing dimensionality, Formative and reflective constructs; Validity, Importance, Internal validity - face validity; Content validity, Substantive Validity, Structural Validity; External validity, Convergent and Discriminant Validity, Known-group validity, Criterion-Related Validity, Consequential Validity, Nomological validity; Methods of assessing various forms of validities, Judges rating, Lawshe's Content Validity Ratio, Item-objective congruence index; Latent variable method; Reliability - Internal consistency reliability – Split-Half, Cronbach alpha; Temporal Stability reliability - test-retest method; Interrater Consistency and Consensus - interrater reliability and interrater agreement; Alternative Forms or parallel forms reliability – Reliability of difference - Factors Affecting the Validity and Reliability of Test Scores; Generalizability Theory.

Unit II

Errors in management: Errors – Meaning and sources; Types - Sampling error, Non-sampling or measurement error and Processing error – Meaning, causes; Effects of errors and biases on data quality; Bias in behavioural research – Meaning, causes, Types – Respondent and researcher biases; Methods of reducing errors and biases in surveys, Questionnaires, Personal interviews, Focus groups and Online methods.

Unit III

Scales, indices and tests: Approaches to measurement and scale development - Classical test theory, Formative or index models, The C–OAR–SE approach and Item Response Theory; Item analysis in Classical test theory, Item difficulty and item discrimination; Scoring performance in scales and tests, Meaning, types and methods; Scale development strategies, Deductive and empirical; Stimulus-centred scales, Method of equally appearing intervals, Paired comparison, Person scaling – Q methodology; Subject-centre scales, The Likert scale and Semantic Differential; Steps in constructing a multi-dimensional scale using confirmatory factor analysis, Response scales, Guttman'sscalogram analysis and The Rasch method.

Unit IV

Indices and tests: Indexes –Meaning, types, Importance; Similarities and differences with scales, Methods of constructing indexes; Common indexes used in extension, Measurement invariance, Meaning, types, Methods of assessing measurement invariance, Tests – meaning, types, importance; Steps in conducting various tests, knowledge test.

Unit V

Qualitative research methods and emerging approaches: Qualitative methods – Meaning; Types – Ethnography, Grounded theory, Phenomenology, Ecological psychology, Discourse Analysis; Observational research; Case study research – Sampling and sample size; Data collection methods, In-depth interviews, Focus groups, Direct observation, Record review; Content analysis; Unobtrusive Measures; Projective and semi-projective techniques; Selecting right qualitative method – Strengths and limitations of qualitative research; Analysis and interpretation of qualitative research data; Research synthesis – meaning, importance, methods; Systematic reviews and meta-analysis – meaning, steps, and applications; Policy research. Mixed methods research – meaning, purpose, types and applications; Participatory research – Meaning, importance, types, methods and tools and applications; Action research – Meaning, importance, Principles, Types, Steps in conducting action research, application in behavioural sciences. Social Network Analysis – Meaning, importance, types, steps in social network analysis, applications; Advanced methods of measuring perception and beliefs. Multi criteria decision making, analytical hierarchy approach.

Unit VI

Ethics in extension research: Research reports – Meaning, types, contents; Presentations – Meaning, types, principles of good presentation - Tell 'Em" and KISS 'Em" principles; Research publications – meaning, importance, types; Guidelines for preparing research papers - Peer review process, citation styles; Open access publishing; Publishing in social media, Software's in academic writing, Ethics in conducting behavioural research; Human subject research – Meaning, history, and ethical guidelines; Ethical aspects of collecting and using Indigenous knowledge and farmers technologies; Ethical practices in publishing; Plagiarism – meaning, sources, Identifying and correcting plagiarism in a research paper using anti-plagiarism software.

VI. Practical

Practice in developing research instruments; Methods of assessing measurement properties of research instruments - dimensionality, reliability and validity; Hands-on experience in constructing tests, scale and indexes; Practice in summated scale development using confirmatory factor analysis; Hands on experience in assessing measurement invariance; Practicing and collecting data using participatory tools and techniques, analysing and interpreting qualitative data; Hands-on experience in writing systematic review using meta-analysis; Field practice in conducting action research; Practical experience in writing research paper; Hands on exercises using software for qualitative data analysis; Practice in detecting and correcting plagiarism using software.

I. Course Title : Educational Technology and Instructional Design

II. Course Code : FEX 602

III. Credit Hours : 2+1

IV. Aim of the course

To develop knowledgeable, responsive and effective teachers committed to educating diverse group of learners in a dynamic extension landscape.

V. Theory

Unit I

The landscape of educational technology and instructional design: Understanding various terms, Educational technology, Instructional design, Instructional systems design, Curriculum design, Pedagogy, Andragogy; Brief overview of the origin and evolution of ET and ID as theory and practice; what is the relevance of ET and ID relevant in extension and rural advisory services? Extensional professionals as instructional designers and architects of the learning experience; Types of learning or learning domains, Bloom's taxonomy of the cognitive domain, Krathwohl and Bloom's affective domain and Simpson's psychomotor domain

Unit II

Technology enabled learning: What is the role of technology in education? Digital media, new tools and technology; Open and distance Learning (ODL); Online Education - Synchronous and Asynchronous learning models; eLearning, Massive Open Online Courses - SWAYAM, Open Education Resources (OERs), Course CERA, EduEx, CoL, RLOs; Digital education and its applications in higher agricultural education; Smart classrooms and Campuses, Web-based remote laboratory (WBRL); Integrating media and digital tools into ID; Types and implications of disruptive technologies for higher education and extension; Augmented learning; Adaptive learning; meaning, features and good practices in using open source Learning Management Systems (Moodle); Quality assurance and certification in e-learning.

Unit III

Theories and models of instruction: Howard Gardner's Theory of Multiple Intelligences, David Kolb's Experiential Learning Cycle, Albert Bandura's Social Learning Theory, Rand Spiro's Cognitive Flexibility Theory and its Application in eLearning, Wlodkowski's Motivational Framework for Culturally Responsive Adult Learning; ADDIE Model, Dick and Carey Model, SAM Model, Bloom's Taxonomy; Integrating the theories of instruction into the practice of ID in extension and RAS ecosystem.

Unit IV

Creating instruction and instructional strategies: Overview of planning, Designing and implementing the curricula and learning experiences; Needs Analysis - meaning, approaches and steps; Task and content analysis - meaning, approaches, steps and techniques (topic analysis, procedural analysis, and the critical incident method); Learner analysis – meaning, importance and approaches, Relevance of Maslow's Hierarchy of Needs and learning styles, Captive Audience vs. Willing Volunteers, Universal vs. user-centered design, Learner Analysis Procedures; Writing learning objectives: Meaning of Learning Goal and Learning Objectives; ABCDs of well-stated objectives; Setting goals, translating goals into objectives; Contextualising ADDIE process within the Extension learning environment; Organizing content and learning activities, scope and sequence of instruction; Posner's levels of organizing (Macro, Micro, Vertical, and Horizontal) and structures of organizing (content vs. media) instruction, Gagne's events of instruction, Edgar Dale's Cone of Experience; Methods of Delivery- classroom teaching, Programmed instruction, Synchronous and asynchronous modes of distance education; Changing role of a teacher in classroom and teaching competencies.

Unit V

Organizing content and learning activities: Scope and sequence of instruction; Posner's levels of organizing (Macro, Micro, Vertical, and Horizontal) and structures of organizing (content vs. media) instruction, Gagne's events of instruction, Edgar Dale's Cone of Experience; Methods of Delivery- classroom teaching, programmed instruction, synchronous and asynchronous modes of distance education; Changing role of a teacher in classroom and teaching competencies.

Unit VI

Trends in instructional design and evaluating instruction: Alternatives to ADDIE (Analysis, Design, Development, Implementation and Evaluation) model - Rapid prototyping and constructivist ID, Reflections on instructional design as science and as an art; Relating ID models and process in extension learning environment; Research in education and instructional design, Meaning of Assessment, Measurement and Evaluation; Developing learner evaluations and their reliability & validity; Assessment techniques for measuring change in knowledge, Skill and attitude of learners, Objective Test Items, Constructed-Response Tests, Direct Testing, Performance Ratings, Observations and Anecdotal Records, Rubrics, Portfolios, Surveys and Questionnaires, Self-Reporting Inventories, Interviews; Conducting learner evaluation pre, during and post-instruction; Formative and Summative Evaluation- meaning, approaches and steps; Evaluating Learner Achievement and the Instructional Design Process; Evaluating the success of instruction; Performance appraisal of teachers.

VI. Practical

Preparation of the analysis report that includes the task/content analysis and learner analysis and the design plan includes learning objectives and corresponding instructional strategies and assessment items; Prepare course outline and lesson plan with an appreciation for diverse learning styles based on temperament, gender, and cultural/ethnic differences and deliver a lecture for UG/PG students; Assessing learning styles through Barsch and Kolb inventories; Development and testing of survey instruments for evaluating learning outcomes/ competencies of students; Development and testing of survey instruments for performance appraisal / competency assessment of teachers; Design an online e-learning module on a topic of interest as a capstone project, Integrate and apply the knowledge and skills gained from the course for creating an effective learning experience for a target audience; Designing and developing a theme based knowledge portals; Exercises on designing an online course using open source LMS like Moodle or EdX; Select and evaluate or design for social al media; Prepare a short research paper on recent theories and models of instructional design; Interview an instructional designer of your choice and prepare a synthesis report about what job roles he/she perform, What ID processes does he or she use, Challenges faced; Develop a prototype for one of the lessons in your design plan using PowerPoint or a website builder such as Weebly to create the screens integrating multimedia content and various functionalities; Field visit to a virtual learning/augmented learning lab, e-learning labs, distance learning centres, etc; Hands-on practice with video-editing software, web conferencing and video conferencing solutions.

I. Course Title : Gender Mainstreaming and Livelihood Development

II. Course Code : FEX 603

III. Credit Hours : 2+1

IV. Aim of the course

To orient students on the importance of "Gender mainstreaming" as well as the other concepts related to gender. The students will be able to understand the gender roles and responsibilities and how in the present times, the roles may be shifting

V. Theory

Unit I

Gender related concepts and divides: Historical perspective of gender; Feminism and emergence of gender as a concept, Scope of gender studies in agriculture and rural development; Agrarian Importance of Gender; Understanding the importance of gender in national and global agriculture, Key gender issues and challenges in agriculture/fisheries, Gender and value chain, Global actions to address gender, Needs and strategies to address gender and women empowerment, Gender related concepts and divides; Understanding of the concepts of gender, Gender equality and equity, Gender balance, Gender blind, Gender relations, Gender neutrality, Gender bias and Discrimination, Gender rights, Gender roles and responsibilities, Gender budgeting, Gender divides and their implications such as gender digital divide, gender access to resources and inputs divide, gender mobility divide, gender wage divide, Gender needs; Practical and Strategic.

Unit II

Gender analysis: Gender analysis, Importance, usage, prerequisites, Tools for gender analysis, Gender sensitive indicators: HDI, GDI, GEM; Gender and technology, How gender and technology impact each other, Gender neutral technology, Gender sensitive technology, Gender supportive assistance in technology adoption-Gender in fisheries research and extension.

Unit III

Gender mainstreaming, women empowerment and policies for women: Gender mainstreaming: Importance of gender mainstreaming in agriculture, Extension strategies to address gender issues such as gender and health, Nutrition, Gender in agricultural / fisheries value chains, Gender and climate change adaptation, Gender and globalization & liberalization for mainstreaming gender concerns into the national programmes and policies, Women Empowerment; Importance of women empowerment, Current national women empowerment and gender indices, Women empowerment approaches (technological, organizational, political, financial, social, legal and psychological), Global Best Practices, Policies and Frameworks, Global best practices, Women empowerment and Gender mainstreaming models and Frameworks for addressing gender concerns in agriculture/fisheries, approaches of various organizations; Gender mainstreaming and special women focused programmes in agriculture and rural development.

Unit IV

Livelihoods and its challenges: Basic concepts of livelihood and development, Types of development-Immanent/inherent and interventionist/ intentional; Why promote livelihood; Livelihood intervention: Definition, types, Spatial, segmental, sector, sub-sector; Systemic view of Livelihoods, Understanding Rural Livelihoods, Farm, Non-Farm, and off farm; Linkages with Farm and Off-farm Livelihoods; Economic Models; Livelihood Challenge, Political economy of Livelihoods, Issues of access to farm and non-farm livelihoods; Livelihoods from a Gender Perspective, Feminization of agriculture/ poverty, Women in the unorganized sector, The issue of unpaid and informal work; Livelihood Coping Mechanism, Climate Change and Livelihoods; Livelihoods and Disasters.

Unit V

Livelihood frameworks, intervention and promotion approaches: Sustainable Livelihoods Approaches (SLAs)-Definition and origins of SLA; Assets or capitals and capabilities in SLA and its linkage to the other capitals; Vulnerability Assessment- Shocks, trends, seasonality; Policies, institutional context and processes; Conceptual Frameworks-DFID, CARE, UNDP, OXFAM, BASIX livelihood triad, Nine square Mandala or Rural Livelihood System's Framework, etc; Past, Present and Possibilities for the future of the SLA, critiques of the approach.

Unit VI

Livelihood promotion approaches: Approaches and programs in India; Livelihood and a Rights Based Approach-MGNREGA and its critique; Livelihood and a Social Capital based approach: NRLM; Livelihood Augmentation (LA)- Basic concepts; Pathways: a) Entrepreneurial strategies for LA; b) NRM based intervention; c) Market based interventions including Value-chain analysis; d) ICT based interventions; e) Livelihood and allied agriculture based livelihood; f) Forest based Livelihoods vis a vis Livelihood Protection and Promotion: Contribution of NTFP in supporting rural livelihoods.

VI. Practical

Visit to a village for understanding gender roles and for capturing shifts in gender roles in fisheries; Conducting gender analysis in a village using gender analysis tool; Exercise for identification and prioritization of issues affecting/needs for men and women in fisheries; Village visit to understand the livelihood pattern of villagers and how the other socio-economic factors affect the livelihood of people; Application of participatory rural appraisal skills for understanding village context; Engagement of working with rural communities and their grass-root institutions, understanding dynamics of working in a group; Visit to different agri-business models as mentioned in the Block 'C'. Group assignments may be given to document the field experience in the form of case study of an enterprise/ entrepreneur/ members and other related stakeholders; Visit to agencies supporting women empowerment followed by report presentation. Each student to visit a different organization such as State Rural Livelihood Mission, Women Development Corporation, Department of Agriculture, Important NGOs working for women empowerment; Interaction with a successful women entrepreneur/ SHG; Case studies based on livelihood promotion and rural development. Case studies on Livelihood augmentation and gender related issues in fisheries sector.

I. Course Title : Extension Service System Management

II. Course Code : FEX 604

III. Credit Hours : 2+1

IV. Aim of the course

To make students' understand extension administration and management, and the functions associated with management.

V. Theory

Unit I

Extension service system: Meaning and scope of extension service system and its management; Public administration and bureaucracy - concepts, origin and development; Marxian, Weberian and Gandhian thoughts on bureaucracy; bureaucratic vs. developmental organisation.

Unit II

Processes of management: POSDCORB; Structure, Organisation, Function, Working and management of public extension service agencies like DoFs, FFDA, BFDA, MPEDA, NFDB, NABARD, Fisheries Development Corporations, State Fish Seed Development Corporations, KVKs, SAUs, Fisheries Co-operatives, international agencies, corporate sector, private organizations and MNCs.

Unit III

Organisational conflicts: Delegation of power, Autonomy and Organisational communication and Conflicts in governmental, UN agencies, Non-governmental and Private extension service organisations; Conflicting roles and responsibilities of extension agents.

Unit IV

Organisational communication: Meaning, methods, types and techniques; Functions and importance in motivation and control; Formal and informal communication networks in GOs, NGOs and POs; Behaviour of individuals in organisations; Organisational change and communication; Patterns of communication of organisational communication; Managing organizational communication in fisheries sector.

Unit V

Research, extension and client systems linkages: Linkages and coordination between Dept. of Fisheries and other line Depts. like Irrigation / Water Resources, Environment, Forestry, Agriculture at grassroots, District, State and Central levels; HRD policy in governmental, Non-governmental and Private extension service organizations, Strengthening governance - Transparency, Accountability and People's participation.

Unit VI

Strengthening extension service system: Strengthening the Human Resources of Extension System, Strengthening the Information and Communications Technology (ICT) Capacity, Decentralize the existing extension system, Developing Participatory Public Extension System: PRA, RRA, etc., Investments needed to strengthen extension systems, Civil Works, Equipment, Vehicles, Technical Assistance and Operational Expenses, Supervising, Monitoring, and Evaluating extension projects.

VI. Practical

Case study and analysis of State Departments of Fisheries in selected States; Case studies in structure organization, staffing, career advancement, quality of service delivery at grassroots level in governmental, nongovernmental and private extension service organisations like DoFs, FFDA, NABARD, State Fish Seed Development Corporations, KVKs, Fisheries Co-operatives, NGOs, and private sector organisations; Study of patterns of communication and effectiveness of Fisheries Development Organisation; Study visit to DoF, NGOs, NABARD, private sector agencies involved in fisheries extension.

I. Course Title : Technology Commercialisation and Intellectual Property Management

II. Course Code : FEX 605

III. Credit Hours : 2+1

IV. Aim of the course

To develop a critical understanding among extension students about how the technology commercialization process is linked to IPR management and entrepreneurship development.

V. Theory

Unit I

Overview of intellectual property rights: Introduction to IPR; Overview & Importance; Genesis; IPR in India and IPR abroad; Patents, Copyrights, Trademarks & Trade secrets, Geographical indication, Industrial design; Emergence of IPR Regimes and Governance Frameworks, Trade-Related Aspects of Intellectual Property Rights (TRIPS), Convention on Biological Diversity (CBD), Cartagena Protocol, International Union for Protection of New Plant Varieties (UPOV), and BIMSTEC.

Unit II

IPR protection laws and systems: National IPR Policy; and IPR laws; Procedures for filing IP protection; Systems of IP protection and management in agricultural universities and research institutions and also by stakeholders; Mechanisms of IPR Management, Institutional arrangement, IP Management processes – invention disclosure; IP portfolio management; Infringement management; National Biodiversity Act (2002); Protection of Plant Varieties and Farmers Rights Act

(2001); Guidelines for registration and transfer of biological resources; Farmers rights; Mechanisms of documenting/ collecting, protecting and commercialising farmers varieties and other biological resources; National Biodiversity Authority, PPVFRA and other agencies involved in management of biological resources in India, Access to Genetic Resources and Sharing of Benefits.

Unit III

Traditional and indigenous knowledge: Grassroots and Farmers Innovations – Meaning, forms and importance; Systems of documentation, Registration, Protection and Commercialisation, Documentation of traditional indigenous knowledge - Traditional Knowledge Digital Library (TKDL), Community Biodiversity Registers (CBRs), People's Biodiversity Registers (PBRs), Plant Biodiversity Register, and Honeybee Network.; The Global Concerns on Use of Genetically Modified Organisms in Food and Agriculture; The Cartagena Protocol on Biosafety; Regulation of GMO in India.

Unit IV

Technology commercialisation and IP valuation: Technology - Definition, functions, Process of technological advancement – Invention, Discovery, Innovation and Technology; Types of innovation, Basic research, Breakthrough innovation, Disruptive Innovation and Sustaining Innovation; Technology transfer and commercialisation, Technology transfer vs Commercialisation; Technology commercialisation process, Elements, Models, Systems and processes; Technology commercialisation strategies, Meaning, approaches for technology commercialisation, technology scaling up, technology licensing, Handholding, Agripreneur development.

Unit V

Technology assessment and refinement: Meaning; Importance; Approaches and methods of assessment and refinement of various technologies, Stakeholder oriented approaches including participatory technology assessment and refinement; Returns to investment; IP Valuation-Oxford context, IP Valuation methods, Cost approach; Income approach, Discounted Cash Flow, Risk-Adjusted Net Present Value, Net Present Value with Monte Carlo Simulation and Real Options Theory; Market approach, Industry Standards Method, Rating/Ranking Method, Rules of Thumb Approach and Auction Method; Hybrid approaches; Royalty rate method.

Unit VI

Technology incubation and promotion: Technology business incubation - Meaning, functions and types; Stakeholder-oriented incubation process, Livelihood incubation, village incubators, System of technology incubation, Incubation process; its effectiveness; Managing profit oriented and non-profit incubators; Schemes for promoting incubators in India; Technology Scouting and Innovations in technology incubation, Technology promotion: Meaning, Types, Business meetings, Scientist-industry/ Entrepreneur meets, Technology conclave, Business plan competition, Farmers fairs, Technology shows; Business Etiquette; Business networking.

VI. Practical

Understanding the technology commercialisation process – Visit to Technology Commercialisation Unit of ICAR Institute/ Agricultural University; Understanding the IPR protection practices – Visit to Patent Attorney office; Hands-on experience in drafting IPR application – Patent/Copyright/ Trademark; Documenting Traditional and indigenous knowledge – Field experience in using various protocols of using traditional and indigenous knowledge; Hands on experience in technology licensing process including drafting agreements; Understanding the Technology Business Incubation – Visit to Agri Business Incubator or Technology Business incubator; Hands on experience in planning and organising technology promotion events; Hands on experience in various techniques in business communication and Business etiquette; Protecting unique local goods through Geographical Indications – Hands on experiences in documenting and registering Geographical indications; Technology assessment/ validation of traditional and indigenous knowledge – QuIK and other methods; Hands on experience in technology valuation.

I. Course Title : Policy Engagement And Extension

II. Course Code : FEX 606

III. Credit Hours : 2+1

IV. Objective

To develop the capacities of students to successfully engage with policy actors and bringing about desirable policy changes to strengthen extension.

V. Theory

Unit I

Understanding policy, policy advocacy and tools: Why policies are important for extension? Role in providing structure, Ensure funding and Framework for providing functions-examples; Policy: definitions and types; Is policy a product or a process or both? Policies and institutions, How these influences defining organizational roles and performance in extension organizations, Role of policies in upscaling knowledge.

Unit II

Role of extension in influencing policies to enable innovation; Definition of advocacy, Approaches to policy advocacy-Advising, Media campaigning, Lobbying, Activism, Information education communication (IEC) and Behaviour change communication

(BCC); Advocacy for RAS; Policy advocacy strategy.

Unit III

Policy analysis and development process: Explain the meaning and use of policy analysis in decision making; Describe different types of policy analysis, Empirical, Evaluative or normative policy analysis, Retrospective/ prospective policy analysis, Predictive/prescriptive/descriptive policy analysis; How to do policy analysis?, Understand the process of policy analysis, Highlight the different methods and techniques used in policy analysis, Doing ethical policy analysis; Tools for policy impact- research tools, Context assessment tools, Communication tools, Policy influence tools, Who drives policy change?, National Governments, Donors, Civil Society-varied experiences.

Unit IV

Understanding the environment and key actors in policy space: Problem identification, Policy adoption, Implementation and evaluation; Stakeholder mapping, Identifying opportunities and Barriers, Mobilising financial resources; Dealing with policy incoherence: Identifying contradictions and challenges in policy implementation, Generating evidence.

Unit V

Role of policy research: Analysing the usefulness and appropriateness of the evidence; Using evidence in policy advocacy; Good practices in influencing policies Organising policy dialogues; Policy engagement strategy, Engaging with policy makers; GO and NGO experiences; Policy working groups; advisory panels; use of committees.

Unit VI

Policies in fisheries sector: Policy and regulatory environment in Marine Fisheries Sector, Inland Fisheries Sector, Brackish water Aquaculture Sector, Freshwater Aquaculture Sector, International policy and regulatory scenario in fisheries sector; FAO's CCCRF; UN's Law of the Sea and other conventions; EU's Common Fisheries Policy; Fisheries policy and regulation of select countries in Asian and American region; WTO and Fisheries; Subsidies and taxation in fisheries sector, NIFAP, Marine Policy.

VI. Practical

Analysis of country/state level fisheries/ extension policy to understand the policy intentions from strengthening EAS, Analysis of fisheries policies of other countries: policy intentions, processes adopted in development of the policy and mechanisms of policy implementation, Interaction with key policy actors in EAS arena at the state/ national level (e.g.: Secretary of fisheries, Director of fisheries, etc) to explore policy level challenges in EAS, Identifying what evidence policy makers look for from extension research (Is the evidence available? If so what form? (Reports, Briefs etc), If not, develop a plan; Explore how different stakeholders influence policies (e.g.: policy advocacy of prominent NGOs, private sector and public sector) -What mechanisms and tools they use, Identifying policy level bottlenecks that constrain effective EAS delivery at the district level- E.g.: Issues around linkages between KVK and ATMA; inter-departmental collaboration; public private partnerships; joint action etc., Case studies on sub-sectoral review of fisheries policy and legislative framework in select Indian States; Case studies on shrimp culture policy and development in Thailand and East Coast of India; Case studies on leasing policy in Bihar, Rajasthan, Tamil Nadu, Orissa, Karnataka, Maharashtra and Himachal Pradesh; Case studies on implications of WTO agreements for Indian and world fisheries.

I. Course Title : Participatory Approaches in Fisheries Extension

II. Course Code : FEX 607

III. Credit Hours : 1+1

IV. Aim of the course

To make students' gain knowledge on participatory approaches in fisheries extension programmes.

V. Theory

Unit I

Participatory approaches for aquatic resources management and development: Need, Importance and guiding principles; Community mobilization methods, Farmer-First Approach; Trickle Down System, Concept, Method and processes; Knowledge Driven Extension System, Concept and method.

Unit II

Community based fisheries management and Fisheries co-management: Concept, Origin, Importance, Types, Method, Processes, Stakeholder rights, Responsibilities and participation, Institutional mechanisms, Implementation constraints, Experiences from other countries; Conflict resolution and management; Public-Private-Community Partnership.

Unit III

Participatory Learning Approach (PLA): Role-plays, Case studies, Brainstorming, and ranking of priority issues, Discovery-based experiential learning, Participatory education methods like FGD.

Unit IV

Participatory appraisal techniques: Census mapping, Resource mapping, Social mapping; Selection of participatory methods and their uses; Farmer Field Schools for Aquaculture, Strength and weakness, Constraints in PRA methods.

VI. Practical

Conducting Participatory Rural Appraisal in select villages and developing action plans; Conducting focused group discussion and developing action plan; Facilitating group formation based on the felt needs and to implement the action plans / plan of work; Reviewing national and international case studies on participatory approach to aquaculture research and development; Case studies and simulation exercises on fisheries co-management /community based fisheries management.

Suggested broad areas for Master's and Doctoral research

- Comparative study on performance of public, private and market led extension systems
- Performance and impact of ATMA model of service delivery/knowledge dissemination
- Communication effectiveness of different media
- Impact of social media in technology transfer
- Impact of community radio and ICT led extension systems
- Case studies on co-management and community based fisheries management experiences in India
- Training need assessment of State Department of Fisheries
- Impact of B.Voc Programmes in addressing need of skilled human resource in fisheries and aquaculture sector
- Aquapreneurship and youth
- Recruitment policy and career advancement in State Department of Fisheries (or) State Fisheries Universities
- Role and importance of PRIs and NGOs in implementing fisheries development programmes
- Critical factors in successful development of community based organisations
- Reach and impact of fisheries innovations
- Stakeholder analysis of fisheries innovations
- Developing effective interactive e-learning and multimedia products
- Reach and impact of fisheries innovations
- Socio-economic impact assessment of development programmes
- HRM practices of Various State Fisheries Departments, NGOs and private consultancies
- Division of labour and gender equity among fishing communities
- Content analysis of development oriented articles / features in print /electronic media for their reach, readability, and persuasion and conviction
- Political economy of mass media and development journalism
- Case studies on documentation and validation of ITK practices in fisheries sector Impact of Tsunami 2005 on fishers' livelihoods and fisheries
- Pattern of rehabilitation work and its impact
- Returns to investment in fisheries and aquaculture extension
- Evolving participatory result oriented monitoring and evaluation system for fisheries development programmes in developing countries. Developing appropriate scaling technique for measuring the attitude of fishers towards conservation technologies
- Professionalism in Service Delivery System Performance of public and NGO led extension systems
- Developing and field testing of effective training tools for trainers
- Conflict between small scale fishers and large scale fishers and inadequacy of the present resolution mechanism.
- Social change, mobility and integration in fishing communities
- Case studies on success stories in use of ICT for fisheries development Limiting factors in effective use of ICT for Development
- Comparative study of effectiveness performance of extension systems in India and other developing South-East Asian Countries (Indonesia / Thailand) or developing agrarian economy based countries
- Levels of workload among Fishers and their impact on health
- Administrative advantage of formation of exclusive ministry/council for fisheries

Vol. 5

Fisheries Science
– Fish Physiology and Biochemistry

Preamble

(Fish Physiology and Biochemistry)

Fish physiology and Biochemistry is a basic discipline in the field of fisheries science. Physiology is the scientific study of the normal function in living systems in their living environment. One of the major objectives is to know the basic function of organs and their interaction at a macro-level while biochemistry provides more basic understanding in a micro-level about the existence of life in the organism. Physiology is closely related to anatomy which is the study of form and structure. Fish physiology seeks to understand the mechanisms that work to keep the fish body alive and functioning, through scientific enquiry into the nature of mechanical, physical, and biochemical functions of fishes, their organs, and the cells of which they are composed. Biochemistry will broaden our understanding on the physiology and helps to understand the chemical aspects of biological processes. The principal level of focus of physiology is at the level of organs and systems within the body. The endocrine and nervous systems play major roles in the reception and transmission of signals that integrate function in animals. Homeostasis is a major aspect with regard to such interactions within the organisms. The biological basis of the study of physiology, integration refers to the overlap of many functions of the systems of the body, as well as its accompanied form. It is achieved through communication that occurs in a variety of ways, both electrical and chemical. Few of the most extensively researched and applied areas in fish physiology and biochemistry is the physiology of reproduction as well as the nutritional physiology. With the help of this course, students learn to find scientific answers to the problems related with the various modes of aquaculture production before attempting to solve them. This course takes a systematic approach with emphasis on the reproductive, circulatory, endocrine, muscular, nervous, metabolic, and respiratory systems. The knowledge will certainly enable students to amicably address the failure in captive reproduction, larval growth and survival issues of new aquaculture candidates, adaptation to altered habitats, growth and immunity under various salinities, mitigation strategies for alleviating stresses and identifying welfare indicator of fishes in different aquaculture systems. In addition to the basic body systems, the course also covers the deviations from normal physiology such as stress and adaptive physiology and interactions of physiology with environment in context of foreseeable climate change scenario.

The major emphases of the discipline are as follows:

How the physiological processes happen and their biochemical basis

How they might change with environment and their biochemical basis

How one process inûuences the other

How this relates to real scenario of finfish and shellfish aquaculture.

Overall, Purpose of the 'Fish Physiology and biochemistry" course, is to provide a foundation on many basic processes that keep a fish alive and how understanding biochemical and physiological processes have practical applications. Further, the understanding of physiology will help to find reasons to recurrent practical problems such as fish mortalities, low production or breeding failure and ways to help the situation. In academics the understanding of physiology and biochemistry is invaluable for interpreting data from many fields such as nutrition, immunity, and genetics. Understanding why something happen leads to new questions and therefore new research directions can be created. The course focuses on physiological processes in fish including reproduction, nutrition, respiration, circulation, acid-base balance, smotification, osmo-ionic regulation, swimming and buoyancy, sensory physiology, egg and larval physiology, digestion, energetic and growth, immunity and adaptations to adverse climate and environments.

With the background of immense importance of the 'Fish Physiology and Biochemistry", members of the BSMA committee and the invited experts from pioneer institution like IITs and industry reviewed the existing PG and Ph.D. course syllabus critically several times, incorporated the recent content learning both in theory and practical to bring it in this elevated format to groom the fish physiology and biochemistry specialists and professionals to the industry, R&D and academics. The syllabus has been made following the same pattern maintained in preparing other disciplines. Under M.F.Sc. program minor change in title of 1 course has been made with several minor changes in the contents of different courses to keep the syllabus more relevant to the needs of the day. In Ph.D. program, only course was subjected to major changes and a new course "Diagnostic Biochemistry and Physiology" has been introduced to understand and to develop new methods of identifying disturbances in fish welfare well before of sickness and outbreak of diseases. In M.F.Sc one course "Aquatic radioecology" has been excluded from the syllabus due to lack of facilities needed to run such course.

Justification for Fish Physiology and Biochemistry Disciplines in Fisheries Science

Earlier committee reports such as, Fifth Deans' Committee Report (2013) and Report of PG and Ph.D restructuring done under the Chairman ship of Dr. Keshavanath (2009) have recommended offering "Fish Physiology and Biochemistry" for the PG/Ph.D. in Fisheries Science. The new Education Policy 2020 envisages making the education system more flexible for the Higher education students. At the PG and Ph.D. level naturally, it is essential to branch out into more specialisations and there is a need to offer many courses for students to choose from. Thus, students will be offered with a wider choice of courses and they need not be restricted to a limited no. of courses. Moreover, withdrawing the already introduced Courses on "Fish Physiology and Biochemistry" after few years would certainly affect the career of those students earned degree. It would be detrimental to the settlement of those students who pursued the courses.

Course Title with Credit Load
M.F.Sc. in Fish Physiology and Biochemistry

Course Code	Course Title	Credit Hours
	Major Courses	**20 Credits**
FPB 501	Fish Physiology	2+1
FPB 502	Reproductive Physiology and Endocrinology	2+1
FPB 503	Fish Biochemistry	2+1
FPB 504	Metabolism of Biomolecules	2+1
FPB 505	Cellular and Molecular Physiology	2+1
FPB 506	Crustacean Physiology	1+1
FPB 507	Diagnostic Biochemistry	2+1
	Minor Courses	**8 Credits**
	(From the subjects closely related to a student's major subject)	
FPB 508	Tools and Techniques in Biochemistry	1+2
FPB 509	Principles in Fish Nutrition	2+1
FPB 510	Nutraceuticals as Functional Foods	1+1
FPB 511	Fish Pathology and Immunobiology	1+1
FPB 512	Sensory Physiology	1+1
FPB 513	Physiology of Fish Behaviour	1+1
FPB 514	Pharmaco-biology of Aquaculture Drugs	1+1
FPB 515	Eco-physiology of Fishes	1+1
FPB 516	Enzymology	2+1
FPB 517	Fish Nutrigenomics	2+1
FPB 518	Feeds and Feed Technology	2+1
FPB 519	Nutritional Requirement and Feeding Management	2+1
	Supporting Courses	**6 Credits**
	(The subject not related to the major subject. It could be any subject considered relevant for students research work (such as Statistical Methods, Design of Experiments etc.) or necessary for building his/her overall competence)	
	Common Courses	
	(The following courses, one credit each will be offered)	**5 Credits**
	1. Library and Information Services	
	2. Technical Writing and Communication Skills	

Course Code	Course Title	Credit Hours
	3. Intellectual Property and its management in Agriculture	
	4. Basic concepts in Laboratory Techniques	
	5. Agricultural Research, Research ethics and Rural Development Programmes	
	Total Course Work Credits	**39 Credits**
	Masters' Seminar	**1 Credit**
FPB 591	Master's seminar I	0 + 1
	Masters' Thesis Research	**30 Credits**
FPB 599	Master's Research (Semester III)	0 + 15
FPB 599	Master's Research (Semester IV)	0 + 15
	Total M.F.Sc. Program Credit Hours	**70 Credits**

Course Contents
M.F.Sc. in Fish Physiology and Biochemistry

I. Course Title : Fish Physiology

II. Course Code : FPB 501

III. Credit Hours : 2+1

IV. Aim of the course

To understand the basic physiology of fish

V. Theory

Unit I

Cell Physiology: Structures, Membranes, Organelles and Functions; Cell cycle; Signaling and cell death; Cellular functions in aquatic environment; Extracellular matrix biology; Bioluminescence and physiology of electric organs in fishes.

Unit II

Physiology of GIT: Anatomy; Digestion, Absorption and assimilation of food salt and water; Digestive enzymes, Neural and hormonal regulation; Impact of nutrition.

Unit III

Physiology of respiration: Morphology of gills, Respiratory pigments and their functions; Mechanism of gaseous exchange, Gill ventilation countercurrent principle, CO_2 transport,; Fluid dynamics on gill functions and respiratory mechanisms.

Unit IV

Circulatory system: Structure and functions of heart, Blood circulation, Blood pressure, Composition of blood, Heart and cardiac output, Structure of blood/ haemolymph pigments; Water salinity and blood composition.

Unit V

Physiology of Osmoregulation and Respiration: Excretory and osmoregulatory organs in fish and shellfish and their functions; Mechanism of osmotic and ionic regulation; Acid base regulation, Mechanism of excretion of nitrogenous waste; mechanisms of osmoregulation against aquatic pollutants.

Unit VI

Physiology of Reproduction: Structure and functions of gonads, Gametogenesis; Vitellogenesis; Gonadal steriodogenesis; Seasonality of reproduction, and endocrine control of reproduction; Circadian rthyme in fish physiology; Aquatic pollutants and reproduction.

VI. Practical

Cell proliferation assay: Estimation of haemoglobin /haemocyanin and blood CBC; Estimation of ion transporter activity; Measuring osmolality of blood/ haemolymph; dissection and display of reproductive system, Estimation of hormones.

I. Course Title : Reproductive Physiology And Endocrinology

II. Course Code : FPB 502

III. Credit Hours : 2+1

IV. Aim of the course

Basic concepts of reproductive physiology and endocrinology.

V. Theory

Unit I

Modes of reproduction: Sex determination and differentiation; Sexual dimorphism; Primary and secondary sex characters; Bisexual reproduction; Hermaphroditism, Sex reversal; Parental care reproductive behavior and adaptations.

Unit II

Neuroendocrine regulation: Pituitary gland and hypophthalamus; Structure and functions of GnRH other neuropeptides, Gonadotropins; Gonadotropin receptors structure, Function and regulation of their secretion.

Unit III

Gonad development and maturation: Oocyte and spermatocyte growth, Vitellogenesis; Nutrient transport and incorporation into oocytes; Oocyte maturation and ovulation; Spermiation; Metabolic changes during gametogenesis; Nutrient regulation of gonad development and endocrine function; Seminal vesicle and function.

Unit IV

Reproductive Rhythm: Daily and seasonal rhythms; Environmental cues, Photo-transduction, Role of melatonin and neuropeptides, Lunar clock, Biological Clock, Time of day, reproduction; Pheromones; Migration in fish.

Unit V

Reproductive technology: Hormonal manipulation of reproduction; Cryopreservation of gametes/ germ cells; Artificial insemination, Synthetic hormones and analogues for induced spawning; Stripping and fertilization.

Unit VI

Peripheral endocrine glands and hormones: Structure and functions; Thyroid, ultimobranchial body, Corpuscles of Stannius, Adrenal homologues, and Urophysis, PTH-related peptides, Calcitriol, Pancreatic hormones; Gut hormones; Neuroendocrine hormones.

VI. Practical

Dissection and display of reproductive and endocrine organs. Assay of hormones-testosterone, estradiol, cortisol, thyroxine; histological examination of gonad, maturity; Short term preservation of milt; Cellular morphology of pituitary gland.

I. Course Title : Metabolism of Biomolecules

II. Course Code : FPB 504

III. Credit Hours : 2+1

IV. Aim of the course

Metabolism of different biomolecules.

V. Theory

Unit I

Carbohydrate metabolism: Glycolysis, TCA cycle; Feeder pathways of carbohydrate metabolism: Pentose phosphate pathway and gluconeogenesis; Glycogen metabolism, Regulation of blood glucose level.

Unit II

Lipid metabolism: Biosynthesis of fatty acids; Oxidation of fatty acids; Ketone bodies; desaturation and Elongation mechanisms; Control of fatty acid metabolism.

Unit III

Oxidative phosphorylation: Substrate level phosphorylation; Electron Transport Chain; NADH, NADPH, and $FADH_2$. Fo-F1 ATP synthesis.

Unit IV

Protein and amino acid metabolism: Biosynthesis of protein; Degradation of amino acids; Transamination and deamination, ammonia carrier and excretion; Biosynthesis of non-essential amino acids.

Unit V

Nucleic acids metabolism: Purine and pyrimidine metabolism, Biosynthesis of deoxyribonucleotides and ribonucleotides.

Unit VI

Vitamins and mineral metabolism: Metabolomics; Basic concepts and applications, Xenobiotic metabolism.

VI. Practical

End product estimation of aerobic and anaerobic carbohydrate metabolism (pyruvate and lactate) Estimation of lipoprotein lipase, acetyl choline esterase LDH, MDH, AST, ALT, NADH, NADPH, RNAses and DNAses.

I. Course Title : Cellular and Molecular Physiology

II. Course Code : FPB 505

III. Credit Hours : 2+1

IV. Aim of the course

To understand the cellular signaling cascades and related molecular physiology.

V. Theory

Unit I

Cell structure: General organization of euaryotic and prokaryotic cell; Structure and function of cell organelles, Cell membrane, Compartments, Electrolytes and Extracellular matrix, Membrane fluidity.

Unit II

Cell cycle and division: Meiosis and Mitosis regulation of cell cycle factors affecting cell cycle; Apoptotic and necrotic pathways.

Unit III

Cell signaling: General principles; Second messenger system; Concept of ligand; Ligand and receptor interactions Mechanism of cell signaling, Intracellular and extracellular receptors (Ion channel linked, G-Protein linked and enzyme linked) mediated signaling pathways; GPCR structures and functions; Concepts of membrane bound receptors and cytoplasmic/ nuclear receptor; second messenger system; Steroid hormone actions.

Unit IV

Cellular trafficking: Endocytic and Exocytic pathways membrane transport protein sorting vesicular transport.

Unit V

Gene expression: DNA replication, transcription translation and regulation of gene expression.

Unit VI

Translation and epigenesist: Pre and Post transcriptional and post translational modifications; Gene splicing, duplication and mutation, DNA damage and repair, Pathways; Epigenetic regulations.

VI. Practical

RNA isolation and cDNA synthesis, PCR, Genomic DNA isolation, PAGE and SDS-PAGE, DNA barcoding.

I. Course Title : Crustacean Physiology

II. Course Code : FPB 506

III. Credit Hours : 1+1

IV. Aim of the course

To understand basic physiology of crustacean.

V. Theory

Unit I

Reproduction: Reproductive physiology of crustaceans, Neuroendocrine glands and their functions.

Unit II

Molting and growth: Physiology of Molting, molting cycle, Growth.

Unit III

Ion and metabolites homeostasis: Osmoregulatory and Excretory physiology of crusataceans.

Unit IV

Digestive physiology: Function and structure of different components of digestive system, Feeding and sensory appendages, Hepatopancreas, Chemoreception.

VI. Practical

Identification of different organs, morphology of gonads; Molting cycle in relation to environment; osmolality and ionic estimation of haemolymph, anatomy of digestive tract.

I. Course Title : Tools and Techniques in Biochemistry

II. Course Code : FPB 508

III. Credit Hours : 1+2

IV. Aim of the course

Different experimental techniques in the fish Biochemistry.

V. Theory

Unit I

Theory and application of spectrophotometry: Beer-Lambert's law; Calibration plot; UV-visual, fluorescent, IR, CD spectroscopy, Atomic mass spectroscopy, RT-PCR and NMR, X-ray crystallography.

Unit II

Basic principles of chromatography: Theory and applications of paper, Affinity, Column, Thin layer, Ion-exchange, Size exclusion and gas chromatography, HPLC; HP-TLC; LC-MS; Factors affecting chromatographic resolutions, Resolving power and retention time.

Unit III

Radioimmunoassay (RIA) and Enzyme-linked immunosorbent assay (ELISA): Basic principle and application in quantitative estimation of biological analytes; Development of assays.

Unit IV

Electrophoresis: Theory and applications of electrophoresis; Gel electrophoresis of proteins and nucleic acids, Determination of molecular weight of proteins and nucleic acids; Electrophoretic Mobility Shift Assay (EMSA).

VI. Practical

Spectrophotometric estimation of biomolecules: Spectrum analysis, Validation of Beer-Lamberts law IR spectroscopy FTIR, NMR Isolation and purification of protein; protein isolates and concentrate preparation, chromatographic purification of proteins, Separation of amino acids by paper chromatography; TLC separation; HPLC analysis GC-MS analysis; Qualitative and quantitative estimation of fatty acids by gas chromatography; Isolation of plasmid and genomic DNA, Total RNA, PCR, RT-PCR and qPCR, Separation of proteins and nucleic acids by gel electrophoresis: Vertical and horizontal electrophoresis. RIA and ELISA.

I. Course Title : Diagonistic Biochemistry

II. Course Code : FPB 507

III. Credit Hours : 2+1

IV. Aim of the course

To understand the different aspects of biochemical diagnostic Techniques.

V. Theory

Unit I

Blood analysis: Analytes in blood, Tissues, Invasive and non-invasive techniques of blood drawing in fish, Their limitations and interpretation, Hemoglobin, Hematocrit, Plasma proteins, Glucose tolerance test.

Unit II

Enzymes and metabolic disorders: Subcellular distribution of enzymes, Isolation and purification of enzymes, General properties, Enzyme activity, Marker enzymes, Metabolic disorders related to carbohydrate, Lipid, Protein and nucleic acid metabolism in fishes.

Unit III

Enzyme markers: Enzymes and iso-enzymes of clinical significance; Acid phosphatase, Alkaline phosphatase, Amylase, angiotensin converting enzyme, Cholinesterase, Creatine phosphokinase, Gammaglutamyl transferase, Lactate dehydrogenase.

Unit IV

Vitamins and minerals: Vitamins and Minerals sub-clinical and clinical deficiencies, Electrolytes and acid-base balance**,** Regulation of electrolyte content of body fluids, Biochemical indicators for vitamin and mineral stress.

Unit V

Lipids carriers and disorders: Chylomicrons, VLDL and IDL, HDL, LDL - Implications in disease, Fatty liver, liver, kidney and bone disorders, Liver function tests, Detoxification mechanisms of gill, liver and kidney, Pesticide poisoning.

Unit VI

Immunoglobulins: Structure, Classes, Properties and functional significance of Immunoglobulins, Monoclonal antibodies.

VI. Practical

Estimation of blood glucose, albumin and globulin, gel electrophoresis of serum proteins, quantification of serum proteins, determination of A/G ratio in serum, Analysis of stress proteins; Liver and plasma enzyme assay (GOT, GPT, ALP, AchE, CPK, LDH, Urease); Blood hemoglobin, serum bilirubin, Blood calcium. Histology of vital organs. Estimation of vitamin A and D. Tests for immunoglobulins.

I. Course Title : Principles of Fish Nutrition

II. Course Code : FPB 509

III. Credit Hours : 2+1

IV. Aim of the course

To understand the basic principles of fish nutrition and the role of different nutrients.

V. Theory

Unit I

Protein nutrition: Protein and amino acids, Their specific functions, Classification and evaluation criteria of dietary protein (nutrient gain, nutrient efficiency, TGC, PER, NPU, BV, EAAI, chemical score), Protein deficiency symptoms.

Unit II

Lipid nutrition: Lipids and fatty acids, Their specific functions, Classification and evaluation of lipid quality, Lipid deficiency symptoms.

Unit III

Carbohydrate nutrition: Carbohydrates, Functions, Classification and Utilization of carbohydrate in fish diets.

Unit IV

Vitamin and mineral nutrition: Specific functions, Classification, Sources of vitamins and minerals and their deficiency symptoms.

Unit V

Nutritional energetics: Definition, Different forms of energy and energy value of feed (gross energy, digestible energy, metabolizable energy, net energy), Importance of protein-energy ratio in fish diets.

Unit VI

Larval and Brood stock nutrition: Larval gut morphology, Importance of live feed and formulated feeds in larval nutrition, Nutrients required for egg and sperm quality and reproductive efficiency.

VI. Practical

Proximate analysis; moisture, crude protein, crude lipid, gross energy, ash, acid insoluble ash, crude fibre, nitrogen free extract of feed and fish tissue, analysis of fatty acids and amino acids, calcium, phosphorus, vitamin C content of feed.

I. Course Title : Nutraceuticals as Functional Foods

II. Course Code : FPB 510

III. Credit Hours : 1+1

IV. Aim of the course

To understand the role of nutraceuticals in the physiological wellbeing of fish and shellfish.

V. Theory

Unit I

Functional foods v/s Nutraceuticals: Definitions, Concepts and Beneficial roles, Application of functional foods in immune modulation and disease prevention.

Unit II

Characteristics of nutraceuticals and delivery systems: Nanotechnology of drug delivery system such as biocompatible polymers, Stimuli responsive polymers.

Unit III

Modes of action and benefits: Probiotics, Prebiotics, Stanols and sterols, Their immunomodulatory effects.

Unit IV

Stress mitigation and growth enhancement: Interrelationships of stress and growth in fish, Functional feed additives and role of functional foods in stress mitigation and growth enhancement.

VI. Practical

Estimation of immunomodulatory parameters (lysozyme, NBT, MPO, antibody titre), estimation of antioxidant enzymes (SOD, catalase, GPx), extraction of bioactive compounds, in vitro antioxidant assay, Pro PO.

I. Course Title : Fish Pathology and Immunobiology

II. Course Code : FPB 511

III. Credit Hours : 1+1

IV. Aim of the course

Different aspects of immunostimulants and their effect on fish immunity, stress and disease resistance.

V. Theory

Unit I

Basic principles of immune system: Immune system in fishes, Cell and organ involved in immunity.

Unit II

Mechanism of immunity: Different mechanisms, Humoral and cell mediated immunity, Cytokines, Interferon, Lymphokine, Chemokines, Their role in immune response.

Unit III

Immunoprophylaxis: Immunoprophylaxis in fish, Toxin, Toxoid and Vaccines, Immuno-stimulant and immunomodulation.

Unit IV

Antibodies and their function: Biosynthesis of antibody, Function of different antibodies; Interaction of Endocrine with immune system; antibody classes and genes involved.

VI. Practical

Challenge study, Lysozyme activity, Estimation of NBT and MPO Estimation of CBC. Estimation of prophenol oxidase, Estimation of superoxide dismutase, Estimation of IgM.

I. Course Title : Sensory Physiology

II. Course Code : FPB 512

III. Credit Hours : 1+1

IV. Aim of the course

To understand different sensory organs and their functional mechanism in fish.

V. Theory

Unit I

Sense organs and their functions: Electroreceptors, Chemoreceptors, Baroreceptors, Propioreceptors, Hydroreceptors and Photoreceptors.

Unit II

Olfactory and auditory organs: Physiological mechanisms; Fisheries acoustics.

Unit III

Sensory neurons: Action potential, Synapse, Neurotransmitters, Impulse transmission, Excitation-contraction coupling.

Unit IV

Luminescence: Chemoluminescence and bioluminescence; Chromatophores; electrophysiology.

VI. Practical

Practical on chemoreception using different feeding attractants. Study of chemosensor cell function in response to salinity, dissolved oxygen levels and pH changes Chromatophores function in relation to background colour light, temperature, etc.

I. Course Title : Physiology of Fish Behaviour

II. Course Code : FPB 513

III. Credit Hours : 1+1

IV. Aim of the course

To understand the behavioural physiology of fish.

V. Theory

Unit I

Fish behavior: Concept, types, and regulatory mechanism.

Unit II

Feeding and predation: Predatory avoidance; Feeding behavior

Unit III

Social and reproductive behavior: Sexual and aggressive behavior; Parental behavior; Endocrine control of behaviours.

Unit IV

Adaptation mechanism in altered environment: Migration, Schooling, Shoaling, bottom dwelling.

VI. Practical

Tagging studies, Audio visual recording of behavior in simulated experiment.

VII. Suggested Reading

I. Course Title : Pharmaco-biology of Aquaculture Drugs

II. Course Code : FPB 514

III. Credit Hours : 1+1

IV. Aim of the course

To understand aquaculture drugs and their delivery mechanism.

V. Theory

Unit I

Drugs in aquaculture and fish health management: E.O., FDA and ISO standards of levels of drugs.

Unit II

Pharmacological studies: Kinetics and dynamics; Detoxification; Drug metabolic profile; Liver function tests.

Unit III

Chemotherapeutic agents: Antiprotozoal agents, Ectoparasiticide, Antihelmenthic, Anaesthetics; Dosage determination/ optimization.

Unit IV

Antimicrobial drugs: Antibacterial, Antifungal, Antiviral drugs and their delivery system.

VI. Practical

Estimation of residual level of different drugs; Minimum Inhibitory Concentration of drugs test, Pharamaco-kinetics of aquaculture drugs

VII. Suggested Reading

I. Course Title : Ecophysiology of Fishes

II. Course Code : FPB 515

III. Credit Hours : 1+1

IV. Aim of the course

To understand the physiology of fish in changing ambient environment.

V. Theory

Unit I

Fish habitats: Disruption of habitats; Pollutants, Toxicants and Radionuclides emittants.

Unit II

Climate change effectors: Impacts on ecology, Growth and reproduction; Mitigation mechanisms; Migration patterns.

Unit III

Thermal and hypoxic stress: Physiological and metabolic responses; Heat shock protein (HSP); Hypoxia Inducing Factor (HIF); cardiovascular and gill ventillatory systems.

Unit IV

Radioecology: Occurrence of radioactive substances in water and threat on food chain, Use of radioisotopes in tracer techniques for metabolic studies, International radiological limits for the export and import of aquatic products; Radioactive substances and fish physiology.

VI. Practical

Estimate threshold of thermal and hypoxia tolerance, Estimation of LC_{50} of pollutants, Estimation of stress enzymes, isozymes, Estimation of cortisol. Use of isotopes in tracer techniques for metabolic studies, Quantification of Tritium and other radioisotope levels in fish tissues.

VII. Suggested Reading

I. Course Title : Enzymology

II. Course Code : FPB 516

III. Credit Hours : 2+1

IV. Aim of the course

To understand enzyme kinetics and regulation.

V. Theory

Unit I

Enzymes: Introduction; enzyme specificity; Mode of action; Nomenclature, Classification and EC numbering; Structure of enzymes, active site.

Unit II

Enzyme kinetics and equilibrium: Kinetics; Enzyme equilibrium; Single substrate enzyme kinetics and factors affecting the rates of enzyme catalyzed reactions; Michaelis- Menten equation; K_m and V_{max} values; Enzyme efficiency; Line weaver and Burke Plots; Multi-substrate enzyme kinetics.

Unit III

Enzyme inhibition: Reversible and non-reversible, Competitive, Uncompetitive and Non-competitive inhibition; Enzyme poisoning.

Unit IV

Enzyme regulation: Allosteric enzymes; Factors affecting enzyme activity, Holoenzyme and coenzyme, Zymogens, Isoenzymes, Ribozymes; Immobilized and restriction enzymes.

Unit V

Role of vitamins in enzyme reactions: Structure and biological function of coenzyme A, Thiamine pyrophosphate, Pyridoxal phosphate, NAD+, NADP+, FMN, FAD, Lipoic acid and vitamin B12; Mechanisms of reactions catalyzed by above cofenzymes.

Unit VI

Role of elements in enzyme reactions: Copper enzymes, Superoxide dismutase, Cytochrome oxidase Coenzymes; Molybdenum enzymes: Xanthine oxidase; Zinc enzymes: Carbonic anhydrase, Carboxy peptidase and Interchangeability of zinc and Cobalt in enzymes; Vitamin B12 and B12 coenzymes.

VI. Practical

Enzyme extraction and purification, specific activity, enzyme substrate reactions, mode of enzyme kinetics, assay of enzyme activity (alkaline phosphatase, transaminases, amylase, LDH, MDH, G6PD).

I. Course Title : Fish Nutrigenomics

II. Course Code : FPB 517

III. Credit Hours : 2+1

IV. Aim of the course

To understand the nutrient-gene interactions in fish

V. Theory

Unit I

Functional Genomics: Comparative nutrigenomics to understand the metabolic diversity; Nutritional biochemistry and Climate change.

Unit II

Nutritionally important genes: Genes regulation by protein lipid, Carbohydrates, Genes in fatty acid synthesis, Desaturases, Elongases, Genetic control of metabolic pathways.

Unit III

Omic Studies: Transcriptomics, Proteomics and Metabolomics.

Unit IV

Epigenesis: Methylation, Acetylation and Farnesylation, Nutrigenetics, Histone modifications.

Unit V

Techniques used in omic studies: RT PCR, cDNA synthesis, Realtime PCR, Gene cloning and Restriction digestion.

Unit VI

Basic bioinformatics tools: Primer designing, Softwares, Data mining and NGS data analysis. Full genome sequencing of fishes

VI. Practical

Short term nutrigenomics experiment for gene expression study; glycolytic enzymes expressions in fish liver; studies on fatty acid synthesis; Desaturases and elongases expressions.

I. Course Title : Feeds and Feed Technology

II. Course Code : FPB 518

III. Credit Hours : 2+1

IV. Aim of the course

To learn basic concept of feed formulation and different feed processing techniques

V. Theory

Unit I

Feed formulation: General principles and criterions, Different methods of feed formulation; Pearson's square method and least cost formulation (quadratic equation, solver function, graphic solution, Linear programming and software assisted formulations), Limitations of formulation methods.

Unit II

Types of feed: Wet, Moist and Dry (pellets – steam compressed, extruded and crumbled, flakes, powdered/ mash, micro-encapsulated, micro-bound and micro-coated diets), Farm made feeds, experimental diets; Reference diet, purified and semi-purified diet, Compact pellet, Floating and slow sinking pellet feeds; Starter, grower, Finisher and Broodstock feeds, High energy eco-friendly and medicated feed.

Unit III

Feed processing technology: Receiving of raw materials, Equipments used in feed manufacture and processing; Grinder/pulverizer, mixer, Pelletizer/extruder, Crumbler, drier, Vacuum coater/ fat sprayer, Automatic bagging and sealing, Role of pre-conditioning in feed preparation, Effects of processing on the nutritional value and availability of nutrients.

Unit IV

Feed storage: Hydro-stability of feed and their storage; Prevention of spoilage from rancidity, Fungus and associated toxins; Vectors of fish disease in feed and quality control; Nutritional value in relation to feed storage.

Unit V

Feed additives and supplements: Binders, carotenoids, Attractants, Antioxidants, probiotics, Prebiotics, Synbiotics, Immunostimulants, Nutraceuticals, Acidifiers and preservatives, Bile acids, Herbal additives and Vitamins, minerals, Limiting amino acids, Essential fatty acids, Phospholipids, and cholesterol.

Unit VI

Quality control in fish feed manufacturing: Quality control procedures, Raw materials, Finished products; Safety of farm fish products, Harmful residues (pesticides, antibiotics, and pollutants), Geometrical, and physical feature; Mechanical characteristics in air, Behavioural characteristics in water, Feed economics and evaluation.

VI. Practical

Feed formulation: Preparation of mineral and vitamin premix. Feed additives, binders, water stability test, and available lysine. Determination of feed particle size. Development of feed dispensers both for laboratory and pond feeding as part of project assignment. Visit to feed processing industries.

I. Course Title : Nutritional Requirement and Feeding Management

II. Course Code : FPB 519

III. Credit Hours : 2+1

IV. Aim of the course

To learn nutritional requirements, feeding methods and feed management of commercially important fish and shellfish

V. Theory

Unit I

Nutritional requirements of finfish and shell fish: Nutritional requirements of larvae, Growout and Broodstock of commercially important finfish and shellfish,

–Methods of studying nutritional requirements; Qualitative and quantitative methods; Nutrients deficiency symptoms.

Unit II

Nutritive value of live food: Algae, Artemia, Cladocerans, Ostracods, Rotifers and Copepods, Bio enrichment of artemia and zooplankton, Experimental diets; Reference diet, Purified and semi-purified diet.

Unit III

Response indices for nutrient requirement studies: Weight gain, Specific growth rate (SGR)/ Daily growth coefficient (DGC), Thermal growth coefficient (TGC) and, Feed Conversion Ratio (FCR), Protein Efficiency Ratio (PER), Net Protein Utilization (NPU), Physiometabolic parameters, Dose response curves, Gonadosomatic Index (GSI).

Unit IV

Body composition of fish and shellfish: Influence of nutrients on body composition and flesh quality; Effect of rations on fecundity and egg quality.

Unit V

Feeding methods and devices: Broadcasting, bag feeding, tray feeding, Raft feeding, Demand feeder, Mechanical automatic feeder, Blower feeder, Check tray feed monitoring, Ration size/ feeding rate and feeding frequency, Restricted feeding and mixed feeding.

Unit VI

Feeding management: Application of research findings to farming situations, Record keeping, growth prediction and feeding management.

VI. Practical

Determination of feed intake in fry and fingerlings; Determination of nutrient requirements of fish/prawn using purified diet; Analysis of experimental data from growth study; Measures of protein quality (PER, NPU, BV); Exercise on feeding.

Course Contents
Ph.D in Fish Physiology and Biochemistry

I. Course Title : Advances in Fish Physiology
II. Course Code : FPB 601
III. Credit Hours : 2+1

IV. Aim of the course

To understand the advances in fish Physiology

V. Theory

Unit I

Cardio-vascular Physiology: Laws of Thermodynamics; Raoult's law; Partial pressure of oxygen and carbon dioxide in gas and blood; Blood pressure; Cardiac morphology and output; ECG; Environmental influences of fish Cardiovascular physiology; Cardiac plasticity in fish.

Unit II

Physiology of bimodal gas exchanges: Haemoglobin; structure and functions; Carbonic anhydrase and respiration; Oxygen sensing; Respiratory control, Concept of fluid dynamics across respiratory structures; Mechanism of gaseous exchange.

Unit III

Physiology of ion transport and excretion: Functional morphology of branchial ionocytes; Mechanism of ion transport and water balance, Osmo-sensing, Role of gut and Kidney in osmoregulation, Nitrogen excretion.

Unit IV

Understanding growth in fish: Myogenic cells and growth; Muscle satellite cells; muscle fibre dynamics, Genetic and environmental factors regulating muscle growth; Diversity and plasticity in muscle fiber.

Unit V

Reproduction and Fertility: Formation of eggs and spermatozoa; Vitellogenin: structure, Synthesis and transportation to oocytes; Egg envelop proteins; Gonadal steriodogenesis; Physiology of Fertilization; Mechanism of egg activation and endocrine disruption.

Unit VI

Reproductive biotechnology: Cryopreservation of milts/germ cells, Process of sex reversal; Development of surrogate brooders, Growth hormone, transgenesis in fish.

VI. Practical

Measurement of heart rate, ECG; Measurement of Osmolality of plasma and muscle, Techniques for examining of channel proteins under environmental conditions, Assay of reproductive steroids; Examination of progress of gonad maturity in fish; DNA/RNA ratio measurement as an indicator of growth parameter.

I. Course Title : Advances in Fish Biochemistry

II. Course Code : FPB 602

III. Credit Hours : 2+1

IV. Aim of the course

To understand advances in fish biochemistry.

V. Theory

Unit I

Saccharide chemistry: Significance of monosaccharides; Amino sugars, Acidic sugars, Glycosides, Sulfonated sugars; Oligosaccharides; Mannan oligosaccharide, Fructose oligosaccharide, Galactose oligosaccharide, Polysaccharides; Glycans, Glycogen, Mannan, Levan, Alginates, Chitin, Heparin, Keratin sulphate, Chitosan and hyaluronic acid, Carbohydrates of immunological importance.

Unit II

Lipid chemistry: Simple and complex lipids; Classification; Significance of fatty acid derivatives, Prostaglandins, Thromboxanes, Leukotrienes; Plasmalogens, Gangliosides, Sphingomyelin, Cerebrosides, Liposomes, Glycero-phospholipid metabolism, Lipids of clinical significance; Distribution patterns of lipids.

Unit III

Protein chemistry: Classification; Significance of glycoproteins, Lipoproteins, Protein folding, Trafficking and protein sequencing, Bioactive peptides; Chaperones, Heat shock proteins; Antifreeze proteins, Cytochrome P450, Metallothionenes, Immunoglobulins, Clinical proteomics, Proteins of clinical significance.

Unit IV

Nucleic acid chemistry: Classification; Types of DNA and RNA, Metabolic functions of nucleotides, Sense and antisense RNA, RNA interference; Cistron, Operon and transposon; RNA splicing, miRNA and lnRNA.

Unit V

Enzyme chemistry: Classification, Types of enzymes, Mechanisms of enzyme action, Enzyme kinetics, units of enzyme activity, Coenzymes, Co-factors and prosthetic groups, Enzymes of clinical significance.

Unit VI

Vitamin and mineral chemistry: Classification, Active forms of vitamins, Types of vitamins and essential minerals; Deficiency syndromes of vitamins and minerals; Clinical significance of vitamins and essential minerals.

VI. Practical

Extraction, purification and quantification of specific proteins by SDS-PAGE; Estimation of phytic acid, Estimation of fatty acids by GC-MS; Assay of metabolic enzymes. DNA and RNA isolation, Restriction digestion, amplification of DNA by PCR, analysis of amino acids and steroids. Assays of vitamins A and C.

I. Course Title : Climate Change and Physiology of Adaptation

II. Course Code : FPB 603

III. Credit Hours : 2+1

IV. Aim of the course

To understand environmental factors affecting fish physiology leading to adaptation.

V. Theory

Unit I

Basic concepts of global warming and climate change; concept of carbon credit

Unit II

Interaction of climate change with multiple stressors (Pesticides, salinity, starvation, hypoxia, disease, pH, water hardness, turbidity; microbial load) and its impacts on fish.

Unit III

Stress responses: Primary, Secondary and tertiary stress responses; General Adaptive Syndrome, Genetically based adaptation, Modulation of intermediary metabolic pathways.

Unit IV

Thermal adaptation mechanisms: Types of heat shock proteins, Anti-freeze proteins and their roles, Enzyme variants (Isozymes), Thermal limits; Thermal optima; Mechanism of thermal adaptations, Oxygen and capacity limited thermal tolerance; Adaptive changes in proteins.

Unit V

Global warming impacts: Habitat, reproductive performance; Embryonic and larval development; Growth; Osmoregulation; Cardiovascular functions, Thermal death, DNA decay.

Unit VI

Mitigation strategies: Cross protection through behavioural, Adaptational, Nutritional and Genetic intervention.

VI. Practical

Evaluation of stress markers; plasma cortisol level, glucose, HSP expression, HIF expression; Determination of oxygen consumption rates; Determination of temperature, salinity and hypoxia tolerance in fish.

I. Course Title : Analytical Biochemistry and Instrumentation

II. Course Code : FPB 604

III. Credit Hours : 1+2

IV. Aim of the course

To understand the principles and application of analytical instruments.

V. Theory

Unit I

Spectrophotometry: UV-visual, Fluorescent spectrophotometer, Infra-red, mass spectroscopy MALDI-TOF, ESI_TOF CD spectroscopy, NMR spectroscopy, X-ray crystallography, Atomic absorption spectroscopy, ICP-MS.

Unit II

Electrophoresis: Capillary, Vertical slab and horizontal electrophoresis, Immuno-electrophoresis, 2-D electrophoresis, Imaging: SEM, TEM.

Unit III

Chromatography: Paper, TLC; HP-TLC; LC-MS ion exchange, Molecular sieving, Affinity, FPLC, HPLC and Gas Chromatography, Sonication, Centrifugation techniques, ultracentrifugation.

Unit IV

Molecular techniques: Blotting (Southern, Northern, Western) techniques; Plasmid isolation and cloning; qRT-PCR.

VI. Practical

Quantitative estimation of metabolites and enzymes, purification of proteins from tissue samples, chromatographic separation and fractionation of proteins, characterization of proteins by Native PAGE, SDS- PAGE and 2D electrophoresis, Spectrophotometric estimation of fish protein, nucleic acids and glycogen; Enzyme assay from fish tissues; Molecular weight determination of fish protein by PAGE; Isolation of plasmid and genomic DNA, and amplification by PCR, cloning of gene in vectors, selection of recombinant and non –recombinant clones, Agarose gel electrophoresis; Southern and dot blotting; Fatty acid analysis by GCMS.

I. Course Title : Endocrinology

II. Course Code : FPB 605

III. Credit Hours : 2+1

IV. Aim of the course

To understand the endocrine functions in fish.

V. Theory

Unit I

Endocrine glands: Structure and functions of pituitary, Pineal, Thyroid, Ultimobranchial body, Corpuscles of Stannius, Gonads, Kidney, Adrenals, Urophysis.

Unit II

Mechanism of hormone action: Hormone receptors and signaling pathways.

Unit III

Hormones in calcium and Phosphorus homeostasis: Calcitonin, Stanniocalcin, Calcitriol, PTH- related peptide, Mechanism and interaction of PTH, Calcitonin and vitamin-D on Ca^{++} metabolism.

Unit IV

Hormones in growth, Digestion and colour change.

Unit V

Role of hormones in osmotic, Ionic regulation and adaptation, The Renin; angitensin system.

Unit VI

Reproductive hormones: Neuropeptides and hormones in regulating gonadotropins; Gonadal steroids and peptides, Prostaglandins, Adrenal steroids; Steroidogenesis

VI. Practical

Histological study of endocrine glands; *in vivo* demonstration of endocrine glands; estimation of vitamin D3; assay of steroid hormones; quantification of vitellogenin by ELISA. Analysis of expression of insulin growth factor-1 and IGFBP.

I. Course Title : Intermediary Metabolism

II. Course Code : FPB 606

III. Credit Hours : 2+1

IV. Aim of the course

To understand the intermediary metabolism of biomolecules.

V. Theory

Unit I

Scope and significance: Integration and regulation of lipid, Carbohydrate and protein metabolism in fishes.

Unit II

Lipid metabolism: Oxidation of fatty acids (SFA, MUFA, PUFA, HUFA); Biosynthesis of n-3 and n-6 fatty acids; Desaturases and elongases in freshwater fish; Biosynthesis of triglycerides, Phospholipids, Sphingolipids and cholesterol.

Unit III

Carbohydrate metabolism: Coordinated regulation of glycogen synthesis and breakdown; Enzymatic control of glycolysis; Feeder pathways for glycolysis; TCA cycle; Gluconeogenesis; pentose phosphate pathway; Electron transport chain.

Unit IV

Protein metabolism: Oxidative degradation of amino acids; Transamination and deamination; Biosynthesis of amino acids.

Unit V

Nucleic acid metabolism: Synthesis of deoxy and ribonucleotides; Uric acid production; Derivation of nucleotide groups of CoA, NAD, FAD from ATP.

Unit VI

Metabolomics, Proteomics, Transcriptomics; Nutrigenomics; Environmental metabolomics.

VI. Practical

Assay of mitochondrial and cytoplasmic enzymes, quantification of genes of metabolic pathways.

VII. Suggested Reading

- Sharma MK. 2013. *Biomolecules and Metabolic Activities*.

I. Course Title : Proteomics and Metabolomics

II. Course Code : FPB 607

III. Credit Hours : 1+1

IV. Aim of the course

To understand the emerging field of metabolomics.

V. Theory

Unit I

Introduction to Metabolomics and Proteomics: Functional and Structural Proteomics.

Unit II

Analytical methods: Separation and detection methods of proteins and metabolites; 2D-electrophoresis, mass spectrometry, Protein arrays HPLC, GC-MS.

Unit III

Experimental and computational methods: Databases, Genevestigator and OncoMine – browsing microarray-derived gene expression profiles.

Unit IV

Environmental Metabolomics: Nutrigenomics and metabolic health; Future challenges.

VI. Practical

Gene expression study of metabolic pathways, Cross feeding mechanism, 2D-electrophoresis, mass spectrometry, bio-informatics tools.

I. Course Title : Diagnostic Biochemistry and Physiology

II. Course Code : FPB 608

III. Credit Hours : 1+2

IV. Aim of the course

To monitor the systems that keep body functioning.

V. Theory

Unit I

Clinical Signs and sample collection: History, Clinical signs, Environmental conditions, Site history, Handling of animals, Sample collection, Methods of processing and preservation of samples; Fish Welfare Management; Fish welfare and emotions- functional aspects; Behavioural responsiveness; Fear; pain; Appetite, Satiety, Exercise, Metabolic shifts; Diet-gene interaction for fish welfare.

Unit II

Evaluation of cardiovascular and respiratory disorders: Partial pressures in gill and blood; Hb estimation, Blood CBC, RBC morphology, pH, Carbonic anhydrase, Blood gases: O_2, CO_2, HCO_3, H+; ECG; Doppler test; C-reactive protein; Gill morphology/pathology; oxygen exercise; Cardiovascular monitoring.

Unit III

Evaluation of homeostasis and Acid-base: Respiratory and metabolic acids, Their elimination; Blood osmolality, Chloride, Carbonic anhydrase, pH, Lactate, Ammonia; Kidney morphology.

Unit IV

Growth, reproductive and immunity disorders: Tissue DNA/RNA ratio; Metabolic enzyme profiles; Liver function tests; Appetite estimation; Hormone assay: Gonadotropins, Sex-steroids, cortisol, Blood enzymes: GOP, GPT, ALP, Glucose, CPK, LDH, Lactate, Albumin, Immunoglobin, AChE, Blood ammonia, Urea and creatinine; NH_4, NBT, Ovarian/liver biopsy, Blood CBC; Ultrasonography.

VI. Practical

Handling an sample collection; Tissue DNA/RNA; Hb estimation, RBC morphology, Blood pH and Carbonic anhydrase; Blodd gas analysis: O2, CO2, HCO3, H+; ECG; Ultra-sound, Blood osmolality, Chloride, lactate, ammonia, urea; Glycolytic enzymes; Liver function test, Blood enzymes: GOT, GPT, ALP, CPK, LDH, AChE, NBT, Immunoglobin, blood CBC, liver/ovary biopsy; ultrasonography.

I. Course Title : Macro and Micronutrient Nutrition

II. Course Code : FPB 609

III. Credit Hours : 2+1

IV. Aim of the course

To understand recent developments in macro and micro nutrient nutrition for fish and shellfish.

V. Theory

Unit I

Protein and aminoacids: Requirements, functional roles of aminoacids, Ideal protein concept, Nitrogen excretion, Aminoacidantagonism, Improving nitrogen retention, Dietary supply of synthetic aminoacids in different forms.

Unit II

Lipid and essential fatty acids: Functions and deficiencies, Fatty acid oxidation, Antioxidants, Role of phospholipids and steroids.

Unit III

Optimization of carbohydrates in diets: Strategies for improving carbohydrate utilization; Potential of exogenous enzymes, Solid state fermentation (SSF).

Unit IV

Micronutrients: Physiological roles and functions of vitamins and minerals; Forms of supply of minerals and vitamins, Deficiency symptoms.

Unit V

Recent developments in energy nutrition and feed additives: Recent advances in nutritional energetics and feed additives, Medicated feeds (farm-made and commercial), Regulations and certification of feed additives.

Unit VI

Designer fish production: Tailoring flesh quality, Food safety, Roles of nutrients and additives (fatty acids, antioxidants, drugs etc.), Flesh quality evaluation (colour, texture and sensory), Estimation of fatty acids, Aminoacids and minerals in ingredients, feeds and Flesh of fish and shrimp; Dietary effects on nitrogen excretion.

VI. Practical

Protein quality estimation (PER, NPU), Digestibility studies. Estimation of fatty acids and amino acids.

VI. Suggested Reading

I. Course Title : Feed Technology and Feed Mill Mangement

II. Course Code : FPB 610

III. Credit Hours : 2+1

IV. Aim of the course

To study the feed formulation techniques; design of feed mill and feed manufacturing; feed quality assurance and regulations.

V. Theory

Unit I

National and global scenario of feed ingredients and feed industry: Availability demand and supply; types of feeds, BIS and international standards for fish feed, overview of feed mill business.

Unit II

Feed formulation: Different methods of feed formulation, Use of feed formulation softwares; Nutritional and physical quality of feed ingredients; Importance of additives formulation of nutritionally balanced diet (amino acid, micronutrients).

Unit IV

Feed manufacturing process and control: Receiving of raw material, Grinding, Mixing, Conditioning, Pelleting /extrusion, Drying and cooling. coating/top dressing, Packaging and labelling, Factors affecting feed manufacture and stability of nutrients, Effects of processing on the nutritional value of feeds, Processing methods for non-compacting feed; Economics of feed manufacturing.

Unit III

Emerging new feed ingredients: Scope and exploration of new feed ingredients, Anti-nutritional factors and methods of detoxification (e-beam irradiation, solvent extractions, SSF, Protein concentrates/isolates, genetic improvement of plants etc.).

Unit V

Storage and quality control: Ingredient quality assurance, Feed processing quality assurance and processed feed quality assurance, Miscellaneous adventitious toxins and effect on feed safety; Storage of feed and quality deterioration, CGMPs and HACCP feed regulation, Feed transmitted bioterrorism and its implications.

Unit VI

Design of a feed mill unit: Layout, Feed mill design and safety of operation, Maintenance and record keeping.

VI. Practical

Analysis of anti-nutritional and toxic substances in feed ingredients and feed; Formulation of diets using software. Preparation of different types of feed and their quality evaluation; Effect of feed storage on nutritional value of feed, preparation of farm made feeds.

I. Course Title : Larval and Broodstock Nutrition

II. Course Code : FPB 611

III. Credit Hours : 2+1

IV. Aim of the course

To understand the role of nutrition in reproductive performance and larval development of fish and shellfish

V. Theory

Unit I

Embryonic and larval development: Nutritional profile of egg yolk and mechanism of egg yolk utilization, Degradation of egg yolk platelets and granules, Utilization of egg protein, Amino acid and lipid, Influence of abiotic factors on yolk absorption; Criteria for evaluation of early larval development.

Unit II

Larval digestive system: Ontogenesis of digestive systems, Digestion and absorption of protein and lipid, Mechanism of transition from endogenous to exogenous nutrition.

Unit III

Larval nutrition: Importance of live foods, Weaning diets and their importance in larval nutrition; Nutritional requirements and deficiency symptom, Nutritional status of larvae

Unit IV

Broodstock nutrition: Effect of nutrition on fecundity, Fertilization, Embryonic development and larval quality.

Unit V

Improving brood-stock performance: Special ingredients and specific nutrients for improving gonadal development and reproductive performance; Effective feeding periods for optimum brood-stock performance.

Unit VI

Feeding strategies: Manual, mechanical and automatic Feeding; feeding devices and strategies, Larval feeding behaviour and feed management.

VI. Practical

Preparation of larval feed, Nutritional profiling of egg yolk and larvae. Nutritional analysis of live food organisms, Estimation of proteases in larvae, Estimation of gonado-somatic index and fecundity.

Suggested Broad Areas for Master's and Doctoral Research

- Functional significance and mechanism of action of nutraceuticals /micronutrients
- Mechanistic studies with respect to drug delivery
- Pharmacokinetics and pharmacodynamics of functional molecules
- Osmoregulatory challenges in fish and shellfish with respect to altered environments
- Thermal tolerance in commercially important fishes
- Hypoxia tolerance in commercially important fishes
- Salinity tolerance in commercially important fishes
- Tolerance of nitrite of fish and shellfish

- Tolerance of ammonia in fish and shellfish and enhancing tolerance limits
- Interaction of nutrients and anti-nutrients on physiology of fishes
- Development of salinity tolerance in freshwater fishes for rearing in saline affected waters
- Rearing of marine economically important crustacea in low saline water
- Mineral fortification in inland saline water for aquaculture
- Multiple stressor interactions in fish
- Stress physiology during live transportation of fishes and their mitigation
- Waterless transportation of crustacean
- Waterless aquaculture for air breathing fishes
- Physiology of migration in commercially important migratory fishes
- Identifying physiological causes of retardation of growth in migratory fishes in captivity.
- Effect of climate change on fish physiology
- Ontogeny of gut in economically important fishes
- Physio-metabolic responses in fishes on feeding various macro and micro nutrients
- Factors affecting the immune system of fishes
- Interactions of stress and immunity
- Nanotoxicity in fishes and mitigation
- Endocrine disruption in fishes
- Effect of biotic and abiotic factors affecting brood stock and larval development
- Effect of endocrine disrupting compounds in sex determination in fishes
- Production of sterile fish
- Development of surrogate broods
- Sensor development for monitoring physiological distress
- Physio-metabolic response and pharmacodynamics of drugs administered in fishes
- Factors affecting molting frequency in crustacea
- Shell (Gastropod) selection and shell occupation behavior in hermit crab during adverse conditions
- Physiology of crab fattening
- Germ cell isolation and preservation for conservation of threatened/endangered aquatic animals
- Fish as a model for studying Systemic disorders in mammals.
- Development of chemoattractants
- Development of improved inducing systems for spawning aquatic animals
- Development of kits for assessing physiological status viz., maturity status, feeding and nutritional status
- Identifying molecular markers for assessing reproductive activity if fish and shellfish
- Development of In-vitro process of gametes maturation and ovulation.
- Development of in-vitro process for sperm production.
- Development of molecules for accelerating gonad maturity.
- Biochemical markers for evaluating purity of seed of fishes.
- Mitigation strategy of climate change effects through the nutritional intervention

ANNEXURE I

List of BSMA Committee Members for Fisheries Science-2020

(Ref: ICAR File No.7/6/2017 – EQR Dt: 04/04/2018)

Name	Address	Specialization
1. **Dr S. Felix** Vice Chancellor	Tamil Nadu Dr J. Jayalalithaa Fisheries University, Vetter River View Campus, Nagapattinam-611 002 felix@tnfu.ac.in Mobile No: 09443131025	Chairman
2. **Dr N. P Sahu** Dean	ICAR-Central Institute of Fisheries Education, Mumbai-400 061 npsahu@cife.edu.in npsahu1@rediffmail.com Mobile No: 09869120627	Convener
3. **Dr E J Jayaraj** Professor	Department of Aquaculture, College of Fisheries, Kankanady, Mangalore-575 002, Karnataka jayaettigi@yahoo.com jayaraj@fisheriesroundup.com Mobile: 09448033957	Aquaculture
4 **Dr Hukam Singh Dhaker** Dean	Faculty of Fisheries, Shirgaon, Ratnagiri, Maharashtra state, hukamsingh69@yahoo.com Mobile: 09421230257	Aquaculture
5 **Dr P. Jawahar Professor** Dean	Department of Fisheries Biology and Resource Management, Fisheries College and Research Institute, Thoothukudi-628 008, Tamil nadu jawaharphd@gmail.com Mobile: 09487078758	Fisheries Biology and Resource Management

Name	Address	Specialization
6 **Dr L.L. Sharma** Former Dean	College of Fisheries, Maharana Pratap University of Agriculture and Technology, Udaipur, Rajasthan Residential Address: PN-207,Road - 13, Ashok Nagar, Udaipur-313 001, Rajasthan llsharma.206@gmail.com Mobile: 09829230343	Aquatic Environment Management
7 **Dr Raman Kumar Trivedi** Professor	Department of Aquatic Environment Management, West Bengal University of Animal and Fishery Sciences, 37 & 68 Khudiram Bose Sarani, Kolkata, West Bengal-700 037 ramankumart@rediffmail.com Mobile: 09432491149	Aquatic Environment Management
8 **Dr J.J. Abraham** Professor	Department of Aquatic Animal Health Faculty of Fishery Sciences, West Bengal University of Animal and Fishery Sciences, Chakgaria, Kolkata-700 094, West Bengal abrahamtj1@gmail.com abrahamtj@yahoo.com Mobile: 09432206950 /09433368328	Aquatic Animal Health Management
9 **Dr S. Jahageerdar** Principal Scientist	Department of Fish Genetics and Biotechnology ICAR-Central Institute of Fisheries Education Panch Marg, off. Yari Road, Versova, Andheri West Mumbai, Maharashtra-400 061 jahageerdar@cife.edu.in jahageerdar@rediffmail.com jahageerdar@gmail.com Mobile: 09969300125	Fish Genetics and Biotechnology
10 **Dr K. Karl Marx** Professor	Directorate of Incubation and Vocational Training in Aquaculture (DIVA) ECR Muttukadu Chennai-603 112 kkmarx@gmail.com Mobile: 09444543858	Fisheries Biotechnology

Name		Address	Specialization
11	**Dr G. Sugumar** Professor	Directorate of Incubation and Vocational Training in Fisheries (DIVF) Mandapam Ramanathapuram-614 904 sukumar@tnfu.ac.in Mobile: 09443844820	Fish Processing Technology
12	**Dr M. Rajakumar** Professor	Department of Fisheries Extension Economics and Statistics Dr M.G.R. Fisheries College & Research Institute Tamil Nadu Dr J. Jayalalithaa Fisheries University Thalainayeru, Nagapattinam-611 002 Rajasaro@rediffmail.com Mobile: 09444232349	Fisheries Economics

Additional Technical Team

Name		Address	Specialization
1	**Dr S.A. Shanmugam** Dean (Basic Sciences)	Institute of Fisheries Postgraduate Studies OMR Campus, Vaniyanchavadi, Chennai-603 103. deanipgs@tnfu.ac.in shanmugam@tnfu.ac.in	Fisheries Microbiology & Fish Processing Technology
2	**Dr Sundaramoorthy** Dean	Fisheries College and Research Institute Tamil Nadu Dr J. Jayalalithaa Fisheries University Thoothukudi-628008 Tamil Nadu, India. deanfcrituty@tnfu.ac.in sundaramoorthy@tnfu.ac.in	Fishing Technology & Engineering
3	**Dr Sujath Kumar** Professor and Head	Dept. of Fisheries Extension, Economics and Statistics Fisheries College and Research Institute Tamil Nadu Dr J.Jayalalithaa Fisheries University Thoothukudi-628 008 sujathkumar@tnfu.ac.in	Fisheries Extension

Name		Address	Specialization

ANNEXURE II

Consultation Process
Members of BSMA (Fisheries Science)

Chairman

Dr S.Felix, Vice-Chancellor, TNJFU, Nagapattinam

Convener

Dr N.P.Sahu, Dean, ICAR-CIFE, Mumbai

Members

1. Dr E.J.Jayaraj, Professor,
   Dept. of Aquaculture, College of Fisheries, Mangalore
2. Dr P.Jawahar, Professor,
   Dept. of Fisheries Biology and Resource Management,
   Fisheries College and Research Institute, Thoothukudi
3. Dr L.L.Sharma, Former Dean,
   College of Fisheries, Maharana Pratap University of
   Agriculture and Technology, Udaipur, Rajasthan
4. Dr Raman Kumar Trivedi, Professor
   Department of Aquatic Environment Management,
   West Bengal University of Animal and Fishery Sciences
   Presently working as Director (Students Welfare), BASU,
   Patna, Bihar
5. Dr T.J.Abraham, Professor,
   Department of Aquatic Animal Health,
   West Bengal University of Animal and Fishery Sciences,
   Kolkata
6. Dr S.Jahageerdar, Principal Scientist,
   Department of Fish Genetics and Biotechnology,
   ICAR-CIFE, Mumbai
7. Dr K.Karal Marx, Dean
   Institute of Fisheries Postgraduate Studies,
   TNJFU, Chennai
8. Dr ShyamSundar Dana, Professor
   Department of Fisheries Extension,
   West Bengal University of Animal and Fishery Sciences, Kolkata
9. Dr M.Rajakumar, Professor,
   Department of Fisheries Extension, Economics & Statistics
   Fisheries College and Research Institute, Thoothukudi
10. Dr Human Singh Dhaker, Dean
    Faculty of Fisheries, Shirgaon, Ratnagiri, Maharashtra.
11. Dr G.Sugumar, Dean
    Fisheries College and Research Institute, Thoothukudi

The consultation process was completed after four consultations involving all the stake holders like faculties of different fisheries colleges of the country, scientists of the fisheries research institutes and scientists of other ICAR research institutes, industry personnels, entreprenuers, students, faculty from overseas universities and alumini. First, third and fourth meeting was conducted among the BSMA members, whereas the 2nd workshop was conducted at ICAR-CIFE, Mumbai by involving all the stake holders for in depth discussion for 2 days. The details are given below:

First Consultation (6th August 2020)

The first meeting of the BSMA (Fisheries Science) Committee was held at ARTP, Madhavaram Campus of Tamil Nadu Dr J.Jayalalithaa Fisheries University, Chennai on 06.08.2018. The first meeting was conducted among the members of BSMA to appraise all the points to be covered while preparing the syllabus revision. It was decided that all the members to take up the task seriously as revision of PG courses is usually conducted once in 10 years and hence members should prepare a curriculum that would stay relevant for the next 10 years giving scope for improving knowledge, skill, entrepreneurship, attitude, competence and confidence of the students. The following points were discussed during the interaction

- Introduction of technology-oriented courses
- Global approach
- Developing common nomenclature for courses with ARS orientation
- Number of PG disciplines.
- Timely completion of the task

Further discussions were held on the following issues:

- Faculty improvement
- New teaching methods
- Infrastructure sharing
- Improving employability
- Bringing all fisheries professionals under one umbrella
- 4T approach (Tradition, Technology, Talent and Trade) in the course curriculum
- Uniformity among all colleges in credit load, duration of Ph.D. course work, examination pattern, supporting and compulsory courses, plagiarism, grading system, etc.
- It was decided to enlist the fisheries colleges with the courses offered
- Lengthy discussion held on bringing the subjects under 5 major disciplines in line with agriculture and animal science
- Revision of syllabus for courses and changes on need basis – A minimum of 20% change in the existing syllabi and industry requirements should be considered.
- No constructive changes be made and all based on need and changes in the field
- Aspects on climate change shall be included in all areas wherever necessary
- UG subjects shall not be repeated in PG courses although some overlap may be allowed if found inevitable
- Molecular and genetic approach should be included
- Recent references should be consulted
- New titles and content development
- Further, one credit load was suggested to be based on 6-9 instructional classes and equals 3 units of syllabus – unitization be revised accordingly.
- The non-credit course (six credits in PG) shall be completed by ICT based open / online courses relevant to fisheries
- Internship may be tried for students in industries
- Regarding admission criteria, UGC guidelines be followed

Instruction to BSMA – subject experts:

- All subject experts are requested to contact their peers in fisheries colleges and research institutes to seek for suggestions and ideas of innovations for revision of syllabus concerned to their subjects

- Any novel and new ideas shall be shared among members of BSMA for adoption
- All experts are to come up with details of
  - New titles
  - New courses
  - Percentage of content revision
  - Need for content revision
- The above details are to be presented by individual member
- All should join in a whatsapp group for fast communication
- All the members should discuss within the group if some new idea clicks, so that all will do the needful if it is accepted.
- The course contents of Animal science may be consulted for churning out any new things to be added. The experts from the overseas universities may also be consulted. All the members should share the link for overseas contact.

2.Second consultation (workshop from 18-19 February, 2019)

The second workshop on "Syllabus Revision and Academic Reformation in Higher Fisheries Education" was conducted at ICAR-Central Institute of Fisheries Education, Versova, Mumbai during 18-19th February 2019. The main objective of this workshop is to prepare a uniform syllabus for Masters and Ph.D. courses all over the country and building the competent human resource in the field of Fisheries Science by making the post-graduate programs at par with the global standard of Fisheries higher education.

Expert from various institutes, especially State Agriculture Universities and other ICAR-research institutes and student representatives from various disciplines of CIFE were attended the workshop. Discipline wise discussion was held among 12 different groups. Each group was allotted with minimum of two external subject experts, faculties of particular discipline and a student representative nominated from the particular discipline. The forenoon session included discussion of addition, deletion or modification of MFSc syllabus and PhD syllabus was covered in the afternoon session.

The second day of the programme was started with the introduction by Dr N.P. Sahu, Dean (Academics), ICAR-CIFE & Convener, BSMA (Fisheries Science) and remarks by Dr S. Felix, Vice-Chancellor, TNFU & Chairman, BSMA (Fisheries Science). Dr C. Gopal, Member Sec., CAA, Chennai, Dr Sanu Jacob, Joint Director, Export Inspection Agency, Mumbai, Dr A.K. Pal, Ex-Joint Director, ICAR-CIFE & Representative from Industry, Mr. Raghavan Sampathkumar, Executive Director, CLEFMA, Mumbai, Sri Vellanki Ravi, President, Shrimp farmers Association of India and Sri Saji Chacku, Vice-president ABG Aquaculture Ltd, Billimora, Gujarat conveyed their remarks including role of industry in framing academic curriculum. Dr G. Venkateshwarlu, ADG-EQR, ICAR and BSMA Coordinator and Dr Gopal Krishna, Director & Vice Chancellor, ICAR-CIFE conveyed their notes and commented on the remarks made by invitees.

A discussion held after the invited talks for three hours emphasizing the importance of practical oriented schemes for students, lessening course work duration for PhD, removal of compulsory non-credit courses, industry internships, graduate assistantship, video classes, improvisation of student exchange programmes and fellowships, credit course by industry, Research Ethics Committee constitution, economical support for data collection and abstract or paper publications, provisions for training to the faculties and PhD students and the reducing number of disciplines etc.

Towards the end of the session BSMA members Dr E.G. Jayaraj, Dr P. Jawahar, Dr L.L. Sharma, Dr R. K. Trivedi, Dr T.J. Abraham, Dr S. Jahageerdar, Dr K. K. Marx, Dr S.S. Dana, Dr M. Rajakumar, Dr H.K. Dhaker, Dr G. Sugumar and Dr S. Dasgupta were presented the major changes made in the syllabus of each discipline. Dr S. Felix, Dr G. Venkateshwarlu and Dr Gopal Krishna were concluded the session by emphasizing the points discussed and Dr Rupam Sharma thanked the invitees, speakers and students.

Third consultation (6th May 2019)

3rd Consultation was held on 6 May 2019 at TNJFU, Chennai among the members of BSMA (Fisheries). This was the first meeting after major revision of the course curriculum to discuss the following points:

- Semester-wise break-up of courses along with credit hours
- Courses should be breakup under the heading Major, Minor and supporting, Seminar and Research
- There will be two and one semester course work for Master and Ph.D, respectively.
- Filed visit may be kept within the total credit (2 credit) for one month. This is only subject specific. If you feel, it is not required for your discipline may not be kept.
- The Contents under each course should be divided into units and it should be uniformly followed. For example, if a course is 1+0, total units should be 3, which should be covered with 18 classes. Similarly, for 2+1 the units should be 6, which should be covered with 36 classes and for 3+1, it should be 9 units and covered with 54 classes.
- Inclusion of some references and suggest names of books for each courses
- 2-3 objectives should be written for each course, justifying the inclusion of that course
- For framing the academic rules the academic guidelines developed by the Rani Laxmi Bai CAU, Jhansi should be considered as the base with some modification as deemed fit with the consent of core committee members.

Fourth Consultation (14 May 2019)

The DDG -Education organized this meeting at the ICAR complex, New Delhi to finalize the no. of Disciplines for the Fisheries Science. All the committee members along with the Chairman, the Convener and the ADG (Edun.) have attended this meeting.

The Chairman presented all the 15 Disciplines of Fisheries Science currently being offered by institutions in the country. After a long deliberations the DDG permitted to have 12 Disciplines for the BSMA – Fisheries Science which include the following:

i. Aquaculture
ii. Fisheries Resource Management
iii. Aquatic Environment Management
iv. Aquatic Animal Health Management
v. Fish Genetics and Breeding
vi. Fish Nutrition and Feed Technology
vii. Fish Processing Technology
viii. Fish Biotechnology
ix. Fishing Technology & Engineering
x. Fisheries Economics
xi. Fisheries Extension
xii. Fish Physiology and Biochemistry

Fifth consultation (22-23 September, 2019)

The fifth consultation was conducted at TNJFU, Chennai from 22 to 23 September, 2019 to give a final shape with limited members along with Chairman and Convener. The uniformity was checked for all the courses at one go along with some minor corrections. The final draft was ready after 2 days consultation, which was circulated among the members.

Foreword

THE ICAR has been continuously striving to bring necessary reforms for quality assurance in agricultural education. The Council has appointed National Core Group and BSMA Committees for revision and restructuring of Post-graduate and Doctoral syllabi in consultation with all the stakeholders to meet the challenges and harness opportunities in various disciplines of agriculture and allied sciences. It has been observed that a paradigm shift is necessary in academic regulations to comply with various provisions of National Education Policy-2020. It is heartening to note that the respective Committees have taken due care by following flexible, multi-disciplinary and holistic approach while developing the syllabus and academic regulations. The students are given opportunities to select the courses to support their planned research activities, to register for online courses and to pursue internship for development of entrepreneurship during Masters' programme. Further, the Teaching Assistantship has been introduced to provide experience to the Ph.D. scholars on teaching, evaluation and other related academic matters. This is an important part of doctoral training all over the world and it is expected to address the shortage of faculty in many institutions/universities. By intensive discussion with the subject experts and based on the feedback from the faculty and students, the syllabus of Masters' and Doctoral programmes in 79 disciplines was restructured and new courses were introduced. The syllabus has been revised suitably with the view to equip the students to gain knowledge, enhance their employability and skill sets to mould towards entrepreneurship and build themselves to prepare for global competitiveness. The opinions and suggestions invited from the concerned institutions, eminent scientists and other stakeholders were also reviewed by the Committees.

The Council sincerely thanks Dr Arvind Kumar, Chairman of the National Core Group and its members for the guidance to develop the syllabus in line with contemporary and projected national and global agricultural trends. The Council acknowledges the dedicated efforts and contribution of all the Chairpersons and members of 19 BSMA Committees for preparation of the syllabus. It gives me immense pleasure to express profuse thanks to the Agricultural Education Division for accomplishing this mammoth task under the guidance of Dr N.S. Rathore, former DDG and Dr R.C. Agrawal, DDG. I compliment Dr G. Venkateshwarlu, former ADG (EQR) for his sincere efforts and overall coordination of the meetings. Special thanks to DKMA for bringing out the entire syllabus in six volumes.

(T. Mohapatra)

Date: 13th August 2021
Place: New Delhi-110 001

Preface

THE curricula development is a part of the continued process and effort of the ICAR in this direction for dynamic improvement of national agricultural education system. In this resolve, the ICAR has constituted a National Core Group (NCG) for restructuring of Master's and Ph.D. curriculum, syllabi and academic regulations for the disciplines under agricultural sciences. On the recommendations of the NCG, 19 Broad Subject Matter Area (BSMA) Committees have been constituted by the ICAR for revising the syllabus. These Committees held discussions at length in the meetings and workshops organized across the country. The opinions and suggestions invited from institutions, eminent scientists and other stakeholders were also reviewed by the Committees. The respective BSMA Committees have examined the existing syllabus and analysed carefully in terms of content, relevance and pattern and then synthesized the new syllabus.

The revised curricula of 79 disciplines has been designed with a view to improve the existing syllabus and to make it more contextual and pertinent to cater the needs of students in terms of global competitiveness and employability. To mitigate the concerns related to agriculture education system in India and to ensure uniform system of education, several changes have been incorporated in common academic regulations in relation to credit load requirement and its distribution, system of examination, internship during Masters programme, provision to enrol for online courses and take the advantage of e-resources through e-learning and teaching assistantship for Ph.D. scholars. As per recommendations of the National Education Policy-2020, the courses have been categorized as Major and Minor/Optional courses. By following the spirit of Choice Based Credit System (CBCS), the students are given opportunity to select courses from any discipline/department enabling the multi-disciplinary approach.

We place on record our profound gratitude to Dr Trilochan Mohapatra, Director General, ICAR, New Delhi, for providing an opportunity to revise the syllabi for PG and Ph.D. programs in agriculture and allied sciences. The Committee is deeply indebted to Dr R.C. Agrawal, DDG (Agri. Edn), and to his predecessor Dr N.S. Rathore for their vision and continuous support. Our thanks are due to all Hon'ble Vice Chancellors of CAUs/SAUs/DUs for their unstinted support and to nominate the senior faculty from their universities/institutes to the workshops organized as a part of wider consultation process.

The revised syllabi encompass transformative changes by updating, augmenting, and revising course curricula and common academic regulations to achieve necessary quality and need-based agricultural education. Many existing courses were upgraded with addition and deletion as per the need of the present situation. The new courses have been incorporated based on their importance and need both at national and international level. We earnestly hope that this document will meet the needs and motivate different stakeholders.

G. Venkateshwarlu
Member-Secretary

Arvind Kumar
Chairman, National Core Group

Overview

A National Core Group has been constituted by ICAR for development of Academic Regulations for Masters and Ph.D. programmes, defining names and curricula of Masters' and Ph.D. disciplines for uniformity and revision of syllabi for courses of Masters' and Ph.D. degree disciplines. On the recommendations of the members of National Core Group, 19 Broad Subject Matter Area (BSMA) Committees have been constituted for revising the syllabus. These committees have conducted several meetings with the concerned experts and stakeholders and developed the syllabus for their respective subjects. While developing the syllabi, various provisions of National Education Policy-2020 have also been considered and complied to provide quality higher education and develop good, thoughtful, well-rounded, and creative individuals. Necessary provisions have been made in the curricula to enable an individual to study major and minor specialized areas of interest at a deep level, and also develop intellectual curiosity, scientific temper and creativity.

I express my gratefulness to Dr Arvind Kumar, Vice-Chancellor, Rani Lakshmi Bai Central Agricultural University, Jhansi and Chairman, National Core Group under whose guidance the syllabi for Master's and Doctoral programme is completed. His vast experience in agricultural education and research helped in finalising the syllabi. I wish to place on record the suggestions and directions shown by Dr N.S. Rathore, former Deputy Director General (Education) and Dr G. Venkateswarlu, ADG (EQR) and Member Secretary, National Core Group throughout the period without which the present target could not have been achieved. I am extremely thankful to 19 BSMA Committees for their stupendous job in restructuring and articulating curricula in the light of technological developments and employability prospects in agriculture and allied sciences. I also appreciate and acknowledge the efforts made by Dr S.K. Sankhyan, Principal Scientist (EQR), Dr S.K. Singh, Project Director (DKMA), Mr Punit Bhasin, Incharge, Production Unit (DKMA), Dr Kshitij Malhotra and Dr Sumit Saini, Research Associates to take up the work of editing, proof reading, finalizing and bringing out these six volumes of BSMA in this shape.

I also take this opportunity to express a deep sense of gratitude to Dr Trilochan Mohapatra, Secretary, DARE and Director General, ICAR for his guidance, cordial support and valuable input throughout the revision of the syllabus by BSMA, which helped in completing this task through various stages. The support and help extended by all Deputy Director Generals and the staff of Education Division is also greatly acknowledged.

During this comprehensive exercise of upgrading the course contents, the much-needed academic support, hospitality and participation rendered by Hon'ble Vice-Chancellors of CAUs/SAUs/DUs is greatly acknowledged. My deep sense of gratitude goes to Deans, Directors, Professors, Heads, faculty members and students at the universities who contributed by their effective participation and interaction.

R.C. Agrawal

Contents

Common Academic Regulations for PG and Ph.D. Programmes

1. Academic Year and Registration

- An academic year shall be normally from July to June of the following calendar year otherwise required under special situations. It shall be divided into two academic terms known as semesters. Dates of registration, commencement of instructions, semester end examination, end of semester and academic year, etc. The Academic Calendar shall be developed by the concerned University from time to time and notified accordingly by the Registrar in advance.
- An orientation programme shall be organized by the Director (Education)/ Dean PGS for the benefit of the newly admitted students immediately after commencement of the semester.
- On successful completion of a semester, the continuing students shall register for subsequent semester on the date specified in the Academic/ Semester Calendar or specifically notified separately. Every enrolled student shall be required to register at the beginning of each semester till the completion of his/ her degree programmes.

2. Credit requirements

2.1 Framework of the courses

The following nomenclature and Credit Hrs need to be followed while providing the

syllabus for all the disciplines:

		Masters' Programme	Doctoral Programme
(i)	**Course work**		
	Major courses	20	12
	Minor courses	08	06
	Supporting courses	06	05
	Common courses	05	–
	Seminar	01	02
(ii)	**Thesis Research**	30	75
	Total	70	100

Major courses: From the Discipline in which a student takes admission. Among the listed courses, the core courses compulsorily to be taken may be given *mark

Minor courses: From the subjects closely related to a student's major subject

Supporting courses: The subject not related to the major subject. It could be any subject considered relevant for student's research work (such as Statistical Methods, Design of Experiments, etc.) or necessary for building his/ her overallcompetence.

Common Courses: The following courses (one credit each) will be offered to all students undergoing Master's degree programme:

1. Library and Information Services
2. Technical Writing and Communications Skills
3. Intellectual Property and its management in Agriculture
4. Basic Concepts in Laboratory Techniques
5. Agricultural Research, Research Ethics and Rural Development Programmes

Some of these courses are already in the form of e-courses/ MOOCs. The students may be allowed to register these courses/ similar courses on these aspects, if available online on SWAYAM or any other platform. If a student has already completed any of these courses during UG, he/ she may be permitted to register for other related courses with the prior approval of the Head of Department (HoD)/ Board of Studies (BoS).

2.2 Supporting Courses

The following courses are being offered by various disciplines (The list is only indicative). Based on the requirement, any of the following courses may be opted under the supporting courses. The syllabi of these courses are available in the respective disciplines. If required, the contents may be modified to suit the individual discipline with approval of the concerned BoS:

Code	Course Title	Credit Hours
STAT 501	Mathematics for Applied Sciences	2+0
STAT 502	Statistical Methods for Applied Sciences	3+1

Course Code	Course Title	Credit Hours
STAT 511	Experimental Designs	2+1
STAT 512	Basic Sampling Techniques	2+1
STAT 521	Applied Regression Analysis	2+1
STAT 522	Data Analysis Using Statistical Packages	2+1
MCA 501	Computers Fundamentals and Programming	2+1
MCA 502	Computer Organization and Architecture	2+0
MCA 511	Introduction to Communication Technologies, Computer Networking and Internet	1+1
MCA 512	Information Technology in Agriculture	1+1
BIOCHEM 501	Basic Biochemistry	3+1
BIOCHEM 505	Techniques in Biochemistry	2+2

2.3 Syllabus of Common Courses for PG programmes

LIBRARY AND INFORMATION SERVICES (0+1)

Objective

To equip the library users with skills to trace information from libraries efficiently, to apprise them of information and knowledge resources, to carry out literature survey, to formulate information search strategies, and to use modern tools (Internet, OPAC, search engines, etc.) of information search.

Practical

Introduction to library and its services; Role of libraries in education, research and technology transfer; Classification systems and organization of library; Sources of information- Primary Sources, Secondary Sources and Tertiary Sources; Intricacies of abstracting and indexing services (Science Citation Index, Biological Abstracts, Chemical Abstracts, CABI Abstracts, etc.); Tracing information from reference sources; Literature survey; Citation techniques/ Preparation of bibliography; Use of CD-ROM Databases, Online Public Access Catalogue and other computerized library services; Use of Internet including search engines and its resources; e-resources access methods.

TECHNICAL WRITING AND COMMUNICATIONS SKILLS (0+1)

Objective

To equip the students/ scholars with skills to write dissertations, research papers, etc. To equip the students/ scholars with skills to communicate and articulate in English (verbal as well as writing).

Practical (Technical Writing)

- Various forms of scientific writings- theses, technical papers, reviews, manuals, etc.;
- Various parts of thesis and research communications (title page, authorship contents page, preface, introduction, review of literature, material and methods, experimental results and discussion);
- Writing of abstracts, summaries, précis, citations, etc.;

- Commonly used abbreviations in the theses and research communications;
- Illustrations, photographs and drawings with suitable captions; pagination, numbering of tables and illustrations;
- Writing of numbers and dates in scientific write-ups;
- Editing and proof-reading;
- Writing of a review article;
- Communication Skills - Grammar (Tenses, parts of speech, clauses, punctuation marks);
- Error analysis (Common errors), Concord, Collocation, Phonetic symbols and transcription;
- Accentual pattern: Weak forms in connected speech;
- Participation in group discussion;
- Facing an interview;
- Presentation of scientific papers.

INTELLECTUAL PROPERTY AND ITS MANAGEMENT IN AGRICULTURE (1+0)

Objective

The main objective of this course is to equip students and stakeholders with knowledge of Intellectual Property Rights (IPR) related protection systems, their significance and use of IPR as a tool for wealth and value creation in a knowledge-based economy.

Theory

Historical perspectives and need for the introduction of Intellectual Property Right regime; TRIPs and various provisions in TRIPS Agreement; Intellectual Property and Intellectual Property Rights (IPR), benefits of securing IPRs; Indian Legislations for the protection of various types of Intellectual Properties; Fundamentals of patents, copyrights, geographical indications, designs and layout, trade secrets and traditional knowledge, trademarks, protection of plant varieties and farmers' rights and biodiversity protection; Protectable subject matters, protection in biotechnology, protection of other biological materials, ownership and period of protection; National

Biodiversity protection initiatives; Convention on Biological Diversity; International Treaty on Plant Genetic Resources for Food and Agriculture; Licensing of technologies, Material transfer agreements, Research collaboration Agreement, License Agreement.

Suggested Readings

1. Erbisch FH and Maredia K.1998. *Intellectual Property Rights in Agricultural Biotechnology*. CABI.
2. Ganguli P. 2001. *Intellectual Property Rights: Unleashing Knowledge Economy*. McGraw-Hill.

BASIC CONCEPTS IN LABORATORY TECHNIQUES (0+1)

Objective

To acquaint the students about the basics of commonly used techniques in laboratory.

Practical

- Safety measures while in Lab;
- Handling of chemical substances;
- Use of burettes, pipettes, measuring cylinders, flasks, separatory funnel, condensers, micropipettes and vaccupets;
- Washing, drying and sterilization of glassware;
- Drying of solvents/ chemicals;
- Weighing and preparation of solutions of different strengths and their dilution;
- Handling techniques of solutions;
- Preparation of different agro-chemical doses in field and pot applications;
- Preparation of solutions of acids;
- Neutralisation of acid and bases;
- Preparation of buffers of different strengths and pH values;
- Use and handling of microscope, laminar flow, vacuum pumps, viscometer, thermometer, magnetic stirrer, micro-ovens, incubators, sandbath, waterbath, oilbath;
- Electric wiring and earthing;
- Preparation of media and methods of sterilization;
- Seed viability testing, testing of pollen viability;
- Tissue culture of crop plants;
- Description of flowering plants in botanical terms in relation to taxonomy.

Suggested Readings

1. Furr AK. 2000. *CRC Hand Book of Laboratory Safety*. CRC Press.

2. Gabb MH and Latchem WE. 1968. *A Handbook of Laboratory Solutions*. Chemical Publ. Co.

AGRICULTURAL RESEARCH, RESEARCH ETHICS AND RURAL DEVELOPMENT PROGRAMMES (1+0)

Objective

To enlighten the students about the organization and functioning of agricultural research systems at national and international levels, research ethics, and rural development programmes and policies of Government.

Theory

UNIT I History of agriculture in brief; Global agricultural research system: need, scope, opportunities; Role in promoting food security, reducing poverty and protecting the environment; National Agricultural Research Systems (NARS) and Regional Agricultural Research Institutions; Consultative Group on International Agricultural Research (CGIAR): International Agricultural Research Centres (IARC), partnership with NARS, role as a partner in the global agricultural research system, strengthening capacities at national and regional levels; International fellowships for scientific mobility.

UNIT II Research ethics: research integrity, research safety in laboratories, welfare of animals used in research, computer ethics, standards and problems in research ethics.

UNIT III Concept and connotations of rural development, rural development policies and strategies. Rural development programmes: Community Development Programme, Intensive Agricultural District Programme, Special group – Area Specific Programme, Integrated Rural Development Programme (IRDP) Panchayati Raj Institutions, Co-operatives, Voluntary Agencies/ Non-Governmental Organisations. Critical evaluation of rural development policies and programmes. Constraints in implementation of rural policies and programmes.

Suggested Readings

1. Bhalla GS and Singh G. 2001. *Indian Agriculture - Four Decades of Development*. Sage Publ.
2. Punia MS. *Manual on International Research and Research Ethics.* CCS Haryana Agricultural University, Hisar.
3. Rao BSV. 2007. *Rural Development Strategies and Role of Institutions - Issues, Innovations and Initiatives*. Mittal Publ.
4. Singh K. 1998. *Rural Development - Principles, Policies and Management*. Sage Publ.

2.4 Mandatory requirement of seminars

- It has been agreed to have mandatory seminars one in Masters (One Credit) and two in Doctoral programmes (two Credits).
- The students should be encouraged to make presentations on the latestdevelopments and literature in the area of research topic. This will provide training to the students on preparation for seminar, organizing the work, critical analysis of data and presentation skills.

3. Residential requirements

- The minimum and maximum duration of residential requirement for Masters'

Degree and Ph.D. Programmes shall be as follows:

P.G. Degree Programmes	Duration of Residential Requirement	
	Minimum	Maximum
Masters' Degree	2 Academic Years (4 Semesters)	5 Academic Years (10 Semesters)
Ph.D.*	3 Academic Years (6 Semesters)	7 Academic Years (14 Semesters)

*Student may be allowed to discontinue temporarily only after completion of course work

In case a student fails to complete the degree programme within the maximum duration of residential requirement, his/ her admission shall stand cancelled. The requirement shall be treated as satisfactory in the cases in which a student submits his/ her thesis any time during the 4^{th} and 6^{th} semester of his/ her residentship at the University for Masters' and Ph.D. programme, respectively.

4. Evaluation of course work and comprehensive examination

- For M.Sc., multiple levels of evaluation (First Test, Midterm and Final semester) is desirable. However, it has been felt that the comprehensive examination is redundant for M.Sc. students.
- For Ph.D., the approach should be research oriented rather than exam oriented. In order to provide the student adequate time to concentrate on the research work and complete the degree in stipulated time, the examination may have to be only semester final. However, the course teacher may be given freedom to evaluate in terms of assignment/ seminar/ first test.
- For Ph.D., the comprehensive examination (Pre-qualifying examination) is required. As the students are already tested in course examinations, the comprehensive examinationshould be based onoral examinationby an external expert and the evaluation should cover both the research problem and theoretical background to execute the project. This shall assess the aptitude of the student and suitability of the student for the given research topic. The successful completion of comprehensive examination is to obtain the "Satisfactory" remark by the external expert.

5. Advisory System

5.1 Advisory Committee

- There shall be an Advisory Committee for every student consisting of not fewer than three members in the case of a candidate for Masters' degree and four in the case of Ph.D. degree with the Advisor as Chairperson. The Advisory Committee should have representatives from the major and minor fields amongst the members of the Post-graduate faculty accredited for appropriate P.G. level research. However, in those departments where qualified staff exists but due to unavoidable reasons Post-graduate degree programmes are not existing, the staff having Post-graduate teaching experience of two years or more may be included in the Advisory Committee as member representing the minor.
- At any given time, a P.G. teacher shall not be a Chairperson, Advisory Committee (including Master's and Ph.D. programmes) for more than five students.

- The Advisor should convene a meeting of the Advisory Committee at least once in a Semester. The summary record should be communicated to the Head of Department, Dean of the College of concerned, Director (Education)/ Dean PGS and Registrar for information.

Advisor/ Co-guide/ Member, Advisory Committee from other collaborating University/ Institute/ Organization

- In order to promote quality Post-graduate research and training in cutting edge areas, the University may enter into Memorandum of Understanding (MOU) with other Universities/ Institutions for conducting research. While constituting an Advisory Committee of a student, if the Chairperson, Advisory Committee feels the requirement of involving of a faculty member/ scientist of such partnering university/ Institute/ Organization, he/ she may send a proposal to this effect to Director (Education)/ Dean PGS along with the proposal for consideration of Student's Advisory Committee (SAC).
- The proposed faculty member from the partnering institution can be allowed to act as Chairperson/ Co-guide/ Member, SAC, by mutual consent, primarily on the basis of intellectual input and time devoted for carrying out the research work at the particular institution. The faculty member/ scientist of partnering institutions in the SAC shall become a temporary faculty member of the University by following the procedure approved by the Academic Council.

Allotment of students to the retiring persons

Normally, retiring person may not be allotted M. Sc. Student if he/ she is left with less than 2 years of service and Ph.D. student if left with less than 3 years of service. However, in special circumstances, permission may be obtained from the Director (Education)/ Dean PGS, after due recommendation by the concerned Head of the Department.

Changes in the Advisory Committee:

(i) Change of the Chairperson or any member of the Advisory Committee is not ordinarily permissible. However, in exceptional cases, the change may be effected with due approval of the Director of Education/ Dean PGS.

(ii) Normally, staff members of the university on extra ordinary leave or on study leave or who leave the University service will cease to continue to serve as advisors of the Post-graduate students of the University. However, the Director (Education)/ Dean PGS may permit them to continue to serve as advisor subject to the following conditions:

   (a) The concerned staff member must be resident in India and if he/ she agrees to guide research and must be available for occasional consultations;

   (b) An application is made by the student concerned duly supported by the Advisory Committee;

   (c) In case of a Ph.D. student, he/ she must have completed his/ her comprehensive examinations and the research work must be well in progress and it is expected that the student will submit the thesis within a year;

   (d) The Head of the Department and the Dean of the College concerned agree to the proposal;

(e) The staff member, after leaving the University service is granted the status of honorary faculty's membership by the Vice-Chancellor on the recommendation of the Director (Education)/ Dean PGS for guiding as Chairperson or Member, Advisory Committee the thesis/ theses of the student(s) concerned only.

(iii) In case the Chairperson/ member of a Student's Advisory Committee retires, he/ she shall be allowed to continue provided that the student has completed his course work and minimum of 10 research credits and the retiring Chairperson/ member stays at the Headquarters of the College, till the thesis is submitted.

(iv) If the Chairperson/ member proceeds on deputation to another organization, he/ she may be permitted to guide the student provided his/ her new organization is at the Headquarters of the College and his/ her organization is willing for the same.

(v) The change shall be communicated to all concerned by the Head of Department.

6. Evaluation of research work

- It is highly desirablefor Ph.D. programme and this should be done annually as an essential part of research evaluation. The Student Advisory Committee shallreview the progress of research and scrutinize annual progress reports submitted by the student.
- Midterm evaluation of Ph.D. (to move from JRF to SRF) is a mandatory requirement for all the funding agencies. Hence, the second review of annual progress report need to be done after completion of two years. The successful completion enables the students to become eligible for SRF.

6.1 Prevention of plagiarism

- An institutional mechanism should be in place to check the plagiarism. The students must be made aware that manipulation of the data/ plagiarism is punishable with serious consequences.

7. Learning through online courses

- In line with the suggestion in new education policy and the initiatives taken by ICAR and MHRD in the form of e-courses, MOOCs, SWAYAM, etc. and also changes taking place globally in respect of learning through online resources it has been agreed to permit the students to enrol for online courses. It is expected that the provision of integrating available online courses with the traditional system of education would provide the students opportunities to improve their employability by imbibing the additional skills and competitive edge.

The Committee recommends the following points while integrating the online courses:

1. Board of Studies (BoS) of each Faculty shall identify available online courses and a student may select from the listed courses. The interested students may provide the details of the on-line courses to the BoS for its consideration.
2. A Postgraduate student may take up to a maximum of 20% credits in a semester through online learning resources.
3. The host institute offering the course does the evaluation and provide marks/ grades. The BoS shall develop the conversion formula for calculation of GPA and it may do appropriate checks on delivery methods and do additional evaluations, if needed.

8. Internship during Masters programme

Internship for Development of Entrepreneurship in Agriculture (IDEA)

Currently, a provision of 30 credits for dissertation work in M.Sc./ M.Tech/ M.F.Sc./ M.V.Sc. programmes helps practically only those students who aspire to pursue their career in academic/ research. There is hardly any opportunity/ provision under this system to enhance the entrepreneurship skills of those students who could start their own enterprise or have adequate skills to join the industry. Therefore, in order to overcome this gap, an optional internship/ in-plant training (called as IDEA) in lieu of thesis/ research work is recommended which will give the students an opportunity to have a real-time hands-on experience in the industry.

It is envisaged that the internship/ in-plant training would enhance the interactions between academic organizations and the relevant industry. It would not only enable the development of highly learned and skilled manpower to start their-own enterprises but also the industry would also be benefitted through this process. This pragmatic approach would definitely result in enhancedpartnerships between academia and industry.

The main objectives of the programme:

1. To promote the linkages between academia and industry
2. To establish newer University – Cooperative R&D together with industry for knowledge creation, research and commercialization
3. Collaboration between Universities and industries through pilot projects
4. To develop methods for knowledge transfer, innovation and networking potential
5. To enhance skill, career development and employability

Following criteria for IDEA will be taken into consideration:

- At any point of time there will not be more than 50% of students who can opt under IDEA
- Major Advisor will be from Academia and Co-advisor (or Advisory Committee member) from industry
- Total credits (30) will be divided into 20 for internship/ in-plant training and10 for writing the report followed by viva-voce similar to dissertation
- Work place will be industry; however, academic/ research support would be provided by the University or both. MoU may be developed accordingly
- The IPR, if any, would be as per the University policy

9. Teaching assistantship

- Teaching assistantship shall be encouraged. This will give the required experience to the students on how to conduct courses, practical classes, evaluation and other related academic matters. This is an important part of Ph.D. training all over the world and it is expected to address the shortage of faculty in many institutions/ universities.
- The fulltime doctoral students of the University with or without fellowship may be considered for award of Teaching Assistantships in their respective Departments. The Teaching Assistantship shall be offered only to those doctoral students who have successfully finished their course work. Any consideration for award of Teaching Assistantships must have the consent ofthe supervisor concerned.
- Teaching Assistantships shall be awarded on semester to semester basis on the recommendation of a screening/ selection committee to be constituted by the

ViceChancellor. All classes and assignments given to the Teaching Assistants, including tutorials, practicals and evaluation work shall be under the supervision of a faculty member who would have otherwise handled the course/ assignment.

- Each Ph.D. student may be allowed to take a maximum of 16 classes in a month to UG/ Masters students.
- No additional remuneration shall be paid to the students who are awarded ICAR JRF/ SRF. The amount of fellowship to be paid as remuneration to other students (who are receiving any other fellowship or without any fellowships) may be decided by the concerned universities as per the rules in force.However, the total amount of remuneration/ and fellowship shall not exceed the amount being paid as JRF/ SRF of ICAR.
- At the end of each term, Teaching Assistants shall be given a certificate by the concerned Head of the Department, countersigned by the School Dean, specifying the nature and load of assignments completed.

10. Registration of project personnel (SRF/ RA) for Ph.D.

- A provision may be made to enable the project personnel (SRF/ RA) to register for Ph.D. However, this can be done only if they are selected based on some selection process such as walk-in-interview. The prior approval of PI of the project is mandatory to consider the application of project personnel (SRF/ RA) for Ph.D. admission
- The candidates need to submit the declaration stating that the project work shall not be compromised because of Ph.D. programme. Further, in order to justify the project work and Ph.D. programme, the number of course credits should not be more than 8 in a semester for the project personnel (SRF/ RA) who intend to register for Ph.D.

11. Compliance with the National Education Policy-2020

- While implementing the course structure and contents recommended by the BSMA Committees, the Higher Education Institutions (HEIs) are required to comply with the provisions of National Education Policy-2020, especially the following aspects:
- Given the 21st century requirements, quality higher education must aim to develop good, thoughtful, well-rounded, and creative individuals. It must enable an individual to study one or more specialized areas of interest at a deep level, and also develop character, ethical and Constitutional values, intellectual curiosity, scientific temper, creativity, spirit of service, and 21st century capabilities across a range of disciplines including sciences, social sciences, arts, humanities, languages, as well as professional, technical, and vocational subjects. A quality higher education must enable personal accomplishment and enlightenment, constructive public engagement, and productive contribution to the society. It must prepare students for more meaningful and satisfying lives and work roles and enable economic independence (9.1.1. of NEP-2020).
- At the societal level, higher education must enable the development of an enlightened, socially conscious, knowledgeable, and skilled nation that can find and implement robust solutions to its own problems. Higher education must form the basis for knowledge creation and innovation thereby contributing to a growing national economy. The purpose of quality higher education is, therefore, more than the creation of greater opportunities for individual employment. It represents the key to more vibrant, socially engaged, cooperative communities and a happier,

cohesive, cultured, productive, innovative, progressive, and prosperous nation (9.1.3. of NEP-2020).

- Flexibility in curriculum and novel and engaging course options will be on offer to students, in addition to rigorous specialization in a subject or subjects. This will be encouraged by increased faculty and institutional autonomy in setting curricula. Pedagogy will have an increased emphasis on communication, discussion, debate, research, and opportunities for cross-disciplinary and interdisciplinary thinking (11.6 of NEP-2020).
- As part of a holistic education, students at all HEIs will be provided with opportunities for internships with local industry, businesses, artists, crafts persons, etc., as well as research internships with faculty and researchers at their own or other HEIs/ research institutions, so that students may actively engage with the practical side of their learning and, as a by-product, further improve their employability (11.8 of NEP-2020).
- HEIs will focus on research and innovation by setting up start-up incubation centres; technology development centres; centres in frontier areas of research; greater industry-academic linkages; and interdisciplinary research including humanities and social sciences research (11.12. of NEP-2020).
- Effective learning requires a comprehensive approach that involves appropriate curriculum, engaging pedagogy, continuous formative assessment, and adequate student support. The curriculum must be interesting and relevant, and updated regularly to align with the latest knowledge requirements and to meet specified learning outcomes. High-quality pedagogy is then necessary to successfully impart the curricular material to students; pedagogical practices determine the learning experiences that are provided to students, thus directly influencing learning outcomes. The assessment methods must be scientific, designed to continuously improve learning and test the application of knowledge. Last but not least, the development of capacities that promote student wellness such as fitness, good health, psycho-social well-being, and sound ethical grounding are also critical for high-quality learning (12.1. of NEP-2020).

Definitions of Academic Terms

Chairperson means a teacher of the major discipline proposed by the Head of Department through the Dean of the College and duly approved by the Director of Education/ Dean Post Graduate Studies (or as per the procedure laid down in the concerned University regulations) to act as the Chairperson of the Advisory Committee and also to guide the student on academic issues.

Course means a unit of instruction in a discipline carrying a specific number and credits to be covered in a semester as laid down in detail in the syllabus of a degree programme.

Credit means the unit of work load per week for a particular course in theory and/ or practical. One credit of theory means one class of one clock hour duration and one credit practical means one class of minimum two clock hoursof laboratory work per week.

Credit load of a student refers to the total number of credits of all the courses he/ she registers during a particular semester.

Grade Point (GP) of a course is a measure of performance. It is obtained by dividing the per cent mark secured by a student in a particular course by 10, expressed and rounded off to second decimal place.

Credit Point (CP) refers to the Grade point multiplied by the number of credits of the course, expressed and rounded off to second decimal place.

Grade Point Average (GPA) means the total credit point earned by a student divided by total number of credits of all the courses registered in a semester, expressed and rounded off to second decimal place.

Cumulative Grade Point Average (CGPA) means the total credit points earned by a student divided by the total number of credits registered by the student until the end of a semester (all completed semesters), expressed and rounded off to second decimal place.

Overall Grade Point Average (OGPA) means the total credit points earned by a student in the entire degree programme divided by the total number of credits required for the P.G. degree, expressed and rounded off to second decimal place.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 6

Community Science
– Apparel and Textile Science

Preamble
(Apparel and Textile Science)

The field of Apparel and textiles is multidisciplinary with holistic approach to education. It is a combination of science, technology, fine arts, fashion, innovation, creative skills, soft skills, management, consumer education and many more. It provides trained personnel to the textile and apparel industry which accounts for 30% of the total employment generated in the country and 12% of the country's export earnings. It is imperative to develop skills in students so that they can cope with the present needs of textile and apparel industry and build career in the industry. The hands on trainings are necessary to implement the ideas and acquire the practical knowledge, which ultimately helps to implement the theoretical aspects into practical work. Keeping this in mind the course curricula of ATS is modified as per present needs.

The curriculum includes major, minor, supporting and compulsory courses which will strengthen the knowledge of the students both theoretically as well as practically. The students will be equipped with knowledge in apparel, textile chemistry, woven textile designing, Computer Aided Textile and Apparel Designing, Textile and Apparel Industrial Management, Historical Costumes, Textile Ecology (eco- friendly, natural clothing), Colour Application, Textile Conservation, Operational Management in Textiles and Apparels. The textile courses will focus on understanding the textile chemistry behind manufacturing, colouring and conservation of textiles. The apparel courses will highlight the designing using CAD application, fashion marketing and merchandising as well as socio- psycho aspects and revival of traditional costumes which reflects the culture of any country.

New subjects of current importance such as Textile and Apparel Product Development, Operation Management in Textiles and Apparels, Sustainability in Textile and Apparel Industry are introduced for brightening the career of the students and entreprise development. Students acquire advanced skills in all fields of apparel and textiles that increase their confidence to take up entrepreneurial activities online with the National policy on education 2020.

The Members of BSMA Community Science are thankful to faculty of different SAU's who have taken pains to share their experiences in the field and hope that the curriculum will be helpful for the PG students to learn, teach and undertake entrepreneurial activities which will fulfill the ever expanding requirements of Apparel and Textile industry, not only in India but abroad also.

Modifications Suggested in Courses in the Revised Curricula

M.Sc. (Community Science) Apparel and Textile Science

Course Code	Course Title	Credit Hours	Remarks
	Core Courses (20 Credits)		
*ATS 501	Textile Chemistry	3(2+1)	Content updated
*ATS 502	Textile and Apparel Quality Analysis	3(2+1)	Two courses Merged
*ATS 503	Pattern Making and Draping	3(1+2)	Two courses Merged
*ATS 504	Woven Textile Design	3(2+1)	Content Modified
ATS 505	Wet Processing of Textiles	3(2+1)	Title changed
ATS 506	Computer Aided Textile and Apparel Designing	2(0+2)	
ATS 507	Textile and Apparel Industrial Management	3(3+0)	Content Modified
ATS 508	Historic Textiles and Costumes	2(1+1)	Content Modified
ATS 509	Textile Auxiliaries	3(2+1)	
ATS 510	Socio Psychological Aspects of Clothing	2(2+0)	
ATS 511	Sustainability in Textile and Apparel Industry	2(2+0)	New course
ATS 512	Textile and Apparel Product Development	2(1+1)	New course
ATS 513	Laboratory Techniques in Textile Research	2(0+2)	New course
ATS 514	Special Project	1(0+1)	
	Minor Courses (08 Credits)		
FN 505	Nutrition and Physical fitness	3(2+1)	Minor Courses
FN 509	Food safety and Standards	3(2+1)	may be selected
FN 513	Human Physiology	3(3+0)	from subjects
EECM 502	Development communication	3(2+1)	closely related to a
EECM 505	Dynamic communication skills	2(0+2)	student's major
EECM 507	Organisational development and HRD	2(1+1)	subject. Apart from these
EECM511	Climate change management	2(1+1)	courses, a student
HDFS 503	Methods and techniques of assessment in human development	3(2+1)	can register any course offered by

Course Code	Course Title	Credit Hours	Remarks
HDFS 506	Management of differently abled	3(2+1)	any other department
	Supporting Courses (06 Credits)		
	Research Methodology	3(2+1)	Course numbers will be assigned by the departments that offer these courses.
	Statistical methods and application	3(2+1)	
	Common Courses (05 Credits)		
	Library and Information Services	1(0+1)	Common to all disciplines. The course numbers will be assigned by the departments that offer these courses
	Technical Writing and Communications Skills	1(0+1)	
	Intellectual Property and its management in Agriculture	1(0+1)	
	Basic Concepts in Laboratory Techniques	1(0+1)	
	Agricultural Research, Research Ethics and Rural Development Programmes	1(0+1)	
ATS 591	Seminar	1(1+0)	
ATS 599	**Thesis/ Research**	**30**	Increased credits for Research
	Total	**70**	

*Core courses/ compulsory courses

Ph.D. (Community Science) Apparel and Textile Science

Course Code	Course Title	Credit Hours	Remarks
	Major Courses (12 Credits)		
*ATS 601	Textile Ecology	2(2+0)	
*ATS 602	Technical Textiles	3(2+1)	Modified
ATS 603	Technological Developments in Textiles and Apparel	2(2+0)	
ATS 604	Colour Application in Textiles	2(1+1)	Content updated
*ATS 605	Functional Clothing	3(2+1)	

Course Code	Course Title	Credit Hours	Remarks
ATS 606	Textile Conservation	2(1+1)	Modified
ATS 607	Operational Management in Textiles and Apparel	2(2+0)	New
ATS 608	Technology of Nonwovens	2(2+0)	
ATS 609	Special Project	2(0+2)	
	Minor Courses (06 Credits)		
CS/PGS 601	Research and Publication Ethics	2(1+1)	Minor Courses may be selected from subjects closely related to a student's major subject. Apart from these courses, a student can register any course offered by any other department
FN604	Global Nutrition Problems	2(2+0)	
FN 608	Energy Metabolism	2(2+0)	
EECM 602	Impact Assessment of Development Programmes	3(1+2)	
EECM 603	Scaling Techniques for Behavioural Research	3(1+2)	
EECM 607	Media application and product promotion	4(2+2)	
HDFS 608	Qualitative research methods	3(2+1)	
RMCS 603	Globalization and Consumer Economics	3 (2+1)	
RMCS 606	Environmental Issues and Challenges	2 (2+0)	
RMCS 607	Family Dynamics and Women Power	3 (2+1)	

Supporting Courses (05 Credits)

A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM portal or other online courses up to a maximum of 5 credits.

ATS 691	Doctoral Seminar I (Major Field)	1(1+0)	
ATS 692	Doctoral Seminar II (Minor Field)	1(1+0)	
ATS 699	**Research**	**75**	Increased credits for Research
	Total	**100 Credits**

*Core courses/ compulsory courses; **Apart from the courses listed under minor courses, the student may opt courses from any other department related to the research undertaken.

Course Contents
M.Sc. in Apparel and Textile Science

I. Course Title : Textile Chemistry

II. Course Code : ATS 501

III. Credit Hours : 3(2+1)

IV. Rationale

Fabrics made of different textile fibres exhibit varied properties. It is imperative to understand the structure and polymer content of the fibres. The reactions of these fibre polymers to different chemicals, finishing agents, dyes and other biological conditions provide an understanding for further processing and care of fabrics.

V. Aim of the course

- To provide knowledge on polymers and their molecular structure
- It provides understanding of the structure – property relations of textile fibres.
- To equip students to identify and evaluate different fibres and their performance.

VI. Theory

Unit I: Chemistry of polymers

Polymerization- types, degree and characteristics; Structure of textile fibres-molecular bonding, length, orientation; Requirements of fibre forming polymers; Bi-component and Bi-constituent fibres- types, characteristics, application and spinning (fibre forming systems)

Unit II: Structure-property relations of natural fibres

Repeating units, bonds, reactive groups; Reactions of cotton, linen, jute, silk, wool, and minor natural fibres to, heat, light, various chemicals and microorganisms.

Unit III: Structure-property relations of Man-made and Synthetic fibres

Repeating units, bonds, reactive groups and reactions of viscose rayon, modal (HWM), polyester, nylon, acrylic, spandex to heat, light, various chemicals and microorganisms; Fibre Blending- principles, types and scope.

Unit IV: Introduction to high performance fibres

Aramid, Ultra-High Molecular Weight Polyethylene (UHMWPE), High Density Polyethylene (HDPE), Carbon, Fibres with Limited Oxygen Index (LOI), Glass and Special fibres.

VII. Practicals

- Preparation of chemical solutions for fibre testing.
- Fibre testing – Natural fibres- cross sectional view of cotton, Jute, Linen, Wool and Silk.
- Cross sectional view of Man-made fibres – Viscose, polyester, acrylic and minor fibres.
- Effect of heat on cellulosic, protein and synthetic fibres.
- Effect of dilute and conc acids on cellulosic, protein and synthetic fibres.

- Effect of dilute and conc alkali on cellulosic, protein and synthetic fibres.
- Detection of acid damage on Cotton.
- Mercerization of cotton fibres and yarns- with and without tension.
- Effect of bleaching on textile fibres – Detection of damage due to over bleaching.
- Effect of finishing agents and solvents on cellulosic, protein and synthetic fibres.
- Detection of damage to cellulosic and protein fibres by acids and alkalies.
- Quantitative analysis of binary fibre blends.
- Conditioning and estimation of fibre blend ratio.
- Quantitative analysis of tertiary fibre blends.
- Conditioning and estimation of fibre blend ratio.
- End term Assessment.

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Demonstrations
- Customised testing
- Group Work

IX. Learning Outcome

After successful completion of this course, the students can:

- Differentiate the fibres based on the chemistry of polymers and fiber structures
- Analyse the properties of fibres based on their structure
- Get acquainted with the recent developments in fibres and finishing
- Understand the performance of blends

Weekly Lecture Schedule

Duration (week)	Topics
1	Polymerization- types, degree and characteristics
2-3	Structure of textile fibres- molecular bonding, length, orientation
4	Requirements of fibre forming polymers
5	Bi-component and Bi-constituent fibres- types, characteristics, application and spinning

Duration (week)	Topics
6	Repeating units, bonds, reactive groups and reactions of cotton, linen, jute, silk, wool, and minor natural fibres to various chemicals, heat, light and microorganisms
7	Repeating units, bonds, reactive groups and reactions of Linen and jute to various chemicals, heat, light and microorganisms
8	Repeating units, bonds, reactive groups and reactions of silk and Wool to various chemicals, heat, light and microorganisms
9	Repeating units, bonds, reactive groups and reactions of minor natural fibres to various chemicals, heat, light and microorganisms
10	Repeating units, bonds, reactive groups and reactions of Rayon and Modal fibres to various chemicals, heat, light and microorganisms
11	Repeating units, bonds, reactive groups and reactions of nylon and Polyester fibres to various chemicals, heat, light and microorganisms
12	Repeating units, bonds, reactive groups and reactions of Acrylic and Spandex fibres to various chemicals, heat, light and microorganisms
13	Aramid, Ultra-High Molecular Weight Polyethylene (UHMWPE)
14	High Density Polyethylene (HDPE) and Carbon fibres
15	Fibres with Limited Oxygen Index (LOI)
16	Glass and Specialty fibres

I. Course Title : Textile and Apparel Quality Analysis

II. Course Code : ATS 502

III. Credit Hours : 3 (2+1)

IV. Rationale

Textiles of different varieties are available in the market, the quality and price of which range from low to high. The consumer is in great confusion to select fabrics for their end-use performance. Textile industries need to check the quality of fibre raw material used for making customised quality of the final product such as yarn in case of spinning or fabric in case of knitting or weaving. Fabric quality is paramount in predicting the garment performance.

V. Aim of the course

- To familiarise the students with the methods and techniques used to analyze textile fibres, yarns and fabrics for end-use performance.
- To acquaint the students with principles, test methods of different testing equipment and the internationally accepted textile and apparel quality standards.
- To equip the students to analyze and interpret the results and predict the quality of textile and apparel.

VI. Theory

Unit I: Quality analysis and control

Importance of quality analysis and control; Effect of moisture and humidity on properties of textiles; Standard conditions of testing; Sampling – methods and techniques for fibre, yarn and fabric

Unit II: Fibre and yarn testing

Fibre testing - length, linear density, maturity and strength; Yarn testing – yarn count, single and lea strength, twist, crimp and evenness.

Unit III: Fabric testing

Fabric testing – Geometrical properties - thread count, weight, thickness, strength - breaking, tearing and bursting; Abrasion resistance, pilling, crease recovery, stiffness, drapability, air permeability, thermal properties, flammability, water absorbency and repellency, dimensional stability, colour fastness; Comfort and fabric handle measurement.

Unit IV: Apparel quality Control

Yarn and fabric defects; Preliminary inspection- Quality specifications and standards in raw material purchasing – fabric and accessories; In-process inspection - Quality control in spreading, cutting and bundling products; Quality factors in sewing, pressing, folding and finishing; Quality aspects of trims and accessories; Tolerance limits for garment dimensions; Final inspection – general garment defects; Procedure for quality checking and reporting.

Unit V: National and international organizations for standards

National and international organizations for standards – BIS and other global standards; Quality auditing system – process and product audit, internal quality audit procedure.

VII. Practicals

1. Sampling techniques of fibre, yarn and fabric.
2. Testing of fibre – length, maturity and linear density.
3. Yarn Testing – count, twist, crimp and evenness
4. Fabric testing – Geometrical properties - weight, thickness and fabric count
5. Fabric testing – abrasion resistance, pilling
6. Fabric testing – crease recovery, stiffness and drapability
7. Fabric testing – air permeability and thermal properties
8. Fabric testing – water permeability, wicking and dimensional stability
9. Breaking Strength– tensile strength of fibre, yarn and fabric
10. Estimation of tearing and bursting strength of fabrics
11. Processing, statistical analysis of the test data and interpretation of results
12. Garment Quality - Inspection of raw materials and analysis of defects in raw materials
13. Product quality analysis with respect to specification sheets- raw materials, product dimensions, construction and labeling.
14. Study of quality auditing system in the industry.
15. Quality analysis of low priced, medium priced and high priced garments available in market – fabric quality, workmanship, fitting and sizing
16. Visit to textile testing laboratory

VIII. Teaching Methods/ Activities

- Lecture
- Demonstration
- Hands-on-experience on textile and apparel quality testing machinery
- Industrial exposure
- Assignment
- Publication Review
- Student presentation
- Group Work

- Case Analysis and case studies
- Guest Lectures from industry experts

IX. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Perceive quality in fibre, yarn and fabrics for end-use performance
- Pursue career in quality control labs and apparel industries

Weekly Lecture Schedule

Duration (weeks)	Topic
1	Importance of textile testing, standardization and quality control; Effect of moisture and humidity on properties of textiles. Standard conditions of testing
2	Sampling – methods and techniques for fibre, yarn and fabric; Functions of BIS and other standards
3	Fibre testing - length, linear density, maturity
4	Yarn testing - count, twist, crimp and evenness.
5	Tensile Strength measurement of textiles- Principles of tensile testing; various testers for tensile testing of fibres, yarns and fabrics
6	Fabric testing – geometric parameters- Fabric count, thickness; tearing and bursting strength, abrasion resistance and pilling
7	Fabric testing- crease recovery, stiffness, drapability and air permeability
8	Fabric testing - thermal properties, flammability, water absorbency and repellency, dimensional stability
9	Colour fastness tests; Comfort and fabric handle measurement
10	Yarn and fabric defects
11	Preliminary Inspection in garment industry- Quality specifications and standards in raw material purchasing; quality control in spreading, cutting and bundling products.
12	In-process inspection- Quality factors in sewing, pressing, folding and finishing; quality aspects of trims and accessories.
13	Final Inspection- Quality considerations in construction and finishing. Tolerance limits for garment dimensions
14	Various inspection systems. Procedure for quality checking and reporting.
15	National and international organizations for standards.
16	Quality auditing system – process and product audit. Internal quality audit procedure.

I. Course Title : Pattern Making and Draping

II. Course Code : ATS 503

III. Credit Hours : 3 (1+2)

IV. Rationale

Pattern making helps to interpret a design with a practical understanding of garment construction. It is a connection step between design and product. Draping serves as a major function in the customization and fit of a garment. Both are the methods of creating a garment as per the design. It is understood that they are not totally exclusive methods, but some designs call for a combination of both the techniques in achieving design satisfaction for both the designer and consumer. It will enable students to make advance patterns and obtain perfect fit and enable the students to make pattern from sketch/photograph.

V. Aim of the course

- To Understand the style reading, pattern making, draping and garment construction techniques
- To acquire skill in advance pattern making and obtain perfect fit and harmony between the fabric and design of the garment
- To enable students to make pattern from sketch/photograph

VI. Theory

Unit I: Advanced techniques of pattern making and draping

Advanced techniques of pattern making and draping: incorporating style lines and fullness.

Unit II: Contouring

Contouring – principles, contour guide patterns, classic, empire, surplice, off-shoulder designs, halters

Unit III: Bodice - Sleeve variations

Raglan sleeve variations – one-piece raglan, deep armhole raglan, armhole-princess raglan, yoke raglan with bell sleeve; Drop shoulder, exaggerated armholes, caftan

Unit IV: Pattern Grading and Fitting

Pattern grading – principles, grading bodice, sleeve, collar; Fitting – principles, standards, fitting problems and remedies

VII. Practicals

1. Dart manipulation through pivotal transfer
2. Dart manipulation through slash and spread method
3. Methods of adding fullness and contouring
4. Developing designs with added fullness and contouring using darts
5. Developing designs with added fullness and contouring using pleats
6. Developing designs with added fullness and contouring using tucks & gathers
7. Contouring -application in classic and empire designs
8. Contouring -application in off-shoulder designs
9. Contouring -application in halter neckline designs
10. Contouring -application in surplice designs
11. Draping of dartless shirt designs
12. Incorporating style lines

13. Draping collars
14. Draping Cowls at neckline and underarm
15. Draping Cowls in skirts
16. Draping Built-in necklines
17. Draping Flounces
18. Draping Ruffles
19. Draping Peplums
20. Draping designs with knit fabrics and making patterns
21. Pattern making for variations in sleeves
22. Pattern making for variations in skirts
23. Pattern making for variations in trousers
24. Pattern grading- Bodice and sleeves
25. Pattern grading of skirts; men's and woman's garments
26. Designing garment 1 based on both the methods of pattern making and draping and making patterns
27. Designing garment 2 based on both the methods of pattern making and draping and making patterns
28. Designing garment 3 based on both the methods of pattern making and draping and making patterns
29. Construction of custom garment 1
30. Construction of custom garment 2
31. Construction of custom garment 3
32. Assessment of custom garments for quality and body fit

VIII. Teaching Methods/ Activities

- Lecture
- Demonstration
- Design Scrapbook
- Student presentation
- Group Work
- Design Analysis
- Guest Lectures
- Assignment

IX. Learning Outcome

After successful completion of this course, the students are able to:

- Understand the style reading, pattern making, draping and garment construction techniques
- Get knowledge about advance pattern and obtain perfect fit and harmony between the fabric and design of the garment

X. Suggested Reading

- Natalie Bray. 1994. *Dress Fitting*. Blackwell

Weekly Lecture Schedule

Duration (week)	Topics
1 & 2	Techniques of pattern making-drafting, flat pattern and draping
3 & 4	Use of style lines and fullness in pattern making
5,6 & 7	Understanding principles of contouring, surplice/off shoulder and halter designs
8 & 9	Types of Built -in necklines, cowls and collars
9,10 & 11	Introduction to advanced sleeve variations, exaggerated armholes, pockets and bias-cut dresses.
12, 13 & 14	Types of Skirts and pants
15 & 16	Pattern adoption to knits

I. Course Title : Woven Textile Design

II. Course Code : ATS 504

III. Credit Hours : 3 (2+1)

IV. Rationale

Consumers are seeking variety in woven textiles having new, interesting textures and functionality. Constant innovation in woven textiles is possible through textile design which combines elements from aesthetic creativity with technical skills. Knowledge on textile designing, aesthetics, materials, and techniques help in constructing new fabrics in tune with a new season's forecast.

V. Aim of the course

- To expose students to different looms and types of weaves
- To gain skills in designing woven patterns and weaving

VI. Theory

Unit I: Types of looms, scope and importance

Shuttleless looms –scope, importance and types -projectile, rapier, air jet, water jet weaving; multiple shed loom; Circular weaving; Tri-Axial looms; Pre-weaving processes for advance weaving; Automation in weaving.

Unit II: Woven designs and various weaves

Woven Design – fabric textures; Graphical representation of design, draft and peg plan; Classification of weaves; Warp weight and weft weight calculations; Twill weave and its modification; Colour and weave effects.

Unit III: Types of textured and decorative weaves

Construction of crepe, toweling- honeycomb, huck-a-back, bedford cord and curtain weaves-mockleno; Construction and production of complex structures - leno, double cloth, extra warp and extra weft figuring, terry pile and velveteens.

Unit IV: Specialty fabrics

Construction and production of damask and brocade fabrics using jacquard patterning devices; Methods of carpet making; Use of specialty fibres, specialty yarns, designing and production of specialty fabrics.

VII. Practicals

1. Weaving introduction – Procurement of yarn, setting up loom
2. Analysis of woven samples from different weaves
3. Construction of design, draft and peg plans for different weaves
4. Weaving samples of basic weave variations- plain and satin
5. Weaving samples of basic twill weave variations
6. Developing woven designs for weaving
7. Motif preparation and placement in different styles
8. Developing colour and texture plans
9. Weaving of the fabric with woven designs
10. Contd weaving of the fabric with woven designs
11. Documentation of traditional textile designs
12. Development of modified textile designs
13. Documentation of modified textile designs
14. Visit to Modern Weaving Mill with shuttleless looms
15. Portfolio development with woven samples and created designs
16. End term Assessment

VIII. Teaching Methods/ Activities

- Lecture
- Assignment
- Fabric structure Analysis
- Develop Compendium of woven designs and swatches
- Scrapbook of woven designs and weave calculations
- Student presentation
- Group Work
- Guest Lectures

IX. Learning Outcome

After successful completion of this course, the students are expected to:

- Be able to analyze different weave patterns
- Identifydifferent woven designs
- Be confidentin producing woven patterns on sample looms

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Shuttleless looms –scope, importance and types -projectile, rapier, air jet, water jet weaving
2	Multiple shed loom; Circular weaving; Tri-Axial looms

Duration (week)	Topics
3	Pre-weaving processes for advance weaving- machinery involved
4	Automation in weaving- Automatic controls
5	Woven Design – fabric textures; Graphical representation of design, draft and peg plan
6	Classification of weaves; Warp weight and weft weight calculations
7	Twill weave and its modification
8	Colour and weave effects for different weaves
9-10	Construction of crepe, toweling- honeycomb, Huck-a-back, bedford cord and curtain weaves-mockleno
11	Construction and production of complex structures - leno, double cloth, extra warp and extra weft figuring
12	Construction and production of complex structures- terry pile and velvetens
13	Construction and production of damask and brocade fabrics using jacquard patterning devices
14	Methods of carpet making
15	Use of specialty fibres, specialty yarns Designing and production of specialty fabrics.
16	Discussion on selection of weave for customized weaving

I. Course Title : Wet Processing of Textiles

II. Course Code : ATS 505

III. Credit Hours : 3 (2+1)

IV. Rationale

Almost all fabrics produced undergo some form of wet processing or other based on the market demand. Consumers do not prefer grey fabrics but rather demand specialised prints, textures and functional fabrics – all of which are produced with various wet processing techniques.

V. Aim of the course

- To develop knowledge about types of dyes and theory of dyeing
- To acquire skills in advanced dyeing and printing techniques
- To familiarize with the finishing treatments specific to fibre type

VI. Theory

Unit I: Chemistry of dyes and pigments

Theory of dyeing; Chemistry of dyes and pigments- composition, structure, properties, affinity towards fibres, method of application, fixing, after treatments and fastness properties; Dyeing with natural dyes and role of mordants.

Unit II: Advanced Dyeing and Printing Techniques

Dyeing of blends; Advanced dyeing techniques – macro, micro and nano; Dyeing machines used at the cottage and industrial level for fibre, yarn and fabric; Dyeing and printing defects and remedies; Advanced printing techniques- digital printing, 3D prints, automated flat bed and rotary screen printing; Assessment of colour fastness.

Unit III: Textile Finishes

Textile finishes – concept, scope and importance ; functional finishes on different fabrics – antimicrobial, soil and stain release, durable press, UV protective, flame retardancy; Comfort imparting finishes - application, uses, characteristics, problems and evaluation; Finishing with enzymes; Finishing of blended fabrics.

VII. Practicals

1. Preparation of fabrics for dyeing
2. Preparation of fabrics for printing
3. Preparation of fabrics for finishing
4. Developing shade cards on different substrate with various classes of dyes and colour matching.
5. Developing shade cards and colour matching.
6. Natural dyes
7. Dyeing with different mordants
8. Advanced techniques of fabric printing
9. Identification of finishing agents
10. Application of finishing agents
11. Eco-friendly finishing of textiles
12. Assessment of properties of finished fabrics
13. Study of labels pertaining to finishes
14. Theme based project work –Theme selection
15. Project preparation
16. End-term assessment

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Compendium of fabric shades
- Student's Swatch Book of printed textiles
- Student presentation
- Group Work
- Case Analysis and case studies
- Guest Lectures

IX. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Select dyes as per the fiber type
- Produce dyed and printed portfolios
- Showcase skill in surface enrichment with combination techniques of dyeing and printing

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Concept of colour and its relation to light. Classification of dyes/colouring matter
2	Theories of dyeing.
3&4	Chemistry of dyes and pigments- composition, structure, properties, affinity towards fibres, method of application, fixing, after treatments and fastness properties
5	Dyeing with natural dyes and role of mordants.
6	Dyeing of blends.
7	Advanced dyeing techniques – macro, micro and nano
8	Dyeing machines used at the cottage and industrial level for fibre, yarn and fabric
9	Dyeing and printing defects and remedies
10&11	Advanced printing techniques
12	Assessment of colour fastness
13	Textile finishes – concept, scope and importance
14	Application of functional finishes on different fabrics
15	Comfort imparting finishes - application, uses, characteristics, problems and evaluation
16	Finishing with enzymes. Finishing of blended fabrics.

I. Course Title : Computer Aided Textile and Apparel Designing
II. Course Code : ATS 506
III. Credit Hours : 2 (0+2)

IV. Rationale

Computers have become vital component in the fashion and textile designing arena. Computers have varied use in design room of a fashion/textile designer thereby reducing the demand for several manual skills and augment the industry in keeping up with high turnaround times.

V. Aim of the course

- To impart skill in computer aided textile and apparel designing
- To develop CAD portfolios as per fashion forecast
- To build design libraries in textiles and apparel styles

VI. Practicals

1. CAD commands
2. Textile designing softwares

3. Creation of textile designs (2D and 3D)
4. Application of Textile designs for different end uses.
5. Creating stripes using various commands
6. Creating checks using various commands
7. Creating weave library
8. Assigning weaves to the designed stripes and Checks for weaving.
9. Introduction to commands from different tool groups- file menu, freehand, geometric, selection, selection utility, colour utilities and general utilities.
10. Practicing on above tools
11. Developing motifs by scanning and drawing using the CAD commands
12. Creating full design/ repeat using drop devices.
13. Creating weaves and storing in Jacquard weave library.
14. Assigning weaves to the design plan.
15. Learning print commands- simulation and graph/ point paper.
16. Developing a computer aided portfolio of different motifs
17. Introduction to different software - Command bars and assistants. Menu bar and options. Drawing tools.
18. Colour rendering;
19. Fill, pattern and repeat
20. Creation of Special effects Layers and layer settings;
21. Apparel pattern making modules.
22. Development of basic pattern through CAD.
23. Principles of pattern making and basic blocks.
24. Adaptation of styles
25. Fundamentals of grading and marking.
26. Introduction to draping mode.
27. Outlining, creation of grid and editing the object
28. Draping scanned pictures
29. Texture mapping and creating effects
30. Development of library and printing designed patterns
31. Preparation of portfolio of developed designs,
32. Product designing and development of trims, foot wears, hand bags, buttons, buckles, belts, hats, scarf and jewellery.

VII. Teaching Methods/ Activities

- Demonstration
- Working with customised software
- Student's e Book on apparel and textile designs
- Student presentation
- Group Work
- Design Analysis & discussion
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Customise the designs based on the clients requirement
- Build competency for a career in design studios and textile industry

IX. Suggested Reading

- Iowa State university digital repository- https://lib.dr.iastate.edu/

I. Course Title : Textile and Apparel Industry Management
II. Course Code : ATS 507
III. Credit Hours : 3 (3+0)

IV. Rationale

Textile and apparel industry occupy a prominent position in India next to agriculture providing employment to millions of people. The diverse culture and ethnicity in the country gives India a competitive advantage to cater to the needs of both the domestic and global clientele. Deep understanding of textile and apparel industry prepares the students to position themselves better in terms of future career prospects.

V. Aim of the course

- To identify the role of textile and garment industry in the Indian economy, industry trends and various export- import policies
- To understand the management issues related to apparel and textile industry
- To develop awareness about the quality standards and automation in enhancing productivity

VI. Theory

Unit I: Indian Textile industry

Textile industry- history, development and status; export and import policies of Government; Textile research associations; Textile crafts councils.

Unit II: Status of garment industry in India

Status of garment industry in India-production, marketing, distribution, consumption and export trends over last five years; problems of apparel industry and remedial measures. Complexity of management in garment industries: objective and expectations.

Unit III: Management in Apparel industry

Classification of apparel industry- large, medium, small and role of MSMEs; Infrastructural facilities and personnel management in apparel industry; Techniques in managerial application of cost volume profit analysis; Productivity analysis, case studies.

Unit IV: Trade related organisations

Apparel parks, apparel export promotion council, National fashion and design institutes; GATT, TUF, ISO 9001: 2015, 14001: 2015 and 26000: 2010 standards;

WTO and its impact on textile and apparel industries; Effect of trade globalization on apparel industry.

Unit V: Automation in apparel and textile industries

Recent advancements in CAD/CAM applications; automation in the industry; role of robotics in productivity management

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Publication Review - Discussion
- Student presentation
- Group Work
- Case Analysis and case studies
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Enhance knowledge on management systems in apparel and textile industries
- Apply appropriate standards to augment and productivity through automation.

IX. Suggested Reading

- Cooklin G. 1997. *Garment Technology for Fashion Designers*. Blackwell.
- Dickerson K. 1995. *Textiles & Apparels in Global Economy*. Merrill Prentice Hall.
- Glock R. 1990. *Apparel Manufacturing*. Macmillan.
- Karpan 2004. *Change in Trends in Apparel Industry*. Abishek Publ.
- Kathryn MG.1978. *Fashion Innovation & Marketing*. Macmillan Co.
- Mehta PV. 1998. *Managing Quality in Apparel Industry*. New Age International.
- Uncertain Supply Chain Management http://m.growingscience.com/beta/uscm/
- University of Wollongong Research https://ro.uow.edu.au/

Weekly Lecture Schedule

Duration (weeks)	Topic
1&2	Introduction to Indian Textile Industry and its SWOT Analysis. History and development of textile industry. Export and Import policies of Government.Objectives and contributions of Textile Research Associations: NITRA, SITRA, BTRA and ATIRA and Textile Crafts Council.
3&4	Introduction to Indian Garment industry and its SWOT Analysis. Current status of garment industry in India in terms of production, marketing, distribution and consumption. Export trends of garments over the last five years.
5	Problems of apparel industry: lack of skilled manpower and automation, meeting lead times, logistic issues, maintaining optimum inventory levels, changing customer needs, cut throat competition, maintaining multichannel sales, managing supply chain and sustainability.Remedial Measures: ERP solutions, logistic and marketplace integration, centralized inventory management, following leagile supply chains, robust omnichannel solutions, progress report tracking, meeting corporate social responsibility, upgradation of skills of workforce and technology upgradation.
6	Strategic management in garment industry: top, middle and lower level management, objectives and expectations. Role of a Manager in a garment industry.
7	Classification of apparel industry: large, medium, small and MSME.Industry and infrastructure: need, existing facilities and challenges. Trade infrastructure for

Duration (week)	Topics
	export scheme (TIES) and its role in infrastructure development of export oriented units.Personnel Management in apparel industry: recruitment, training, work scheduling, compensation and rewards, motivation and promotion.
8&9	Cost Volume Profit (CVP) Analysis: need and assumptions. Factors affecting CVP Analysis: volume of production, product mix, internal efficiency, method of production and size of plant. Techniques of CVP analysis: break-even analysis and profit-volume analysis.
10&11	Key performance indicators(KPI) in apparel manufacturing. Productivity analysis and improvement in labour, equipment and resources productivity. Importance of productivity rate analysis. Technology upgradation of apparel units: use of CAD, CAM and CIM solutions, automated inspection (AIN), automated material handling devices (AMHD), Production planning/ inventory management software (PPIC) and pick-place robots (PPR).
12&13	Governmental schemes for boosting apparel exports: Scheme for Integrated Textile Parks (SITP), Technology Upgradation Fund Scheme (TUFS), Market Access Initiative (MAI) and Market Development Initiative (MDI).General Agreement on Trade and Tariff (GATT): Purpose and its effect on trade.World Trade Organization(WTO): organizational structure and functions. Impact of WTO on textile and apparel industries.
14	Apparel Export Promotion Council: role, vision and various AEPC's in India.
15	ISO textile testing standards. ISO 9000, 14000 and 26000 standards: their aim and application in textiles and apparel industries.
16	Globalization: definition, advantages and disadvantages for textile and apparel industry. Effect of trade globalization of apparel industry.

I. Course Title : Historic Textiles and Costumes

II. Course Code : ATS 508

III. Credit Hours : 2 (1+1)

IV. Rationale

Understanding the textiles and costumes worn in the past is way to learn the history inside out. Learning about the historic textiles and costumes is a definitive way to move forward as it generates new research questions and strengthens the student's design sensibilities. The style variations in the historic costumes inspire the student in creating contemporary styles.

V. Aim of the course

- To enable students to learn the historical development in Western textiles and costumes from ancient world to 21st century
- To acquaint students with textiles and costumes of western countries.
- To get design inspiration from historic costumes and textiles

VI. Theory

Unit I: Study of traditional textiles

Study of traditional dyed, printed, embroidered and non-woven textiles in terms of fibre content, fabrics, motifs, colours, designs and dyes used in Egypt, Greece, Rome, France, America, Japan and China.

Unit II: Study of traditional costumes

History and evolution of traditional costumes and accessories for men and women of Egypt, Greece, Rome, Japan, France, America and China.

VII. Practicals

1. Collection and documentation of traditional textile prints and surface designs of Egypt & Greece
2. Collection and documentation of traditional textile prints and surface designs of Rome & France
3. Collection and documentation of traditional textile prints and surface designs of America & Japan
4. Collection and documentation of traditional textile prints and surface designs of China
5. Developing textile surface designs with combination of motifs of different countries
6. Developing textile surface designs with combination of motifs of different countries
7. Documentation of various styles of men's garments of various countries
8. Documentation of various styles of women's garments of various countries
9. Designing and adaptation of outfits for men from historic costumes according to current trends.
10. Designing and adaptation of outfits for women from historic costumes according to current trends.
11. Visit to the museum 1
12. Visit to the museum 2
13. Reporting and Presentation of the visits
14. End term Assessment

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Develop costume style catalogue
- Create textile motif catalogue
- Student presentation
- Group Work
- Museum visits and videos
- Guest Lectures

IX. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Distinguish the patterns and designs in western textiles from ancient times to the present day.
- Portray style variations in ancient costumes of western countries across centuries.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Introduction to historic textiles and costumes, and their application in textile and costume designing.
2	Traditional dyed, printed and embroidered textiles of Egypt with reference to fibre content, fabrics, motifs, colours, dyes and designs.
3	Characteristic features of male and female Egyptian costumes, accessories and hair styles.
4	Features of Grecian textiles with respect to fibre content, fabrics, motifs, colours, dyes and designs.
5	Characteristic features of male and female costumes of Greece, accessories and hair styles.
5, 6 & 7	Details of historic textiles of Rome and their symbolism in ancient Roman Empire. Costumes, accessories and hair styles worn by Romans.
8 & 9	Historical account of evolution of textiles, costumes, accessories and hair styles of France.
10 & 11	Colonial textiles of America with respect to fibre content, fabrics, motifs, colours, dyes and designs.
12 &13	Characteristic features of male and female colonial costumes, accessories and hair styles worn in America.
14, 15 & 16	Brief account of traditional textiles, costumes, accessories and hair styles used in Japan and China.

I. Course Title : Textile Auxiliaries

II. Course Code : ATS 509

III. Credit Hours : 3 (2+1)

IV. Rationale

Textile auxiliaries are widely used in the wet processing industry to bring out fabrics with special properties. In addition to improving the efficiency of the various wet processes, the auxiliaries help in cost optimisation and add to the functional properties of a textile. The role played by the textile auxiliaries in the industry is pivotal and hence it is essential for a student to learn of the new developments in the industry.

V. Aim of the course

- Become familiar with various textile auxiliaries used in textile processing
- Gain knowledge about the judicial use of auxiliaries based on end use performance

VI. Theory

Unit I: Introduction to auxiliaries

Textile auxiliaries– definition, classification, selection and uses in processing operations.

Unit II: Surface active agents

Chemistry and synthesis of surface-active agents - essential requirements of surfactants, classification and biodegradability; Physical principles of cleansing efficiency; Scouring, bleaching and mercerizing auxiliaries.

Unit III: Dyeing and Printing auxiliaries

Dyeing auxiliaries - Wetting, leveling, stripping, dye fixing, swelling, dispersing agents and carriers; Printing auxiliaries – thickeners and their classification, wetting, hygroscopic, antifoaming, reducing, oxidizing agents and pigment binders, fixers and miscellaneous auxiliaries.

Unit IV: Finishing auxiliaries

Stiffening, cross linking, optical brighteners, softeners, water proof/repellents, flame proof/ retardants, soil release, anti-pilling, antimicrobial, moth and mildew proofing; methods of producing nanoparticles of auxiliaries for textile finishing.

VII. Practicals

1. Textile auxiliaries-An Introduction
2. Market survey of different Textile auxiliaries
3. Analysis of the surfactant properties of surfactant 1
4. Analysis of the surfactant properties of surfactant 2
5. Preparation of detergent
6. Preparation of sizing combination 1
7. Preparation of sizing combination 2
8. Analysis of the sized samples
9. Selection of suitable combinations
10. Assessment of whiteness index of fabrics finished with various bleach 1
11. Assessment of whiteness index of fabrics finished with various bleach 2
12. Assessment of whiteness index of fabrics finished with optical brightening agent 1
13. Assessment of whiteness index of fabrics finished with optical brightening agent 2
14. Assessment of whiteness index of fabrics finished with detergent 1
15. Assessment of whiteness index of fabrics finished with detergent 2
16. End term Assessment

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Discussion on suitability of auxiliaries
- Problem solving approach
- Publication Review
- Student presentation
- Group Work
- Guest Lectures

IX. Learning Outcome

After successful completion of this course, the students are expected to:

- Select appropriate auxiliaries for end-use performance
- Skill in analysing the textiles finished with various auxiliaries.

X. Suggested Reading

1. Bogley M. 1977. *Textile Dyes, Finishing and Auxiliaries*. Garland Publ.

2. Fiscus G and Grunenwald D. 1996. *Textile Finishing: A Complete Guide*. Textile Institute, Manchester.
3. Hall KJ. 1966. *Textile Finishing*. Heywood.
4. NPCS Board of Consultants and Engineers (2019). *Handbook on Textile Auxiliaries, Dyes and Dye Intermediates Technology,* Asia Pacific Business Press Inc., New Delhi
5. Textile Finishing Chemicals: An Industrial Guide http://library.aceondo.net/ebooks/Home_Economics/Textile_Finishing_Chemicals.pdf
6. Chemosphere- https://www.journals.elsevier.com/chemosphere
7. Journal of Hazardous Materials https://www.journals.elsevier.com/journal-of-hazardous-materials
8. *Textile auxiliaries and chemicals* https://www.academia.edu/30859937/Textile_Auxiliaries_ and_Chemicals_Ebook

Weekly Lecture Schedule

Duration (week)	topics
1	Definition and classification of textile auxiliaries
2	Selection of textile auxiliaries and uses in processing operations
3 & 4	Chemistry and synthesis of surface-active agents - essential requirements of surfactants, classification and biodegradability
5	Physical principles of cleansing efficiency.
6	Scouring, bleaching and mercerizing auxiliaries
7	Dyeing auxiliaries- wetting, levelling
8	Dyeing auxiliaries- stripping, dye fixing, swelling
9	Dyeing auxiliaries- dispersing agents and carriers
10,11 &12	Printing auxiliaries – thickeners and their classification, wetting, hygroscopic, antifoaming, reducing, oxidizing agents and pigment binders, fixers
13	Miscellaneous auxiliaries
14,15& 16	Finishing auxiliaries–stiffening, cross linking, optical brighteners, softeners, water proof/repellents, flame proof/retardants, soil release, anti-pilling, antimicrobial, moth and mildew proofing; Methods of producing nanoparticles of auxiliaries for textile finishing.

I. Course Title : Socio-psychological Aspects of Clothing

II. Course Code : ATS 510

III. Credit Hours : 2 (2+0)

IV. Rationale

Study of dress and human behaviour throws an insight into the definite relationship between dress, the body, and the self. Clothes act as a stimulus influencing one's behaviour and self esteem of both the wearer and the viewer. There exists a specific relationship between dress and specific social and cultural identities and changing attitudes concerning dress among several ethnic groups. Study of socio-psychological aspects of clothing of consumers will help the industry to come up with saleable solutions that the market can easily embrace.

V. Aim of the course

- To study the socio-psychological effects of clothing on the individual in social situations
- To develop understanding about consumer behaviour.

VI. Theory

Unit I: Clothing

Clothing-origin, theories, functions and modern philosophy of clothing in relation to culture; Clothing symbolism; Factors effecting clothing -fashion, fad, custom, tradition, culture contact, status, age, education, technology and role of legislation.

Unit II: Socio-psychological aspects of clothing

Socio-psychological aspects of clothing-first impression, individual values, interest, attitude, motivation in clothing choices, self-respect, self-enhancement, self-expression, gender desirability and individuality, clothing and society, clothing and social behaviour, influence of religion; beliefs, customs and traditions; clothes and conformity; cloths and occupation; socio-psychological impact of clothing among different age groups; significance of uniforms and national costumes. Clothes for conformity, mobility, aesthetic appearance. Health and sanitation related to clothing.

Unit III: Consumer behaviour

Consumer behaviour: concept and importance, consumer needs and motivations, consumer perspective and viewpoints; environmental influence; individual differences. Consumer resourses: involvement and motivation; knowledge, attitudes; individual differences in behaviour; psychological processes.

Consumer decision-making processes; model of consumer decision-making; consumer analysis and marketing strategy; retailing; consumer trends; market segmentation; diffusion of innovation; Counterfeit textiles and consumer protection measures; consumerism and role of media.

Unit IV: Marketing concept

Marketing concept; Types of customers; Understanding consumers and customer demand; Market segmentation and consumer adopter categories- their characteristics, psychographics and the interrelationship with production, price zones and marketing strategies in relation to fashion cycle; Theories of fashion adoption; Role of fashion influencers.

VII. Teaching Methods/ Activities

- Lecture
- Case Analysis and case studies
- Assignment (Reading/Writing)
- Publication Review
- Student presentation
- Group Work
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Relate clothing to socio-psychological aspects of the individual.
- Establish backward linkage to the industry by passing on consumer oriented inputs

IX. Suggested Reading

- Cranz RLM. 1972. *Clothing Concepts*. Collier Macmillan.
- Horn MJ. 1981. *The Second Skin – An Interdisciplinary Study of Clothing*. Hughton Miffin and Hill House.
- Marion S. 1963. *Dress Selection and Design*. The Macmillan Co.

- Mary Kefgen and Phyllis 1971. *Individuality in Clothing Selection & Personal Appearance*. The Macmilliam Co.
- Ryan MS. 1966. *Clothing - A Study in Human Behaviour*. Winston
- Stecker P. 1996. *Fashion Design Manual*. Mac Millan.

Weekly Lecture Schedule

Duration (weeks)	Topic
1	Origin, theories, functions and modern philosophy of clothing in relation to culture. Clothing symbolism.
2	Factors effecting clothing -fashion, fad, custom, tradition, culture contact, status, age, education, technology and role of legislation
3&4	Socio-psychological aspects of clothing: first impression, individual values, interest, attitude, motivation in clothing choices, self-respect, self-enhancement, self-expression, gender desirability and individuality
5	Clothing and society: clothing and social behaviour, influence of religion, beliefs, customs and traditions; clothes and conformity; clothes and occupation; socio-psychological impact of clothing among different age groups.
6	Significance of uniforms and national costumes. Clothes for conformity, mobility, aesthetic appearance. Health and sanitation related to clothing.
7	Consumer behaviour: concept and importance, consumer needs and motivations, consumer perspective and view points.
8	Environmental influence; individual differencesin behavior and psychological processes.
9	Marketing concept. Types of customers. Understanding consumers and customer demand.
10&11	Market segmentation and consumer adopter categories- their characteristics, psychographics and the interrelationship with production, price zones and marketing strategies in relation to fashion cycle.
12	Theories of fashion adoption. Role of fashion influencers.
13	Consumer decision-making processes; model of consumer decision-making; consumer analysis and marketing strategy; retailing
14	Consumer trends; market segmentation; diffusion of innovation.
15&16	Counterfeit textiles and consumer protection measures; consumerism and role of media.

I. Course Title : Sustainability in Textile and Apparel Industry
II. Course Code : ATS 511
III. Credit Hours : 2 (2+0)

IV. Rationale

Incorporating sustainability into the supply chain is becoming a key priority for many textile and apparel companies owing to its detrimental effects to the eco system. Sustainability in terms of product strategy, investment, performance evaluation, corporate social responsibility, and environmental management system adoption contribute to the development of sustainable supply chain management in the textile and apparel industry. To safeguard the planet, sustainable eco measures need to be studied and improved upon.

V. Aim of the course

- To expose students to global environmental issues and strategies
- To understand the measures undertaken for maintaining ecological balance in micro and macro environment of Textile industry.

VI. Theory

Unit I: Impact of textile sector on environment

Environmental threats in textile and apparel industry- raw materials and processes; Banned dyes and chemicals in India; Concept of green supply chain; Certified organic, renewable and low impact raw material; Reduced toxicity in fiber processes and treatments; Effluent Treatment Plants; Concept of zero wastage and lean manufacturing; Pre -consumer and post-consumer textile wastage; 3-R approach and its advantages; Environmental friendly packaging and eco labeling; Certified agencies imparting eco label.

Unit II: Natural dyes

Natural dyes – importance, classification of natural pigments; extraction methods including the concept of supercritical dyeing, microwave and ultrasonication, mordants and dyeing methods; Role of natural dyes in safeguarding the environment.

Unit III: Reduced energy processes

Reduced energy processes; Use of alternative sources of energy during product lifecycle; Importance of carbon credits in textile and apparel manufacturing.

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Publication Review
- Student presentation
- Group Work
- Videos
- Case Analysis and case studies
- Exposure visit to ETP (Effluent Treatment Plants)
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Identify the ecologically safe processes, dyes and chemicals
- Offer ecological solutions for mitigating the harmful effects of the textile effluents on environment

IX. Suggested Reading

- Blackburn RS. 2009. *Sustainable Textiles INNBUNDET*. Woodhead Publishing House.
- Miraftab M and Horrocks AR. 2004. *Ecotextiles: The Way Forward for Sustainable Development in Textiles*. Woodhead Publishing House.
- Subramanian SM. *Sustainability in the Textile Industry* (Textile Science and Clothing Technology).
- Wang Y. *Handbook of Sustainable Textile Production. 1st Edition. Recycling in Textiles.* Woodhead Publishing House.
- *Journal of Environmental Science and Health* https://www.tandfonline.com/toc/lesa20/current
- *Ecological Economics* https://www.sciencedirect.com/journal/ecological-economics

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Environmental threats in textile and apparel industry- raw materials and processes
2	Banned dyes and chemicals in India
3	Concept of green supply chain
4	Certified organic, renewable and low impact raw material
5	Reduced toxicity in fiber processes and treatments
6	Effluent Treatment Plants
7	Concept of zero wastage and lean manufacturing;
8	Pre -consumer and post-consumer textile wastage
9	3-R approach and its advantages; Environmental friendly packaging and eco labeling;
10	Certified agencies imparting eco label
11	Natural dyes – importance, classification and chemical groups of natural pigments
12	Natural dye extraction methods including the concept of supercritical dyeing, microwave and ultrasonication
13	Natural dye application on textiles- mordants used; mordanting and dyeing methods; Role of natural dyes in safeguarding the environment.
14	Reduced energy processes; Use of alternative sources of energy during product lifecycle;
15	Importance of carbon credits in textile and apparel manufacturing and estimation of carbon points
16	Discussion on adoption green technologies in Textile and apparel industries

I. Course Title : Textile and Apparel Product Development

II. Course Code : ATS 512

III. Credit Hours : 2 (1+1)

IV. Rationale

Product development in the field of apparel and textiles is identifying the market opportunity, create product that appeal the customers, developing technical specifications, testing and modification for production. Skill in product development provides immense career opportunities as merchandisers in indudtries.

V. Aim of the course

- To impart the knowledge about various product standards and product specifications
- To learn the process of product development towards market need

VI. Aim of this Course

The course is designed to impart both basic and applied knowledge on the subject of sustainability in textile and apparel industry. This course will impart the knowledge about various product standards and product specifications to the students. Further, students will learn the process of product development towards market need.

VII. Theory

Unit I: Textile and apparel product development

Textile and apparel product development – concept, history, objective; product design, product life cycle and new product development. Merchandising – role, responsibilities, use of calendar, branding, labelling and retailing.

Unit II: Product testing

Product – testing, economics, standards and specifications; product quality control; technical services, positioning and marketing.

Unit III: Organizational behaviour

Organizational behaviour; accounting; product intellectual property law.

Unit IV: Commercial product development

Commercial product development - Role of computers and related software in product development. e-marketing – concepts and application.

VIII. Practicals

- Product review- Analyzing existing products of textile in terms of design, life cycle and assessment of market need for new product development.
- Development of survey Performa for preparation of product profile of Textile product-1.
- Development of survey Performa for preparation of product profile of Textile product-2.
- Development of survey performa for preparation of product profile of Apparel product-1.
- Development of survey performa for preparation of product profile of Apparel product-2.
- Survey on selected products from textiles field.
- Survey on selected products from apparel field.
- Product testing and analysis of selected textiles – quality, serviceability, material.
- Product testing and analysis of selected textiles – construction, performance.
- Product testing and analysis of selected textiles – Products standard ,specifications and cost.
- Product testing and analysis of selected apparels – quality, serviceability, material.
- Product testing and analysis of selected apparels – construction, performance.
- Product testing and analysis of selected apparels – Products standard, specifications and cost.
- Product planning on the basis of- market needs, aesthetic, functional requirements and producibility.
- Production of new product- with aesthetic, functional requirements and producibility.
- Project work.

IX. Teaching Methods/ Activities

- Lecture
- Assignment
- Publication Review
- Student presentation
- Group Work
- Case Analysis and case studies
- Guest Lectures

X. Learning Outcome

After successful completion of this course, the students are expected to:

- Know about various product standards and product specifications

- Acquire skill in customized product development

XI. Suggested Reading

- Bhargav R. 2005. *Design Ideas and Accessories.* Jain Publ.
- Harold C and Pomeroy J. 1996. *Fashion Design and Product Development.* Blackwell Science.
- The International Journal of Advanced Manufacturing Technology https://link.springer.com/journal/170
- References, Conservation and Recycling https://www.sciencedirect.com/journal/References-conservation-and-recycling

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Concept, history and objectives of product development in textiles and apparel.
2&3	Product design process, stages of product life cycle and steps of product development
4	Role of merchandiser in product development and use of merchandising calendar
5	Branding, labelling and retailing
6	Importance of product testing, concept and types of market test
7	Product economics-analysis of design cost, product profitability and design profits or Economic analysis-market potential, estimation of sales, cost breakeven analysis, return on investment
8	Product standards and specifications.
9&10	Product Quality control- fabric, garment or design and manufacturingspecifications
11	Importance of product positioning in marketing plan.
12&13	Organizational behavior-B2B buying decisions, Stages of organizational buying process, R&D accounting
14	Role of Intellectual property law in product development
15	Role of computers in design development and manufacturing of product
16	Basic principles and concepts of e-marketing-chain of activities, ethical code and marketing mix

I. Course Title : Laboratory Techniques in Textile Research

II. Course Code : ATS 513

III. Credit Hours : 2 (0+2)

IV. Rationale

Textile research can include a wide gamut of areas – fibre, fabric and apparel. A researcher should have a broad understanding of the tools and equipment used in research- be it qualitative or quantitative. A prior knowledge of these tools/ techniques will equip the student to focus intensely on the areas of interest.

V. Aim of the course

- To impart knowledge on laboratory techniques in textile research.
- To provide hands on training on analytical instruments

VI. Practical

1. Preparation of buffers for pre-processes.
2. Preparation of reagents for pre-processes.

3-4. Preparation of standard solutions for pre-processes.

5-6. Demonstration on Microencapsulation– Preparation and application; assessment through TEM.

7-8. Demonstration on Microencapsulation– Preparation and application; assessment through SEM.
9-10. Demonstration on Microencapsulation– Preparation and application; assessment through FTIR.
11. Demonstration on Nano synthesis – Preparation and application; assessment through TEM.
12. Nano synthesis – Preparation and application; assessment through SEM.
13. Nano synthesis – Preparation and application; assessment through and FTIR.
14. Optimization of variables for various dyes.
15. Optimization of variables for various printing.
16. Optimization of conditions for various finishing treatments.
17. Optimization of conditions for various enzyme treatments.
18. Analysis of water- pH, TDS.
19. Analysis of dye extracts.
20. Analysis of finishing extracts.
21-22. Analysis of water -dye effluents, BOD, COD, anions, cations.
23. Laboratory techniques for assessing colour strength.
24. Laboratory techniques for assessing reflectance.
25. Laboratory techniques for assessing Spectrophotometry-visible, ultraviolet.
26. Laboratory techniques for assessing Spectrophotometry-infrared and chromatographic techniques.
27. Use of different scales to assess light fastness.
28. Use of different scales to assess washing fastness.
29. Use of different scales to assess rubbing fastness.
30. Management and interpretation of data generated.
31. Statistical analysis of test results in SPSS package.
32. End term Assessment.

VII. Teaching Methods/ Activities

- Demonstration on technical equipment handling/learning operations
- Assignment
- Laboratory manuals/Specification sheets
- Student interactive session
- Group Work on textile testing
- Use of SPSS Software for statistical analysis

VIII. Learning Outcome

After successful completion of this course, the students are expected to be able to:

- Confident in handling advanced instruments
- Prepare common analytical reagents for qualitative and quantitative analysis of dyes and finishes.

IX. Suggested Reading

- Roger Carpenter. 1999. *Vision Research: A Practical Guide to Laboratory Methods*, Oxford University Press, Oxford
- Research papers on functional testing, performance of textiles, Herbal treated/ Nano finished/ microencapsulated apparels and textiles, etc.
- Equipment manuals on Nano synthesis - assessment through SEM,TEM and FTIR.
- E book on- Principles of Textile Finishing by Asim Kumar Roy Choudhury
- E book on -A Practical Guide to Textile Testing By K. Amutha

Course Title with Credit Load
Ph.D. in Apparel and Textile Science

Course Code	Course Title	Credit Hours
	Major Courses (12 Credits)	
*ATS 601	Textile Ecology	2(2+0)
*ATS 602	Technical Textiles	3(2+1)
ATS 603	Technological Developments in Textiles and Apparel	2(2+0)
ATS 604	Colour Application in Textiles	2(1+1)
*ATS 605	Functional Clothing	3(2+1)
ATS 606	Textile Conservation	2(1+1)
ATS 607	Operational Management in Textiles and Apparel	2(2+0)
ATS 608	Technology of Nonwovens	2(2+0)
ATS 609	Special Project	2(0+2)
	Minor Courses (06 Credits)	
CS/PGS 601	Research and Publication Ethics	2(1+1)
FN604	Global Nutrition Problems	2(2+0)
FN 608	Energy Metabolism	2(2+0)
EECM 602	Impact Assessment of Development Programmes	3(1+2)
EECM 603	Scaling Techniques for Behavioural Research	3(1+2)
EECM 607	Media application and product promotion	4(2+2)
HDFS 608	Qualitative research methods	3(2+1)
RMCS 603	Globalization and Consumer Economics	3 (2+1)
RMCS 606	Environmental Issues and Challenges	2 (2+0)
RMCS 607	Family Dynamics and Women Power	3 (2+1)
	Supporting Courses (05 Credits)**	
ATS 691	Doctoral Seminar I (Major Field)	1(1+0)
ATS 692	Doctoral Seminar II (Minor Field)	1(1+0)
ATS 699	Research	75
	Total	**100 Credits**

*Core courses/ compulsory courses; **A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM portal or other online courses up to a maximum of 5 credits.

Course Contents
Ph.D. in Apparel and Textile Science

I. Course Title : Textile Ecology
II. Course Code : ATS 601
III. Credit Hours : 2 (2+0)

IV. Rationale

The textile wet processing industry is considered as the highest polluting industry as the chemicals used are toxic and harmful to both human and the environment. Some of the dyes and chemicals are banned by the government due to their toxic nature and Effluent treatment is made mandatory. It is high time for the students who would like to take up career in these industries or personnel already working in the industry to acquire knowledge in effluent pollution and its mitigation processes. Hence the course.

V. Aim of the course

- To impart knowledge among the students about types of pollution caused by textile industry, effect on the environment and mitigating strategies.
- To understand the health hazards faced by textile workers and the remedial measures adopted.

VI. Theory

Unit I: Textile ecology

Textile ecology – concept and importance; Industrialization, eco-balance and sustainability; Air, noise and water pollution by mechanical and chemical textile processing units and their effect. Organic and coloured cotton, natural dyes and detergents.

Unit II: Treatment and disposal of textile effluents

Particulate matter and pollution control devices ; Treatment processes of sewage. Waste minimization and management strategies; Recovery and reuse of water and chemicals

Unit III: Banned dyes and chemicals used in Textile industries

Banned dyes, heavy metals, pesticides and auxiliaries in Textile and related industries. Health hazards of textile workers and their remedial measures; Colour removal technologies

Unit IV: Indian and international environmental legislations

Indian and international environmental legislations. Eco-standards, eco-labeling, management and auditing. Management of packaging waste.

VII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's presentation

- Case studies
- Guest Lectures
- Exposure visits
- Mini Project

VIII. Learning Outcome

After successful completion of this course, the students are expected to:

- Develop awareness on the types of pollution from textiles processing units and their effect on environment
- Design processes to reduce or alleviate pollution in wet processing
- Handle remedial measures to mitigate health hazards of textile workers

IX. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topics
1	Textile ecology – concept and importance
2	Industrialization, eco-balance and sustainability
3-4	Air, noise and water pollution by mechanical and chemical textile processing units and their effect
5	Organic and coloured cotton, natural dyes and detergents.
6	Particulate matter and pollution control devices
7-8	Treatment processes of sewage
9	Waste minimization and management strategies
10	Recovery and reuse of water and chemicals
11	Banned dyes, heavy metals, pesticides and auxiliaries in Textile and related industries.;
12	Health hazards of textile workers and their remedial measures
13	Colour removal technologies
14	Indian and international environmental legislations.
15	Eco-standards, eco-labeling
16	Management and auditing, Management of packaging waste

I. Course Title : Technical textiles
II. Course Code : ATS 602
III. Credit Hours : 3 (2+1)

IV. Rationale

Textile materials are finding ways into various walks of life from home to industry to warfare, with technical performance, meeting the demands of varied fields. The global demand for a variety of such textiles has continuously increased in end use industries. Demand is on the rise from these end use industries, such as automotive, construction, healthcare, protective clothing, agriculture, sports equipment/ sportswear and environmental protection. In India the area of technical textiles has to pace up to meet the ever growing demands of industry and other applications. The area of technical textiles provides immense research opportunities to the students to develop/ customize functional performance of clothing.

V. Aim of the course

- To impart knowledge regarding types, composition, characteristics and uses of technical textiles.
- To acquaint the students with manufacturing techniques and uses of nanofibres and micro fibres.

VI. Theory

Unit I: Introduction to technical textiles

Technical textiles- importance, classification, types of fibres and materials.

Unit II: Developments in nano fibre and micro fibres

Types of nano and micro fibres, performance characteristics, production and application; Developments in nano fibre based non-wovens

Unit III: Technical textiles in industrial applications

Agro tech, Build tech, Geo tech, Mobil tech, pack tech, indu tech and oeko tech.

Unit IV: Technical textiles in personal environment

Medi tech, Pro tech, Sport tech, Home tech and Cloth tech.

Unit V: Smart textiles

Factors affecting the selection and uses of smart textiles, phase change materials, chromic materials, shape memory materials. Conductive materials and other functional materials- characteristics and its applications.

VII. Practicals

1. Introduction to all types of Technical textiles – showcasing the fabric samples and their applications.

2-3. Survey for technical textiles in the market and collection of swatches.

4. Identification of swatches, preparation of technical textile portfolio.
5. Preparation of nano particles for an end-use and their characterization.
6. Application on textiles.
7. Assessment of the functional property of nano finish on textiles.

8-9. Agri tech applications- mulch formation for nursery raising (interface with Agricultural college).

10. Medi tech applications – preparation of any anti-microbial finishing solution for application on hospital textiles/ patient monitoring/ similar application.

11. Application of anti-microbial finish on fabric.
12-13. Assessment of anti-microbial finish on fabric – visit to the lab having microbiology facility.
14-15. Mini project (group activity)- Designing technical textiles/ smart textiles using phase change materials/ shape memory materials/ dopplers, etc. for specific functional performance.

VIII. Teaching Methods/ Activities

- Lecture
- Videos and films
- Video conferencing
- Assignments
- Student's presentation
- Group activity
- Exposure visits to Centre of Excellence for Technical Textiles

IX. Learning Outcome

After successful completion of this course, the students are expected to:

- Understand the functions and uses of various technical textiles, nanofibres and microfibers.
- Aware of recent development in the field of technical textiles
- Design and customize protective wear for various end uses

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topics
1	Technical textiles-Introduction, definitions, scope Classification of technical textiles-areas of application

Duration (week)	Topics
2	Fibres used in technical textiles-domestic fibres, high functional fibers, Form of Textile Fibers in technical textiles, Finishing of technical textile materials
3	Growth of textile materials, Progress of Technical textiles in Global Market
4	Developments in nanofibre and micro fibres
5	Types of nano and micro fibres, performance characteristics
6	Production and application, Developments in Nano-fibre, microfibre
7	Production and application, Developments in nanofibre based non-wovens
8	Technical textiles in industrial applications: Agro tech, Build tech
9	Technical textiles in industrial applications: Geo tech, Protech
10	Technical textiles in industrial applications: indu tech and oeko tech.
11	Technical textiles in industrial applications: Mobil tech, pack tech
12&13	Smart textiles: Factors affecting the selection and uses of smart textiles
14	phase change materials, chromic materials, shape memory materials
15	Conductive materials, - characteristics and its applications.
16	Other functional materials- characteristics and its applications.

I. Course Title : Technological Developments in Textiles and Apparel

II. Course Code : ATS 603

III. Credit Hours : 2 (2+0)

IV. Rationale

The advancements in Science and Technology have brought in revolutionary changes in the field of textiles and apparel. The application of these technologies improved the functional characteristics of textiles and made a beginning of functional clothing for variety end-use performance. The advancements in innovative fibre production, spinning, weaving, wet processing, dyeing and printing, garment production technology offer wide opportunities for research.

V. Aim of the course

- To develop awareness about the recent advances in production, manufacturing, processing, testing and quality control of various textiles and apparels.

VI. Theory

Unit I: Recent advances in manufacture of textile and garments

Recent researches in production and manufacture of textile fibres, yarns, fabrics and garments. Chemical processing of natural and synthetic textiles and their conversion into clothing.

Unit II: Developments in the field of functional textiles

Developments in the field of functional textiles; Use of special techniques in textile processing.

Unit III: Innovations in garment technology and apparel manufacturing

Innovations in apparel designing; Developments in garment manufacturing technology; Advances in retailing; merchandising; biological and psychological aspects of clothing.

Unit IV: Research issues

Thrust areas of contemporary research and future projections

VII. Teaching Methods/ Activities

- Lecture
- Videos/films
- Assignment
- Student's presentation
- Guest Lectures
- Expose visits
- Participation in seminars

VIII. Learning Outcome

After successful completion of this course, the students are expected to:

- Possess in depth knowledge of latest developments in textile and apparel industry
- Develop a perspective on contemporary research issues in the field of textiles and apparel.

Weekly Lecture Schedule

Duration (week)	Topics
1	Recent advances in production and manufacturing of textile fibres.
2	Recent advances in production and manufacturing of textile yarns and blends.
3	Recent advances in production and manufacturing of fabrics and garments.
4	Chemical processing of natural and synthetic textiles and their conversion into clothing

Duration (week)	Topics
5	Developments in the field of functional textiles
6&7	Special techniques in textile processing with reference to functional textiles
8	Innovations in apparel designing, softwares used
9	Innovations in textile designing, software used
10	Developments in garment manufacturing technology
11	Advances in merchandising
12	Advances in retailing
13	Biological and psychological aspects of clothing.
14	Future projections in apparel research
15&16	Future projections in textile research

I. Course Title : Colour Application in Textiles

II. Course Code : ATS 604

III. Credit Hours : 2 (1+1)

IV. Rationale

Colour plays a very important role in selection of textiles and apparel. The key issue in colouration of textiles is the colour control system in the industries where colour matching among the batches of dyed textiles is paramount. Knowledge of colour measurement is imperative to the students to take up research in the field of dyeing and printing and pursue career in the wet processing industries.

V. Aim of the course

- To give an in depth knowledge into theories of dyeing band dye chemistry.
- To acquaint the students with different color matching systems and its assessment.

VI. Theory

Unit I: Colour theory and Dye Structure

Theory of colour science. Dyeing theories- physical, chemical, fibre complex, solid solution and pigment. Dye structure- size, shape and molecular weight of dye, state of the dye, electrical nature of dye molecule, chemical groups attached to dye and dyeing parameters.

Unit II: Colour measurement system

Colour measurement systems- Spectrophotometer- features, types and viewing systems; Software and hardware for colour measuring systems; Objective specification of colour- tristimulus values, colour strength, colour difference, shade sorting and various colour spaces; Assessment of whiteness, yellowness and brightness; Assessment of fastness of colour.

Unit III: Computer Colour Matching

Computer Colour Matching- Theory, Isomeric and metameric colour matching, accuracy of match prediction, measurement of reflectance, benefits; Pass Fail Systems.

VII. Practicals

1-2. Identification of dye classes: primary and confirmatory tests- direct, basic, acid, sulphur, vat, and reactive dyes.

3-4. Handling colour spectrophotometer- familiarization of commands to use Software

5-6. Recording reflectance values of coloured samples, recording colour strength.
7. Assessment of colour fastness and recording the grey scale fastness grades
8. Colour assessment techniques for assessing dyed fibre, yarn and fabric.
9. Determination of relative dye strength in solution
10-13. Creation of data files and reproduce dyed samples with the match prediction
14. Management and interpretation of data generated
15. Exposure to Pass/ Fail system in industry
16. End-term assessment

VIII. Teaching Methods/ Activities

- Lecture
- Demonstrations and hands on experience
- Assignment
- Guest Lectures
- Exposure visits

IX. Learning Outcome

After successful completion of this course, the students are expected to

- Be Confident in handling the Spectrophotometers
- Assess the dyed fibre, yarn and fabric
- Predict computer colour matching

Weekly Lecture Schedule

Duration (week)	Topics
1	Theory of colour science.
2	Dyeing theories- physical, chemical, fibre complex,
3	Dyeing theories- solid solution and pigment
4	Computers match prediction in dyeing fibres, yarns, fabrics and formulation of dyeing recipes
5	Dye structure- size, shape and molecular weight of dye, state of the dye
6	Electrical nature of dye molecule,
7	Chemical groups attached to dye; Dye and dyeing parameters.
8	Colour measurement systems- principles, types and uses in colour assessment
9	Software and hardware for colour measuring systems
10	Objective specification of colour, colour difference,
11	Shade sorting and various colour spaces.
12	Assessment of whiteness, yellowness & brightness
13	Assessment of fastness of colour

Duration (week)	Topics
14	Computer Colour Matching-Theory, Isomeric and metameric colour matching
15	Accuracy of match prediction, measurement of reflectance, benefits
16	Pass - Fail Systems

I. Course Title : Functional Clothing
II. Course Code : ATS 605
III. Credit Hours : 3 (2+1)

IV. Rationale

Today clothing is considered not only for aesthetic aspect but also to perform specific function. Functional clothing represents the evolutionary segment of the technical textiles market, representing an area where clothing crosses the conventional boundaries and integrates with the domains of medicine, biotechnology, nanotechnology, physics and computing among others, to meet the multifaceted and complex requirements of the user. Immense customised research opportunities make this course very interesting to the students.

V. Aim of the course

- To understand the importance of functional and portable clothing
- To identify and analyse the functional features in special purpose clothing
- To develop skill in designing functional clothing for special purpose

VI. Theory

Unit I: Introduction to functional clothing and other associated aspects

Clothing as a portable environment. Comfort in clothing - principles of heat transfer in apparels, thermal insulation, clothing systems for thermal protection, breathable textiles.

Unit II: Clothing design for special groups

Functional Design Process; Clothing design for special groups – expectant and lactating mothers, clothing design to accommodate differently abled. Geriatric clothing; Impact theory- designing impact-protective clothing

Unit III: Functional and protective clothing

Requirements and designing of functional and protective clothing – sports, farm, military, industrial workers, fire fighters, mines, space and marine. Fastening systems in clothing.

VII. Practicals

1-2. Survey on selected functional clothing available in the market.
3. Functional designing process- Assessment of functional aspects
4. Designing clothing for expectant woman
5. Designing clothing for nursing mothers.
6. Designing garments for physically handicapped – disabled hands.
7. Designing garments for physically handicapped – disabled legs
8. Designing garments for physically handicapped – wheel chair incumbent
9. Designing protective clothing for pesticide applicators and analysis
10. Designing protective clothing for selected industrial workers and analysis

11. Designing protective clothing for fire fighters and analysis.
12. Designing impact clothing- use of different material and techniques of padding
13. Designing locale specific sports clothes and analysis.

14-15. Mini Project- Designing customized functional clothing

16. End-term assessment

VIII. Teaching Methods/ Activities

- Lecture
- Assignment
- Publication Review
- Student presentation
- Group Work
- Case Analysis and case studies
- Guest Lectures
- Video

IX. Learning Outcome

After successful completion of this course, the students are expected to:

- Design functional clothing
- Customize clothing for a special purpose

Weekly Lecture Schedule

Duration (week)	Topics
1	Introduction to functional; Concept clothing and other associated aspects
2	Clothing as a portable environment.

Duration (week)	Topics
3	Comfort in clothing, Types of comforts
4	Principles of heat transfer in apparels
5	Thermal insulation, clothing systems for thermal protection; Breathable textiles
6	Functional Designing Process
7	Requirements and designing functional clothing for special groups – expectant and lactating mothers
8	Key requirements in designing functional clothing for special groups- physically handicapped
9	Impact theory- designing impact-protective clothing- Ballistic materials & bullet proof vests
10	Requirements and designing of functional and protective sports clothing
11	Requirements and designing of functional and protective farm clothing
12	Key issues in designing of functional and protective clothing military
13	Requirements and designing of functional and protective clothing industrial workers
14	Requirements and designing of functional and protective clothing fire fighters
15	Requirements and designing of functional and protective clothing mines, space and marine
16	Fastening systems in clothing.

I. Course Title : Textile Conservation

II. Course Code : ATS 606

III. Credit Hours : 2 (1+1)

IV. Rationale

Textiles and costumes of bygone era are valued for their historic interest, their aesthetic appeal and their cultural significance. A course on Textile conservation helps to understand the techniques to be adopted for addressing the damage of textile or a costume due to storage.

V. Aim of the course

- To impart basic knowledge on textile conservation.
- To develop awareness about textile conservation and skill in assessment of damage, repair and stabilization of textiles.

VI. Theory

Unit I: Introduction to textile conservation

Importance of textile conservation; Important terminologies in conservation; Various methods for analysis of textiles - fibre content, yarn and fabric structure.

Unit II: Object examination and Assessment

Object examination; Damage causing agents – insects, pests, microorganisms, mildew, and environmental factors; Condition assessment, repair and stabilization of textiles and apparel in museum collections; Recording, handling and pre-preparations in conservation; Materials and methods used for conservation treatments.

Unit III: Support and Considerations in textile conservation

Support and Considerations in textile conservation; Reassembly and Finishing;

Examination of storage and exhibition techniques; Transportation of artifacts/ historic textiles; Equipment and the workspace for textile conservation

Unit IV: Principles of cleaning fragile textiles

Principles of cleaning fragile textiles; Dry, aqueous and solvent cleaning; Conservation of Linen and Flags, historic costumes and feather work, lace, leather goods, tapestries and carpets; Proper conditions for storage and display of various textiles.

VII. Practicals

1-2. Visit to a museum and study of various textile conservation methods
3-4. Analysis of aged textiles - fibre content, yarn and fabric structure
5-6. Assessment of damage
7-9. Repair and stabilization of textiles
15. Determination of colour strength
11-12. Exposure to cleaning techniques
13-15. Mini Project work
16. End-term assessment

VIII. Teaching Methods/ Activities

- Lecture
- Videos/films
- Visit to Museums
- Student's presentation
- Case study

IX. Learning Outcome

After successful completion of this course, the students are expected to

- Develop skill in textile conservation and assessment of damage, repair and stabilization of textiles
- Become confident to take up career in Museum and related institutes

Weekly Lecture Schedule

Duration (week)	Topics
1	Importance of textile conservation; Important terminologies in conservation; Various methods for analysis of textiles - fibre content, yarn and fabric structure.
2	Various methods for analysis of textiles - fibre content, yarn and fabric structure.
3	Object examination. Damage causing agents – insects, pests, micro organisms, mildew, and environmental factors.

Duration (week)	Topics
4	Condition assessment, repair and stabilization of textiles and apparel in museum collections.
5	Recording, handling and pre-preparations in conservation; Materials and methods used for conservation treatments
6	Support and Considerations in textile conservation; Reassembly and Finishing
7	Examination of storage and exhibition techniques.
8	Transportation of artifacts/ historic textiles; Equipment and the workspace for textile conservation
9	Principles of cleaning fragile textiles Dry, aqueous and solvent cleaning.
10	Conservation of Linen and Flags
11	Conservation of historic costumes and feather work, lace
12	Conservation of leather goods, tapestries and carpets, etc.
13	Proper conditions for storing of various textiles
14	Proper conditions for display of various textiles – curtains, bedsheets, flat fabrics, carpets, tapestries, etc
15	Categorization of Display Techniques Mannequins, Slanting Technique, Mounting Technique
16	Categorization of Display Techniques, Hanging Technique, Vacuumed with Inert Gas

I. Course Title : Operations Management in Textiles and Apparel

II. Course Code : ATS 607

III. Credit Hours : 3 (3+0)

IV. Rationale

The very essence of any business is to cater needs of customer by providing services and goods, and in process create value for customers and solve their problems. Production and operations management talks about applying business organization and management concepts in creation of goods and services. Proper management of References based on effective planning, reduction in production costs through control of material handling, improving the productivity, ergonomic interventions, and so on contribute to success of the industry.

V. Aim of the course

- To enable students to understand the importance of operations management in textiles and apparel industries.
- To impart in depth knowledge about various concepts of production and operations management for textiles and apparel units.

VI. Theory

Unit I: Scope of production and operations management in textiles and apparel

Scope of production and operations management in textiles and apparel, methods and measurement of capacity planning. Plant climatology-Plant building and its significance, considerations of building design, types of industrial building- plant lighting; need, types and factors governing. Importance of ventilation.

Unit II: Plant location

Plant location; factors governing, types of location; rural, sub-urban and urban, merits and demerits. Plant layout; objectives of scientific layout, principles of layout, types of material flow, factors governing the layout, types of layouts, merits and demerits.

Unit III: Material handling

Material handling- need, classification, handling costs, principles and types of material handling equipment; Maintenance management- need, types, organisation of maintenance department, maintenance audit, maintenance cost, maintenance indices.

Unit IV: Work study

Work study- need, objectives from apparel and textile industry point of view; Method study- steps in method study, tools of record. Time study-time and motion economy, steps, elements, allowances, work measurement and derivation for standard minute value (s m v or s a m) – calculations from apparel industry; Ergonomics- meaning, scope in apparel and textile industry, impact on working conditions and productivity, recommendations for better ergonomically conditions.

Unit V: Automation in Textile & Apparel Industries & Government Policies:

Mechatronics in Apparel & Textile Industries; Scope for Robotics and applications in Apparel & textile Industries; Policies of the government in export and import of materials and made-ups. Government initiatives for various sectors of textile and apparel industry.

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing) and student's presentation
- Group Work
- Guest Lectures
- Exposure visits

VIII. Learning Outcome

After successful completion of this course, the students are expected to:

- Acquired in depth understanding of various concepts of production and operations management in textiles and apparel units
- Prepare for management careers in Apparel and textile units

16	Policies of the government in export and export of materials and madeups. Government initiatives for various sectors of textiles and apparel industry

I. Course Title : Technology of Nonwovens

II. Course Code : ATS 608

III. Credit Hours : 2(2+0)

IV. Rationale

Nonwoven textiles are one of the most popular multi-utility textiles produced in the world. These encompass a large variety of raw materials and production technologies and characteristics. Knowledge of nonwovens will help in increasing the competency of the students in the field of textiles.

V. Aim of the course

- To acquaint the students with raw materials used, manufacturing techniques, characteristics and uses of nonwovens
- To impart knowledge related to testing and evaluation of nonwoven textiles.

VI. Theory

Unit I: Development of the nonwovens industry

Development of the non-woven industry. Types of Nonwovens- dry, wet and polymer-laid non-woven, web formation, bonding and raw materials.

Unit II: Types of web formation

Types of web formation, mixing and blending, card clothing, cross lapping.

Developments, physical properties and practical applications of air laid fabrics. Wet-laid fabrics- raw materials, bonding systems, finishing and product application. Polymer- laid fabrics- raw materials, bonding techniques, spun-bond fabrics, characteristics, properties and other extrusion properties.

Unit III: Types of bonding

Types of bonding: Mechanical bonding- stitch, needle punching, hydro entanglements process technology and applications. Thermal bonding- raw materials, contact, thermal reaction/ infrared and ultrasonic bonding and applications. Chemical bonding- chemicals, binder polymers, mechanism, drying and applications.

Unit IV: Non-woven fabric finishing

Non-woven fabric finishing - wet, chemical, lamination, mechanical, surface and other developing technologies. Fabric inspection.

Unit V: Characterization of non-woven fabrics

Characterization of non-woven fabrics - weight, thickness, density and other structural parameters. General standards for testing non wovens- absorption, strength, bonder and optional properties.

VII. Teaching Methods/ Activities

- Lecture
- Videos/films
- Assignment
- Student's presentation
- Group Work
- Guest Lectures
- Field visits

VIII. Learning Outcome

After successful completion of this course, the students are expected to:

- Develop knowledge about fundamental techniques of nonwoven textiles.
- Undertake testing and evaluation of nonwoven textiles.

IX. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topics
1	Development of the non-woven industry.
2	Types of Non wovens- dry, wet and polymer- laid non-woven, web formation, bonding and raw materials.
3	Types of web formation, mixing and blending, card clothing, cross lapping
4	Development, physical properties and practical applications of air laid fabrics. Wet-laid fabrics- raw materials, bonding systems, finishing and product application
5	Polymer- laid fabrics- raw materials, bonding techniques, spun-bond fabrics, characteristics, properties and other extrusion properties.
6	Types of bonding: Mechanical bonding- stitch, needle punching, hydro entanglements
7	Process technology and applications. Thermal bonding- raw materials, contact,
8	Thermal reaction/ infrared and ultrasonic bonding and applications.
9	Chemical bonding- chemicals, binder polymers, mechanism, drying and applications.
10	Non-woven fabric finishing - wet, chemical, lamination, Fabric inspection.
11	Non-woven fabric finishing - mechanical, surface and other developing technologies. Fabric inspection.
12	Characterization of non-woven fabrics - weight, thickness, density and other structural parameters.
13	General standards for testing non wovens- absorption, strength, bonder and optional properties.
14	Testing and evaluating of Laminated fabrics

I. Course Title : Research and Publication Ethics
II. Course Code : ATS 611
III. Credit Hours : 2 (1+1)

IV. Aim of the course

- To focus on basics of philosophy of science and ethics, research integrity, publication ethics
- To provide hands-on experience to identify research misconduct and predatory publications, Indexing and citation databases, open access publications, research and plagiarism tools

V. Theory

Unit I: Philosophy and Ethics

Introduction to philosophy- definition, nature and scope, concept, branches; Ethics: definition, moral philosophy, nature of moral judgments and reactions

Unit II: Scientific Conduct

Ethics with respect to science and research; Intellectual honesty and research integrity; Scientific misconducts- Falsification, Fabrication, and Plagiarism (FFP); Redundant publications; duplicate and overlapping publications, salami slicing; Selective reporting and misrepresentation of data

Unit III: Publication Ethics

Publication ethics- definition, introduction and importance; Best practices/ standards setting initiatives and guidelines- COPE, WAME, etc.; Conflicts of interest;

Publication misconduct: definition, concept, problems that lead to unethical behavior and vice versa, types; Violation of publication ethics, authorship and contributorship; Identification of publication misconduct, complaints and appeals; Predatory publishers and journals

VI. Practicals

Unit IV: Open Access Publishing

Open access publications and initiatives; SHERPA/RoMEO online resource to check publisher copyright & self-archiving policies; Software tool to identify predatory publications developed by SPPU, Journal finder/journal suggestion tools, viz., JANE, Elsevier Journal Finder, Springer Journal Suggested, etc.

Unit V: Publication Misconduct

Group Discussions - Subject specific ethical issues, FFP, authorship; Conflicts of interest; Complaints and appeals: examples and fraud from India and abroad
Software tools- Use of plagiarism software like Tumitin, Urkund and other open source software tools

Unit VI: Databases and Research Metrics

Databases- Indexing databases; Citation databases: Web of Science, Scopus, etc.
Research Metrics - Impact Factor of journal as per Journal Citation Report, SNIP, SJR, IPP, Cite Score; Metrics: h-index, g index, i10 index, altmetrics.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 6

Community Science
– Extension Education and Communication Management

Preamble

(Extension Education and Communication Management)

Specialisation in Extension Education and Communication Management, should foster unique capabilities and competitive skills among students to satisfy the community that is with versatile information needs. This is exceedingly challenging in the world of digital media device and product development, as well as their usage. Extension education being an advisory system of application of latest scientific and technological innovations, its amalgamation with communication management for effective and sustainable human development is the cutting edge. Moreover the Education Policy lays meticulous emphasis on the development of creative potential of each individual, for remunerative career opportunities. Professionalism in planning of extension systems and implementation through effective communication thus becomes an integral part of this component. In the advent of change in the nomenclature from Home Science to Community Science where the sphere of clientele enlarged, it has become all the more crucial for improvisation.

Accordingly, the courses being offered were critically reviewed for their contribution in molding students as professional extension scientists. Based on this, some courses are continued, but with addition of content in view of contemporary developments. New courses, six and four course in M.Sc. and Ph.D., respectively are included to fill the gaps. Overall, the courses can be categorized into three: i) Extension systems and processes, ii) Media development and management and iii) Extension research. With adequate practical component, all the courses persuade participative learning.

A multi-dimensional approach is adopted to deal with the techniques/ technologies to encourage entrepreneurship development. Innovative methodologies are suggested to advance the understanding and vision of the students. Simulated learning through project mode i.e. attachment of students to AICRP units for transfer of technology, and University Extension programmes is incorporated. Knowledge entrepreneurship development education by means of special projects for teaching/learning materials for differently able groups is planned to enlarge the creativity of students. Special project encourages outsourcing of students skills, thus making them specialized service providers. Teaching methods like Inter-university exchange through online group discussions make students competitive.

Modifications Suggested in Courses in the Revised Curricula

M.Sc. Community Science (Extension Education & Communication Management)

Course Code	Course Title	Credit Hours	Remarks
	Major Courses		
EECM 501	Global Extension Systems	3 (3+0)	Content modified in view of emergence of innovative processes in extension systems
EECM 502	Development communication	3 (2+1)	Title changed and content modified to suit to developmental challenges
EECM 503*	ICT and New Media	4 (1+3)	Credits enhanced and content modified by focusing ICT in community education
EECM 504*	Technology Transfer and Management	3 (1+2)	New course to engage students for on-hands training by attaching to AICRP/KVKs
EECM 505*	Dynamic Communication skills	3 (1+2)	New course for development of holistic communication skills.
EECM 506	Participatory Programme Management	3 (1+2)	Content modified for practical orientation to application and analysis in different situations

Course Code	Course Title	Credit Hours	Remarks
EECM 507	Organizational Development and HRD	2 (1+1)	New course to orient students towards professional management of organizations.
EECM 508	Educational Technology	3 (2+1)	Content modified to achieve proficiency in teaching and learning.
EECM 509	Group Dynamics	2 (2+0)	Content modified, highlighting adoption of SHG for simulated learning
EECM 510	Community Development and Outreach	3 (2+1)	New course to stimulate strong connection with community and communication.
EECM 511*	Climate change management	2 (1+1)	New course to mold students as service providers in climate change management.
EECM 512	Gender Sensitization for Empowerment	2 (2+0)	Content modified to promote interest in national gender sensitive issues.
EECM 513	Special Project- Out sourcing for Media product development	2 (0+2)	New course for entrepreneurial skills.
	Minor Courses		
FN 505	Nutrition and Physical fitness	3(2+1)	Proposed minor courses from subjects closely related to a student's major subject.Apart from these courses a student can register any other course
FN 509	Food Safety and Standards	3(2+1)	
FN 513	Human Physiology	3(3+0)	
HDFS 503	Methods and Techniques of Assessment in Human Development	3(2+1)	
HDFS 506	Management of differently abled	3(2+1)	
ATS 512	Apparel and Textile Product Development	2(1+1)	
ATS 513	Laboratory Techniques in Textiles Research	2(0+2)	

Course Code	Course Title	Credit Hours	Remarks
RMCS 513	Environmental Resource Management	2(1+1)	offered by any other departments
RMCS 508	Product Design	3(1+2)	
RMCS 507	Consumer Issues and Legislations	2 (2+0)	
	Supporting Courses		
	Research methodology	3(2+1)	Course numbers will be assigned by the departments that offer these courses.
	Statistics	3(2+1)	
	Total	**6(4+2)**	
	Common Courses		
	Library and Information Services	1(0+1)	The common courses will be registered with the respective departments that offer these courses
	Technical Writing and Communication Skills	1(0+1)	
	Intellectual Property and its management in Agriculture	1(0+1)	
	Basic Concepts in Laboratory Techniques	1(0+1)	
	Agricultural Research, Research Ethics and Rural Development Programmes	1(0+1)

EECM591	Seminar	1(0+1)	
EECM599	Thesis/Research	30	
	Total	**70**	

*Compulsory core curses

Ph.D. Community Science (Extension Education and Communication Management)

Course Code	Course Title	Credit Hours	Remarks
	Major Courses		
EECM 601*	Managerial Skills for Extension Professionals	3 (2+1)	Content updated for delivery of specialized extension support in competitive environment

Course Code	Course Title	Credit Hours	Remarks
EECM 602	Impact Assessment of Development programmes	3 (1+2)	New title, by taking a part of content from HECM 606 , Monitoring, Evaluation and Impact Assessment. Content focuses on Case study method
EECM 603*	Scaling Techniques for Behaviour Research	3 (1+2)	New course, to provide expertise in development of scales.
EECM 604	Design and Development of e-Extension Project	3 (0+3)	New course to provide comprehensive experience of Extension-Research-Education through digital communication.
EECM 605	Sustainable Livelihood Systems	2 (1+1)	Content updated, highlighting sustenance processes to different contexts and situations of uncertainty
EECM 606	Extension Research Project Management	3 (1+2)	Title of HECM 604 Research project management is changed and content modified to focus on Extension research
EECM 607	Media application and Product Promotion	4 (2+2)	Basics of media are covered at UG and M.Sc. level. Hence HECM 603 Advanced media management is

Course Code	Course Title	Credit Hours	Remarks
			modified for application skills in media product development
EECM 608	Advocacy and Behavior Change Management	3 (1+2)	New course to provide skills for logical thinking in planning behaviour change communication programme.
	Total	24 (9+15)	
	Minor Courses		
FN 604	Global Nutrition Problems	2(2+0)	Proposed minor courses from subjects closely related to a student's major subject.Apart from these courses a student can register any other course offered by any other departments
FN 608	Energy Metabolism	2(2+0)	
HDFS 608	Qualitative research methods	3(2+1)	
ATS 602	Technical Textiles	3(2+1)	
ATS605	Functional Clothing	3(2+1)	
ATS 607	Operational Management in Textiles and Apparel	2(2+0)	
RMCS 603	Globalization and Consumer Economics	3 (2+1)	
RMCS 606	Environmental Issues and Challenges	2 (2+0)	
RMCS 607	Family Dynamics and Women Power	3 (2+1)	

Supporting Courses

Student can choose any course relevant to the research from other faculties of the University or from Swayam portal or online courses.

EECM 691	Doctoral Seminar I Optional Field)	1 (1+0)	
EECM 692	Doctoral Seminar II (Core Field)	1 (1+0)	
EECM 699	Research	75	
	Total	100 Credits

Course Contents
M.Sc. (Community Science) in Extension Education and Communication Management

I. Course Title : Global Extension Systems

II. Course Code : EECM 501

III. Credit Hours : 3 (3+0)

IV. Rationale

India has the pre and post-independence history of extension programmes. In course of time many changes occurred in policies and plans based on ever changing needs. Based on lessons learned with in the country and from other developing countries, all the time new efforts are being made making extension system more strategic. This course provides such information with an analytical perspective of Indian extension system in comparison with other countries over the Globe. It will give an opportunity to the students to get an insight into the strengths and weakness of each of the system, to mould themselves as policy contributors and planners.

V. Aim of the course

- To appraise students the perspectives of extension systems in India
- To enable students for comparative analysis of Indian extension systems with other countries
- To acquaint students with the extension systems in ICAR and SAUs.

VI. Theory

Unit I: Orientation to extension systems

Early extension efforts; Indian extension systems - reforms, challenges of extension management in India; Paradigm shift in extension systems; Extension approaches in view of globalization and market liberalization; Privatization of extension services – introduction, scope, advantages, limitations and experiences; Decentralization of extension systems; Revolution in extension systems.

Unit II: Governance and extension systems

Indian governance and role of extension systems - retrospection on Indian governance; Role of extension system; Ministries - rural development, agriculture, science and technology, human resource development, health, industries, education and women and child development; NGO collaboration; Review of five year plans.

Unit III: ICAR extension system

History; Extension system; Organisational structure; Policy issues; Existing extension systems and challenges; National and regional institutions - vision, objectives, activities, innovations, programmes; Extension systems in SAUs - organisational structure, personnel, roles, innovations, SWOT analysis.

Unit IV: Extension management and training organisations and institutions

FAO, IFAD, IFRI, WFO, WHO, *Biodiversity international,* MANAGE, NIRD, National Institute of Agricultural Marketing (NIAM), NAARM, EEI, SAMETI, FTC.

Unit V: Comparative analysis of extension system

India with USA, UK, Israel, China, Pakistan, Bangladesh, Japan, Italy, South Africa, Island, Indonesia, Philippines and Brazil - history, approaches, organizational structure, methodology, services, problems and research linkages.

VII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's Book/Publication Review
- Students' presentation
- Online group discussion

VIII. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend different national and other global extension systems and their focus areas.
- Compare and analyse the differences in extension systems between nations in terms of their approaches and priorities.
- Explain extension systems in ICAR and SAU.
- Conceptualise the challenges in execution of extension systems.

Weekly Lecture Schedule

Duration (week)	Topic
1.	Early extension efforts, Indian Extension systems – Reforms, Challenges of extension management in India, Paradigm shift in extension systems.
2.	Extension approaches in view of globalization and market liberalization, Privatization of extension services - Introduction, Privatization of extension services – Scope, Advantages and limitations.
3.	Privatization of extension services – Experiences, Decentralization and devolution of extension services, Revolution of extension systems.
4.	Retrospection on Indian governance, role of extension system , Ministry of Rural Development, Ministry of Aagriculture and Farmers' Welfare.
5.	Ministry of Science and Technology, Ministry of Human Resource Development, Ministry of Industries.
6.	Ministry of Women and Child Development, Ministry of Health and Family Welfare.
7.	NGO collaboration, Review of five year plans.

Duration (week)	Topics
8.	History of extension systems in ICAR organisational structure of extension system, Policy issues, Existing extension systems and challenges, National and regional extension institutions – Vision and objectives.
9.	National and regional extension Institutions - Programmes and activities, National and regional extension institutions- Innovations and interventions, National and regional extension Institutions- Case studies and success stories.
10.	Extension systems in SAUs - Organisational structure, Personnel and roles, Extension systems in SAUs – Role of extension in academic, Research and training activities, Innovative extension systems in SAUs- Case studies.
11.	SWOT analysis of extension system in SAUs, Introduction, FAO and IFAD. WFO (World Farmers' Organisation) and WHO.
12.	*Bioversity International,* MANAGE, NIRD.
13.	NIAM, NAARM, EEI.
14.	SAMETI and FTC, IFPRI, India and USA, UK - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages.
15.	India with Israel, China - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages, India and Pakistan, Bangladesh - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages, India and Japan, Italy - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages.
16.	India and South Africa, Island - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages, India and Indonesia, Philippines - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages, India and Brazil - History, Approaches, Organizational structure, Methodology, Services, Problems and research linkages.

I. Course Title : Development Communication

II. Course Code : EECM 502

III. Credit Hours : 3 (2+1)

IV. Rationale

Globally, development communication is an approach for sustainable growth in versatile areas of quality life. Communication refers to the use of different types of media for the process of development, while development refers to the process of betterment of a society. Students specializing in EECM play multiple roles in the process of addressing various development issues pertaining to sustainable development goals, which the globe is looking at. This course imparts knowledge and skill to communicate responsive information aiming at feedback. The scope of innovation, creativity and continuity motivates students to make public programmes and policies real, meaningful and sustainable.

V. Aim of the course

- To familiarize students with global perspective of development communication issues
- To impart analytical skills with regard to the process of development communication
- To understand the role and use of media in attaining sustainable development goals.

VI. Theory

Unit I: Over view of development communication- Hypothetical concepts and theories- Press theories

Normative - authoritarian, libertarian, social responsibility, democratic participant theory; Sociological - uses & gratification, agenda setting; two-step flow; Psychological; Bullet theory; Theories of persuasion and advocacy; Critical theory of frank furt school; Attitude change theories; Political economy theory; Critical cultural theory of birmingham school and framing theory.

Unit II: National and international perspectives of development communication

National and international perspectives; Evolution of development communication concept; Government and non-government initiatives; Government and non-government organisations - FAO, UNDP, WHO, UNICEF, CARE and strategies.

Unit III: Millennium development goals (MDGs) and sustainable development goals (SDGs)

Achievements of MDGs - analytical review and recommendations; SDGs - document, vision and objectives; Targets and strategies for implementation.

Unit IV: Research perspectives of development communication:

Emerging issues; Measurable and variables of development communication; Existing research projects; Research lag and supporting organisations.

Unit V: Media initiatives for development communication:

Conventional and contemporary media technologies; Globalisation and media convergence; Ethical issues and media impact analysis.

VII. Practical

1. Research review on hypothetical concepts and theories of Development communication
2. Presentation on hypothetical concepts and theories of Development communication
3. Critical analysis of Sustainable Development goals (SDGs)
4. Report writing and presentation on critical analysis of SDGs
5. Case study preparation focusing national and international organisation efforts for development communication.
6. Presentation of national and international organisation efforts
7. Critical review on ongoing Development Communication research projects in respective SAUs
8. Presentation on ongoing Development Communication research projects
9. Interaction with personnel and consumers of development communication projects and group discussion.
10. Interaction with personnel and consumers of development communication projects and group discussion.
11. Selection of contemporary media for development of communication issue, dissemination through existing channels of respective SAUs
12. Analysis of contemporary media for development of communication issue
13. Analysis of contemporary media for development of communication issue

14. Presentation of media analysis of the issue
15. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's Book/Publication Review
- Simulation exercise
- Media development and transmission
- Student presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend the theories and perspectives of development communication
- Critically analyse SDGs in terms of niche research in development communication
- Understand the process of development communication in various national and international organizations
- Recognise the efforts of SAUs for development communication
- Plan and disseminate communication media on development issues

Duration (week)	Topics
	international perspectives of development communication - Evolution of development communication concept.
9.	Government and non-government initiatives, Organisations and strategies – FAO.
10.	Organisations and strategies - UNDP, Organisations and strategies - WHO.
11.	Organisations and strategies - UNICEF, Organisations and strategies - CARE.
12.	Millennium development goals (MDGs) and sustainable development goals (SDGs) - Achievements of MDGs - Analytical review and recommendations, Achievements of MDGs - Analytical review and recommendations.
13.	SDGs - Document, Vision and objectives of SDGs.
14.	Targets and strategies for implementation, Research perspectives of development communication - Emerging issues, Measurable and variables of development communication.
15.	Existing research projects, Research lag and supporting organisations, Media initiatives for development communication - Conventional and contemporary media technologies, Globalization and convergence.
16.	Mass media and ethical issues, Mass media impact analysis.

I. Course Title : ICT and New Media

II. Course Code : EECM 503

III. Credit Hours : 4 (1+3)

IV. Rationale

A revolution has occurred in information technology, significantly impacting human communication; thereby human development. The speed and rapidity of information process due to information technology revolution, maximised the gadget adoption and usage irrespective of geographical and demographical range. Thus, a new set of relationships and responsibilities emerged among the information processors to satisfy the information needs of versatile users. This course provides such competency among the students for interactive communication in a flash to any corner of the world.

V. Aim of the course

- To familiarize students with ICT and new media technologies and provide application skills though industry attachment
- To provide hands-on-experience on application of ICT tools and devices
- To expertise in analytics tracking to analyse information reach.

VI. Theory

Unit I: Information communication technology

Information communication technology - components of ICT, role of ICT in community education; IT enabled services - call centre, helpdesks, data warehouse; Current status of application; Government policy on ICT; Emerging research issues.

Unit II: Perspective of new media

Definitions, Soft and hardware components, Traditional media transition to new media; Knowledge management and archiving; Networks; Social Media - advantages and limitations.

Unit III: Multimedia - concept and evolution

Digital Audio - sound design and mixing, digital videography and photography, digital text writing.

Unit IV: Web and blog designing

Hosting; Introduction of HTML and basic tags and HTML document structure; Cascading style sheets; Text in CSS and working.

VII. Practical

1. Multimedia and emerging technologies - Introduction to Video-on demand, internet - radio and web television
2. Introduction to Internet and the browsers
3. Introduction to Internet access and browsing
4. Introduction to Internet access and browsing extension related websites, blogs and data bases
5. Exposure to network
6. Compose e-mails, send and receive mails
7. Video on demand- different video formats
8. Creating a Basic Video Clips with Video Editing software.
9. Adding audio into developed videos
10. Editing of existing videos and audios
11. Video on demand-accessing downloads and editing of required video formats
12. Internet radio- Accessing different radio channels in online websites and browsing
13. Web Television- Exposure and accessing
14. Impact of new media on traditional media- listing of various traditional media and new media formats- collection of literature
15. Group discussion/debate on advantages and disadvantages of traditional media and new media
16. Writing on specialized area on the web
17. Writing for general interest web- script writing concepts, principles for web
18. Writing for online- script writing concepts, principles, styles for online
19. Writing for net newspapers and editions- script writing concepts, principles, styles for online
20. Writing for blogs and search engines- script writing concepts, principles, styles for online
21. Writing for video logs, citizen journalism- script writing concepts, principles, styles for online
22. Evaluation of e-journals- Exposure to electronic journals, browsing sites, accessing and down loading the journal articles
23. Evaluation of e-journals
24. Submission of reports
25. Unique features of web language-, open source softwares, viz., wordpress, joomla, moodle
26. Introduction and basics to Advanced HTML
27. Introduction of Cascading Style Sheets
28. Orientation – java script and HTML scripts
29. Designing web page- Home page(landing page), hyperlinks with using CSS
30. Practical exercise on designing a web page by using HTML5 and CSS3.
31. How to create responsive (Mobile friendly) Pages with Using HTML5 and CSS3.

32. Designing web page- Home page, hyperlinks - open source softwares, viz., Wordpress
33. Explanation of WordPress Dashboard and creating blog in Wordpress
34. Hosting a WordPress Blog online
35. Creating Google Analytics
36. Adding Google Analytics into HTML page and Wordpress Pages
37. Introduction to interactive web media- web animation
38. Understanding web animation- jquery, dream weaver and Photoshop
39. Exposure to animated graphics in the web
40. Introduction to designing interactive elements, sound addition
41. Introduction to web visual editor, creation and editing.
42. Acquiring a domain and webhosting to host the website/blog.
43. Familiarisation with FTP and Cpanel
44. Hosting website into Online
45. Updating/change the contents and images online Website after Hosting.
46. How to take the backups of the website after hosting a website.
47. Tracking Web Traffic from Analytics
48. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's Book/Publication Review
- Practice sessions
- Media development and transmission
- Student presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend the role of ICT based services for community education and development
- Figure out the required soft and hard ware components in application of new media for interactive communication
- Develop content for web sites
- Design, develop and manage websites
- Track web analytics and analyse the impact

I. Course Title : Technology Transfer and Management

II. Course Code : EECM 504

III. Credit Hours : 3 (1+2)

IV. Rationale

Technology transfer is the process of transferring skills and knowledge of a proven technology to users for application to enhance and sustain qualitative life. It is the mandate of Agricultural universities to ensure that scientific and technological developments are accessible to a wider range of users who can then further develop and exploit the technology into new products, processes, applications, materials or services. On the other hand, the importance of technology transfer has been increasing with the growing need for modern technologies, innovation, inventions and R&D. In this context, it is pertinent to provide adequate skill and knowledge to the students in transfer of technology and management.

V. Aim of the course

- To acquaint students with the process of TTM
- To provide hands-on-experience in TTM
- To sensitise students towards technology transfer career.

VI. Theory

Unit I: Introduction to technology transfer

Transfer of Technology - Definition and importance; Models of technology transfer -

different models, qualitative technology transfer models, dimensions of technology transfer, features of technology package, routes of technology transfer; FLD, OFT, Minikits.

Unit II: Technology acquisition

Technology acquisition; Alternatives for acquiring new technologies; Reasons; Management of acquired technology; Measures of scale and mechanisms for acquiring technologies - economy of scale, levels of scale, measurement of scale, factors affecting the choice of scale.

Unit III: Introduction to technology management

Concept and meaning of technology management; Evolution and growth of technology management.

Unit IV: Role and significance of technology management

Impact of technology on society; Technology and competition; Key issues in managing technological innovation, Forms of technology - product and process technologies; Technology forecasting - methods and principles; Role of government in technology management.

Unit V: Technological change

Characteristics of technological change; Classification of technological change; Impact of technological change; Technology life cycle; Technology transformation; Technology policies and policy instruments.

Unit VI: Technology assessment

Technology choice; Technology assessment and refinement; Technology assessment process; Technology leadership and followership; Writing technology assessment report.

Unit VII: Invention, innovation and creativity

Meaning and differences; Innovation management; Intellectual property management.

Unit VIII: Technology adoption, diffusion, and absorption

Technology adoption diffusion and absorption; Role of technology absorption - benefits, constraints in technology absorption, technology package and technological dependence, Indian experience in technology absorption efforts, issues involved in the management of technology absorption and government initiatives.

Unit IX: Development of technology

Development process and steps; Technology development and competition; Managing research & development (R & D); Reforms in technology development.

Unit X: Social issues in technology management

Technological change and industrial relations; Implementation of rationalization and automation in India.

VII. Practical

Note: Students may be attached to AICRP on Home Science/ Research project all through the semester for practical experience with either one of the departments, or for a stipulated duration with every department may be left to the discretion of course-in-charge. Students' report may consist the following information.

1. Enlisting of technologies already transferred under five disciplines/ research project.
2. Selection of technologies for observation of change attained and preparation of observation schedule
3. Field visit and interaction with clientele to collect data
4. Analysis of data and preparation of report
5. Presentation of report
6. Group discussion on technology refinement/ sustainability issues
7. Enlisting and description of technologies transferred by the concerned scientist/s during the semester
8. Description of invention, innovation and creativity of the selected technology
9. Description of transfer of technology model
10. Design and development of transfer of technology process
11. Presentation of technology transfer process
12. Preparation and finalisation of work plan for participation in technology transfer

13–25. Execution of work plan as per time line

26. Analysis of technology adoption and diffusion stages
28. Preparation of report on technology transfer
29. Presentation of report
30. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's Book/Publication Review
- Implant training/ Placement
- Student presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend technology transfer perspectives
- Select and execute technology in accordance with the needs of community
- Practice the management process
- Analyse the stages of technology adoption, diffusion and absorption
- Write the report on TTM

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction to technology transfer - Transfer of technology models, Traditional technology transfer models, Qualitative technology transfer models, Dimensions of technology transfer features of technology package, Routes of technology transfer, FLD, OFT, Minikits.
2	Technology acquisition - Technology acquisition, Alternatives and reasons for acquiring new technologies, Management of acquired technology, Measures of scale and mechanisms for acquiring technologies, Economy of scale.
3	Technology acquisition - Levels of scale, Measurement of scale factors affecting the choice of scale, Introduction to technology management - Concept and meaning of technology management, Evolution and growth.
4	Role and Significance of technology management, Impact of technology on society technology and competition, Key issues in managing technological innovation.
5	Forms of technology; Product and process technologies, Technology forecasting-Methods and principles.
6	Role of government in technology management, Technological change - Characteristics and classification of technological change.
7	Technological change - Impact of technological change, Technology life cycle, Technology transformation, Technology policies and policy instruments.
8	Technology assessment - Technology choice, Technology assessment process, Technology leadership and followership.
9	Technology assessment - Reporting technology assessment - Method, Invention, Innovation and creativity - Meaning and differences.
10	Invention, Innovation and creativity - Innovation management, Intellectual property management.
11	Technology adoption, diffusion, and absorption - Technology adoption diffusion and absorption, Role of technology absorption- Benefits.
12	Technology adoption, diffusion, and absorption - Constraints in technology absorption, Technology package and technological dependence.
13	Technology adoption, diffusion, and absorption - Indian experience in technology absorption efforts, Issues involved in the management of technology absorption government initiatives.
14	Development of technology - Developmental process and steps, Managing research & development (R & D).
15	Development of technology - Technology development and competition, Reforms in technology development.
16	Social issues in technology management - Technological change and industrial relations, Implementation of rationalization and automation in India.

I. Course Title : Dynamic Communication Skills

II. Course Code : EECM 505

III. Credit Hours : 3 (1+2)

IV. Rationale

Academic success and career achievement depend much on communication and presentation skills. As master's student, the individual is expected to analyse, prepare and present the content in the class room, conferences and seminars and also write technically and scientifically. Hence dynamic communication includes both oral and written communication. This course builds awareness, understandings and frameworks for skills development in the qualities and attributes of presentational formats that involve the voice and the body when used together with technologies to present ideas and concepts that not only inform but also seek to persuade and motivate.

V. Aim of the course

- To develop competency of students in effective oral communication skills.
- To develop skills in science communication
- To understand corporate and business communication.

VI. Theory

Unit I: Need and importance of communication in present context

Types of communication skills - verbal, non-verbal and written communication; Types of corporate and business communication skills - oral presentations, group discussions, facing interviews, e-mail, memos, business letters, blogs, inter office memorandums, report writing; Hard and soft skills; difference between hard and soft skills.

Unit II: Scientific communication

Meaning; Need and importance; Fora of scientific writing - conference, seminar, symposium, workshop and colloquia; Writing for scientific journals; Thesis writing and writing articles for popular media; Farm journalism and its importance in agriculture and allied sectors; Science communication and formats for scientific writing; Writing for scientific journals and their ratings; NAAS rating; Impact factor and h-index; Oral and poster presentation; Reading and comprehension of - print and audio video media; General and technical articles.

Unit III: Introduction to public speaking

Types of speeches - persuasive, informative, and motivational or inspirational speech; Structuring the speech - introduction, body content and conclusion; Effective delivery - voice modulation, appearance during speeches and delivery; Platform performance - posture, gesture, eye contact, emphasis, pause, voice pitch, overcoming fear and anxiety of public speaking; Visuals in presentation - type of visuals for public speaking, tips for effective use, computer aided visual presentation, body language.

Unit IV: Importance of listening

Introduction; Listening styles - active & passive and direct & indirect listening, thinking & listening, adjusting listening style to that of speaker, social situations & listening; Listening improvement techniques.

VII. Practical

1. Orientation to NAAS rated Journals related to respective discipline
2. Enlisting relevant national and international journals
3. Exercise on writing a review article on given topics
4. Presentation of the topic
5. Exercise on writing popular articles for Newspapers, Magazines and farm journals in English
6. Presentation and group discussion
7. Exercise on writing popular articles for Newspapers, Magazines and farm journals in vernacular language
8. Presentation and group discussion
9. Exercise on writing thesis in UAS format

10. Presentation and group discussion
11. Exercise on Numbers, Units, Abbreviations and nomenclature
12. Presentation and group discussion
13. Scientific style and use of English in research paper
14. Presentation and group discussion
15. Exercise on writing business letters, e mail, blogs, Internet etiquettes
16. Presentation and group discussion
17. Exercise on listening skills
18. Presentation and group discussion
19. Exercise on presentation skills
20. Presentation and group discussion
21. Exercise on writing for radio
22. Presentation and group discussion
23. Message preparation for SMS
24. Practice on modalities of SMS dissemination
25. Presentation and group discussion
26. Learning skills of indexing, footnote and bibliographic procedures
27. Presentation and group discussion
28. Tips for public speaking
29. Exercise on public speaking
30. Organising public speaking- Impromptu, Extemporaneous, Manuscript and Memorized
31. Evaluation of public speaking
32. End term assessment

VIII. Teaching Methods/ Activities

- Participatory lectures
- Assignment
- Simulation exercises
- Online group discussions
- Organise public speaking
- Student's Book/Publication Review
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Understand the importance of communication skills for goal achievement
- Differentiate scientific writing from other writings
- Write for different contexts and different media
- Organise and present public speaking
- Recognise the importance of NAAS rating for professional career

X. Suggested Reading

- D'Souza YK. 2000. *Encyclopedia of Advanced Journalism*. Vols. I-III. Anmol Publ.
- Khan PM. 2002. *Textbook of Extension Education*. Himanshu Publications, New Delhi.

Weekly Lecture Schedule

Duration (week)	Topic
1	Need and importance of communication in present context - Types of communication skills - Verbal, Non-verbal and written communication.
2	Types of corporate and business communication skills - Oral presentations, Group discussions, Facing interviews, E-mail, Memos, Business letters, Blogs, Inter office memorandums, Report writing.
3	Hard and soft skills; difference between hard and soft skills.
4	Scientific communication - Meaning; Need and importance; Fora of scientific writing - Conference, Seminar, Symposium, Workshop and colloquia.
5	Writing for scientific journals; Thesis writing and writing articles for popular media.
6	Farm journalism and its importance in agriculture and allied sectors.
7	Science communication and formats for scientific writing; Writing for scientific journals and their ratings; NAAS rating; Impact factor and h-index; Oral and poster presentation.
8	Reading and comprehension of - Print and Audio Video Media; General and technical articles.
9	Introduction to public speaking - Types of speeches - Persuasive, Informative, and Motivational or Inspirational speech.
10	Structuring the speech - Introduction, Body content and conclusion; Effective delivery- Voice modulation, Appearance during speeches and delivery.
11	Platform performance - Posture, Gesture, Eye contact, Emphasis, Pause, Voice pitch, Overcoming fear and anxiety of public speaking.
12	Visuals in presentation - Type of visuals for public speaking.
13	Tips for effective use, Computer aided visual presentation, Body language.
14	*Importance of Listening* -Introduction.
15	Listening styles - Active & passive and direct & indirect listening, Thinking & listening.
16	Adjusting listening style to that of speaker, Social situations & listening; Listening improvement techniques.

I. Course Title : Participatory Programme Management

II. Course Code : EECM 506

III. Credit Hours : 3 (1+2)

IV. Rationale

In the context of community development, the participatory programme planning and management is a process by which a community undertakes to reach a given socio-economic goal by consciously diagnosing its problems and charting a course of action to resolve those problems. The belief behind participatory programme management is its capability in leading to increased productivity, motivation and quality assurance. This is very essential for students of all disciplines to learn, especially for those who will be undertaking change agent career. This course creates a learning experience for students to develop positive attitude towards management of programme with the participation of people, rather than working in isolation.

V. Aim of the course

- To orient the students towards principles, procedure and approaches PPM
- To facilitate application of PPM techniques in field situation.

VI. Theory

Unit I: Overview to PPM

Concept; Meaning; Importance; Types of participation in development; Advantages and disadvantages of participation by different stakeholders; Role of government and non profit organizations in promoting participation; Conceptual framework of extension programme planning; Objectives; Principles and process.

Unit II: Participatory planning

Concept; Importance; Process; Techniques of participatory planning - RRA, PRA, PLA and their application in extension; Approaches of participatory planning - cooperative, democratic, bottom up and down.

Unit III: Project management techniques

Administration of the Project; Concept of Professional management - stakeholder analysis, force field analysis, SWOT analysis, logical framework analysis, PERT, CPM.

Unit IV: Monitoring and evaluation

Concept; Meaning and importance of monitoring and evaluation; Components of M&E - physical, financial, staff performance; Technical aspects - output, outcome & impact; Trends in people‘s participation in M & E; Contribution of right to information Act.

VII. Practicals

1. Literature survey and research review on different perspectives of PPM
2. Presentation of review reports
3. Observation of PPM techniques in SHGs (female groups)
4. Observation of PPM techniques in SHG village federations
5. Observation of PPM techniques in SHG mandal/block level federations
6. Observation of PPM techniques in SHG district level federations
7. Observation of PPM techniques in SHGs (male groups)
8. Observation of PPM techniques in watershed management groups
9. Preparation of case study and presentation
10. Preparation of case study and presentation
11. Preparation of case study and presentation
12. Application of PRA methods – Critical analysis of different methods through research review- Mapping techniques
13. Application of PRA methods – Critical analysis of different methods through research review- Ranking techniques
14. Application of PRA methods – Critical analysis of different methods through research review- Transaction techniques
15. Application of PRA methods – Critical analysis of different methods through research review- Focus group discussion
16. Application of PRA methods – Critical analysis of different methods through research review- Problem analysis
17. Application of PRA methods – Critical analysis of different methods through research review- Institutional analysis
18. Preparation and implementation of home improvement work plans
19. Preparation and implementation of home improvement work plans
20. Critical evaluation of work plan

21. Critical evaluation of work plan
22. Application of project management techniques- PERT
23. Presentation of feedback on project management techniques- PERT
24. Application of project management techniques – CPM
25. Presentation of feedback on project management techniques – CPM
26. Application of project management techniques- SWOT
27. Presentation of feedback on project management techniques- SWOT
28. Application of project management techniques- Stake holder analysis
29. Presentation of feedback on project management techniques- stakeholder analysis
30. Application of project management techniques- Logical frame work analysis
31. Presentation of feedback on project management techniques- Logocal frame work analysis
32. End term assessment

VIII. Teaching Methods/ Activities

- Participatory lectures
- Assignment
- Simulation exercises
- Online group discussions
- Preparation of work plans
- Student's Book/Publication Review
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Understand the underlying perspectives of PPM
- Realise the importance of PPM for sustainable achievement
- Acquire skill in observation of PPM techniques applied in different situations
- Plan, apply and analyse PPM techniques and write reports

Weekly Lecture Schedule

Duration (week)	Topic
1	Overview to PPM - Concept, Meaning and Importance.
2	Types of Participation in development.

Duration (week)	Topics
3	Advantages and disadvantages of participation by different stakeholders.
4	Role of Government and Non-Profit Organizations in promoting participation.
5	Conceptual framework of extension programme planning; objectives, principles and process.
6	Participatory planning - Concept, importance, process.
7	Techniques of participatory planning - RRA, PRA, PLA and their application in extension.
8	Approaches of participatory planning - cooperative, democratic, bottom up and down.
9	Project management techniques - Administration of the Project.
10	Concept of professional management - Stakeholder analysis.
11	Force field analysis, SWOT Analysis.
12	Logical Framework Analysis, PERT, CPM.
13	Monitoring and evaluation - Concept, Meaning and Importance of Monitoring and Evaluation.
14	Components of M&E - Physical, Financial, Staff Performance.
15	Technical aspects - Output, outcome and impact.
16	Trends in People 's Participation in M & E; Contribution of Right to Information Act.

I. Course Title : Organizational Development and Human Resource Development

II. Course Code : EECM 507

III. Credit Hours : 2 (1+1)

IV. Rationale

Every organization caters to the needs of its customers. But the best corporate thinking is leading the institution towards success by means of simplified processes and models. There are many frame works and models available, towards which the students are to be exposed to critically analyse the best means. The contemporary HRD trends and process provide students professional skills in capacity building and employee motivation programme planning. Beyond this, the students as employees in any organization in future endeavors can be professionals as they acquire technical skills in identifying the required deliverables for the company.

V. Aim of the course

- To orient students with OD and provide diagnostic skills in HRD processes
- To make students capable of applying the principles and techniques as professionals for developing human resources in an organization.

VI. Theory

Unit I: Introduction to organization development

Definition; scope and importance; Relevance of organization development in community science; History of organizational development; Revolution in organizational development; Planned change - theories of planned change, models of planned change; General and specific.

Unit II: Designing interventions for organisational development

Types; Interpersonal and group process approaches - process consultation, third party evaluation; Organisation process approaches - organization confrontation meeting, intergroup relations interventions, large group interventions; Techno-structural interventions - engineering approach, motivational approach, socio-technical systems approach; Human resource management interventions performance management - goal setting performance appraisal and rewards systems.

Unit III: Introduction to human resource development

Concept; Relationship between human resource management and human resource development; HRD mechanisms - processes and outcomes; HRD matrix; HRD interventions; Roles and competencies of HRD professionals; Challenges in HRD.

Unit IV: HRD process

Assessing need for HRD; Designing and developing effective HRD programmes; Implementing HRD programmes; Evaluating effectiveness of HRD programmes; HRD audit; HRD culture and climate; Employee development activities - approaches, leadership development, action learning, assessment and development centres; Intellectual capital and HRD.

Unit V: HRD Trends

Coaching and mentoring; Career management and development; Employee counselling; Competency mapping (CM); People capability maturity model (PCMM); Balanced score card; Appreciative inquiry; Integrating HRD with technology and Employer branding and other emerging trends.

VII. Practical

1. Visit to an organization to study the models of planned change and preparation
2. Presentation of report on models of planned change
3. Research review and presentation of organizational interventions in national context
4. Research review and presentation of organizational interventions in international context
5. Collection of data/information and preparation of case studies on organizational interventions in health
6. Collection of data/information and preparation of case studies on organizational interventions in education
7. Collection of data/information on organizational interventions in welfare and training organizations and preparation of case studies.
8. Presentation of case studies.
9. Study of existing HRD strategies of respective SAUs/Institutions
10. Analysis of existing HRD strategies of respective SAUs
11. Analysis of existing HRD strategies of respective Institutions
12. Presentation of reports with recommendations
13. Preparation of CM of the organization and planning for planned change
14. Preparation of PCM of the organization and planning for planned change
15. Presentation of reports
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Field visit

- Case study writing
- Student's Book/Publication Review
- Students'presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend and differentiate OD processes and HRD strategies
- Enlist, explain and prepare case study OD interventions in organisations
- Analyse HRD strategies of organisations
- Prepare CM and PCM plan for planned change

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction to Organization Development - Definition, scope and importance, History of Organizational Development.
2	Revolution in Organizational Development, Relevance of organization development in community science.
3	Planned Change - Theories of Planned Change, Models of Planned Change-general and specific.
4	Designing Interventions for Organisational Development – Types - Interpersonal and Group Process Approaches, Process consultation, Third party evaluation, Organisation process approaches Organization confrontation meeting, Intergroup relations interventions, Large group interventions.
5	Techno-structural interventions - Engineering approach, Motivational approach, Socio-technical systems approach, Human Resource Management Interventions Performance Management, Goal setting performance appraisal, Rewards systems.
6	Introduction to Human Resource Development – Concept, Relationship between human resource management and human resource development.

Duration (week)	Topics
7	HRD mechanisms - processes and outcomes, HRD matrix.
8	HRD interventions, Roles and competencies of HRD professionals.
9	Challenges in HRD, HRD Process - Assessing need for HRD.
10	Designing and developing effective HRD programs, Implementing HRD programs.
11	Evaluating effectiveness of HRD Programs, HRD audit.
12	HRD culture and climate, Employee development activities- Approaches, leadership development, action learning, assessment and development centres.
13	Intellectual capital and HRD, HRD Trends - Coaching and mentoring.
14	Career management and development, Employee counselling.
15	Competency mapping (CM), People Capability Maturity Model(PCMM).
16	Balanced Score Card, Appreciative inquiry, Integrating HRD with technology Employer branding and other emerging trends.

I. Course Title : Educational Technology

II. Course Code : EECM 508

III. Credit Hours : 3 (2+1)

IV. Rationale

Educational technology is a process of adopting modern technology for quality education. This primarily focuses on the educational values of the tools and applications, and later how adequate they are in acquisition of knowledge. Both theoretical and practical inputs the students are taught this course, mold them for effective learning at present and proficient instructors in future endeavors. Rational exposure to conventional and contemporary educational approaches and strategies will help the students for self learning as well promote learning.

V. Aim of the course

- To sensitize students towards the role of educational technology for effective teaching and learning
- To build competency as a teacher and public speaker
- To enable self learning among students for application of education technology.

VI. Theory

Unit I: Overview of educational technology

Meaning; Concepts and scope of educational technology; Curriculum design and development; Lesson planning; Concept and methodology; Modularised instruction - fundamentals, process, formulation of objectives, selection of media, field testing and evaluation of module.

Unit II: Teaching learning process

Meaning and characteristics of teaching and learning; Maxims of teaching - stages, forms and levels of teaching and learning; Motivation - concept, importance and techniques; Teaching styles - expert, formal authority, personal model, facilitator, delegator; Learning Styles - visual, aural, read/write, kinaesthetic (VARK).

Unit III: Teaching learning strategies

Microteaching; Programmed instruction; Simulation role-play; Team teaching; Experiential learning; Traditional media; ICT Applications in education; Multimedia based teaching and learning.

Unit IV: Current education

Genesis and trends; Management of formal and non formal education in India; Vocationalization of education; Distance education; Guidance and counselling; Innovative instructional aids - web instruction, e-learning, virtual laboratories.

Unit V: Educational technology for differently able

Visual impaired script - advances in braille; Hearing impaired - advances in Indian sign language; People with special needs - educational programmes and government policies.

Unit IV: Evaluation

Question bank; Introduction to evaluation - need and importance in education appraisal of teacher performance; Development of question bank; Evaluation of instructional effectiveness; Competency based question paper; Reliability and validity of question papers.

VII. Practical

1. Identification of key terms in educational technology and preparation of directory
2. Critical analysis of UG and PG curriculum of Community Science in relation to course objectives
3. Research review on planning and implementation of lesson planning
4. Presentation of research review report
5. Preparation of lesson plan
6. Conducting class as per lesson plan and self and peer evaluation
7. Preparation of inventory for identification of teaching styles and execution
8. Preparation and presentation of report
9. Preparation of inventory for identification of learning styles and execution
10. Preparation and presentation of report
11. Construction of Objective questions- Multiple choice, fill in the blanks
12. Construction of competency based question paper- Matching, Technical terms
13. Construction of subjective questions- Short type
14. Construction of subjective questions- Essay type
15. Analysis of questions in terms competency evaluation- knowledge, memory, application, analysis
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Student's Book/Publication Review
- Survey and analysis
- Mock sessions
- tudent presentation
- Online group discussion

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend conventional and contemporary trends of educational technology for various groups of learners
- Analyse critically the course curriculum and lesson planning in terms of reaching course objectives

- Prepare and execute inventory to identify learning styles
- Construct competency based objective and subjective question papers

12	Educational technology for differently able-Innovative Instructional Aids - Web Instruction, e learning, Virtual laboratories, Educational technology for differently able-Visual impaired- Advances in Braille script.
13	Educational technology for differently able-Hearing impaired- Advances in Indian sign language, People with special needs- Educational Programs and Government policies.
14	Introduction to evaluation- need and importance in education, Evaluation-Development of Question Bank.
15	Evaluation-Appraisal of Teacher Performance, Evaluation of instructional effectiveness.
16	Evaluation-Competency based question papers, Reliability and validity of question papers.

I. Course Title : Group Dynamics

II. Course Code : EECM 509

III. Credit Hours : 2 (2+0)

IV. Rationale

Group approach is proved to be the effective strategy as well as approach for execution of extension interventions through participation. By orienting students who are pursuing expertise in the field of extension education, towards group behavior and its dynamics they can accelerate the participatory development processes by means of team and conflict management. Further, group dynamics is a system of behaviors and psychological processes occurring within a social group or between social groups i.e intra and intergroup dynamics. Hence it will be useful in understanding decision-making behaviour, forms of social prejudice and discrimination, which are some of the major influencing factors of human development.

V. Aim of the course

- To develop understanding about group behavior and dynamics for effective communication and group management
- To acquaint students with techniques for sustainable group dynamics.

VI. Theory

Unit I: Introduction to group and group dynamics

Meaning; Characteristics; Types and functions of groups; Stages and process of group formation; Group norms and structure; Values; Ethics; and Morals.

Unit II: Understanding group behaviour

Definitions; Theories - social comparison, cognitive dissonance, self presentation, drive, social impact, self attention, social cognition theories; Individual; Interpersonal and human behaviour and dimensions.

Unit III: Group dynamics

Cooperation; Competition; Communication; Group pressure; Group cohesiveness; Group leadership; Measurement of group dynamics - tools and techniques; Group break down - causes and solutions; Strengths; Weaknesses and myths; Crowds and the mob mentality; Diversity and difference; Group dynamic skills - training and development.

Unit IV: Managing group

Team building; Conflict management; Stress management; Active listening and feedback; Achieving cooperative group structure.

Unit V: Understanding collective action in groups

Collective action meaning; Theories and applications; Incentives for collective action; Research reviews on collective action for sustainable group dynamics.

VII. Teaching Methods/ Activities

- Participatory lectures
- Field visits and interaction
- Assignment
- Demonstration
- Role play

- Presentation
- Research review

VIII. Learning Outcome

After successful completion of the course the students will be able to:

- Analyze the features and developmental stages of groups and team process
- Critically evaluate the theoretical concepts of group behaviour in real situation Able to measure group dynamics
- Demonstrate group dynamic skills
- Apply problem-solving skills and higher level thinking strategies

2	Stages and process of group formation, Group norms and structure.
3	Values, Ethics, and Morals, Understanding group behaviour – Definitions
4	Theories - social comparison, cognitive dissonance, self presentation, drive, social impact.
5	Self attention, social cognition theories
6	Individual, interpersonal and human behaviour and dimensions. Group dynamics-concept and indicators - Concept and indicators of Cooperation.
7	Concept and indicators of Competition, Concept and indicators of Communication.
8	Concept and indicators of Group pressure, Concept and indicators of Group cohesiveness.
9	Concept and indicators of Group leadership, Measurement of group dynamics - tools and techniques.
10	Group break down - causes and solutions, Strengths, weaknesses and myths
11	Crowds and the mob mentality, Diversity and difference.
12	Group dynamic skills - training and development. Managing group - Team building
13	Conflict management, Stress management.
14	Active listening and feedback, Achieving cooperative group structure.
15	Understanding collective action in groups - Collective action meaning, Theories and applications.
16	Incentives for collective action, Research reviews on collective action for sustainable group dynamics.

I. **Course Title : Community Development and Outreach**

II. **Course Code : EECM 510**

III. **Credit Hours : 3 (2+1)**

IV. **Rationale**

This course prepares students for an interdisciplinary field working. It teaches facilitation and organize a grassroots effort, equipping with skills to empower a local, regional or international community to bring about change. A real-world experience through the programs' will benefit strong connections in and with the community and communicate effectively with local groups as well as public and private agencies. It builds skills for critical thinking in matters of social justice, sustainable development, community engagement, community asset-mapping, fundraising, team building, collaborative leadership, project management, research and project evaluation.

V. **Aim of the course**

- To orient students with community development and outreach perspectives
- To impart participatory research skills
- To handle a special project for analysis of community development outreach.

VI. **Theory**

Unit I: Community development

Definition; Issues and concepts; Historical perspective of community development in India and emerged changes since inception to current era.

Unit II: Approaches

Approaches - concept and characteristic features gandhian approach, community development approach, sectoral approach, target approach, area approach, minimum need approach, integrated or holistic approach, participatory development approach; Strategies - multipurpose strategy, growth oriented strategy and spatial planning strategy; The modernization theory; Human development model (components, HDI, ranking, gender related development index, HPI)

Unit III: Key principles of community development

Community participation - definition and scope; Inclusion; Equality; Collective action; Empowerment and community development process; Provision of information; Identification of felt needs and common issues; Consultation for Shared vision; Mobilisation for action; Reflection and evaluation.

Unit IV: Community development and governance in India

Community development policy in India; Community development perspectives in five year plans.

Unit V: Cross cutting edges of community development

Horizontal edges - education, health, women empowerment, skill development, agriculture and caste occupations; Vertical edges - adults, youth, adolescents, children, pregnant and lactating mothers, physically and mentally challenged.

Unit VI: Outreach of community development

General orientation to outreach models - precede model, evaluation and indicator metrics; Outreach of urban; Rural and tribal community development programmes; Impact - economic and social perspectives.

Unit VII: Globalisation impact on community development

Impact on social forms - individualism, enclavism and fatalism, transition between **gemeinschaft and gesellschaft, issues of migration and mitigation.**

VII. Practical

Development of special project to study Community Development programme outreach in selected area and execution. Preparation of project report and presentation

1. Selection of Community development programme and detailed description of the programme in terms of objectives, targets, inputs, expected outputs and outcome
2. Visit to programme operating area and interaction with stakeholders- implementing agency, personnel and beneficiaries
3. Visit to programme operating area and interaction with stakeholders- implementing agency, personnel and beneficiaries
4. Framing of special project for measurement of outreach – title, objectives, study area, research review and plan of work
5. Finalisation of tools and techniques for execution of project
6. Finalisation of tools and techniques for execution of project
7. Preparation of tools for execution of project
8. Field testing and finalization of tools

9-12. Execution of work plan

12. Data analysis and preparation of project report
13. Data analysis and preparation of project report
14. Presentation of report
15. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Field visit
- Case study writing
- Special project
- Student's Book/Publication Review
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend and differentiate OD processes and HRD strategies
- Critically analyse different approach of community development
- Plan and execute special project
- Analyse the results and write report
- Write research paper based on the special project

Weekly Lecture Schedule

Duration (week)	Topic
1	Community development - Definition, issues and concepts, Historical perspective of community development in India and emerged changes since inception to current era.
2	Approaches- concept and characteristic features - Gandhian approach, Community Development Approach.
3	Sectoral Approach, Target Approach.
4	Area approach, Minimum Need Approach.
5	Integrated or Holistic approach, Participatory Development approach.
6	Strategies - Multipurpose strategy, Growth oriented strategy and Spatial planning strategy.
7	Key principles of Community development - Community participation- definitions and scope, Inclusion, Equality and Collective action.
8	Empowerment and community development process, Provision of information Identification of felt needs and common issues.
9	Consultation for participation Shared vision, Mobilisation for action, reflection and evaluation.
10	Community Development and Governance in India - Community development policy in India, Community development perspectives in Five year plans.
11	Community Development issues - Horizontal issues - Education, health, Empowerment, Vocational and skill development, Agriculture and caste occupations.
12	Vertical - Adults, Women ,Youth, Adolescents, Children, Pregnant and lactating mothers.
13	Physically and mentally challenged, Outreach of community development - General orientation to outreach models - precede model.
14	Evaluation and indicator metrics, Outreach of Urban, Rural and Tribal community development programmes.
15	Impact - Economic and social perspectives, Globalisation impact on community development - Impact on social forms – Individualism.
16	Enclavism and Fatalism, Transition between Gemeinschaftand Gesellschaft, Issues of migration and mitigation.

I. Course Title : Climate Change Management

II. Course Code : EECM 511

III. Credit Hours : 2 (1+1)

IV. Rationale

Geographically, every community is facing numerous challenges due to changes in the climate. This course provides students to address such challenges covering adaptation and mitigation solutions across a wide range of sectors and regions, with special reference to domestic management practices. It provides an opportunity to get exposed to climate change policies and prepares for climate change communication. It also creates a research question, gather and analyse data, and share findings academically and in lay terms.

V. Aim of the course

- To conversant students with CCM and equip with managerial skills at home level
- To generate interest for climate communication to cope up with climate changes.

VI. Theory

Unit I: Basics of climate and climate change

Introduction to climate and climate change - Definition and meaning; Climate change classification; Method of classification; General concept of environmental Science; Natural and manmade causes of climate change; Affects for climate change; Consequences risks and uncertainty of climate change; Climate system; Major predictions.

Unit II: Greenhouse gases and global warming

Major greenhouse gases and sources; Global warming effect and causes, Responses to global warming; Different views on greenhouse gases and global warming natural resource management; Solid waste management; Biodiversity; Alternative livelihood security; Drought prone technologies.

Unit III: Climate change Impacts

Impacts on biodiversity - wetland, forest, agriculture, transportation, coastal area, water resources; Global, National and regional impacts; Vulnerability assessment; Climate modelling.

Unit IV: Climate change policy

Introduction; Various policies in India; National action plan; Sector specific policies and policies instruments; Environment impact assessment; Environment planning and management; Climate resilient technology.

Unit V: Climate change communication

Introduction - definition, perspectives and importance; Engaging climate change communication; Audiences; Frames; Values and Norms.

Unit VI: Visual communication on climate impacts and solutions

Theories of visual perception; Classification and selection of visuals.

Unit VII: Advocacy and communicating global climate action

National international advocacy groups and organisations; Strategies and programmes.

Unit VIII: Role of stake holders

Media; Scientific Experts; Policymakers; and academic institutions on climate change communication.

VII. Practical

1-4. Visit to Climate management organization to understand strategies and observe the impacts
5. Identification of climate management needs at home level and development of suitable technology- Apparel and textiles
6. Identification of climate management needs at home level and development of suitable technology- Food and Nutrition

7. Identification of climate management needs at home level and development of suitable technology- General health
8. Identification of climate management needs at home level and development of suitable technology- domestic appliances and arrangements
9. Identification of climate management needs and development of suitable technology- Children and senior citizens.
10. Identification of climate management needs and development of suitable technology- differently able
11. Preparation of climate communication media – print
12. Preparation of climate communication media – radio
13. Preparation of climate communication media – video
14. Preparation of climate communication media – blog/web writing
15. Exhibition on climate change management
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignment
- Field visit
- Product making
- Student's Book/Publication Review
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend climate climate change affects species, societies and ecosystems, and the consequences these changes can have on natural systems
- Have advanced knowledge about national and international climate policy, and its application
- Knowledge of how the society can transform energy production and use in a more environmentally friendly direction
- Advanced knowledge of strategies, actions and tools for adapting to climate change and reducing greenhouse gas emissions, nationally and globally
- Critically assess different sources of information, and use them to structure and develop an academic argument
- Identify climate management needs and prepare communication media products on versatile issues

Weekly Lecture Schedule

Duration (week)	Topic
1	Basics of climate and climate change - Introduction to climate and climate change, Climate change classification, Method of classification.
2	General concept of environmental Science, Natural and man made causes of climate change.
3	Effects of climate change, Consequences, risks and uncertainty of climate change.
4	Climate system, Major predictions.
5	Greenhouse gases and Global Warming - Major greenhouse gases and sources.Global warming effect and causes, responses to global warming.
6	Different views on Greenhouse gases and Global warming Natural Resource Management, Solid waste management.
7	Biodiversity, Alternative livelihood security using drought prone technologies, Climate change Impacts - Impacts on Biodiversity - Wetland, Forest, Agriculture, Transportation.
8	Coastal area, water resources, Global, National and regional impacts.
9	Vulnerability assessment, Climate modeling, Climate Change Policy - Introduction, Various policies in India.
10	National action plan, Sector specific policies and policies instruments.
11	Environment impact assessment, Environment planning and management.
12	Climate resilient technology, Climate Change Communication – Introduction, definition, perspectives and importance.
13	Engaging Climate Communication, Audiences, Frames, Values and Norms.
14	Visual Communication on Climate Impacts and Solutions - Theories of visual perception, Classification and selection of visuals.
15	Advocacy and Communicating Global Climate Action -National international advocacy groups and organisations, Strategies and programmes, Role of stake holders – Media.
16	Scientific Experts, Policymakers, Academic Institutions on climate change communication.

I. Course Title : Gender Sensitization For Empowerment

II. Course Code : EECM 512

III. Credit Hours : 2 (2+0)

IV. Rationale

This course provides sensitivity among the students towards involvement of women in decision making processes in all aspects of economic, political, social and cultural life as active administrators, decision makers, participants and beneficiaries. It also provides skill to identify lapses in gender equity and equality like sex ratio, employment and wages, literacy and education and health. With this perspective they can play an active role in issues of national interest like gender budgeting, gender accounting and gender analysis frame work.

V. Aim of the course

- To sensitize students towards gender perspectives and development, legal rights

and using gender tools and methodologies
- To enhance students' capability for identifying and analyzing gender issues in family/home, community, agriculture and allied sector.

VI. Theory

Unit I: Overview of gender

Concept; Meaning and related terms; Gender sensitization - concept, meaning and importance of gender sensitization; Gender and empowerment - meaning, definitions and need; Gender issues in home - community and organization.

Unit II: Gender issues

Gender issues and challenges in development; Understanding gender and subordination of women; Gender as a development tool; Policy approaches for women development; Gender perspectives in development of women - roles, responsibilities, access and control over resources, constraints and opportunities.

Unit III: Gender tool kit for assessment of gender empowerment

Gender budgeting and gender analysis framework - context, activities, resources and programme action profile; Concept of GDI, GEM, GSI; National and regional indicators.

Unit IV: Gender issues and development

National policy for empowerment of women since independence; Interventions to enhance women's empowerment at individual; Community and national level; Livelihood implications of gender - health and nutrition, agriculture, violence, governance, education, media and legal issues.

VII. Practicals

1. Simulation role play to understand sex and gender, gender blind: gender aware: gender sensitive: gender equity.
2. Critical analysis of status of women in different sectors
3. Presentation of reports
4. Public speaking on Gender issues- Gender mainstreaming
5. Public speaking on Gender issues- Drudgery
6. Public speaking on Gender issues- Agriculture and allied sectors
7. Public speaking on Gender issues- Health and Nutrition
8. Public speaking on Gender issues- Business and Enterprise
9. Public speaking on Gender issues- Politics and Public administration
10. Preparation of case studies on selected issues/personalities
11. Gender sensitive interventions in SAUs and their objectives and frame work
12. Critical analysis of selected interventions and projects in operation
13. Preparation of report
14. Presentation of report
15. Critical review of Gender policy of GOI
16. End term assessment

VIII. Teaching Methods/ Activities

- Participatory lectures
- Assignment
- Mock sessions
- Student's Book/Publication Review
- Student presentation

VIII. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend gender issues and challenges for development
- Realise the need for modification of behavior by raising awareness of gender equality concerns
- Examine their personal attitudes and beliefs and questioning the 'realities' they thought they know
- Prepare themselves for public speaking on gender issues
- Analyse the gender sensitive interventions of SAUs

	Total	**100 Credits**

*Compulsory core curses

Course Contents
Ph.D. (Community Science) in Extension Education and Communication Management

I. Course Title : Managerial Skills for Extension Professionals

II. Course Code : EECM 601

III. Credit Hours : 3 (2+1)

IV. Rationale

This course is a capsule programme for imparting competency skills among students in management process, to be professionals in delivery of extension services. The students explore the fundamental roles and processes of planning, leading, organizing and controlling that comprise the managers' role, while acquainting themselves with the basic concepts and processes of management. It focuses on the entire organization from both a short and long term perspective for strategic vision, setting objectives, crafting a strategy and then implementing it. This creates a demand for specialized extension support. This course will develop skills related to professional management practices as required in today's competitive environment.

V. Aim of the course

- To orient to professional management perspective with special reference to modern management trends
- To motivate for learning professional management practices.

VI. Theory

Unit I: Orientation to management

Concept; Process; Functions; Management problems in extension organizations; Managerial skil1 – definition, nature and importance; Skills for effective management of extension activities and organizations.

Unit II: Theories of management

Scientific theory; Administrative theory; Bureaucratic theory; Human relations theory; Systems theory y; X&Y theory.

Unit III: Strategic planning

Importance; Steps and techniques; Concept of management by objective (MOB) as applicable to extension organizations; Techniques of transactional analysis for improving interpersonal communication.

Unit IV: Contemporary professional management trends

Artificial intelligence (AI), Unified talent management (UTM); Self-directed micro learning (SDML); Personalisation; Design thinking; Augmented reality and virtual reality tools (AR&VR).

Unit V: Creative problem solving techniques

Stress management practices; Total quality management (TQM); Team building and management; Concept of learning organization; Time management practices; Management of information system; Self-management techniques.

Unit VI: Work motivation

Organizational climate; Resource management - concept and methods; Team building- process and strategies at organizational and village levels; Mobilization and empowerment skills; Concept and strategies in mobilization; Concretisation and empowerment of rural people.

VII. Practicals

1. Identification of professional management skills required for extension organisation through literature survey
2. Finalisation of major and specific professional management skills
3. Preparation of case studies of professional extension management professionals and visual presentation
4. Preparation of inventories for identification of professional skills
5. Finalisation and presentation of inventories for identification of professional skills
6. Execution of inventories- interviews with extension professionals in Government organisations
7. Execution of inventories- interviews with extension professionals in Non-Government organisations
8. Compilation and analysis of data
9. Report writing and presentation of data with special reference input training for professional skills
10. Hands-on-training for selected professional skills
11. End term assessment

VIII. Teaching Methods/ Activities

- Participatory lectures
- Assignment
- Simulation exercises
- Online group discussions
- Case study writing
- Student's Book/Publication Review
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend the fundamentals of management and managerial effectiveness
- Explore the required professional skills for extension managers
- Develop and execute inventories for measurement of extension professional skills
- Analyse and interpret the data to compare and contrast professional skills between Government and Non-Government extension professionals
- Practice certain professional skills

Weekly Lecture Schedule

Duration (week)	Topic
1	Orientation to management - Concept of management, Process of management.
2	Functions of management, Management problems in extension organizations.
3	Managerial skil1 - nature and importance, Skills for effective management of extension activities and organizations.
4	Theories of Management - Scientific Theory, Administrative Theory.
5	Theories of Management - Bureaucratic Theory, Human Relations Theory.
6	Theories of Management - Systems Theory, X&Y Theory.
7	Strategic planning - Importance; Steps and techniques, Concept of management by objective (MOB) as applicable to extension organizations.
8	Techniques of transactional analysis for improving interpersonal communication, Contemporary professional management trends - Artificial intelligence (AI).
9	Unified talent management (UTM), Self directed micro learning (SDML).
10	Personalisation, Design thinking.
11	Augmented reality and virtual reality tools (AR&VR), Creative problem solving techniques - Stress management practices.
12	Total quality management (TQM), Team building and management.
13	Concept of learning organization, Time management practices.
14	Management of information system, Self-management techniques.
15	Work motivation - Organizational climate, Resource management - concept and methods.
16	Team building - process and strategies at organizational and village levels, Mobilization and empowerment skills - concept and strategies in mobilizationConcretisation and empowerment of rural people.

I. Course Title : Impact Assessment of Development Programmes

II. Course Code : EECM 602

III. Credit Hours : 3 (1+2)

IV. Rationale

Impact assessment is to weigh up the relevance and effectiveness of a project, programme or public policy in bringing about a desired change in the well-being of the target population. Further, it measures improvements in pre-defined indicators in the sector concerned that can be attributed to the development intervention. Hence this course contributes a research perspective of an evaluation when undertaken during a defined period subsequent to an intervention. It facilitates the use of techniques, that measure and compare the results achieved with what would have happened, if the project/programme intervention not taken place.

V. Aim of the course

- To familiarise students with impact assessment procedures and provide skill in documentation
- To provide hands-on-experience for impact assessment of development programme.

VI. Theory

Unit I: Orientation to development programme

Development issues and goals; National and International Perspectives - goals, strategies, structure and achievements.

Unit II: Analysis of contemporary national development programmes

Public Health; Nutrition; Education; Environment; Employment; Income generation; Welfare; Marketing; Human Resource Development - objectives, clients, salient features, inputs, deliverables, outputs and outcomes.

Unit III: Orientation to impact assessment

Sustainability impact; Social impact; Health impact; Environmental and institutional impact - frame works and element; Log frame analysis.

Unit IV: Impact identification and prediction

Identification techniques - checklist, matrices, networks, overlays, expert systems, professional judgements; Prediction methods - extrapolative-trend and scenario analysis, analogies; Intuitive forecasting from group consensus(Delphi technique); Normative methods - mathematical models, statistical models, field and laboratory experiment methods, physical models and expert judgement.

VII. Practical

1. Documentation of exiting national and international development programmes and their objectives
2. Presentation and group discussion on developmental issues of each programme
3. Research review on development policy of India and developed countries
4. Presentation of comparative analysis
5. Preparation and presentation of case study on impact of Public Health programmes
6. Preparation and presentation of case study on impact of Nutrition programmes
7. Preparation and presentation of case study on impact of Education programmes
8. Preparation and presentation of case study on impact of Environment programmes
9. Preparation and presentation of case study on impact of Employment programmes
10. Preparation and presentation of case studyon impact of Income generation programmes
11. Preparation and presentation of case study on impact of Welfare programmes
12. Preparation and presentation of case study on Marketing programmes
13. Consolidate report writing focusing on inputs, deliverables, outputs and outcome of every programmes and analysis of achievements and gaps.
14. Hands-on-experience on impact assessment – measurement of sustainability impact
15. Hands-on-experience on impact assessment – measurement of social impact
16. Hands-on-experience on impact assessment – Health impact
17. Hands-on-experience on impact assessment – Environment
18. Hands-on-experience on impact assessment – Long frame analysis

19. Hands-on-experience on impact assessment – Institutional impact
20. Hands-on-experience on impact identification techniques- Checklist
21. Hands-on-experience on impact identification techniques- Matrices
22. Hands-on-experience on impact identification techniques- Networks
23. Hands-on-experience on impact identification techniques- Overlays
24. Hands-on-experience on impact identification techniques- Expert systems
25. Hands-on-experience on impact identification and prediction techniques- Professional judgements
26. Hands-on-experience on impact prediction techniques- Trend and scenario analysis
27. Hands-on-experience on impact prediction techniques- Delphi technique
28. Hands-on-experience on impact prediction techniques- Statistical model
29. Hands-on-experience on impact prediction techniques-Field and laboratory experiment methods
30. Selection and planning for impact analysis development programme
31. Presentation and group discussion
32. End term assessment

VIII. Teaching Methods/Activities

- Participatory lectures
- Assignment
- Research review
- Survey
- Case study writing
- Students' presentation
- Hands-on-training

IX. Learning Outcome

After successful completion of the course the students will be able to:

- Comprehend the national and international perspectives of assessment of development programmes
- Review on development policy of India and developed countries
- Enlist and explain impact assessment and prediction techniques
- Write case studies on the impact of development programmes
- Apply impact assessment and prediction techniques, analyse and predict the results of the selected development programmes

Weekly Lecture Schedule

Duration (week)	Topic
1	Orientation to development programme - Development issues and goals.
2	National and international perspectives – goals and strategies.
3	Structure and achievements.
4	Analysis of contemporary national development programmes - Public health, nutrition, education and environment.
5	Employment,income generation, welfare, marketing.
6	Human Resource Development - Objectives, clients, salient features, inputs, deliverables, outputs and outcomes.
7	Orientation to impact assessment - Sustainability impact assessment.
8	Social impact assessment and health impact assessment.
9	Environmental and institutional impact assessment - frame works and element.
10	Log frame analysis.
11	Impact identification and prediction of impact - Identification techniques - checklist, matrices, networks, overlays, expert systems, professional judgment.
12	Prediction methods, extrapolative- trend and scenario analysis, analogies.
13	Intuitive forecasting from group consensus (Delphi technique).
14	Normative methods - Mathematical and statistical models.
15	Field and laboratory and experiment methods.
16	Physical models and expert judgment.

I. Course Title : Scaling Techniques for Behaviour Research

II. Course Code : EECM 603

III. Credit Hours : 3 (1+2)

IV. Rationale

This course is highly essential for students undertaking social and behavioural research as it provides knowledge on developing scales for measuring attributes of objects and people. Measurement is a process of mapping empirical phenomena by using system of numbers. Basically, the events or phenomena that researchers interested can be existed as domain. Measurement links the events in domain to events in another space which called range; which is nothing but consisting of scale. This enables researchers to interpret the data with quantitative conclusion which leads to more accurate and standardized outcomes, without which systematic and accurate interpretation of data is impossible.

V. Aim of the course

- To familiarize students with scaling techniques and the development process for behaviour measurement
- To provide hands-on-experience in development of scale for behavior measurement.

VI. Theory

Unit I: Introduction

Definition - scaling techniques and behaviour research; Need and importance; Attitude, Knowledge and Practice measurement techniques and relevance to behaviour research.

Unit II: Structured techniques

Nominal; Ordinal; Interval; Ratio scales; Self rating scales- graphic rating scale; Itemized rating scales- likert scale, semantic differential scale, stapel's scale, multi-dimensional scaling, thurston scales, guttman scales/scalogram analysis and the q sort technique.

Unit III: Non structured techniques

Projective - association, completion, construction, expressive, problems and promises; Word association; Sentence completion; Story completion and pictorial; Advantages and limitations for adoption in behaviour research.

Unit IV: Knowledge and practice tests

Knowledge - objective multiple choice questions (MCQs); True/False Assertion - reason questions; Multiple response questions (MRQs); Text/Numerical matching ranking questions; Sequencing questions; Field simulation questions; Graphical hotspot questions; and Subjective tests; Practice - worksheets, performance metrics.

Unit V: Scalability of techniques

Measurement of Reliability and Validity of scales.

VII. Practical

1. Presentation of research review on need and importance of scaling techniques in behavior research
2. Review and presentation of research articles on different scaling techniques Self rating scales- Graphic Rating Scale
3. Review and presentation of research articles on different scaling techniques Itemised rating scales-Likert Scale
4. Review and presentation of research articles on different scaling techniques-Semantic Differential Scale
5. Review and presentation of research articles on different scaling techniques-Stapel's Scale
6. Review and presentation of research articles on different scaling techniques-Multi-Dimensional Scale
7. Review and presentation of research articles on different scaling techniques-Thurston Scale
8. Review and presentation of research articles on different scaling techniques-Scalogram Analysis
9. Review and presentation of research articles on different scaling techniques-The Q Sort technique
10. Review and presentation of research articles on Projective techniques- association and sentence completion
11. Review and presentation of research articles on Projective techniques-Construction, and expressive
12. Review and presentation of research articles on Projective techniques- Problems and promises
13. Review and presentation of research articles on Projective techniques- Word association
14. Review and presentation of research articles on Projective techniques- Story completion and pictorial
15. Development of Self rating scales- Graphic Rating Scale

16. Execution and presentation of results
17. Development of Self rating scales- Likert Scale
18. Execution and presentation of results
19. Development of Self rating scales- Semantic Differential Scale
20. Execution and presentation of results
21. Development of Self rating scales- Stapel's Scale
22. Execution and presentation of results
23. Development of Self rating scales- Multi Dimensional Scale
24. Execution and presentation of results
25. Development of Self rating scales- Thurston Scale
26. Execution and presentation of results
27. Development of Self rating scales- Scalogram Analysis
28. Execution and presentation of results
29. Development of Self rating scales- Q sort technique
30. Execution and presentation of results
31. Hands-on-experience in writing research article on scale development
32. End term assessment

VIII. Teaching Methods/Activities

- Participatory lectures
- Assignment
- Research review
- Survey
- Case study writing
- Students' presentation
- Hands-on-training

IX. Learning Outcome

After completion of this course the students will be able to:

- Recognise the importance of scaling techniques in social and behavioural research
- Define the nature and characteristic feature of each scale
- Review, interpret and present the results of each scale
- Develop and apply different scales and analyse the data for presentation
- Write research article based on the selected scale

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction - Definition - scaling techniques and behaviour research.
2	Need and importance.
3	Attitude, Knowledge and Practice measurement techniques and relevance to Behaviour research.
4	Structured techniques - Nominal, Ordinal, Interval, Ratio scales.
5	Self rating scales - Graphic Rating Scale.
6	Itemized Rating Scales- Likert Scale, Semantic Differential Scale.
7	Stapel's Scale, Multi-Dimensional Scaling, Thurston Scales.
8	Guttman Scales/Scalogram Analysis and The Q Sort technique.
9	Non structured techniques - Projective - association, completion, construction, expressive, problems and promises.
10	Word association, sentence completion, story completion and pictorial.
11	Advantages and limitations for adoption in behaviour research.
12	Knowledge and Practice tests - Knowledge - Objective multiple choice questions (MCQs).
13	True/False assertion - Reason questions multiple response questions (MRQs).
14	Text/Numerical matching ranking questions, sequencing questions, field simulation questions, graphical hotspot questions and subjective tests.
15	Practice - worksheets, performance metrics.
16	Scalability of techniques - Measurement of reliability and validity.

I. Course Title : Design and Development of E-extension Project

II. Course Code : EECM 604

III. Credit Hours : 3 (0+3)

IV. Rationale

Keeping in view the extension service system under the National Agricultural Extension Policy, this course is planned to sensitise the students towards the need for ICT mediated extension services to ensure quality life in the sectors of health, nutrition, family and human relationships, which are vital areas of community science. It is essential to gain digital communication skills to reach masses for knowledge empowerment by transferring research findings compatible to the situation and context. Hence this course guides the students in gaining comprehensive experience of Extension-Research-Education by exposing themselves to the existing e-extension projects of SAU and designing new projects.

V. Aim of the course

- To orient students with design, development and analysis of e- extension projects
- To provide hands-on-experience in executing e-extension project.

VI. Practicals

1. Orientation to e-extension projects- Knowledge projects-moocs
2. Orientation to e-extension projects -Marketing projects- e choupla
3. Orientation to e-extension projects- Bulk SMS (Text and Voice) MMS
4. Orientation to e-extension projects- Video lessons
5. Orientation to e-extension projects-Virtual class rooms
6. Orientation to e-extension projects- Off line and Online Community Radio.
7. Interaction with personnel/professionals for understanding of media tools, hardware requirements of e-Extension projects
8. Interaction with personnel/professionals for understanding of media tools software requirements of e-Extension projects
9. Report writing and presentation
10. Identification of needs for skill development and proposal for skill training to undertake e-Extension project- application of software, access to hardware, etc.
11. Orientation to existing e-Extension projects of respective SAUs
12. Hands-on-experience in e- Extension projects of SAUs - content development, management and analytics report
14. Selection of multimedia e-Extension project and submission of proposal-knowledge management, product promotion, message alerting, analytical reports, etc. (Example Digital literacy promotion, Audio/ Video streaming, Social media for product promotion)
15. Presentation of proposal
16. Content development and time lines for execution of project

17-23. Execution of project and measurement of analytics as per time line

24. Report writing and presentation
25. Practical examination

VII. Teaching Methods/Activities

- Assignment
- Research review
- Group discussions
- Report writing
- Students' presentation
- Hands-on-training

VIII. Learning Outcome

After completion of the course the students will be able to:

- Identify public and private e-extension projects in the discipline of community science
- Recognise essential skills for undertaking e-extension projects
- Gain first-hand experience in content writing, management and track analytical report
- Write e-extension project, execute and measure analytics as per timeline

I. Course Title : Sustainable Livelihood Systems

II. Course Code : EECM 605

III. Credit Hours : 2 (1+1)

IV. Rationale

Sustainable livelihood is a systemic and adaptive approach that links issues of poverty reduction, sustainability and empowerment processes. For this, the large scale success of sustainable livelihoods will depend on our ability to design sustainable technologies, sustainable enterprise, sustainable economies and sustainable institutions of governance. The attractiveness of Sustainable livelihoods lies in its applicability to different contexts, situations of uncertainty and in its capacity as a consultative and participatory process of ideas and strategies between various stakeholders.This course imparts students the link between livelihoods ands and security systems and interventions to address the gap.

V. Aim of the course

- To develop understanding about resources and livelihood systems and dimensions for livelihood security
- To sensitize students towards tools and techniques for sustainable livelihood.

VI. Theory

Unit I: Orientation to livelihood system

Livelihood perspectives - definition, approaches and frame works; Livelihoods and life support systems; Designing livelihood interventions; Process; Tools and technique.

Unit II: Sustainable livelihood systems

Definition; Origin; Principles; Livelihoods - agriculture, horticulture, sericulture, forestry, animal husbandry, dairying, fisheries, non-farm activities; Urban livelihoods - linkage with food security, nutritional security, health security, livelihood security; Measuring sustainable livelihood systems.

Unit III: Critical understanding of livelihood interventions

Intervention of national and international organisations - agriculture based, forest based, non-farm based, market-led based; DFID sustainable livelihoods framework - elements, vulnerability context, policies, institutions and processes, coping and adaptive strategies.

Unit IV: Sustainable development concepts and challenges

Sustainable development concepts and challenges; Ecological; Social and economic dimensions of sustainable development; Peoples participation and sustainability; Indicators of environmental sustainability; Sustainable livelihoods; Quality of life.

Unit V: Livelihood analysis tool kit

Operational model - tools, process; Gaps and challenges; Institutional issues; Participatory methods for analysis.

VIII. Teaching Methods and Activities

- Participatory lectures
- Field visits and interaction
- Assignment
- Demonstration
- Role play
- Presentation
- Research review

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Understand the history and evolution of the sustainable livelihoods approach
- Exercise the sustainable livelihoods framework to analyse the complexities and dynamics of poverty
- Apply and analyse sustainable livelihoods analysis tool kit in the field
- Plan projects from a Sustainable Livelihoods perspective

Weekly Lecture Schedule

Duration (week)	Topic
1	Orientation to livelihood system - Livelihood perspectives –definition, approaches and frame works.
2	Livelihoods and life support systems, Designing livelihood interventions.
3	Process, Tools and technique.
4	Sustainable livelihood systems - Definition, Origin, Principles.
5	Livelihoods – Agriculture, Horticulture.
6	Sericulture, Forestry.
7	Animal husbandry, Dairying.
8	Fisheries, Non-farm activities.
9	Urban livelihoods, Linkage with food security.
10	Nutritional security, health security.
11	Livelihood security, Measuring sustainable livelihood systems.
12	Critical understanding of livelihood interventions - Intervention of National and International organisations - agriculture based, Forest based livelihood interventions.
13	Non-farm based livelihood interventions, Market-led based livelihood interventions.
14	Sustainable development - concepts and challenges - Ecological factors, Social and economic dimensions of sustainable development.
15	Peoples participation and sustainability, Indicators of environmental sustainability.
16	Sustainable livelihood - indicators, Quality of life- indicators.

I. Course Title : Extension Research Project Management

II. Course Code : EECM 606

III. Credit Hours : 3 (1+2)

IV. Rationale

Extension research projects are unique in nature as they call for interactivity with human beings to get timely feedback; thereby reconsider the gaps and restructure the strategy to cope up with the goals to be achieved. It is all together a scientific and methodical approach, where a researcher need to plan meticulously to impress upon stakeholders with a set of activities and milestones to be reached. Through this course the students would be engaged in observation of different dimensions of extension research project in terms of models, types, policy and management practices.

V. Aim of the course

- To familiarize with different dimensions of extension research project management
- To provide investigative and analytical skills for extension research.

VI. Theory

Unit I: Overview to extension research

Definition; Concepts; Models- linear, advisory, facilitation; Types - advisory services, value chains, supply chains, incubation centres, knowledge management; Market led extension; Demand driven extension; Enterprise extension; Mainstreaming extension.

Unit II: Areas of extension research

Policy analysis; Gender issues; Public and private partnership; Product extension;

Process extension; Behaviour change - health security, nutritional security, food security; Impact analysis - technology, training; Funding agencies and project proposal formats.

Unit III: Research project management practices

Project charter and mission; Project life cycle; Project network diagram; Project progress/ performance measures; Project resource loading; Project SOW (statement of work); Project WBS (work breakdown structure) – budgeting, cost benefit analysis, resource management; Risk breakdown structure; SWOT.

Unit IV: Project management approaches and tools

Approaches - result oriented approach, constructivist approach, reflexive approach; Tools - PERT, CPM, GANNT.

VII. Practical

1. Preparation and presentation of case study on linear model extension project
2. Preparation and presentation of case study on advisory model extension project
3. Preparation and presentation of case study on facilitation model extension project
4. Comparative analysis of different models of extension projects
5. Preparation and presentation of case study on advisory services
6. Preparation and presentation of case study on value chains
7. Preparation and presentation of case study on supply chains
8. Preparation and presentation of case study on incubation centers
9. Preparation and presentation of case study on knowledge management
10. Preparation and presentation of case study on market led extension
11. Preparation and presentation of case study on demand driven extension
12. Preparation and presentation of case study on enterprise extension
13. Preparation and presentation of case study on mainstreaming extension
14. Comparative analysis different extension projects
15. Identification of niche areas of extension research in Community Science discipline
16. Identification of organizations for extension research and presentation of organizational objectives
17. Critical analysis of formats for research project writing and presentation
18. Preparation of extension research project (2)
19. Revising the project as per suggestions
20. Presentation of case study on Project Life Cycle
21. Presentation of case study on Project Network Diagram
22. Presentation of case study on Performance Measures
23. Presentation of case study on Project Resource Loading
24. Presentation of case study on Project SOW (statement of work)
25. Presentation of case study on Project WBS (work breakdown structure)
26. Presentation of case study on cost benefit analysis,
27. Presentation of case study on Risk Breakdown Structure;
28. Visit to existing extension research projects of SAU for observation
29. Report writing
30. Presentation of report
31. End term assessment

VIII. Teaching Methods/Activites

- Assignment
- Research review

- Group discussions
- Report writing
- Students' presentation
- Institutional visits

IX. Learning Outcome

After completion of the course the students will be able to

- Comprehend existing extension research models and types
- Analyse and write case studies on extension research projects focusing management practices
- Identify niche areas of research in the discipline of community science
- Recognise supporting organisations for writing extension research projects and write project
- Present case study on SAUs extension research projects

Weekly Lecture Schedule

Duration (week)	Topic
1	Overview to Extension research - Definition and Models - linear, advisory, facilitation.
2	Advisory services, value chains, supply chains, incubation centres and knowledge management.
3	Types -market led extension, demand driven extension, enterprise extensionMainstreaming extension.
4	Areas of extension research - Policy analysis, gender issues, public and private partnership, product extension, process extension, behaviour change-health security, nutrition security and food security.

Duration (week)	Topics
5	Impact analysis - Technology and training funding agencies and project proposal formats.
6	Research project management practices – project charter and mission.
7	Project Life Cycle, Project Network Diagram.
8	Project progress/ performance measures, project resource loading.
9	Project SOW (statement of work).
10	Project WBS (work breakdown structure)- budgeting.
11	Cost benefit analysis, resource management.
12	Risk Breakdown Structure; SWOT.
13	Project management approaches and tools - Approaches - Result oriented approac.
14	Constructivist approach.
15	Reflexive approach.
16	Tools - PERT, CPM, GANNT.

I. Course Title : Media Application and Product Promotion

II. Course Code : EECM 607

III. Credit Hours : (2+2)

IV. Rationale

Media has the capability of promoting products. Also, media as product and application has potential role in enhancing learning. But, technology alone cannot improve teaching and learning. It must be deeply integrated with subject matter content. Therefore there is a need for a technique within which the learners can meet their needs to learn how to think, their need to develop, their ideas and apply what they learn to solve problems. This calls for active participation of the students and lead to get engaged in critical thinking and problem solving skills. Beyond this, as change agents in future endeavours, they need to be convinced for timely updation of media knowledge, because, in today's world information tracking is totally media based.

V. Aim of the course

- To familiarize students with media applications and interpretation of online analytics due to dissemination
- To provide hands-on-experience in preparation of multimedia products for promotion.

VI. Theory

Unit I: Introduction to media applications

Internet media and globalization - concepts and theories; Technology and culture - debates, regulation, gatekeeping and ethics-case studies.

Unit II: Corporate online promotional strategies

Advertising and marketing; Public communication campaigns and global humanitarianism; Multiplatform journalism; Transnational citizen journalism; Grassroots activism and change.

Unit III: Media prospects of mass communication

Historical development and economic; Social and aesthetic impact on mass culture; Individual and mass consciousness.

Unit IV: Audience research

Definitions; Principles and features; Scope; BARC (Broad Cast Audience Research Council) India; Data management techniques and tools.

Unit V: Software access

Advanced new media; Design and edit software; Open and purchase sources; Application regulations; Ethics.

Unit VI: Product promotion

Search Engine Optimization; Social Media Marketing; E-mail marketing - creation, marketing campaign planning, development and execution; Research.

Unit VII: Social media platforms

Types; Optimization; Product page creation; Analytics.

Unit VIII: Social networking

SNS(Social Networking Sites) in India; Advantages and limitations; Critical analysis of role of SNS in mass communication.

Unit IX: Introduction to SEO

Targeting key words; Integrating search keywords; Search engines and directories; Page wise optimization process; Page title tags; META Description tag; META keywords Tag.

Unit X: Reports

Variables; Time line; Report access protocol; Documentation.

VII. Practical

1. Identify and suggest the suitable keywords for a product
2. Adding keywords to website and blogs
3. Preparing Search Engine Optimization (SEO) friendly content for product website
4. Demonstration to get website listed among top Search in (SEO)
5. Demonstration on off page and on page in SEO
6. Identifying best practices for Social Media Marketing, including platform level best practices
7. Connecting product objectives to appropriate Social Media tactics
8. Creating strong content to engage target audience with marketing message
9. Creating events to manage content distribution
10. Creating Social Media policies that combine business objectives with appropriate use of social media channels and content
11. Creating Fan Pages in Social media platforms
12. Hands-on-experience- learning targeting right audience
13. Hands-on-experience on process of running Facebook ads
14. Creating engaging post and creating brand for business
15. Creating channel on YouTube
16. Updating the profile on YouTube Channel
17. Understanding the Creator Studio of YouTube
18. Types of videos and different platforms of video creation
19. Creating videos- Hands-on-Experience
20. Creating videos- Hands-on-Experience
21. Uploading videos on YouTube
22. Practicing SEO of YouTube

23. Hands-on-experience on Page title tags
24. Hands-on-experience on META Description Tag
25. Hands-on-experience on META Keywords Tag
26. Promotion of videos
27. Promotion of product on YouTube
28. Online orientation to email marketing for product promotion.
29. Hands-on-experience on email marketing for product promotion.
30. Review of analytics of product promotion
31. Presentation of multimedia practice experience
32. End term assessment

VIII. Teaching Methods/ Activities

- Participatory lectures
- Assignment
- Student's Book/Publication Review
- Practice sessions
- Media development and transmission
- Students' presentation

IX. Learning Outcome

After successful completion of the curse the students will be able to:

- Comprehend online and offline media applications
- Recognise effective product promotion platforms
- Write SEO friendly online content for product promotion
- Review analytics of product promotion
- Organise email marketing

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction to media applications - Internet media and globalization - concepts and theories, Technology and culture - debates, regulation, gatekeeping and ethics-case studies.
2	Corporate online promotional strategies - Advertising and marketing, public communication campaigns and global humanitarianism, Multiplatform journalism, transnational citizen journalism, grassroots activism and change.

Duration (week)	Topics
3	Media prospects of mass communication - Historical development and economic, social and aesthetic impact on mass culture, Individual and mass consciousness.
4	Audience research - Definitions, Principles and features, Scope, BARC (Broad Cast Audience Research Council) India.
5	Data management techniques and tools, Software access - Advanced new media.
6	Design and Edit software, Open and purchase sources.
7	Application regulations and Ethics, Product promotion - Search Engine Optimization.
8	Social Media Marketing, E-mail marketing - Creation, Marketing campaign planning, development and execution.
9	Research perspectives in product promotion, Social media platforms - Types of Social media platforms.
10	Optimization of SM, Product page creation.
11	Analytics of SM, Social networking - SNS (Social Networking Sites) in India.
12	Advantages and limitations, Critical analysis of role of SNS in mass communication.
13	Introduction to SEO (Search Engine Optimization) - Targeting key words, Integrating search keywords.
14	Search engines and directories, Page wise optimization process.
15	Page title tags - META Description Tag, META Keywords Tag, Reports - Variables, Time line.
16	Report access protocol, documentation.

I. Course Title : Advocacy and Behavior Change Management
II. Course Code : EECM 608
III. Credit Hours : 3 (1+2)

IV. Rationale

The holistic objective of the discipline of extension education and communication management is sustainable behaviour change of human beings. Whether organisations or individuals working towards this end believe that social and behavior change communication is key to solving the world's most pressing health and social problems, while advocacy strategies are an important aspect of behaviour change in terms of changing the enabling environment. This course exposes students to logical thinking in planning behaviour change communication programme.

V. Aim of the course

- To familiarise students with the role of advocacy and behavior change management for human development
- To provide contrived experience in application of advocacy and BCC approaches.

VI. Theory

Unit I: Advocacy

Meaning; Purpose and types of Advocacy; Tools; Techniques and approaches of advocacy; Elements of an advocacy strategy.

Unit II: Advocacy planning cycle

Planning advocacy campaigns for different stakeholders relationship between advocacy and development; Programme communication and social mobilization;

Social marketing- models and approaches.

Unit III: Behaviour change communication

Concept; Approaches of BCC - functional approach, information processing approach, consistency approach, behaviour modification approach, health belief model and the bj fogg model of behavior change; Role of learning theories - social cognitive theory, theories of reasoned action and planned behaviour, trans theoretical model of behavior change.

Unit IV: Processes of behaviour change

Strategic issues and BCC (Health/ Environment/ Consumption); Analysis of BCC campaigns for social mobilization and policy change; BCC campaigns in core areas for stakeholders.

Unit V: Evidences of behaviour change

Global programs- evidences of WASH communication, HIV/AIDS communication, obesity communication, diabetic communication, concept of green marketing and cause marketing.

VII. Practical

1. Interaction with Advocacy personnel to comprehend the advocacy approaches- working with HIV/AIDS patients
2. Interaction with Advocacy personnel- working with drug/alcohol addicts
3. Interaction with Advocacy personnel- Family/ Marriage issues
4. Interaction with Advocacy personnel- working with mentally challenged children
5. Preparation and presentation of report
6. Review of research on BCC approaches- Functional approach
7. Review of research on BCC approaches- Information processing approach
8. Review of research on BCC approaches- Consistency approach
9. Review of research on BCC approaches- Behavior modification approach
10. Review of research on BCC approaches- Health Belief model
11. Review of research on BCC approaches-BJ Fogg model of behavior change.
12. Report writing and presentation
13. Case study on Social marketing in India
14. Identification of Niche research in BCC
15. Presentation of researchable issues in BCC
16. End term assessment

VIII. Teaching Methods/Activities

- Participatory lecture
- Online group discussions
- Blog writing
- Research review
- Case study writing and presentation
- Institutional visits

IX. Learning Outcome

After successful completion of the course the students will be able to

- Comprehend the perspectives of advocacy and behaviour change communication
- Explain the theories of BCC and their application in real world
- Review different BCC approaches and prepare case study

- Identify niche research and researchable issues in BCC
- Sensitise towards working with special groups

Weekly Lecture Schedule

Duration (week)	Topic
1	Advocacy - Meaning and definition of advocacy, Significance of advocacy in community sciences, Purpose and types of advocacy
2	Tools and techniques of advocacy, Approaches of advocacy
3	Elements of an advocacy strategy, Advocacy research and dimensions
4	Advocacy Planning Cycle - Planning advocacy campaigns for different Stakeholders, Relationship between advocacy and development, Critical analysis of Programme communication and social mobilization
5	Social marketing models and approaches, Critical analysisof Social marketing.
6	Research perspectives of advocacy planning cycle, Behaviour Change Communication - Concept of BCC and evolution
7	Approaches of BCC - Functional approach, Information processing approach
8	Consistency approach, Behaviour modification approach
9	Health Belief model, BJ Fogg model of behavior change
10	Role of learning Theories - social cognitive theory, Theories of reasoned action and planned behavior
11	Trans theoretical model of behavior change, Comparative analysis of different models
12	Processes of Behaviour Change - Strategic issues and BCC – Health, Environmentand Consumption, Analysis of BCC campaigns for social mobilization and policy change
13	BCC campaigns in core areas for stakeholders, Stages of behavior change
14	Designing behavior change programme- Steps and outcome, Evidences of behaviour change-Global programs - Evidences of WASH communication
15	Evidences of HIV/AIDS communication, Evidences of obesity communication
16	Evidences of Diabetic communication , Concept of Green marketing and cause marketing

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 6

Community Science
– Food and Nutrition

Preamble
(Food and Nutrition)

Nutrition is well recognized for its central role in national development. The post-graduate curriculum of Food and Nutrition is revised to enable the students to handle the continuous changing nutrition situations of the population and to imply the accurate and scientific knowledge for sustainable handling to induce better health and productivity. The important role of post-graduate students as leaders in extension and community outreach programmes is considered as a need of the hour. The courses are designed to develop a scientific temper among students. Nutrition generates lot of concerns and issues which can be tacked through interdisciplinary approach. The students will study the allied fields along with major courses of basic nutrition with an aim to develop a holistic and multidimensional understanding of the discipline. This course equips the students for skill development, academic understanding, entrepreneurship, community role and employment in various fields of food industry, hospitals, NGOs, etc. Adding the new knowledge to the previous curriculum is very much needed for students to assess the prevailing nutritional situations of a community across age, sex, physiological conditions so that they can suggest the remedial pathways. The students with a good understanding about the role of nutrition in fighting infections and preventing diseases will have better employment opportunities in ever growing health sector.

Nutrition counselling is an upcoming field globally. The major and minor courses will impart high skills in communication, subject knowledge and understanding the client's socio-eco- cultural background to offer curative/ preventive nutritional advice as counsellors. Deep knowledge of food safety and standards along with strong analytical skills in food analysis, food technology and biotechnology may improve the scope for the students for employability in food processing sector. The knowledge of advanced geriatric nutrition will further equip the students to work with elderly population for their better health care. The recent advances in energy metabolism will provide deep insight in human adiposity and the food related disease burden like Type 2 diabetes, heart diseases, cancers, etc.

The courses will include updated information that will enable the students to keep track with agriculture scenario of the country as well as of the entire world to connect with the health status to identify, evaluate and find ways to establish positive interfaces. It is important to equip students with the knowledge of global nutrition problems and prepare them with skills to address the challenges effectively. The students will acquire skills to provide support to vulnerable mother-child duo conducive to development of quality human resource through the advanced courses.

The different entities during rescue operations and how food assistance component has been addressed to meet the needs of stranded population during natural calamities that consistently occur in India such as floods, cyclones, earthquake and droughts have been dealt in the curriculum. A knowledge on the topic will enable the students to act favourably to lessen the miseries of disaster hit population in terms of health and nutrition. A new course on hormones and enzymes gives insight of hormonal and enzymatic dysfunction which may give rise to several lifestyle diseases. In depth knowledge of these two is required to reduce the disease burden. Bioenergetics and regulation of metabolism are taught explicitly so that students are able to understand the increasing prevalence of obesity and related metabolic disorders. Courses on biotechnology, nutrigenomics and food science and technology opens a wide horizon for students to develop novel functional foods with huge potential in local and global markets.

The revision of courses is made to ensure that the students achieve high prominence and excellence in the field of nutrition to become professionals such as educators, researchers, clinical dieticians, health coaches, community health educators, holistic nutritionists rehabilitation counsellors and sports nutritionists.

Modifications Suggested in Courses in the Revised Curricula

M.Sc. (Community Science) in Food and Nutrition

Course Code	Course Title	Credit Hours	Remarks
	Major Courses (20 Credits)		
FN 501*	Macro and Micro Nutrients in Human Nutrition	3(3+0)	Content Modified
FN 502*	Public Health and Nutrition	3(2+1)	Content Modified
FN 503*	Techniques in Food Analysis	3(1+2)	Content Modified
FN 504*	Diet Therapy	3(2+1)	Content Modified
FN 505	Nutrition and Physical Fitness	3(2+1)	Content Modified
FN 506	Developments in Nutrition and Immunity	2(2+0)	Content Modified
FN 507	Clinical Nutrition	3(2+1)	Content Modified
FN 508	Nutrition Counselling	2(0+2)	New
FN 509	Food Safety and Standards	3(2+1)	
FN 510	Nutritional Challenges in Life Cycle	3(2+0)	Content Modified
FN 511	Food Science	3(2+1)	Content Modified
FN 512	Food Processing Technology	3(2+1)	Content Modified
FN 513	Human Physiology	3(3+0)	Content Modified
FN 514	Institutional Food Service Management	2(1+1)	Content Modified
	Minor Courses (08 Credits)		
	Food Science and Technology	3(2+1)	Course numbers will be assigned by the departments that offer the courses. Apart from these courses a student can register any other course offered by any other departments
	Food Biochemistry	3(2+1)	
	Nutritional Biochemistry	3(2+1)	
	Food Microbiology	3(2+1)	
EECM 504	Technology Transfer and Management	3 (1+2)	

Course Code	Course Title	Credit Hours	Remarks
EECM 505	Dynamic Communication Skills	3 (1+2)	
	Supporting Courses (06 Credits)		
	Research Methodology	3(2+1)	Course numbers will be assigned by the departments that offer the courses.
	Statistical methods and application		
	Common Courses (05 Credits)		
	Library and Information Services	1(0+1)	Common to all disciplines. The course numbers will be assigned by the departments that offer the courses
	Technical Writing and Communications Skills	1(0+1)	
	Intellectual Property and its management in Agriculture	1(0+1)	
	Basic Concepts in Laboratory Techniques	1(0+1)	
	Agricultural Research, Research Ethics and Rural Development Programmes	1(0+1)	
FN 591	Seminar	1(1+0)	
FN 599	Thesis/ Research	30	
	Total	**70 Credits**	

*Core courses/ compulsory courses

Ph.D. (Community Science) in Food and Nutrition

Course Code	Course Title	Credit Hours	Remarks
	Major Courses (12 Credits)**		
FN 601*	Macronutrient Metabolism	3(3+0)	Modified
FN 602*	Micronutrient Metabolism	2(2+0)	Modified
FN 603*	Nutrition and Agricultural Interface	3(3+0)	Modified
FN 604	Global Nutritional Problems	2(2+0)	
FN 605	Nutrition in Calamities	2(2+0)	Modified
FN 606	Maternal and Child Nutrition	2(2+0)	
FN 607	Hormones and Enzymes	2(2+0)	New
FN 608	Energy Metabolism	2(2+0)	Modified
FN 609	Application of Biotechnology in Food Science and Nutrition	3(3+0)	Modified
FN 610	Recent Trends in Food Science and Technology	3(3+0)	Modified
	Minor Courses (06 Credits)		
	Food Science and Technology	3(2+1)	Course numbers
	Food Biochemistry	3(2+1)	will be assigned

Course Code	Course Title	Credit Hours	Remarks
	Nutritional Biochemistry Food Microbiology	2(2+0) 3(2+1)	by the departments that offer the courses. Apart from these courses a student can register any other course offered by any other departmentss
EECM 603	Scaling Techniques for Behaviour Research	3 (1+2)	
EECM 605	Sustainable Livelihood Systems	2 (1+1)	

Supporting Courses (05 Credits)

A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM portal or MOOCS or other online courses up to a maximum of 5 credits.

FN 691	Doctoral Seminar I (Major Field)	1(1+0)	
FN 692	Doctoral Seminar II (Minor Field)	1(1+0)	
FN 699	Research	75	Increased credits for Research
	Total	**100 Credits**	

*Core courses/ compulsory courses.

**Practical sessions in Ph.D. Programme are not suggested by the experts in the field of Food and Nutrition on the grounds detailed below:

1. Sufficient hands-on exposures at UG/PG(M.Sc) level in areas of food & Nutrition covering aspects of nutrient analysis in normal and processed conditions. Such exposures ensure hand holding of related equipment/ instruments, chemicals and methods of analysis. Furthermore, nutritional assessment methods at community level provide ample opportunities to gather the expertise in survey research methods.
2. Exposure to Animal Experiments, however, is limited due to the prevailing ethical issues. If a particular field of research necessitates Animal Experiment, facilities available in established organisation could be linked through meaningful and prior arrangements.
3. In these courses, it is expected that the students take up live case studies with regard to the specificity of the course and report. Preliminary training in dealing with case studies may be imparted by a third party for which some funding may be given by ICAR. The University may offer a common training to students from all faculties through experts within the University set-up. The faculty should lead a thorough discussion of all the cases and a consolidated report may be submitted and sent for publication. In each course, the students spend one credit time during the semester for this exercise.

Course Contents
M.Sc. (Community Science) in Food and Nutrition

I. Course Title : Macro and Micro Nutrients in Human Nutrition

II. Course Code : FN 501

III. Credit Hours : 3(3+0)

IV. Rationale

Proper nutrition is the crux of human health along with safe water, sanitation, immunization, etc. Adequate knowledge about this core course on macro and micronutrients in totality will enable the students to handle the nutrition situations of a population and how to imply the knowledge for sustainable handling to induce better health and productivity. Therefore, the necessity lies in this core course.

V. Aim of the course

- To provide in-depth understanding related to macro and micro nutrients
- To impart knowledge about specific requirements of these nutrients as per age, sex, physiological condition, functions, metabolism sources, deficiency parameters for meaningful handling of normal and problem stricken situations.

VI. Theory

Unit I: Carbohydrates

Body composition; Functions, sources, requirements, digestion and absorption of carbohydrates. Composition, classification and functions of dietary fibre; Role of dietary fibre, resistant starch and fructo-oligosaccharides in various physiological disorders; Glycemic response to carbohydrates.

Unit II: Proteins

Classification, functions, sources, digestion and absorption of proteins; Synthesis of non-essential amino acids in the body; Urea cycle; Protein quality; Relationship between energy and protein requirements; Regulation of food intake; Nutrient adaptation to low intake of energy and protein.

Unit III: Fats

Classification, functions, sources, digestion, absorption and deficiency disorders of lipids and essential fatty acids; Role of omega-3 and omega 6 fatty acids in physiological disorders.

Unit IV: Vitamins, minerals and water

Functions, absorption, requirement, sources, deficiency and toxicity of fat-soluble vitamins - A, D, E and K and water-soluble vitamins- thiamine, riboflavin, niacin, pyridoxine, folate, B_{12}, ascorbic acid, pantothenic acid, biotin and amygdalin; Functions, absorption, requirement, sources, deficiency and toxicity of macro minerals – calcium and phosphorus and micro minerals – iron, zinc, sodium, copper, cobalt, selenium and chromium; Water and electrolyte balance, functions and distribution of water in body, Electrolyte composition of body fluids and electrolyte balance.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Group discussion
- Student presentation

VIII. Learning Outcome

Completion of this course will help the students to:

- Acquire advanced knowledge in macro and micronutrients
- Understand specific nutrient related situations in population
- Apply the techniques as per the demand of the human nutritional profile.
- Utilize the learning techniques in population education/publication

Weekly Lecture Schedule

Duration (week)	Topic
1	Body composition. Functions, sources, requirements, digestion and absorption of carbohydrates.
2	Composition, classification and functions of dietary fibre.
3	Role of dietary fibre, resistant starch and fructo-oligosaccharides in various physiological disorders. Glycemic response to carbohydrates.
4	Classification, functions, sources, digestion and absorption of proteins.
5	Synthesis of non-essential amino acids in the body. Urea cycle.
6	Protein quality.
7	Classification, functions, sources, digestion, absorption and deficiency disorders of lipids and essential fatty acids.
8	Role of omega-3 fatty acids in physiological disorders.

Duration (week)	Topics
9	Relationship between energy and protein requirements. Regulation of food intake. Nutrient adaptation to low intake of energy and protein.
10.	Functions, absorption, requirement, sources, deficiency and toxicity of fat-soluble vitamins - A, D, E and K.
11.	Functions, absorption, requirement, sources, deficiency and toxicity of water-soluble vitamins- thiamine, riboflavin, niacin.
12.	Functions, absorption, requirement, sources, deficiency and toxicity of water-soluble vitamins- pyridoxine, folate, $B_{12.}$
13.	Functions, absorption, requirement, sources, deficiency and toxicity of water-soluble vitamins- ascorbic acid, pantothenic acid and biotin.
14.	Functions, absorption, requirement, sources, deficiency and toxicity of macro minerals – calcium and phosphorus.
15.	Functions, absorption, requirement, sources, deficiency and toxicity of micro minerals – iron, zinc, sodium, copper, cobalt, selenium and chromium.
16.	Water and electrolyte balance, functions and distribution of water in body, Electrolyte composition of body fluids and electrolyte balance.

I. Course Title : Public Health and Nutrition

II. Course Code : FN 502

III. Credit Hours : 3(2+1)

IV. Rationale

This core course on public health nutrition will enable the students with the knowledge in assessment of prevailing nutritional situations of a community across age- sex- physiological conditions. Furthermore, opportunities in analysing Public Health consequences in in-situ conditions will empower the students in planning, executing and evaluating the health and nutrition related development schemes of GOs, NGOs and allied bodies to suggest remedial pathways.

V. Aim of the course

- To provide both theory and practical exposure to the students on the subject of Public Health Nutrition
- To make them skilled in management of adequate nutritional statures of the population conducive to National Development.

VI. Theory

Unit I: Nutritional status assessment

Assessment of nutritional status at individual, household and institutional level: direct and indirect methods; Ecological, socio-cultural, economic and demographic correlations of malnutrition.

Unit II: Nutritional deficiencies and life style disorders

Prevalence, aetiology, biochemical and metabolic changes in protein energy malnutrition, vitamin A deficiency, iron deficiency anaemia, iodine deficiency disorders, diabetes mellitus, cancer, hypertension and other life style disorders.

Unit III: Present scenario of nutritional problems

Major nutritional problems of the state, nation and world; Nutrition intervention-definition, importance, methods of nutrition intervention, monitoring and evaluation; E-surveillance.

Unit IV: Nutritional programmes and polices

National nutritional programmes and policies and nutritional surveillance; National programmes and policies regarding food production and distribution.

VII. Practicals

1-3. Techniques of assessment of nutritional status
4-5. Use of Screening Tools
6-7. Visit to the ongoing public health nutrition programme and report writing.
8-9. Study of existing diet and nutrition practices
10-12. Planning and conducting survey
13-14. Analysing data and writing report
15-16. Development, implementation and evaluation of community nutrition and health programmes

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group activities
- On field case identification and analysis
- Project planning and report writing

IX. Learning Outcome

Completion of this course will enable the students to take responsibilities as:

- Nutrition educator
- Health educator
- Extension worker for situational analysis of prevailing public health nutritional problems for cultural adaptation strategies.
- Planner and executor of developmental schemes
- Applied researcher

Weekly Lecture Schedule

Duration (week)	Topic
1	Assessment of nutritional status at individual, household and institutional level: direct and indirect methods.
2	Ecological, socio-cultural, economic and demographic correlations of malnutrition.
3	Prevalence, etiology, biochemical and metabolic changes in Vitamin A deficiency.
4	Prevalence, etiology, biochemical and metabolic changes in Protein Energy Malnutrition.
5	Prevalence, etiology, biochemical and metabolic changes in Iron Deficiency Anaemia.
6	Prevalence, etiology, biochemical and metabolic changes in Iodine Deficiency Disorders.
7	Prevalence, etiology, biochemical and metabolic changes in Diabetes Mellitus.
8	Prevalence, etiology, biochemical and metabolic changes in Hypertension.
9	Prevalence, etiology, biochemical and metabolic changes in Cancer and other life style disorders.
10	Major nutritional problems of the state, nation and world.
11	Nutrition intervention- definition, importance, methods of nutritional intervention, monitoring and evaluation.
12	Methods of nutritional intervention, monitoring and evaluation.
13	E-surveillance.
14	National nutritional programmes and policies and nutritional surveillance.
15	National programmes and policies regarding food production.
16	National programmes and policies regarding food distribution.

I. Course Title : Techniques in Food Anaysis

II. Course Code : FN 503

III. Credit Hours : 3 (1+2)

IV. Rationale

Food analysis is the discipline that deals with the development, application and study of analytical procedures for characterizing the properties of foods and their constituents. It provides analytical data on the quality of a food or product.

V. Aim of the course

- To provide the students an opportunity to develop precision with the principles, techniques and application of different methods analysis for varied food and products.

- To equip the students with knowledge to ascertain quality of the tested food/ products.

VI. Theory

Unit I: Sampling techniques

Preparation of various standard solutions; Sample and sampling techniques; Introduction to standard analytical methods of FSSAI.

Unit II: Analytical techniques

Principle, techniques and applications of colorimeter, spectrophotometer and atomic absorption spectrophotometer, gel filtration and ultra-centrifugation.

Unit III: Photometric methods and electrophoresis

Principle, techniques and applications of fluorimetry, flame photometry and electrophoresis.

Unit IV: Chromatography

Principle, techniques and applications of paper, thin layer, gas liquid and high-pressure liquid chromatography, introduction to animal assay.

VII. Practicals

1-2. Principles and operation of laboratory equipmen
3-6. Determination of moisture content and titratable acidity
7-8. Determination of ash- dry and wet ash
9-10. Determination of reducing sugars and total sugars
11-14. Analysis of protein- Kjeldhal method
15-16. Analysis of amino acids- HPLC
17-20. Analysis of fat - Soxhlet method, Cold extraction method
21-22. Determination of peroxide value and iodine value
23-24. Analysis of crude fibre. Analysis of minerals- sodium and potassium
25-26. Analysis of iron, copper, zinc and lead. Absorption spectrophotometry
27-28. Analysis of phosphorus- Colorimeter method
29-30. Analysis of vitamin C
31-32. Estimation of carotene. Experiments on gel electrophoresis

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Group activities
- Hands on training

IX. Learning Outcome

Successful completion of this course will enable the students to:

- Utilize the methods and tools to cater the needs of food analysis
- Guide the process of quality control
- Act as trained food analyst

Weekly Lecture Schedule

Duration (week)	Topic
1	Preparation of various standard solutions.
2	Sample and sampling techniques.
3	Sample and sampling techniques.
4	Introduction to standard analytical methods of FSSAI.
5	Principle, techniques and applications of colorimeter.
6	Principle, techniques and applications of spectrophotometer.
7	Principle, techniques and applications of atomic absorption spectrophotometer.
8	Principle, techniques and applications of gel filtration.
9	Principle, techniques and applications of ultra-centrifugation.
10	Principle, techniques and applications of fluorimetry.
11	Principle, techniques and applications of flame photometry.
12	Principle, techniques and applications of electrophoresis.
13	Principle, techniques and applications of paper and thin layer chromatography.
14	Principle, techniques and applications of gas liquid chromatography.
15	Principle, techniques and applications of high-pressure liquid chromatography.
16	Introduction to animal assay.

I. Course Title : Diet Therapy

II. Course Code : FN 504

III. Credit Hours : 3 (2+1)

IV. Rationale

Dietetics is a science and art that deals with the optimum nutrition during normal life cycles and its adaptations during ailments. In any situation of life, optimum nutrition can ensure health, endurance, cognition and productivity. As educators/advisors, the professionals need to equip themselves with the knowledge and skills of managing foods particularly during illness as people's mental condition remains at low ebb in ailment.

V. Aim of the course

- To provide both theory and practical knowledge on disease management through appropriate approaches with the most recent scientific input from researchers
- To approach the subject from a multidisciplinary perspective - technical, psycho-social-economic of client, drug diet interaction, etc, enabling the students to become effective member Health Care Team (HCT) in Medical Nutrition Therapy (MNT).

VI. Theory

Unit I: Significance of diet therapy

Importance and scope of diet therapy; Role of dietician in a health care team in hospital and community.

Unit II: Dietary management of nutritional disorders

Newer concepts in dietary management of various nutritional disorders and disease conditions; fevers and infections.

Unit III: Dietary management of diseases

Dietary management during burns, allergy, gastrointestinal disorders, liver diseases, cardiovascular diseases, hypertension, renal disorders, obesity, diabetes, cancer and HIV; Nutrition in critical care.

Unit IV: Nutrigenomics and nutraceuticals

Nutrigenomics. Nutraceuticals. Health foods and supplements; Health foods and supplements; Dietary recommendations for blood donors; Nutrients and drug interaction.

VII. Practicals

1. Formulation of food exchanges
2. Therapeutic modifications of diet in terms of nutrients, consistency and composition
3. Planning and preparation of diet for diabetes

4-5. Planning and preparation of diet for cardiovascular diseases

6-7. Planning and preparation of diet for kidney disorders

8. Planning and preparation of diet for obesity
9. Planning and preparation of diet for cancer patients
10. Planning and preparation of diet for burns patients -first, second and third-degree burns

11-12. Planning and preparation of diet for gastrointestinal disorders

13. Planning of diet for critical care patients
14. Visits to hospital to see preparation of tube feeding diets

15-16. Presentation of case studies

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group activities
- Case studies
- Hands on training

IX. Learning Outcome

After completion of this course, the students are expected to:

- Appreciate the scientific foundation of disease management through diet
- Utilize the techniques and tools for assessing the vulnerability of a disease situation towards rejection/ acceptance of the diet suggestion
- Confident responsible member of Healthcare team (HCT) as decision maker

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1.	New concepts in dietary management of various disorders and diseases, protocols for dietary management.
2.	Importance and scope of diet therapy. Role of dietician in a health care team in hospital and community.
3.	Newer concepts in dietary management of fevers and infections.
4.	Dietary management during burns and allergies.
5.	Dietary management during gastrointestinal disorders.
6.	Dietary management during liver diseases.
7.	Dietary management during obesity.
8.	Dietary management during hypertension and cardiovascular diseases.
9.	Dietary management during diabetes.
10.	Dietary management during renal disorders.
11.	Dietary management cancer and HIV.
12.	Nutrition in critical care.
13.	Nutrigenomics and nutraceuticals.
14.	Health foods and supplements.
15.	Dietary recommendations for blood donors.
16.	Nutrients and drug interaction.

I. Course Title : Nutrition and Physical Fitness

II. Course Code : FN 505

III. Credit Hours : 3 (2+1)

IV. Rationale

Physical fitness is a state of health and well-being and more particularly, the capacity to perform satisfactorily in occupations, daily chores and sports. It is generally achieved through proper nutrition, physical exercise and rest. Physical fitness is considered as a measure of body's ability to function efficiently and effectively in work and leisure activities, to be healthy and to resist diseases and to meet emergency situations.

V. Aim of the course

- To provide both theory and practical exposure to understand the concept of physical fitness
- To incorporate recent techniques of body composition and energy metabolism to ascertain the nutritional stature
- To equip the students with the knowledge and capacity to identify, evaluate and evolve ways in addressing various aspects of physical fitness.

VI. Theory

Unit I: Physical fitness and body composition

Overview of nutritional management vis-à-vis body composition and physical fitness; Techniques to assess physical fitness; Body composition in different physiological conditions and factors affecting it; Methods of measuring body composition.

Unit II: Energy balance

Energy metabolism; Factors influencing energy metabolism and physical fitness; Techniques to measure energy expenditure and energy intake.

Unit III: Sports nutrition

Requirement of nutrients for specific sports events; Exercise physiology and biochemistry; Nutrition support before, during and after sports event; Water and electrolyte requirement during exercise and their role in performance; Ergogenic aids; Definition, types and dosage; Doping: Definition, types and consequences; Muscle physiology for performance and fitness; Biomechanics; Physiological testing for fitness and performance; Strength, flexibility, anaerobic power and cardio respiratory fitness.

Unit IV: Nutrition and ageing

Role of nutraceuticals in fitness; Ageing theories; Physiology, mechanism and role of nutrients in arresting ageing process.

VII. Practicals

1-4. Planning diets for general fitness
5-12. Planning and preparation of diets for different sports categories
13-14. Planning nutritional requirements for sports injuries
15. Visit to a sports academy
16. Visit to established fitness centres

VIII. Teaching Methods/ Activities

- Lectures

- Assignment (Writing/Reading)
- Student presentation
- Group activities
- Case studies
- Hands on training

IX. Learning Outcome

On completion of this course, the students will be able to handle responsibilities as:

- Physical fitness educator/ Adviser
- Utilize methods and techniques for vulnerability assessment as per need of the situation
- Experts in Healthcare Team and fitness centres

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Concept of physical fitness, recent techniques of body composition and energy metabolism.
2	Overview of nutritional management vis-à-vis body composition and physical fitness.
3	Methods of measuring body composition.
4	Body composition in different physiological conditions and factors affecting it.
5	Techniques to assess physical fitness.
6	Energy metabolism. Factors influencing energy metabolism and physical fitness.
7	Techniques to measure energy expenditure and energy intake.
8	Requirement of nutrients for specific sports events.
9	Exercise physiology and biochemistry.
10	Nutrition support before, during and after sports event.
11	Water and electrolyte requirement during exercise and their role in performance.
12	Ergogenic aids: Definition, types and dosage.
13	Doping: Definition, types and consequences. Muscle physiology for performance and fitness.
14	Biomechanics. Physiologic testing for fitness and performance.

Duration (week)	Topic
15	Strength, flexibility, anaerobic power and cardio respiratory fitness Role of nutraceuticals in fitness.
16	Ageing theories Physiology, mechanism and role of nutrients in arresting ageing process.

I. Course Title : Developments in Nutrition and Immunity

II. Course Code : FN 506

III. Credit Hours : 2 (2+0)

IV. Rationale

Immunity is the capability of multi-cellular organism to resist harmful microorganisms from entering it. Good nutrition is essential to build a strong immune system which offers protection from seasonal illness (flu, cold) and other health problems (arthritis, allergies, abnormal cell development, etc.) Students with a good knowledge about role of nutrition in boosting a strong immune system in population will be able to reduce risk factors arising of malnutrition and infection.

V. Aim of the course

- To impart knowledge about role of various macro and micronutrients along with prebiotics, probiotics and phytochemicals in improving immune systems in the population
- To induce understanding about nutrition and immunity in disease management in age- sex groups across all physiological stages.

VI. Theory

Unit I: Immunity and macronutrients

Immunity: definition and history; Classification of immunity and immunological responses; Role of nutrients in immune functions- Carbohydrates, fat and protein; Effect of arginine, glutamine, sulphur amino acids and omega-3 fatty acids on immune system.

Unit II: Immunity and micronutrients

Effect of deficiency and excess of vitamins and minerals on immune cell functions; Effect of malnutrition on immunity; Infections and undernutrition – causes and consequences and role of immunization.

Unit III: Nutrition during infections

Age related immune depression; Role of nutraceuticals and functional foods in immune system; Nutrition, HIV/AIDS and Tuberculosis.

Unit IV: Immunity and chronic diseases

Nutritional immunity and chronic diseases; Probiotics, prebiotics, phytochemicals and immunity; Food allergy.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Written/Reading)
- Students' presentations
- Group discussion

VIII. Learning Outcome

Completion of the course will enable the students to:

- Understand underlying causes of poor immune system
- Appreciate the scientific foundation for better management of risks associated with poor nutrition and immunity
- Act as confident members in healthcare teams
- Utilize information for publication/ education

IX. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Role of nutrients in maintaining and improving the immunity of individuals.
2	Immunity: definition, history and classification of immunity and immunological responses.
3	Role of nutrients in immune functions- Carbohydrates, fats and proteins.
4	Effect of arginine, glutamine, sulphur amino acids and omega-3 fatty acids on immune system.
5	Effect of deficiency and excess of vitamins and minerals on immune cell functions.
6	Effect of malnutrition on immunity.
7	Infections and undernutrition.
8	Causes and consequences and role of immunization.
9	Age related immune depression.
10	Role of nutraceuticals and functional foods in immune system.
11	Nutrition in HIV/AIDS.
12	Nutrition in Tuberculosis.
13	Nutrition, immunity and chronic diseases.
14	Probiotics, prebiotics and immunity.
15	Phytochemicals and immunity.
16	Food allergy.

I. Course Title : Clinical Nutrition

II. Course Code : FN 507

III. Credit Hours : 3 (2+1)

IV. Rationale

Clinical nutrition is nutrition of patients in Health care and refers to the management of patients. It incorporates primarily the scientific fields of nutrition and dietetics. Knowledge of striking a positive energy balance in patients along with providing sufficient amount of other nutrients such as proteins, vitamins, minerals is the basis of patient's Health Care Management.

V. Aim of the course

- To provide both theoretical and applied knowledge on the subject of clinical nutrition for better management of diseases
- To approach various areas of nutrition from a multidisciplinary perspective - biochemical, physiological, pathological and regulatory
- To equip the students to identify the inter-relationship, etiology and management techniques to a specific disease situation including in patients "medical nutrition therapy" understanding to induce situational improvement of health.

VI. Theory

Unit I: Macronutrients

Methods for estimating requirements and recommended allowances of energy, protein, minerals and vitamins for different age groups and physiological state; Growth studies; Depletion and repletion studies; Nutrient balance studies; Use of isotopically labelled nutrients: Nutrient turnover; Obligatory losses of nutrients; National and international recommendations on Nutrient Requirements; Recommendations for Indian by the Indian Council of Medical Research; FAO/ WHO expert committee recommendations; Nutrient interrelationship; therapeutic measures of protein energy malnutrition; Adaptation and chronic energy deficiency; Regulatory processes in chronic energy deficiency; Protein and amino acid turnover; Regulation of amino acid metabolism; Disposal of dietary amino acids and roles of specific organs.

Unit II: Micronutrients

Interrelationship, etiology and preventive measures of vitamin and mineral deficiencies toxicities; Adverse effects of Vitamins and minerals; Upper tolerable levels; Principles and interpretation of clinical laboratory methods with particular emphasis on their interpretation relative to nutritional status and disease; interaction between nutrients, infections and drugs; Functional tests of malnutrition; Nutritional assessment tools in clinical decision making.

Unit III: Nutritional support during disease

Nutritional support, enteral tube feeding, parenteral nutrition, drugs and enteral feeding; Special considerations with nutritional support; Nutrition in surgery and trauma; The stress response to trauma on metabolism; Nutrition support in critically ill patient; Guidelines for use of formula feeds and calculation.

Unit IV: Therapeutic nutrition

Nutrition in GI Diseases; Celiac disease, inflammatory bowel disease, Assessment of liver function - nutritional management in liver disease, acute and chronic pancreatitis, severity scores, nutritional aspects of disease affecting the skeleton, diagnostic imaging, biochemical assessment; Acute and chronic renal failure, nephrotic syndrome, transplantation; Diet and hypertension, stroke, peripheral vascular disease, and chronic heart failure; Wasting syndrome in cancer; Impact of radiation and chemotherapies; Nutritional support on clinical outcomes.

VII. Practicals

1-4. Visit to critical care wards in hospitals for familiarizing with enteral and parenteral feeding methods.
5. Handling and deciphering the medical case sheets.
6-9. Planning enteral feeding, critical care nutritional requirements for different clinical conditions
10-11. Calculating energy, protein, fat and micronutrients after nutritional assessment.
12-13. Presenting case studies of medical cases
14-15. Survey of various enteral feed formulations for different clinical conditions
16. Report writing

VIII. Teaching Methods/Activities

- Lectures
- Assignment (writing/reading)
- Students' presentation
- Group activities
- Case studies in medical setup.
- Hands on training

IX. Learning Outcome

After successful completion of this course, the students will be able to

- Appreciate scientific understanding of the clinical situation of a patient and suggesting complementary nutrition therapy for its management
- Utilize methods and tools related to nutrition assessment and advocacy strategies along with Health Care Team
- Utilize knowledge for scientific Publication
- "Care Education" for target groups
- Utilize the knowledge to act as technical expert in R&D projects

Weekly Lecture Schedule

Duration (weeks)	Topic
1.	Methods for estimating requirements and recommended allowances of energy, protein, minerals and vitamins for different age groups and physiological state.
2.	Growth studies. Depletion and repletion studies. Nutrient balance studies.
3.	Use of isotopically labelled nutrients: Nutrient turnover. Obligatory losses of nutrients.
4.	National and international recommendations on nutrient requirements. Recommendations for Indian by the Indian Council of Medical Research. FAO/ WHO expert committee recommendations.
5.	Nutrient interrelationship; therapeutic measures of protein energy malnutrition. Adaptation and chronic energy deficiency. Regulatory processes in chronic energy deficiency.
6.	Protein and amino acid turnover. Regulation of amino acid metabolism. Disposal of dietary amino acids and roles of specific organs.
7.	Interrelationship, etiology and preventive measures of vitamin and mineral deficiencies toxicities. Adverse effects of vitamins and minerals. Upper tolerable levels.
8.	Principles and interpretation of clinical laboratory methods with particular emphasis on their interpretation relative to nutritional status and disease; interaction between nutrients, infections and drugs.
9.	Functional tests of malnutrition. Nutritional assessment tools in clinical decision making.
10.	Nutritional Support, Enteral tube feeding, Parenteral nutrition, drugs and enteral feeding.
11.	Special considerations with nutritional support, Nutrition in surgery and trauma. The stress response to trauma on metabolism.
12.	Nutrition support in critically ill patient. Guidelines for use of Formula feeds and calculation.
13.	Nutrition in GI Diseases, celiac disease and inflammatory bowel disease. Assessment of liver function-nutritional management in liver disease, acute and chronic pancreatitis, Severity scores.
14.	Nutritional aspects of disease affecting the skeleton. Diagnostic imaging, biochemical assessment. The Kidney- Acute, chronic renal failure, Nephrotic syndrome, transplantation.
15.	Diet and hypertension, stroke, peripheral vascular disease and chronic heart failure.
16.	Wasting syndrome in cancer. Impact of radiation and chemotherapies. Nutritional support on clinical outcomes.

I. Course Title : Nutrition Counselling
II. Course Code : FN 508
III. Credit Hours : 2 (0+2)

IV. Rationale

Nutrition counselling is an ongoing process in which nutrition professional works with an individual to assess his/her usual dietary intake to support growth, development and maintenance conducive to good health in normal and ailing conditions. As counsellor, it requires high skill in communication, subject knowledge and understanding the client's socio-eco- cultural background to offer curative/ preventive nutritional advice.

V. Aim of the course

- To provide ample hands on training to develop skills in communication, application of subject knowledge and understanding client's need and offer curative/ preventing dietary plan in medical or non-medical set-ups
- Tol approach the counselling techniques from and multidimensional perspective i.e. personal, medical, socio-eco cultural good habits and causative factors that contribute to the development of situations affecting normal health of population
- To create effective nutrition counsellors for addressing health and nutritional challenges of population.

VI. Practicals

1-2. Development of resources and dietary guidelines for counselling
3-4. Procedures of nutritional counselling in clinical practice
5-12. Preparing nutritional and dietary care plans for individuals and groups
13-16. Records required for follow up study, group discussion and motivation as tools to bring attitudinal changes in food selection and preparation
17-18. Exercises on writing scientific facts in simple manner for the people
19-22. Diet campaigns, exhibitions, demonstrations and workshops
23-28. Setting up counselling unit. Counselling in outpatient wards in local hospitals
29-30. Simulation techniques for counselling in selected settings
31-32. Use of dietary apps for counselling and assessing food intake

VII. Teaching Methods/ Assignments

- Hands on training
- Group activities
- Project planning and report writing
- Case studies

VIII. Learning Outcome

After successful completion of this practical course, students will be able to:

- Act as confident nutrition counsellor in given setup
- Utilize methods and techniques to correct nutrition related health problems and suggest adaptive strategies in the context of social milieu
- Utilize the scientific knowledge for benefit of the community through population education/ publication
- Act as resource person in handling R&D projects

I. Course Title : Food Safety And Standards

II. Course Code : FN 509

III. Credit Hours : 3 (2+1)

IV. Rationale

Food safety involves the prevention of the adverse effects of chemical substances of food on human beings and means to overcome toxic effect through appropriate processing techniques. It is important to derive maximum benefits of consumed food as far as practicable toxin free.

V. Aim of the course

- To provide both theoretical and practical exposure to the students on the subject of food safety including types of toxin and methods of removal of these in terms of human health
- To approach the related topics ranging from types, causative factors, signs and symptoms of food toxicity, removal and potential containments
- To induce sufficient knowledge regarding national and international food safety standards.

VI. Theory

Unit I: Xenobiotics

Toxicologically relevant principles of the cell and molecular biology; Dynamics and kinetics of xenobiotics; Environmental pollutants entering the food chain.

Unit II: Food poisoning

Introduction and significance of food toxicology; Food poisoning – types, causative factors, signs and symptoms and preventive measures; Naturally occurring food toxins, their harmful effects and methods of removal.

Unit III: Microbial and chemical toxins

Microbial toxins and food intoxication – source of contamination, effects on health, preventive measures and methods of inactivation and destruction; Chemical toxins –

pesticides, insecticides, metallic and others and their residual effects, preventive measures and methods of removal.

Unit IV: Food safety laws and standards

Food packaging material – Potential contaminants from food packaging material; Food safety laws and standards: FSSAI, FPO, ISI, Agmark, Codex Alimentarius, ISO mark for vegetarian and non-vegetarian foods, eco-friendly products and others in operation.

VII. Practicals

1-2. Basic chemical diagnostics of poisonings based on the samples from dead animal's organs and feed
3-7. Methods of identification and quantification of poisons isolation from biological materials
8-9. Principles of sampling and sending biological materials for toxicological analysis
10. Basis of intravital laboratory diagnostics of acute and chronic poisonings
11. Evaluation of toxic effects concerning the degree and the time of exposure to a xenobiotic
12-13. The determination of cholinesterase activity in the whole blood, in blood plasma and in red blood cells after the exposure to organophosphate and carbaminate insecticides
14. Evaluation of the effect of an antidote
15. Identification of nitrite and nitrate in water and in vegetables
16. Evaluation of nitrite and nitrate effect on haemoglobin.

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Group activities
- On field case identification and analysis
- Hands on training

IX. Learning Outcome

Successful completion of this course will enable the students to:

- Be an expert on the subject relating key learnings as food safety officer/ extension worker/ food inspector
- Utilize learning in scientific Publications/ population education

X. Suggested Reading

Weekly Lecture Schedule

Duration (weeks)	Topic
1	Toxicologically relevant principles of the cell and molecular biology.
2	Dynamics and kinetics of xenobiotics.
3	Environmental pollutants entering the food chain.
4	Introduction and significance of food toxicology.
5	Food poisoning – types and causative factors.
6	Food poisoning- signs and symptoms and preventive measures.
7	Naturally occurring food toxins, their harmful effects.
8	Naturally occurring food toxins- methods of removal.
9	Microbial toxins and food intoxication – source of contamination and effects on health.
10	Microbial toxins and food intoxication- preventive measures and methods of inactivation and destruction.
11	Chemical toxins – pesticides, insecticides, metallic and others and their residual effects.
12	Chemical toxins – Preventive measures and methods of removal.
13	Food packaging material- Potential contaminants from food packaging material.
14	Food laws and standards: FPO and ISI.
15	Agmark, Codex Alimentarius and ISO.
16	Mark for vegetarian and non-vegetarian foods, eco-friendly products and others in operation.

I. Course Title : Nutritional Challenges in Life Cycle

II. Course Code : FN 510

III. Credit Hours : 3 (3+0)

IV. Rationale

Nutrition is crucial for the fulfilment of human rights especially those of the most vulnerable groups i.e. infants, children less than 5 years of age, girls and women who constitute the foundation of human development and national prosperity. Knowing the nutritional challenges during various stages of life cycle can reduce susceptibility to infection, morbidity, disability and mortality, thereby, enhancing cumulative lifelong learning capacities and adult productivity.

V. Aim of the course

- To give an exposure to the students with an in-depth basic knowledge regarding nutritional challenges of vulnerable groups during various stages of life cycle
- To approach the areas from various angles like nutritional needs of fetus, mothers (expectant and lactating), adolescents, adults and geriatrics in terms of cognitive learning abilities and to remain healthy and productive
- To equip students to identify, evaluate and evolve management techniques to address nutritional challenge.

VI. Theory

Unit I: Importance of maternal nutrition

Nutritional needs during first 1000 days; Influence of maternal nutritional status on outcome of pregnancy: birth weight of infant and lactation performance.

Unit II: Human milk

Psycho-physiology of lactation; Milk synthesis and secretion; Maternal needs during lactation; Composition of colostrum and mature human milk; Milk of mothers of preterm babies; Milk of animal and formula feeds; Non-nutritional factors of human milk - immunological factors, enzymes and hormones; Human milk banking.

Unit III: Nutrition during childhood, adolescence and adulthood

Nutritional needs of the children and adolescents; Common childhood ailments and dietary considerations; Growth spurt and nutrition; Adolescent fads influencing nutrition, food preferences and nutritional problems; Nutritional requirements in adulthood; Malnutrition, mental development, learning abilities and behavior.

Unit IV: Geriatric nutrition

Overview of ageing process; Nutritional variables related to the ageing process; Physiology of aging; Biological markers of aging; Sociology of aging; Nutritional requirements and deficiencies in elderly; Medications and psychiatric problems in elderly; Immunopathological diseases and aging; Parkinson and Alzheimer syndrome; Care of the elderly; Care-givers and community services.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Student presentation
- Group activities

VIII. Learning Outcome

Successful completion of this course will enable the students to

- Appreciate the scientific understanding of mitigating nutritional challenges and relating key learning as professional expert in the area
- Utilize methods and hand tools for vulnerability assessment and designing adaptation strategies
- Utilize knowledge in scientific publication/ population education
- Be an expert in community health and R&D projects

Weekly Schedule

Duration (week)	Topic
1	Nutritional needs of the foetus during different stages of fetal cell growth
2	Maternal nutritional needs
3	Influence of maternal nutritional status on outcome of pregnancy: birth weight of infant and lactation performance.
4	Psycho-physiology of lactation. Milk synthesis and secretion.
5	Maternal needs during lactation.
6	Composition of colostrum and mature human milk. Milk of mothers of preterm babies. Milk of animal and formula feeds.
7	Non-nutritional factors of human milk -immunological factors, enzymes and hormones.
8	Human milk banking.
9	Nutritional needs of the children and adolescents.
10	Common childhood ailments and dietary considerations.
11	Growth spurt and nutrition. Adolescent fads influencing nutrition, food preferences and nutritional problems.
12	Nutritional requirements in adulthood. Malnutrition, mental development, learning abilities and behaviour.
13	Overview of ageing process. Nutritional variables related to the ageing process. Physiology of aging. Biological markers of aging. Sociology of aging.
14	Nutritional requirements and deficiencies in elderly. Medications and psychiatric problems in elderly.
15	Immuno-pathological diseases and aging. Parkinson and Alzheimer syndrome.
16	Care of the elderly. Care-givers and community services.

I. Course Title : Food Science

II. Course Code : FN 511

III. Credit Hours : 3 (2+1)

IV. Rationale

Food is an integral part of everyone's life. This course will empower the students to understand the science factors of food, effects of different processing methods on its nutritional qualities and how to conserve nutrients to the best benefits of the consumers.

V. Aim of the course

- To expose the students in understanding the changes in foods during various processing methods in laboratory setups
- To equip the students in understanding the desirable and undesirable effects of food treatments and identify the best ones for the benefit of consumers as food or trade.

VI. Theory

Unit I: Evaluation of food

Colloidal chemistry as related to foods; Evaluation of food by subjective and objective methods.

Unit II: Characteristics of sugars and starches

Carbohydrates in foods sources; Characteristics of sugar; Starches - types, sources, uses and chemical characteristics; Factors effecting viscosity of starch paste; Characteristics of cellulose and pectin; Gums in foods; Effect of cooking and processing techniques on carbohydrates; Batters and dough- types, properties.

Unit III: Processing of cereals, legumes and animal foods

Preparation of gluten structure; Dough changes in baking; Protein in foods: Plant and animal protein; Chemical and physical properties related to protein foods; Effect of cooking and processing techniques on animal foods – meat, fish, poultry, eggs, milk and milk products; Effect of cooking and processing of plant foods – cereals, millets, legumes, nuts and oilseeds;

Unit IV: Processing of fruits and vegetables

Classification and importance of fruits and vegetables; Composition of fruits and vegetables. Effect of cooking and other processing methods on the nutritive value of fruits and vegetables; Food pigments; Browning reactions in fruits and vegetables; Classification and importance of beverages; Definition, classification, uses and legal aspects of food additives; Classification, nature and uses of leavening agents.

VII. Practicals

1. Microscopic structure of different starch granules
2. Evaluation of food by subjective and objective methods

3-4. Changes in colour, texture and flavour of foods due to processing

5. Product preparation using leavening agents
6. Physicochemical evaluation of grains like length, breadth, L/B ratio, bulk density, cooking properties, 1000 grains weight
7. functional properties of grains - gelatinization, water absorption capacity, oil retention capacity and water retention capacity

8-9. Sugar cookery

10. Smoking temperature of fats and oils
11. Factors effecting absorption of fats
12. Deep fat fried food preparation
13. Changes in cookery- meat, fish, poultry
14. Coagulation of egg, poached egg, omelette, custard, cake
15. Emulsion - mayonnaise preparation
16. Soaking, germination and fermentation of pulses

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group activities
- Hand on experience

IX. Learning Outcome

After completion of this course, the students are expected to:

- Appreciate the scientific foundation of food and its application to the benefits of human health
- Perform as Food Analyst
- Become Food Entrepreneurs
- Act as Health/ Nutrition advisor

X. Suggested Reading

- Belle Lowe. 2019. *Experimental Cookery from the Chemical and Physical Standpoint*. Facsimile Pub.
- Potter NN and Hotchkiss JH. 2007. *Food Science*. 5th Edition, CBS, New Delhi.

Weekly Lecture Schedule

Duration (week)	Topic
1	Colloidal chemistry as related to foods.
2	Evaluation of food by subjective and objective methods.
3	Carbohydrates in foods sources.
4	Characteristics of sugar.
5	Starches-types, sources, uses and chemical characteristics.
6	Factors effecting viscosity of starch paste.
7	Characteristics of cellulose and pectin. Gums in foods.
8	Effect of cooking and processing techniques on carbohydrates. Batters and dough-types, properties.
9	Preparation of gluten structure. Dough changes in baking.
10	Protein in foods: Plant and animal protein. Chemical and physical properties related to protein foods.
11	Effect of cooking and processing techniques in Animal foods – meat, fish, poultry, eggs, milk and milk products.
12	Effect of cooking and processing of plant foods – cereals, legumes, nuts and oilseeds.
13	Classification and importance of fruits and vegetables. Composition of fruits and vegetables.
14	Effect of cooking and other processing methods on the nutritive value of fruits and vegetables. Food pigments. Browning reactions in fruits and vegetables.
15	Classification and importance of beverages. Definition, classification, uses and legal aspects of food additive.
16	Classification, nature and uses of leavening agents.

I. **Course Title** : **Food Processing Technology**
II. **Course Code** : **FN 512**
III. **Credit Hours** : **3(2+1)**

IV. Rationale

Almost all foods consumed need processing from field to plate. While some processing is applicable to day- to- day life to consume safe and healthy foods, most of the perishable foods require special techniques to conserve nutrients alongside increasing shelf life. Knowledge of the subject is an integral part for food entrepreneurs.

V. Aim of the course

- To give exposure of the subject, with the newer techniques in food processing procedures ranging from preliminary steps to the packaging aspects of different foodstuff for safe consumption and business
- To equip students to identify and application of processing methods suitable to meet the purpose of the consumer.

VI. Theory

Unit I: Food processing techniques

Principles underlying food processing operations including thermal, radiation, refrigeration freezing and dehydration; Effect of processing on physiochemical characteristics; Principles underlying pressure modified processing (high hydrostatic pressure, hyperbaric processing, vacuum cooling, hypobaric storage).

Unit II: Processing technologies for plant foods

Processing technology for preservation and production of variety food products during storage, handling and processing of cereals/millets and legumes, oilseeds, fruits and vegetables; Food preservation by Hurdle technology and canning technology.

Unit III: Processing technologies for animal foods

Processing technology for milk and milk products, egg, meat, poultry and fish, convenience foods and processed foods; Technologies underlying mutual supplementation, enrichment and fortification, fermentation, malting and germination; Food additives commonly used in food industries for colour, flavour and as preservatives; Nanomaterials as food additives.

Unit IV: Quality control in food processing

Quality control in food industry - raw materials and finished products; Waste management and sanitation in food industries; Packaging - self-cooling self-heating packaging, micro packaging, antimicrobial packaging and water-soluble packaging.

VII. Practicals

1. Effect of blanching on enzymatic activity and volume occupation
2. Effect of refrigeration and freezing on quality of fruits and vegetables
3. Dehydration of fruits and vegetables
4. Canning of fruits and vegetables

5-6. Preparation of fruit candy, squash, nectar, malt beverages and quality evaluation with respect to FPO

7. Clarification of juice using various methods (chemical, enzyme and fining agents)

8-9. Malting of green gram, moth bean- enzymatic activity determination

10. Preparation of *Paneer* and curd and its quality evaluation
11. Quality evaluation of egg and fish
12. Effect of chemical preservation on storage quality of food (bread, cake).
13. Storage of nuts and oil seeds under vacuum packaging
14. Packaging of fruits and vegetables for transportation distance market using corrugated fibre boxes
15. Transportation of fresh fruits and vegetables using cushioning system and fibre board
16. Visit to food processing unit

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Group activities
- Hands on training

IX. Learning Outcome

This course will help students to

- Utilize the scientific knowledge to become food processing entrepreneur
- Utilize the acquired knowledge for being an expert in any Processing Unit
- Assist in ascertaining quality control of a consumed food in any given situation

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1.	Principle underlying food processing operations including thermal, radiation, refrigeration, freezing and dehydration.
2.	Effect of processing on physiochemical characteristics.
3.	Principles underlying pressure modified processing (high hydrostatic pressure, hyperbaric processing, vacuum cooling, hypobaric storage).
4.	Processing technology for preservation and production of variety food products during storage, handling and processing of cereals, legumes and oilseeds.
5.	Processing technology for preservation and production of fruits and vegetables.
6.	Food preservation by Hurdle technology.
7.	Food preservation by canning technology.

Duration (week)	Topic
8.	Processing technology for milk and milk products, egg, meat, poultry and fish.
9.	Processing technology for convenience foods and processed foods.
10.	Technologies underlying in mutual supplementation, enrichment and fortification.
11.	Technologies underlying fermentation, malting and germination.
12.	Food additives commonly used in food industries for colour, flavour and as preservatives.
13.	Nanomaterials as food additives.
14.	Quality control in food industry - raw materials and finished products.
15.	Waste management and sanitation in food industries.
16.	Packaging - self-cooling self-heating packaging, micro packaging, antimicrobial packaging and water-soluble packaging.

I. Course Title : Human Physiology

II. Course Code : FN 513

III. Credit Hours : 3 (3+0)

IV. Rationale

Physiology is the scientific study of the function and mechanism which work within a living system. Human Physiology seeks to understand the mechanisms that work to keep the human body alive and functioning through scientific enquiry to keep humans healthy and productive. Changes in Physiology in human can impact vital body functions.

V. Aim of the course

- To give theoretical concepts to complex physiological systems of the human body through scientific enquiry into the nature of mechanical, physical and biochemical function of humans, their organs and cells of which they are composed
- To approach the subject area from variegated angles to equip the students with the knowledge of importance of normal and altered picture of biological markers and suggest remedies.

VI. Theory

Unit I: Circulatory system

Overview of anatomy and functions of human body; Reticuloendothelial system- functions, classification; Lymphatic system- functions, circulation; Circulatory system- blood and composition blood cells, development and function of blood cells, blood clotting, blood grouping and haemoglobin, Heart - anatomy, cardiac cycle, blood pressure and factors affecting blood pressure.

Unit II: Respiratory system

Respiratory system- anatomy, physiology and mechanism of respiration, regulation of respiration; Digestive system- anatomy of gastrointestinal tract and accessory organs, digestion and absorption of food, regulation of appetite.

Unit III: Excretory system

Excretory system- anatomy and functions of kidney, formation, composition and excretion of urine; Endocrine glands, mode of action of hormones.

Unit IV: Reproductive system

Reproductive system- structure and functions of male and female reproductive organs; Anatomy and functions of nervous and musculoskeletal system.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group activities

VIII. Learning Outcome

This course will help students to:

- Apply knowledge in understanding interrelationship between physiology and nutrition.
- Enable to act as a reliable team member in Healthcare team in medical and non-medical setups.
- Apply the acquired techniques for population education

IX. Suggested Reading

- Chaterjee CC. 2012. *Human Physiology Vol. I and Vol. II.* CBS Publications.

Weekly Lecture Schedule

Duration (week)	Topic
1	Overview of anatomy and functions of human body.
2	Reticuloendothelial system- functions, classification.
3	Lymphatic system- functions, circulation.
4	Circulatory System- blood and composition blood cells, development and function of blood cells.
5	Blood clotting, blood grouping and haemoglobin.
6	Heart – anatomy and cardiac cycle.
7	Blood pressure and factors affecting it.
8	Respiratory system- anatomy and physiology.
9	Mechanism of respiration and its regulation.
10	Digestive system- anatomy of gastrointestinal tract and accessory organs.
11	Digestion and absorption of food, regulation of appetite.
12	Excretory system- anatomy and functions of kidney.

Duration (week)	Topics
13	Formation, composition and excretion of urine.
14	Endocrine glands, mode of action of hormones.
15	Reproductive system- structure and functions of male and female reproductive organs.
16	Anatomy and functions of nervous and musculoskeletal system.

I. Course Title : Institutional Food Service Management

II. Course Code : FN 514

III. Credit Hours : 2 (1+1)

IV. Rationale

Institutional food Service Management denotes the entities that provides meals at educational institutes, hospitals, care homes, hotels, public and private cafeteria, etc. Students equipped with updated knowledge in this area will help them to act as an expert to suggest quality food to the customer as per their needs.

V. Aim of the course

- To equip the students with the multi-dimensional knowledge associated with institutional food service in a given setup
- To enable them in planning, execution and control of the management of institutes with ease and profit.

VI. Theory

Unit I: Food service management

Types of food services - organization and management. Tools of management; FSSAI and CODEX guidelines.

Unit II: Record keeping

Personnel management; Books, records and record keeping; Cost control in food services; Menu planning; HACCP.

Unit III: Quantity food production

Meal services management; Types of services; Quantity food production; Principles involved in development of recipes in large scale cooking; Standardization of recipes; Utilization of left-over foods.

Unit IV: Planning of food service unit

Types of kitchens; Planning of layout and equipment for food services; Sanitation and hygiene in handling foods; Personnel hygiene and its importance; Organisation of spaces.

VII. Practicals

1-2. Standardization of basic recipes: planning and preparation
3. Modification in basic recipes
4. Use of left-over foods
5-6. Visit to different types of food service institutions and study the organization, physical plan and layout, food service equipment, sanitation and hygiene.
7-10. Practical experience in organization and management of a college cafeteria/ hotels
11-12. Setting of canteens with formal and informal table setting

13. Scale production of standardised recipes
14-15. Menu planning for snack bars, canteens, residential hostels and hospitals
16. Cost analysis

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group activities
- Hands on training

IX. Learning Outcome

This course will help students to:

- Act as front office managers
- Skilled in centralized/ decentralized service providers in medical/ care homes
- Skilled chef and service providers

X. Suggested Reading

Course Title with Credit Load
Ph.D. (Community Science) in Food and Nutrition

Course Code	Course Title	Credit Hours
	Major Courses (12 Credits)	
FN 601*	Macronutrient Metabolism	3(3+0)
FN 602*	Micronutrient Metabolism	2(2+0)
FN 603*	Nutrition and Agricultural Interface	3(3+0)
FN 604	Global Nutritional Problems	2(2+0)
FN 605	Nutrition in Calamities	2(2+0)
FN 606	Maternal and Child Nutrition	2(2+0)
FN 607	Hormones and Enzymes	2(2+0)
FN 608	Energy Metabolism	2(2+0)
FN 609	Application of Biotechnology in Food Science and Nutrition	3(3+0)
FN 610	Recent Trends in Food Science and Technology	3(3+0)
	Minor Courses (06 Credits)	
	Food Science and Technology	3(2+1)
	Food Biochemistry	3(2+1)
	Nutritional Biochemistry	2(2+0)
	Food Microbiology	3(2+1)
EECM 603	Scaling Techniques for Behaviour Research	3 (1+2)
EECM 605	Sustainable Livelihood Systems	2 (1+1)
	Supporting Courses (05 Credits)	
	A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM portal or MOOCS or other online courses up to a maximum of 5 credits.	
FN 691	Doctoral Seminar I (Major Field)	1(1+0)
FN 692	Doctoral Seminar II (Minor Field)	1(1+0)
FN 699	Research	75
	Total	100 Credits

*Core courses/ compulsory courses

Course Contents
Ph.D. (Community Science) in Food and Nutrition

I. Course Title : Macronutrient Metabolism

II. Course Code : FN 601

III. Credit Hours : 3(3+0)

IV. Rationale

Food intake is sporadic: for most people it occurs in three major boluses each day. Energy expenditure, however, is continuous, with variations during the day that bears no resemblance to the energy intake pattern. Macronutrients are the three sources of energy which are variably stored and assimilated from food each day. A basic understanding of this fact will help the students to address the need of efficient energy metabolism in people to maintain energy balance for health. Furthermore, it will help to guide people how to lessen the food related disease burden like obesity, Type 2 diabetes, heart disease, etc.

V. Aim of the course

- To give a strong theoretical base to the students with reference to metabolism of macronutrients
- To approach the related areas from a multidimensional perspective—digestion, absorption, assimilation and metabolism in relation to normal health maintenance and preventing disease onsets
- To equip the students to identify, stratify and manage the risks associated with energy metabolism.

VI. Theory

Unit I: Macronutrients

Digestion, absorption and metabolism of carbohydrates, proteins and lipids; Inborn errors of metabolism; Degenerative diseases - diabetes, obesity, atherosclerosis, hyperlipidaemia and hypertension; Glucose homeostasis determined by insulin/ glycogen ratio; low carbohydrates diet and its metabolic consequences.

Unit II: Dietary fibre

Glycaemic Index and load; Dietary fibre and its impact in various physiological disorders; Hypoglycaemic action of foods.

Unit III: Proteins

Classification of protein, new discoveries in protein and their functions (protein in immune system, biological buffers and carriers); Evaluation of protein quality- *in vitro* and *in vivo* methods, animal and human bioassays; Amino acid pool, protein turnover in man with special reference to body size, age and various nutrition and pathological conditions; Novel food sources of protein; Role of hormones in protein metabolism; Effect of dietary protein on cardiovascular disease and cholesterol metabolism; Adaptation of body to low intake of energy and protein.

Unit IV: Lipids

Hypolipidemic action of MUFA, PUFA and oxidation products of cholesterol; Effect of saturated fatty acids and trans fatty acids in lipid metabolism, role of reversal diet in cardiovascular disorders; Causes, prevention and treatment of hyperlipidaemia.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Student presentation
- Online Group Discussion

VIII. Learning Outcome

After successful completion of this course, the students will be able to

- Appreciate the scientific knowledge in the process of energy metabolism
- Utilize the methods and tools for the management of hypo/hyper metabolic stages
- Utilize knowledge for scientific deliberations
- Act as Clinical Nutritionist in medical set-ups
- Expert Member of Health Care Team (HCT)
- Researcher in related R&D Projects

IX. Suggested Reading

- https://www.nutrition.org.uk

Weekly Lecture Schedule

Duration (week)	Topic
1	Carbohydrates -digestion, absorption and metabolism. Proteins - digestion, absorption and metabolism. Lipids- digestion, absorption and metabolism.
2	Inborn errors of metabolism. Diabetes.
3	Obesity.
4	Atherosclerosis.
5	Hyperlipidaemia.
6	Hypertension.
7	Glucose homeostasis determined by insulin/glycogen ratio. Low carbohydrates diet and its metabolic consequences.
8	Glycaemic Index and load. Dietary fiber and its impact in various physiological disorders

Duration (week)	Topic
9	Hypoglycemic action of foods. Classification of protein
10	New discoveries in protein and their functions in immune system, biological buffers and carriers.
11	Evaluation of protein quality- *in vitro* and *in vivo* methods, animal and human bioassays. Amino acid pool.
12.	Protein turnover in man with special reference to body size, age and various nutrition and pathological conditions. Novel food sources of protein.
13.	Role of hormones in protein metabolism. Effect of dietary protein on cardiovascular disease and cholesterol metabolism. Adaptation of body to low intake of energy and protein.
14.	Hypolipidemic action of MUFA, PUFA and oxidation products of cholesterol.
15.	Effect of Saturated fatty acids and trans fatty acids in lipid metabolism. Role of reversal diet in cardiovascular disorders.
16.	Causes, Prevention and treatment of hyperlipidemia.

I. Course Title : Micronutrient Metabolism

II. Course Code : FN 602

III. Credit Hours : 2(2+0)

IV. Rationale

Micronutrients are required by human and other organisms all over life in small quantities to coordinate a wide range of physiological functions. While vitamins are chiefly necessary for energy production, immune functions, blood clotting, etc. the minerals play important role in growth, bone health, fluid balance, etc. An advanced understanding of the metabolism aspects of these nutrients will enable the students to guide the population in encouraging proficient metabolic stages in humans to address the public health nutritional problems.

V. Aim of the course

- To give a strong theoretical understanding of the essentiality of micronutrient sufficiency to aid metabolic processes in relation to health and disease onset
- To enhance the knowledge of recent advances in micronutrient nutrition that will help the students to plan and execute policies in micronutrient malnutrition in population.

VI. Theory

Unit I: Vitamins

History, chemistry, distribution and functions of vitamins; Absorption, transportation, metabolism of vitamins; Nutritional requirements of vitamins; Deficiency manifestations of water soluble vitamins; Deficiency manifestations of fat soluble vitamins; Causes of vitamin deficiencies in India; Hypervitaminosis of water-soluble vitamins; Hypervitaminosis of fat-soluble vitamins; Vitamin fortification and supplementation; Methods of assay of vitamins; Interaction with other nutrients, antagonists and analogues of vitamins; Assessment of vitamin status of population.

Unit II: Minerals

Causes of macro and micro mineral deficiencies in India; Chronology, chemistry and distribution of minerals; Functions, absorption, transport and metabolism of minerals; Deficiency manifestations of minerals; Nutritional requirements of minerals; Methods of assay of minerals; Interactions of minerals with other nutrients, antagonists and analogues of minerals; Assessment of mineral status of population; Mineral fortification and supplementation; Metaloenzymes. Antioxidants and their relationship with aging, cancer and various non-communicable diseases.

Unit III: Heavy metal toxicity

Harmful effects of major mineral pollutants on health - mutagenicity, carcinogenicity and heavy metal toxicity; Heavy metal toxicity;

Unit IV: Trace elements

Trace minerals - their chronology, chemistry, distribution. Functions of trace minerals. Absorption and metabolism of trace minerals. Requirements of trace minerals. Deficiency manifestation and interaction of trace minerals. Use of mineral isotopes/ tracers in nutritional studies.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

After successful completion of this course, the students will be able to

- Appreciate the scientific knowledge in the process of various physiological functions of human body
- Utilize the methods and tools for the management of hypo/hyper metabolic stage
- Utilize knowledge for scientific deliberations
- Act as Clinical Nutritionist in medical setups
- Expert Member of Health Care Team (HCT)
- Researcher in related R&D Projects

IX. Suggested Reading

- FAO/WHO. 2004. *Vitamins and Minerals in Human Nutrition. A report of joint FAO/WHO Expert Consultation.* 2nd Edition, World Health Organization and Food and Agriculture Organization of the United Nations.

Weekly Lecture Schedule

Duration(Week)	Topic
1	History, chemistry, distribution and functions of vitamins.
2	Absorption, transport, metabolism of vitamins.
3	Nutritional requirements of vitamins.
4	Deficiency and manifestations of water soluble and fat soluble vitamins.
5	Causes of vitamin deficiencies in India. Hypervitaminosis of water-soluble and fat-soluble vitamins.
6	Vitamin fortification and supplementation.
7	Methods of assay of vitamins. Interaction with other nutrients, antagonists and analogues of vitamins. Assessments of vitamin status of population.
8	Causes of macro and micro mineral deficiencies in India. Chronology, chemistry and distribution of minerals.
9	Deficiency manifestations of minerals. Nutritional requirements of minerals.
10	Methods of assay of minerals. Interactions of minerals with other nutrients, antagonists and analogues of minerals.
11	Assessment of mineral status of population. Mineral fortification and supplementation.
12	Metaloenzymes. Harmful effects of major mineral pollutants on health – mutagencity, carcinogenicity. Heavy metal toxicity.
13	Heavy metal toxicity.
14	Antioxidants and their relationship with ageing and cancer. Antioxidants and their relationship with various non – communicable diseases. Trace minerals - their chronology, chemistry, distribution and functions. Absorption and metabolism of trace minerals.
15	Functions and Requirements of trace minerals. Absorption and metabolism of trace minerals.
16	Deficiency manifestation and interaction of trace minerals. Use of mineral isotopes/ tracers in nutritional studies.

I. Course Title : Nutrition and Agricultural Interface

II. Course Code : FN 603

III. Credit Hours : 3(3+0)

IV. Rationale

There is a clear potential for the agriculture sector to play a critical role in enhancing food and nutrition security and health of population. Agriculture and nutrition are closely linked. Producing foods that are acceptable, accessible and affordable can make population healthy and productive, thus making a virtuous cycle. If this cycle becomes vicious, the turn-over will become negative. This course will enable the students to keep tract with agriculture scenario of a place and connect with the health status to identify, evaluate and find ways to establish positive interfaces.

V. Aim of the course

- To give a clear understanding of interlinking agricultural production and nutritional status of the population
- To assist the students to identify and evaluate the agriculture in terms of nutrition nexus and its effective management.

VI. Theory

Unit I: Food production and consumption

Food situation in India and in the world; Food production and consumption trends; Food balance sheets; Role of nutrition in agricultural planning and national development.

Unit II: Food distribution

Linkages between agricultural practices and food production, distribution and nutritional status; Factors affecting food distribution at macro and micro level; Per capita food availability and consumption; Food and Nutrition security at national and household level; Role of agriculture in enhancing food security; Food crop failure and malnutrition.

Unit III: Farming systems

Poverty and vicious cycle of low food production; Effect of food production and economic policies on food availability; Impact of physical resources, farming systems, cropping system, inputs and manipulation, agricultural marketing system, post-harvest processing of foods on food and nutrition situation; Implementation of nutrition policy.

Unit IV: Agricultural programmes

Sustainable food systems, nutritional impact of agricultural programmes, food price control and consumer subsidy; Contribution of National and International organization in agricultural development.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

After successful completion of this course, the students will be able to

- Understand linkage between agriculture and nutrition
- Apply the knowledge in planning and implementation of agriculture and nutrition related policies
- Act as expert in developmental programmed of GOs and NGOs

IX. Suggested Reading

- FAO. 2017. *The State of Food and Agriculture - Leveraging Food Systems for Inclusive Rural Transformation.* Food and Agriculture Organization, Rome.
- FAO. 2017. *The State of Food Security and Nutrition in the World.* Food and Agriculture Organization, Rome.
- GOI. 2016. *Agricultural Statistics at a Glance.* Ministry of Agriculture & Farmers Welfare Department of Agriculture, Cooperation and Farmers Welfare Directorate of Economics and Statistics, Government of India.
- GOI. 2017. *Agriculture - Statistical Year Book India.* Ministry of Statistics and Programme Implementation, Government of India.
- GOI. 2011. *Census of India.* Government of India.
- GOI. 2018. *A Reference Manualby Publication Division.* Ministry of Information about Broadcasting, Govt. of India.

- http://www.fao.org/home/en
- https://www.india.gov.in/ agriculture
- https://mhrd.gov.in/mid-day-meal

Weekly Lecture Schedule

Duration(Week)	Topic
1	Food situation in India and in the world
2	Food production and consumption trends. Food balance sheets.
3	Role of nutrition in agricultural planning and national development
4	Linkages between agricultural practices and food production, distribution and nutritional status
5	Factors affecting food distribution at macro and micro level. Per capita food availability and consumption
6	Per capita food availability and consumption
7	Food and Nutrition security at national and household level
8	Role of agriculture in enhancing food security. Food crop failure and malnutrition
9	Poverty and vicious cycle of low food production. Effect of food production and economic policies on food availability
10	Impact of physical resources, farming systems, cropping system and inputs and manipulation on food and nutrition situation
11	Impact of agricultural marketing system, post-harvest processing of foods on food and nutrition situation
12	Nutrition policy implementation
13	Sustainable food systems
14	Nutritional impact of agricultural programmes
15	Food price control and consumer subsidy
16	Contribution of National and International organization for agricultural development

I. Course Title : Global Nutritional Problems

II. Course Code : FN 604

III. Credit Hours : 2(2+0)

IV. Rationale

Global Nutrition Report of 2018 by WHO states that malnutrition is still rampant affecting most of world's population at some point in their life cycle from infancy to old age. No country is untouched. Malnutrition is a universal issue holding back development with unacceptable human consequences. Yet the opportunity to end malnutrition has never been better. Malnutrition is responsible for more ill-health than any other cause. It deems necessary for the students to equip thems with the knowledge of the nutrition related global problems and prepare thems with skills to address the challenges effectively.

V. Aim of the course

- To make the students knowledgeable about the world scenario of prevailing malnutrition in variegated forms and measures being adopted at international/ national levels
- To give opportunity to the students to identify, analyse and suggest coping strategies at global, national, regional and community levels.

VI. Theory

Unit I: Food consumption

Food consumption pattern of underdeveloped, developing and developed countries.

Unit II: Nutritional deficiency diseases

An overview of world nutrition situation and assessment of problems of developing and developed countries in light of prevalence, aetiology, indicators and preventive measures.

Unit III: Health programmes

Nutrition and health programmes to alleviate malnutrition, role of national and international organizations.

Unit IV: Health care polices

Impact of health care polices and delivery systems; Micronutrients, food fortification and supplementation.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group work/ group discussion

VIII. Learning Outcome

A successful scholar with this knowledge will be able to

- Appreciate the scientific foundation of risk management associated with malnutrition and relate the key learning to the job of a professional
- Utilize methods and tools to assess the nutritional scenario and plan out suitable interventions

IX. Suggested Reading

- Babu SC, Gajanan SN and Hallam JA. 2017. *Nutrition Economics-Principles and Policy Applications*. Science Direct. Elsevier.
- FAO. 2017. *Regional Overview of Food Security and Nutrition in Asia and the Pacific*. Food and Agriculture Organization, Rome.
- Park JE and Park K. 2007. *Text Book of Preventive and Social Medicine*. Barnasi Das Bhanot Publishers, Jabalpur.
- Semba RD and Bloem MW. 2008. *Nutrition and Health in Developing Countries*. 2nd Edition. Humana Press Inc. New York.
- Temple NJ and Steyn N. 2016. *Community Nutrition for Developing Countries*. AU Press, Athabasca University, Canada and UNISA Press, University of South Africa.
- https://www.who.int
- http://www.fao.org/home/en
- https://www.harvestplus.org
- https://www.hsph.harvard.edu/nutritionsource

Weekly Lecture Schedule

Duration(Week)	Topic
1	An overview of world nutrition situation.
2	Overview of global nutritional problems.
3	Global nutrition intervention programmes.
4	Food consumption pattern of underdeveloped countries.

Duration (week)	Topic
5	Food consumption pattern of developing countries.
6	Food consumption pattern of developed countries.
7	Prevalence and etiology of nutritional problems of developing countries.
8	Indicators of nutritional problems of developing countries.
9	Preventive measures of nutritional problems of developing countries.
10	Prevalence and etiology of nutritional problems of developed countries.
11	Indicators and preventive measures of nutritional problems of developed countries.
12	Nutrition and health programmes to alleviate malnutrition.
13	Role of national organizations in combating nutritional problems.
14	Role of international organizations in combating nutritional problems.
15	Impact of health care polices and delivery systems.
16	Micronutrients food fortification and supplementation.

I. Course Title : Nutrition in Calamities

II. Course Code : FN 605

III. Credit Hours : 2(2+0)

IV. Rationale

Calamities, natural, viz., flood, earthquake, draught) or man-made, viz., riots, war, wrong policies always affect nutritional status of population which may be short-termed or long-termed depending upon the severity of the disaster. A knowledge on the topic will enable the students to act favourably for the favours of the victims to lessen the miseries in terms of health and nutrition.

V. Aim of the course

- To give theoretical base to the scholars in the management of food and nutritional security during a disaster. This course will cover areas of food and water supply, precautions against food shortage, adequate feeding especially of vulnerable groups, control of communicable diseases, health and hygiene, etc. during a calamity
- To equip the students with the knowledge of providing effective support systems according to the need of calamity.

VI. Theory

Unit I: Calamities and undernutrition

Starvation in emergencies arising out of drought, floods, earth quakes, locust, war, wrong policies and poverty and climatic changes, conflict and global economic volatility, historical perspectives.

Unit II: Food needs during emergencies

Effect of inanition, short, medium and long- term emergencies on food and nutrient intake, precautions against food shortage; Population groups most vulnerable to under nutrition; Food needs at national level during normal emergencies.

Unit III: Nutritional deficiency diseases

Major nutritional deficiency diseases in emergencies, mobilization of local resources, general fund distribution, mass and supplementary feeding, therapeutic feeding, social funds; Nutritional Indices and reference standards; Preventing and handling donations in emergencies.

Unit IV: Hygiene and sanitation

Control of communicable diseases, public health and hygiene problems during emergencies.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

After successful completion of the course, the students will be able to:

- Assist in preparedness and disaster risk management
- Assist in taking care of vulnerable population
- Assist in nutrition risk assessment as extension professional

IX. Suggested Reading

- FAO. 2018. *Climate Change Challenge Badge.* 2nd edition. Food and Agriculture Organization of United Nations, Rome.
- Gibney MJ. 2004. *Public Health Nutrition.* Blackwell Science, Oxford.
- Park K. 2007. *Text book of preventive and Social Medicine* 19th Edition. Banarsidas Bhanot Publishers, Jabalpur, India.
- Spark A. 2007. *Nutrition in Public Health: Principles, Policies and Practice.* CRC Press, New York.
- WHO. 2000. *The Management of Nutrition in Major Emergencies.* World Health Organization, Geneva.
- https://www.who.int
- http://www.fao.org/home/en
- https://ndma.gov.in

Weekly Lecture Schedule

Duration (week)	Topic
1	Latest advances in management of food and nutrition in emergent situation.
2	Starvation in emergencies- historical perspectives.
3	Starvation in emergencies arising out of war, wrong policies, poverty and climatic changes.
4	Starvation in emergencies arising out of conflict and global economic volatility.
5	Starvation in emergencies arising out of drought, floods, earthquakes and locust.
6	Population groups most vulnerable to under nutrition.
7	Food needs at national level during normal emergencies.
8	Effect of inanition, short, medium and long- term emergencies on food and nutrients intake.
9	Precautions against food shortage.
10	Major nutritional deficiency diseases in emergencies.
11	Mobilization of local resources, general fund distribution, social funds.
12	Mass and supplementary feeding programmes during emergencies.
13	Therapeutic feeding programmes during emergencies.
14	Nutritional Indices and reference standards.
15	Communicable diseases and their control during emergencies.
16	Public health and hygiene problems during emergencies.

I. Course Title : Maternal and Child Nutrition

II. Course Code : FN 606

III. Credit Hours : 2(2+0)

IV. Rationale

Inadequate maternal and child nutrition is the underlying cause of considerable deaths in the third world countries. The one who survives does not grow to its full potential, remains unproductive and a burden to the society. As professionals, the students need to develop skills to provide support to this most vulnerable mother-child duo conducive to development of quality human resource.

V. Aim of the course

- To impart in-depth knowledge about why this vulnerable group needs special attention in terms of nutrition and other health care areas. This course will emphasize topics like nutritional challenges, physiological changes, IYCF guidelines, feeding of children with special needs, interventions, etc.
- To make students knowledgeable to identify risks and stratify coping strategies.

VI. Theory

Unit I: Nutrition and reproduction

Nutrition challenges, physiological changes, teenage pregnancy and gestational diabetes, nutrient needs, factors affecting nutrition of the women and children.

Unit II: Nutritional deficiencies

Needs and problems of lactating women, fetal malnutrition and low birth weight, nutrition and parasites, children with special needs, Protein energy malnutrition, vitamin A, iron, vitamin D, calcium and other common deficiencies, significance of stem cell and cord blood.

Unit III: Feeding practices

Formula feeding and supplements, lactation and breast feeding in the community, HIV and breast feeding; drug abuse and breast feeding. Human milk banks, IYCF guidelines, WHO breast feeding recommendations

Unit IV: Overnutrition and undernutrition

International programs regarding child and maternal health initiative to prevent overnutrition and undernutrition.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Group Work/ Group Discussion

VIII. Learning Outcome

Successful completion of this course will enable the students to:

- Appreciate the scientific knowledge and relate them to actual work situation to evade long term health crisis of the concerned
- Utilize the methods and tools to assess nutritional demands and suggest coping strategies
- Utilize the knowledge for scientific publication/ population education.
- Act as scientist in related R&D projects

IX. Suggested Reading

- Brown JE. 2016. *Nutrition through the Life Cycle*. 6th Edition. Cengage Learning, Boston.
- Ehiri J. 2009. *Maternal and Child Health - Global Challenges, Programs and Policies*. Springer Nature, Switzerland.
- Gluckman P, Hanson M, Seng CY and Bardsley A. 2015. *Nutrition and Lifestyle for Pregnancy and Breastfeeding*. Oxford University Press, UK.
- Morgan JB and Dickeson JWT. 2003. *Nutrition in Early Life*. John Wiley and Sons Ltd. Chichester.
- https://www.unicef.org
- https://www.india.gov.in/ agriculture
- https://mhrd.gov.in/mid-day-meal

Weekly Lecture Schedule

Duration (week)	Topic
1	Nutrition and reproduction.
2	Nutrition challenges, physiological changes.
3	Teenage pregnancy and gestational diabetes.
4	Nutrient needs, factors affecting nutrition of the women and children.
5	Needs and problems of lactating women.
6	Foetal malnutrition and low birth weight.
7	Nutrition and parasites.
8	Children with special needs.
9	Protein energy malnutrition, vitamin A, iron, vitamin D, calcium and other common.
10	Significance of stem cell and cord blood.
11	Formula feeding and supplements.
12	Lactation and breast feeding in the community.
13	HIV and breast feeding; drug abuse and breast feeding.
14	Human milk banks, IYCF guidelines.
15	WHO breast feeding recommendations.
16	International programs regarding child and maternal health initiative to prevent over weight human nutrition.

I. Course Title : Hormones and Enzymes

II. Course Code : FN 607

III. Credit Hours : 2(2+0)

IV. Rationale

Hormones are chemical messengers providing signals to the cells for performing various functions while enzymes as catalysts enhance the rate of reaction in the body. There are few chances of occurring disease due to enzyme dysfunction however, hormonal dysfunction may give rise to lifelong diseases. Both are important biochemical materials for all living beings. Knowledge on the topic will help the students in ascertaining an effective diet counselling to address health problems linked with hormones and enzymes.

V. Aim of the course

- To learn in detail about the role of hormones and enzymes in human physiology and relate this information to the context of normal health and diseased state like diabetes, hypertension, renal and gastro intestinal disorders, etc. and suggesting relevant dietary managements

- To equip the students with relevant knowledge of effective dietary management of a given disease condition due to hormonal and enzymatic imbalance.

VI. Theory

Unit I: Hormones

History, chemistry, endocrine and exocrine secretion of hormones, organs of secretion, metabolism, mechanism of action, regulation and sites of action, biological effects and interaction.

Unit II: Enzymes

Enzyme pathways in normal functions of the heart, pancreas, gastrointestinal and hepatic functions and kidneys.

Unit III: Metabolic disorders

Altered hormone and enzymatic pathways in obesity, reproductive functions, renal disorders, gastrointestinal disorders.

Unit IV: Degenerative diseases

Altered hormone and enzymatic pathways in hypertension, cardiovascular diseases, diabetes and cancer.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online group work/ group discussion

VIII. Learning Outcome

After successful completion of this course, a scholar will be able to:

- Utilize the scientific foundation to act as an expert of Health Care Team in medical set-ups
- Act as Clinical Nutritionists
- Act as expert in related R&D projects

IX. Suggested Reading

- Berg JM. 2007. *Biochemistry*. 6thEdition. W. H. Freeman and Company, New York.
- Henry HL and Norman AW. 2014. *Hormones*. 3rd Edition. Academic Press, Cambridge.
- Kleine B and Rossmanith WG. 2016. *Hormones and the Endocrine System*. Springer Nature, Switzerland.
- Palmer T and Bonner PL. 2007. *Enzymes*. 2nd Edition. Woodhead Publishing, Cambridge.
- Nelson DL and Cox MM. 2017. *Lehninger Principles of Biochemistry*. 7th Edition. W.H. Freeman Company, New York.
- https://www.nutrition.org.uk
- http://www.nutritioncare.org
- https://nutrition.org

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Histor and chemistry of hormones.
2	Endocrine and exocrine secretion of hormones, organs of secretion.
3	Metabolism, mechanism of action, regulation and sites of action of hormones.
4	Biological effects and interaction of hormones.
5	Enzyme pathways in normal functions of the heart and pancreas.
6	Enzyme pathways in normal functions of the gastrointestinal and hepatic functions.

Duration (weeks)	Topics
7	Enzyme pathways in normal functions of the kidneys.
8	Altered hormone and enzymatic pathways in diseases-hypertension.
9	Altered hormone and enzymatic pathways in cardiovascular diseases.
10	Altered hormone and enzymatic pathways in diabetes.
11	Altered hormone and enzymatic pathways in obesity.
12	Altered hormone and enzymatic pathways in metabolic disorders.
13	Altered hormone and enzymatic pathways in reproductive functions.
14	Altered hormone and enzymatic pathways in renal disorders.
15	Altered hormone and enzymatic pathways in gastrointestinal diseases.
16	Altered hormone and enzymatic pathways in cancer.

I. Course Title : Energy Metabolism

II. Course Code : FN 608

III. Credit Hours : 2(2+0)

IV. Rationale

Energy metabolism is complex process of deriving energy from the nutrients. Imbalance in energy metabolism may be devastating for human health. It is important to understand bioenergetics to overcome the issued related to these imbalances. The understanding of the role of energy metabolism in regulation of hunger to manage body weight and other non-communicable disease by the students will help them to manage obesity related diseases.

V. Aim of the course

- To impart in depth knowledge to the students with new developments in the area of energy metabolism and its relation to human health
- To learn the concept of bioenergetics, thermogenesis, metabolic regulation and hunger for its application in preventing adiposity.

VI. Theory

Unit I: Bioenergetics

Scope and application of bioenergetics for human nutrition; Energy stores in man; Components of energy; Basal metabolism, energy cost of various activities; Factors affecting energy expenditure.

Unit II: Energy expenditure

Direct and indirect methods of assessing energy expenditure; Factors affecting energy requirements; Assessment of energy requirements.

Unit III: Regulation of metabolism

Thermogenesis, metabolic regulation; Weight control and obesity-role of adipose tissues; Effect of hormones on energy metabolism.

Unit IV: Hunger

Mechanism of hunger; Psychological and physiological factors associated with adiposity.

VII. Teaching Methods/Activities

- Lectures

- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

Successful completion of this course will enable the students to:

- Apply the knowledge of bioenergetics in weight management
- Use methods and tools of measuring energy expenditure
- Correlate eating behaviours of people for planning appropriate meals/diets to prevent adiposity

IX. Suggested Reading

- Donohoue PA. 2010. *Energy Metabolism and Obesity*. Humana Press Inc. New York.
- Driskell JA and Wolinsky I. 2007. *Sports Nutrition: Energy Metabolism and Exercise.* 2nd Edition. CRC Press, New York.
- Korbonits M. 2008. *Obesity and Metabolism*. Karger Publishers, London.
- Rathore AK. 2015. *Bioenergetics, Physiology and Biostatistics*. Discovery Publishing House, New Delhi.
- Scott B. 2008. *A Primer for the Exercise and Nutrition Sciences: Thermodynamics, Bioenergetics, Metabolism*. Humana Press Inc. New York.
- http://www.nutritionlink.org
- https://www.icmr.nic.in
- http://www.nin.res.in

Weekly Lecture Schedule

Duration (week)	Topic
1	Scope and application of bioenergetics for human nutrition.
2	Energy stores in man. Components of energy.
3	Basal metabolism.
4	Energy cost of various activities.
5	Factors affecting energy expenditure.
6	Direct methods of assessing energy expenditure.
7	Indirect methods of assessing energy expenditure.
8	Factors affecting energy requirements.
9	Assessment of energy requirements.
10	Thermogenesic.
11	Metabolic regulation.
12	Weight control.
13	Role of adipose tissues in obesity.
14	Effect of hormones on energy metabolism.
15	Mechanism of hunger.
16	Psychological and physiological factors associated with adiposity.

I. Course Title : Application of Biotechnology in Food Science and Nutrition

II. Course Code : FN 609

III. Credit Hours : 3 (3+0)

IV. Rationale

The role of food biotechnology is important in product development. Knowledge of biotechnology will help to develop foods with enhanced taste, shelf life, nutrition and quality. Novel food products with desirable characteristics that are safe, nutritious and suitable in different physiological conditions can be developed by the application of biotechnology. Biotechnology can be an important area of application to manage hunger from population.

V. Aim of the course

- To understand the role of food biotechnology in quality food production for mass feeding
- To equip the students with knowledge of application of biotechnology in the process of food product development.

VI. Theory

Unit I: Food science and biotechnology

History, processes and products of biotechnology, application of biotechnology in production of nutritious foods.

Unit II: Product development

Role of biotechnology in enzymology and product development, fermentation process, fruit juice extraction, genetic improvement of food grade microorganisms.

Unit III: Nutraceuticals

Nutritional significance of food products developed by biotechnological techniques.

Unit IV: Constraints in food biotechnology

Scientific, technological and resource constraints in biotechnology; important factors affecting development in biotechnology.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

Successful completion of this course will enable the students to:

- Utilize the knowledge in modifying foods for therapeutic purpose
- Serve as investigative dietitian in developing novel food products in food industry

IX. Suggested Reading

- Nestle M. 2003. *Safe Food: Bacteria, Biotechnology and Bioterrorism*. University of California Press Ltd., London.
- Panesar PS and Marwaha. 2014. *Biotechnology in Agriculture and Food Processing: Opportunities and Challenges*. CRC Press, Boca Raton, Florida.
- Shetty K, Paliyath G, Pometto A and Levin RE. 2011. *Food Biotechnology*. 2nd Edition, CRC Press, New York.
- Ravishankar Rai V. 2015. *Advances in Food Biotechnology*. Wiley-Blackwell Publishing Company, Boston.
- https://www.bio.org

Weekly Lecture Schedule

Duration (weeks)	Topic
1	History of biotechnology.
2	Processes and products of biotechnology.

Duration (weeks)	Topic
4	Application of biotechnology in production of nutritious foods.
6	Role of biotechnology in enzymology.
7	Product development.
8	Fermentation process.
9	Fruit juice extraction.
10	Genetic improvement of food grade microorganisms.
12	Nutritional significance of food products developed by biotechnological techniques.
14	Resource constraints on biotechnology.
15	Technological constraints on biotechnology.
16	Important factors affecting development in biotechnology.

I. Course Title : Recent Trends in Food Science and Technology

II. Course Code : FN 610

III. Credit Hours : 3(3+0)

IV. Rationale

Environment and food can influence individual's health due to interaction between genes and food components that can cast positive or negative impact on human health. Nutrigenomics relates human genome with response of body to the food. In depth study of recent advances in the field of food analysis and food fortification is imperative to reduce double burden of malnutrition. With the use of application of food science and technology, the novel foods can be formulated which are safe, wholesome and nutritious.

V. Aim of the course

- To acquaint the students with latest advances in food science and technology to meet nutritional challenges
- To understand the integration of genomic science with nutrition
- To understand the physical, chemical and biological makeup of food and ways of food processing and packaging.

VI. Theory

Unit I: Macro and micronutrients

Recent advances in the field of carbohydrates, lipids, proteins, vitamins and minerals in relation to food science; Nutrigenomics, incorporating genetics into dietary guidance.

Unit II: Food analysis

Recent advances in the field of food analysis and food fortification.

Unit III: Advanced techniques

Membrane technology: micro-filtration, ultra-filtration, nano-filtration, reverse osmosis and their applications in food industry; Supercritical fluid extraction- concept and extraction methods; Microwave and radio frequency processing- mechanism and application in food processing; Hurdle technology- concept and its applications.

Unit IV: Foods of future

Food processing and product development; regulating; food processing and preservation through Total Quality Management (TQM) and Hazard Analysis and

Critical Control Points (HACCP); Genetically Modified Foods (GM) foods and their health implications, functional foods and organic foods.

VII. Teaching Methods/Activities

- Lectures
- Assignment (Writing/Reading)
- Students' presentation
- Online Group Discussion

VIII. Learning Outcome

Successful completion of this course will enable the students to:

- Understand the recent advances in technologies used in food industry
- Gain in knowledge of genetically modified, safe and nutritious food products to maintain and improve human health
- Serve as novel therapeutic food designer in pharmaceutical/nutraceutical companies

IX. Suggested Reading

- Clark S, Jung S and Lamsal B. 2014. *Food Processing - Principles and Applications*. 2ndEdition, Wiley-Blackwell Publishing Company, Boston.
- deMan JM, Finley JW, Hurst WJ and Lee CY. 2018. *Principles of Food Chemistry*. 4th Edition, Springer International Publishing, New York.
- Fellows PJ. 2017. *Food Processing Technology*. 4th Edition, Woodhead Publishing Ltd. Cambridge.
- Hartel RW and Heldman D. 2012. *Principles of Food Processing*. Aspen Publishers Inc. New York.
- Ward JD and Ward LT. 2012. *Principles of Food Science*. Goodheart-Willcox Publisher, Illinois.

Weekly Lecture Schedule

Duration (week)	Topic
1.	Recent advances in the field of carbohydrates, lipids and proteins in relation to human nutrition.
2.	Recent advances in the field of vitamins and minerals in relation to human nutrition.
3.	Nutrigenomics.
4.	Incorporating genetics into dietary guidance
5.	Recent advances in the field of food analysis
6.	Recent advances in the field of food fortification.
7.	Membrane technology: micro-filtration, ultra-filtration.
8.	Reverse osmosis and their applications in food industry.
9.	Supercritical fluid extraction- concept and extraction methods.
10.	Microwave and radio frequency processing- mechanism and application in food processing.
11.	Hurdle technology- concept and its applications.
12.	Foods of future; special nutrients.
13.	Food processing and product development.
14.	Regulating food processing and preservation through Total Quality Management (TQM).
15.	Hazard Analysis and Critical Control Points (HACCP).
16.	Genetically Modified Foods (GM) foods and their health implications, functional foods and organic foods.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 6

Community Science
– Human Development and Family Studies

Preamble

Human Development and Family Studies (HDFS) students acquire knowledge to explore the ways in which people develop physically, emotionally, socially and intellectually within the framework of family and society and learn strategies for promoting growth and development in family systems. The face and pace of systematic investigation has accelerated markedly, in all disciplines and the product of research has changed in both quality and quantity. Owing to wide-ranging transition in psychological structures, social systems and family relations, a more specific radical transformation has occurred over the past decade in how we view human development and family studies in the changing ecological settings and complexities of life. Accordingly, research in Human Development is moving away from research focused on development at particular stages (early childhood, adolescence, middle age, older adulthood) and from separate fields of inquiry to a more inclusive, integrative, and interdisciplinary approach to the study of human development across the entire life span. Some problems considered to be of major importance a decade ago receive less attention today, rather other areas of HDFS that had previously been only minor foci of study have become central today.

With this backdrop, Post Graduate curriculum of HDFS has been extensively updated, reshaping previous course contents and developing some new ones after giving due consideration to the needs and requirements of stakeholders thus rendering it suitable for students to pursue for optimal placements. The basic objectives of this updated/ revamped curriculum are the same as they were earlier, but effort has been made to offer the students a broader and deeper understanding and more extended knowledge of the scientific basis of various developmental processes in various ecological settings across cultures. The redesigned courses will help in understanding and critically analyzing the adopted practices in trend to know what is best and what is obsolete for human development. It can prove panacea for many developmental delays, irregularities as well as ills and evils faced by society. The increased number of courses and research credits give massive support to this aspect.

The PG courses are not only meant to give freedom to choose the courses of their interest to enhance their knowledge and abilities in various domains of human development and family studies but also enhance their professionalism, entrepreneurship skills, creativity, innovation, employability, job avenues and develop their confidence to become job providers than job seekers. These courses support and are in line with the objectives of this new educational policy and Skill India. The courses will help in capacity building of the students to develop their managerial and entrepreneurial skills so that they can organize and manage various types of institutions for children, adolescents and elderly which are the need of the day. The courses on HDFS equip the students to engage themselves as child, school and family counsellors, personality development trainers, parent coaches and motivational speakers for public sector and private corporate houses, make them entitled to work with various national and international organizations or to undertake their own enterprise. The main purpose of this new curriculum is to focus on the overall development and performance of students, as it is believed that if their performance over takes their ambitions, it gets lot of success to them.

Modifications Suggested in Courses in the Revised Curricula

M.Sc. (Community Science) in Human Development and Family Studies

Course Code	Course Title	Credit Hours	Remarks
	Major Courses (20 Credits)		
*HDFS 501	Theories of Human Development	3 (3+0)	Course content modified
*HDFS 502	Dynamics of Human Development	3 (3+0)	Contents modified and change in title
*HDFS 503	Methods and Techniques of Assessment in Human Development	3 (2+1)	Contents modified and change in title
*HDFS 504	Innovative Programmes in Early Childhood Development and Education	3 (2+1)	Contents modified
HDFS 505	Gender Issues in Human Development and Relationships	3 (2+1)	Contents modified and change in title
HDFS 506	Adult Development	2 (2+0)	New Course added
HDFS 507	Management of Differently Abled	3 (2+1)	Contents modified and change in title
HDFS 508	Adolescent Development and Challenges	3 (2+1)	Contents modified and change in title
HDFS 509	Guidance and Counselling	3 (2+1)	Contents modified
HDFS 510	Interventions for Differently Abled Children	2(1+1)	New course added
HDFS 511	Family Ecology	2 (2+0)	New Course added
HDFS 512	Family and Cultural Diversities	2(2+0)	New course added
HDFS 513	Family Therapy	3 (2+1)	Contents modified

Course Code	Course Title	Credit Hours	Remarks
	Minor Courses (08 Credits)		
FN 502	Public Health and Nutrition	3(2+1)	Proposed minor courses from subjects closely related to a student's major subject.
FN 505	Nutrition and Physical Fitness	3(2+1)	
FN 510	Nutritional Challenges in Life Cycle	3(2+0)	Apart from these courses a student can register any other course offered by any other departments
FN 513	Human Physiology	3(3+0)	
EECM 501	Global Extension Systems	2 (2+0)	
EECM 502	Development Communication	3 (2+1)	
EECM 508	Educational Technology	3 (2+1)	
EECM 509	Group Dynamics	2 (2+0)	
EECM 512	Gender Sensitization for Empowerment		2 (2+0)
	Supporting Courses (06 Credits)		
	Research Methodology	3 (2+1)	Course numbers will be assigned by the departments that offer these courses
	Statistical Methods and Application	3 (2+1	
	Common Courses (05 Credits)		
	Library and Information Services	1(0+1)	Common to all disciplines. The course numbers will be assigned by the departments that offer these courses
	Technical Writing and Communications Skills	1(0+1)	
	Intellectual Property and its management in Agriculture	1(0+1)	
	Basic Concepts in Laboratory Techniques	1(0+1)	
	Agricultural Research, Research Ethics and Rural Development Programmes	1(0+1)	
HDFS 591	Master's Seminar	1 (0+1)	
HDFS 599	Research	30	Increased credits for research
	Total	**70 Credits**	

*Core courses/ compulsory courses

Ph.D. (Community Science) in Human Development and Family Studies

Course Code	Course Title	Credit Hours	Remarks
	Major Courses (12 Credits)		
*HDFS 601	Advanced Human Development	3(3+0)	Contents and title modified
*HDFS 602	Ecology and Human Development	3(3+0)	Contents and title modified
*HDFS 603	Programme Development for Vulnerable Families	3(2+1)	Contents modified
HDFS 604	Strategic Developmental Intervention	3(2+1)	Contents modified
*HDFS 605	Family Studies	3(3+0)	Contents and title modified
HDFS 606	Adulthood and ageing	3(3+0)	Contents and title modified
HDFS 607	Mental Health	3(3+0)	New course
HDFS 608	Qualitative Research Methods	2(1+1)	Contents modified
	Minor Courses (06 Credits)		
CS/PGS 601	Research and Publication Ethics	2(1+1)	Proposed minor courses from subjects closely related to a student's major subject. Apart from these courses a student can register any other course offered by any other departments
EECM 602	Impact Assessment of Development Programmes	3(1+2)	
EECM 603	Scaling Techniques for Behavioural Research	3(1+2)	
EECM 608	Advocacy and Behavior Change Management	3 (1+2)	
FN 606	Maternal and Child Nutrition	2(2+0)	
FN 604	Global Nutritional Problems	2(2+0)	
FN 605	Nutrition in Calamities	2(2+0)	

Supporting Courses (05 Credits)

A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM portal or other online courses up to a maximum of 5 credits.

HDFS 691	Doctoral Seminar I	1 (0+1)	
HDFS 692	Doctoral Seminar II	1 (0+1)	
HDFS 699	**Doctoral Research**	**75**	Increased credits for Research
	Total	**100 Credits**	

*Core courses/ compulsory courses

Course Contents
M.Sc. in Human Development and Family Studies

I. Course Title : Theories of Human Development

II. Course Code : HDFS 501

III. Credit Hours : 3 (3+0)

IV. Rationale

Theories act as vital tools in the study of human development and provide orderly, meaningful direction to research and out-reach programmes. Children are complex beings and to understand them, it is significant to be familiar with the basis of their development in all aspects i.e. biological, psychological, social and cognitive. No single theory has been able to explain all these aspects. The study of multiple theories helps advance knowledge, since researchers are continuously trying to explore, support and integrate the different points of view.

V. Aim of the course

- To equip the students with the concepts, theoretical framework and critical review of different theories of human development .
- To give orientation towards comparative analysis of theories and their educational implications.

VI. Theory

Unit I: Psycho-dynamic theories

Meaning, types and functions of developmental theories. Theoretical perspectives and approaches- Psycho-dynamic theories- Psycho-analytic theory of Sigmund Freud – life history of Sigmund Freud, key concepts of psycho analytic theory, laws of psychological energy, three components of personality and their operational principles. Structural model of personality. Psycho-sexual stages and their impact on process of personality development. Contribution and criticism of Freudian theory. Neo-Freudians. Psycho-social theory of Erik Erikson – concept of development and basis of development, psycho-social stages of life.

Unit II: Maturation and cognitive theories

Maturational and biological approach- Arnold Gessell's theory of maturation. Cognitive Development theory of Jean Piaget – concepts, cognitive mechanism, cognitive structure, different stages of cognitive development, thought process and implications of the theory. Piaget's contribution to field of education. Neo-Piagetians- Fischer, Robert Case, Robert Sieglar and Bruner. Socio-cultural theory of Lev Vygotsky. Information processing theories.

Unit III: Behavioural and ecological systems theories

Behavioural approach of Watson. Stimulus Response theory by Sears, Skinner and Pavlov. Social- Learning and Social Cognition theory by Albert Bandura and its application in human development. Ecological Systems theory of Urie Bronfrenbrenner - concepts, systems and implications in understanding human development. Contribution of ecological systems theory in guiding families and teachers. Language development theory of Naom Chomsky.

Unit IV: Attachment, self and moral theories

Attachment theories by John Bowlby and Ainsworth. Maslow's Need Hierarchy model. Self Theories- Models of Morris Rosenberg and Cooppersmith. Moral development theories of Lawrence Kohlberg and Jean Piaget. Comparative analysis of theories and their application. Integrated approach to theory building.

VII. Teaching Methods/ Activities

- Lecture cum discussion
- Assignments
- Student presentation
- Content analysis of the seminal work of different theorists
- Classroom discussion
- Video clips/ films
- Quiz and debate
- Incentives

VIII. Learning Outcome

After completion of the course, the students will

- have an overview of theories of human development, learn to critically evaluate these theories and recognize their merits.
- understand the scientific process of human development and learn to know the application of different theories in this process.

IX. Suggested Reading

- Baldwin AL. 1980. *Theories of Child Development*. John Wiley & Sons, New Jersey.
- Craig. 1985. *Theories of Human Development*. 2nd Ed., John Wiley & Sons, New Jersey.
- Grain WC. 1980. *Theories of Development: Concepts and Application*. Englewood Cliffs, Bergon, New Jersey.
- Hall CS. 1998. *Theories of Personality*. 4th Ed., John Wiley, New Jersey.
- Miller PH. 2016. *Theories of Developmental Psychology*. Worth Publishers, New York.
- Newman B and Newman R. 2007. *Theories of Human Development*. Rutledge, New Jersey.
- Sailkind NJ. 2004. *An Introduction to Theories of Human Development*. Sage Publications, New Delhi.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Introduction to the course. Meaning, types and functions of developmental theories. Theoretical perspectives and approaches.
2	Psycho-dynamic theories- Psychoanalytic theory of Sigmund Freud – Life history of Sigmund Freud. Key concepts of Freud's theory of Psychoanalysis, personality components, operational principles of different components and structural model of personality.
3	Freudian theory- Stage approach to nature and process of personality development, implications and criticism of Freudian theory. Neo-Freudians.
4	Psycho-social theory of Erik Erikson – his life history, key concepts, stages of life span development, Erikson's model of Psycho-social development.
5	Maturational and biological approach. Arnold Gessell's theory of maturation.
6	Cognitive Development theory of Jean Piaget – Key concepts, cognitive mechanism.
7	Cognitive Development theory of Jean Piaget – stages and implications. Piaget's contribution to education.

Duration (weeks)	Topics
8	Neo-Piagetians- Fischer, Case and Bruner. Socio-cultural theory of Lev Vygotsky. Information Processing theories.
9	Behavioural approach of J.B. Watson, Stimulus Response theory by Thorndike, Sears, Skinner and Pavlov.
10	Social Learning theory by Albert Bandura. Application of behaviourism, learning and social cognition in human development.
11	Ecological Systems theory of Urie Bronfrenbrenner - concepts, systems and implications in understanding human development and guiding families and teachers
12	Language development theory of Naom Chomsky. Attachment theories by John Bowlby and Ainsworth.
13	Moral development theories of Lawrence Kohlberg and Jean Piaget.
14	Maslow's Need Hierarchy Model.
15	Self Theories- Models of Morris Rosenberg and Coopersmith.
16	Comparative analysis of theories and their application. Integrated approach to theory building.

I. Course Title : Dynamics of Human Development

II. Course Code : HDFS 502

III. Credit Hours : 3 (3+0)

IV. Rationale

Nature and nurture play key role in human development. It is necessary for the students to understand the role of genetic endowment and environmental experiences of an individual in the course of human development. The knowledge of latest trends in the dynamic process of human development and the issues that emerge in it due to ever changing socio-cultural and economic environments becomes important .

V. Aim of the course

- To impart information to students regarding advanced concepts of human development, current trends and issues of development.
- To provide indepth understanding of the developmental concepts and processes in human life span.

VI. Theory

Unit I: Nature vs. Nurture

Human development – basic concepts and issues. Genetic foundation, genetic code, chromosomal abnormalities. Role of epigenesis and canalization in growth and development. Interface between heredity and environment. Genetic research and its influence on child's development. Current research findings on pre-natal development and neo-natal stages – developmental sequence, prenatal environmental influences, developmental threats and DNA methylation.

Unit II: Cognitive development

Brain development- key concepts and process of development. Models of intelligence. Cognitive development during early years - perceptual capacities, attention, memory, imitation, early learning, conditioning and assessment. Role of early deprivation and enrichment in cognition. Information processing. Social cognition, emotional intelligence, metacognition and self regulation and their contribution to human mind and behavior. Gardner's Model of Multiple Intelligence.

Unit III: Psycho-social Issues

Language development and its components - pre-linguistic development, phonology, semantics and bilingualism. Socialization practices and influencing factors. Cultural influence on child outcomes. Exposure to media and technology and role of parents and institutions. Impact of socio-emotional deprivation on different stages of development. Vulnerability and resilience, risk and protective factors. Personality changes and self perceptions through different stages of development. Integrated view of human development.

Unit IV: Current and classic research trends in human development

Seminal work of Sigmund Freud, Erikson, Piaget, Uri Bronfenbrenner and Margaret Mead. Design and field work of "Six cultures project". Current research trends in physical, intellectual, psycho- social and moral development of children from birth to adolescence.

VII. Teaching Methods/ Activities

- Lecture cum discussion
- Assignments
- Students' presentation
- Content analysis of the seminal work of Developmental psychologists
- Video clips/ films
- Quiz and debate
- Incentives

VIII. Learning Outcome

After completion of the course, the students will

- Understand the role of heredity and environmental influence in human development.
- Appreciate and recognize the interdependence of various aspects of human development across lifespan.
- Get oriented to the current researchable issues in human development.

IX. Suggested Reading

- Santrock JW. 2006. Life Span Development. Mc Graw Hill, New York.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Human development perspective- basic concepts and issues. Introduction to genes and environment. Genetic foundation, genetic code, chromosomal abnormalities.
2	Role of epigenesis and canalization in growth and development. Interface between heredity and environment. Genetic research and its influence on child's development.

Duration (week)	Topics
3	Current research findings on pre-natal development and neo-natal stages – developmental sequence, prenatal environmental influences, developmental threats and DNA methylation.
4	Brain development across life span- key concepts and process of development. Structure of cognition. Models of intelligence. Cognitive abilities and development during early years - perceptual capacities, attention, memory, imitation, early learning, conditioning, and assessment.
5	Role of early deprivation and enrichment in cognition. Information processing.
6	Social cognition, emotional intelligence, metacognition and self regulation and their contribution to human mind and behavior.
7	Gardner's Model of Multiple Intelligence.
8	Language development and its components - pre-linguistic development, phonology, semantics and bilingualism.
9	Socialization practices and influencing factors. Influence of cultural factors on child outcomes.
10	Exposure to media and technology and role of parents and institutions.Impact of socio-emotional deprivation on different stages of development. Vulnerability and resilience, risk and protective factors.
11	Personality changes in self perceptions through different stages of development. Integrated view of human development.
12	Current research trends in physical, motor and intellectual development in early childhood.
13	Presentation and group discussion on Seminal work of Sigmund Freud
14	Presentation and group discussion on Seminal work of Erik Erikson
15	Presentation and group discussion on Seminal work of Jean Piaget and Margaret Mead
16	Presentation and discussion on Seminal work of Uri Bronfenbrenner.

I. Course Title : Methods and Techniques of Assessment in Human Development

II. Course Code : HDFS 503

III. Credit Hours : 3(2+1)

IV. Rationale

It is imperative to have knowledge of various methods and techniques of assessment in human development for scientific understanding and analysis of developmental status of individuals for their need based guidance and education. In order to gather required information about the individuals, it makes pertinent to have an insight into the strengths, weaknesses of various research tools and hands-on training in application of these, so as to make assessments in a dependable manner.

V. Aim of the course

- To apprise the students with different methods and techniques of assessment in human development.
- To develop skills in psychological test administration, scoring, analysis, interpretation and report writing.

VI. Theory

Unit I: Developmental assessment, methods and techniques.

Assessment –Concept, functions, characteristics, steps and rationale of assessment.

History of tests and measurements. Different methods of child study/ developmental assessment. Techniques of measurement and their significance in measuring different aspects of human development. Role of assessment in intervention.

Unit II: Types of measures & methods

Scientific methods-definition, importance, goals and steps. Essential criteria of Scientific methods -reliability, validity control, item analysis. Use of objective measures and methods. Types of tests – individual and group tests. Projective techniques. Psychometrics, Sociometry. Types of scales –nominal, ordinal, interval and ratio scale

Unit III: Development of tests/ scales

Developmental Assessment from birth to early childhood. Tests for infants and children. APGAR scoring of new borns. Physical growth assessment. Anthropometric evaluation of nutritional status. Measurement of intelligence. Assessment of personality, aptitude, attitude and environment. Development of test/scale, steps, guidelines and standardization procedure – various methods of calculation of validity and reliability. Variables- extraneous, confounding, researcher variables and participant variables affecting internal validity. Threats to internal validity.

Unit IV: Ethical issues and barriers

Ethical issues in the assessment of human development. Special consideration in assessing young children. Ethical issues and barriers in assessment of infants and young children. Assessment of children with special needs. Interpretation and use of assessment information. Trends and challenges in assessment of human behavior.

VII. Practical

1. Visit to neonatal unit to observe the neonates and to observe their assessment of APGAR score by pediatricians.
2. Physical Growth assessment and nutritional status of children of different age groups.
3. Review of available developmental screening and diagnostic tests for infants, toddlers and pre-school children.
4. Review of available screening and diagnostic tests for school age children and adolescents.
5. Developmental assessment of infants by using Bayley's Scale of Infant Development (BSID)
6. Interpretation of results and report writing
7. Administration of psychological tests for measuring cognitive abilities and intelligence.
8. Administration of psychological tests for assessment of socio-emotional development of children and adolescents.
9. Administration of psychological tests for personality assessment.
10. Administration of psychological tests for assessment of language development of children.
11. Assessment of home environment using HOME (Home Observation and Measurement of Environment) inventory for different age groups of children/ Indian Home Inventory/ Family Environment Scale.
12. Interpretation of results and report writing on home environment
13. Development of scale or check lists on selected areas of development.
14. Standardization of the developed test, scoring and interpretation of results.
15. End term assessment

VIII. Teaching Methods/ Activities

- Lectures cum discussion
- Demonstrations on various methods and techniques of developmental assessment
- Case studies and discussion
- Demonstrations and hands on experience on various psychological tests, administration, scoring, interpretation of results and effective counselling
- Organizing Child Development Assessment Camps (CDAC) for giving hands on training

IX. Learning Outcome

After completion of the course, the students will

- Learn different methods and techniques of assessment of various aspects of human development.
- Gain practical experience of handling various psychological tests – administration, scoring, interpretation of results and report writing.
- Learn basics of developing testing material/ tools.

X. Suggested Reading

- Anastasi A. 1988. *Psychological Testing*. 6th Ed., McMillan Publishing Company, New York.
- Bailey DB and Worley M. 2003. *Assessing Infants and Preschoolers with Handicaps*. Merrill Publishing Company, Delhi.
- Gregory RJ. 2004. *Psychological Testing - History, Principles and Applications*. 4th Ed., Pearson Education, Atlantic.
- Gumbiner J. 2003. *Adolescent Assessment*. John Wiley & Sons, New Jersey.
- Kumar R. 2014. *Research Methodology - A Step by Step Guide for Beginners*, 4th Ed., Sage Publications, New Delhi.
- Miller LA, Macintire SA and Lovler RL. 2012. *Foundations of Psychological Testing - A Practical Approach*. 4th Ed., Sage Publications, New Delhi.
- Shaughnessy JJ and Zechmeister EB. 2014. *Research Methods in Psychology*. 10th Ed., McGraw - Hill Publishing Company, New York.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Concept, functions, characteristics, steps and rationale of assessment.
2	History of tests and measurements. Importance of assessment for intervention.
3	Different methods of developmental assessment/ child study.
4	Different Techniques of measurement and their significance in measuring different aspects of human development.
5	Scientific Methods-definition, importance, goals and steps. Essential criteria of Scientific methods. Concept of reliability, validity, item analysis. Different methods of calculating reliability.
6	Types of validity - face, content, concurrent & predictive and construct validity . Difference between test validity & test reliability. Validity & reliability in qualitative research
7	Item analysis – Item difficulty, item discrimination, item response theory, item analysis of speed tests, cross validation and assessment of item bias.
8	Methods of test classification. Types of tests – individual and group tests. Performance tests. Projective techniques. Psychometrics, Sociometry. Types of scales –nominal, ordinal, interval & ratio scale.
9	Developmental assessment from birth to early childhood. APGAR scoring of new borns. Neuro-behavioral assessment of new born infant. Physical growth assessment. Anthropometric evaluation of nutritional status. Early childhood assessment. Tests for infants and children

Duration (week)	Topics
10	Measurement of intelligence. Assessment of aptitude, attitude and personality. Environmental assessment.
11	Development of test/scale- need, significance, steps, guidelines for composing test items, writing effective items, writing administration instructions, instructions for test take, scoring instructions.
12	Standardization - establishing validity & reliability of the instrument. Variables- extraneous, confounding, researcher variables & participant variables affecting internal validity. Threats to internal validity.
13	Ethical issues in the assessment of human development. Special considerations in assessing infants and preschoolers. Special consideration in assessing young children.
14	Principles of assessment for young children. Ethical issues and barriers in child assessment. Assessment of children with special needs.
15	Interpretation of assessment information and use of assessment information for planning instructional programme.
16	Trends and challenges in assessment of human behavior - current changes in assessment, issues and trends in assessment, computerized testing. Web based assessment, implications for future.

I. Course Title : Innovative Programmes in Early Childhood Development and Education

II. Course Code : HDFS 504

III. Credit Hours : 3 (2+1)

IV. Rationale

Early childhood care and educational experiences play a pivotal role in human development. As change agents, early childhood educators and professionals need to enrich themselves with the advances and innovations that are taking place in the domain of early childhood development and education for strategic planning and execution of child care, development and educational programmes for fostering child development.

V. Aim of the course

- To orient students about the need and scope of innovative programmes in early childhood development and education.
- To develop the abilities in students for planning and executing innovative early childhood development and education programmes for enhancing wholesome development of young children

VI. Theory

Unit I: Innovative programmes in early childhood development and education

Need and scope for innovative programmes for early childhood development and education (ECDE). Innovative pedagogical approaches in early childhood development and education. Developmental patterns of children in early years. Current innovative programmes at State, National and International level. Innovative learning settings in classrooms of early child development and education centres. Usage of virtual and digital classrooms in Child Development and Education Centres

Unit II: Innovative programmes for child development

Methods and principles of designing, execution, monitoring and evaluation of programmes and activities in early childhood care and education centres. Innovative programmes for fostering physical, motor, cognitive, speech and language, creativity, socio- emotional and moral development of children.

Unit III: Stimulatory learning environment

Stimulatory learning environments at home and early childhood child care and education centres and at centres for children with special needs. Current and conventional practices of stimulatory learning. Innovative ideas for planning and execution of customized programmes/ activities for gifted children and differently able children.

Unit IV: Social support network systems

Innovative programmes for involving families in early childhood development and education centres. Challenges of family involvement. Development of social support network systems for inclusion of differently able children

VII. Practical

1. Visits to observe early childhood care, education and development centers using varied pedagogical approaches in urban/ rural settings and study their programme and activities.
   i. Creche/ day care centre and Urban Nursery school
   ii. Visit to Aanganwadi centre and rural nursery school
2. Critical analysis and report presentation
3. Class room discussions on different types of virtual and digital classrooms
4. Designing innovative activities for young children - Physical and motor development
5. Designing innovative activities for young children - Cognitive and language development
6. Designing innovative activities for young children - Social, emotional and moral development
7. Execution of designed innovative activities.
8. Evaluation of the designed innovative activities as per their effectiveness and implementation potential
9. Conducting survey to assess parental needs on knowledge of innovative activities.
10. Designing need based parent education programmes
11. Organization of parent education programme
12. Conducting need assessment study to find out the training needs of ECCE staff
13. Planning of workshop/training for ECCE personnel
14. Conducting workshop/training for ECCE personnel
15. End term assessment

VIII. Teaching Methods/ Activities

- Lectures and discussions
- Showing educational video films.
- Field visits to early childhood care and education centers
- Demonstrations of innovative programmes
- Designing innovative programmes, their implementation and analysis of developmental outcome of children.
- Market survey of available educational play material

- Visit to child libraries.
- Web/ Internet surfing & report presentations

IX. Learning Outcome

After successful completion of this course, students are enabled to:

- Design innovative child development and education programmes.
- Evaluate early childhood programmes, understand and differentiate the mundane and innovative programmes being run early childhood development and education centeres.
- Utilize the knowledge and skills acquired in it for establishing innovative child care & education institutions as a worthy enterprise with win-win principle (employment for self and others too).

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Need and scope for innovative programmes for early child care, development and education centers. Principles of pedagogy in early child care, development and education centers. Innovative pedagogical approaches in early child care, development and education centers.
2	Physical and motor development patterns during early childhood. Cognitive development pattern during early childhood. Speech and language development patterns of early childhood. Socio-emotional and moral development patterns during early childhood.
3	Current innovative programmes of State and National level for early child care, development and education.
4	Innovative learning settings in classrooms of early child development and education centers. Usage of virtual and digital classrooms in Child Development and Education centers
5	Methods and principles of designing, executing, monitoring and evaluation of early child care, development and education centers.
6	Innovative integrated programmes with special focus on enhancing physical and motor development of children. Innovative integrated programmes with special focus on fostering intellectual development of children.
7	Innovative integrated programmes with special focus on fostering speech & language development of children. Innovative integrated programmes with special focus on promoting socio- emotional and moral development of children.

Duration (week)	Topics
8	Innovative integrated programmes with special focus on inculcating moral values in children. Need and benefits of inclusive early childhood education.
9	Stimulatory learning environments at home and early childhood child care and education centers. Creating Stimulatory learning environments at centers for children with special needs.
10	Current and conventional practices of stimulatory learning. Innovative ideas for planning and execution of customized programmes/ activities for gifted children and differently able children.
11	Significance of customized programmes for differently able children and challenges in it. Precautions to be taken while customizing programmes for differently able children and challenges in it.
12	Innovative programmes for differently able children at State and National level and their effectiveness.
13	Innovative programmes for differently able children at international level. Innovative ideas for planning and execution of customized programmes for gifted children and their effectiveness.
14	Innovative ideas for planning and execution of customized programmes for differently able children and challenges in it.
15	Innovative programmes for involving families in early childhood development and education centers and challenges in it. Innovative programmes for involving families in early childhood development and education centers.
16	Social support network systems for execution of innovative early childhood care development and education centers. Social support network for planning and execution of innovative programmes for developmentally differently able children in ECDE centers.

I. Course Title : Gender Issues In Human Development and Relationships

II. Course Code : HDFS 505

III. Credit Hours : 3 (2+1)

IV. Rationale

Gender stereotypes have been existing in different cultures, though, at various degrees. In rapidly changing socio-cultural and economic scenario, gender issues in human development and relationships have become a very sensitive and vital issue for protection of human rights and dignity. It is important to enlighten students about the various aspects of gender studies and its repercussion on human development, behaviour, relationships, family functioning and societal values.

V. Aim of the course

- To orient the students regarding the gender issues in human development and family relationships.
- To impart experiences regarding gender issues, family practices and biases prevalent in Indian Society.

VI. Theory

Unit I: Gender perspectives and theories

Concept of gender- biological and socio-cultural connotations. Historical perspectives. Gender differences in human development. Gender theories- Gender Orientation theory of Sandra Bem. Gender Schema theory, theory of Ego Development and Gender. Gender Stratification theory by Blumberg. Gender Identity Formation theory.

Unit II: Gender discrimination, gap and parity

Gender equality and development. Gender inequalities in human development– dimensions, causes and consequences. Gender discrimination indicators- global gender gaps. Gender Development Index, Global Gender Gap Index and Gender Parity Index. Demographic challenges to family ecology- gender role socialization.

Unit III: Gender violence and empowerment

Gender violence- dowry harassment and deaths, suicides, prostitution, sexual harassment and exploitation and prevention. Family violence, amniocentesis, female feticide, infanticide, eve teasing. Gender empowerment strategies- working towards family solidarity and social well-being. Gender main streaming- concept, policy of United Nations, objectives, requirements and principles. Empowering lives of women by controlling – patriarchy system, women's sexuality, fertility, labour, lack of visibility. Gender budgeting.

Unit IV: Changing trends in status of women

Status of women in India. Various plans and policies designed for achieving gender equality. Changing trends in gender role orientation- early civilization, pre-independence, post independent India, contemporary times, socio economic impact on the family and society, cultural impact on the family. Gender role portrayal in mass media. Gender stereotyping in schools. Gender issues at workplace.

VII. Practical

1. Gender analysis of mass media: Print media and E-media
2. Report writing
3. Study of adopted socialization practices for children of both genders
4. Report writing
5. Case studies of three generations on dynamics of gender orientation
6. Report presentation and discussion
7. Case studies of three generations on dynamics of Gender roles and responsibilities.
8. Report presentation and discussion
9. Views of adolescents on their gender role orientation- designing questions .
10. Survey through questionnaire
11. Report presentation and discussion
12. Case studies on changing trends of roles and responsibilities of women and men
13. Report writing
14. Visits to women welfare Govt. organizations/ agencies/ NGOs
15. Presentation of report and class discussion.
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures.
- Viewing of educational video films.
- Case studies on women and men in different occupations- issues & challenges.
- Intergenerational case studies of families.
- Interviews with lawyers of women welfare courts.

- Field visits to Govt and Non- Govt institutions.
- Analysis of mass media narratives.

IX. Learning Outcome

After successful finishing of this course,

- Students become capable of recognizing gender related issues, problems and challenges in society, it's influencing factors and solutions.
- Students are able to design and organize effective programmes for protection of rights and dignity of women in families, society and workplace.

16	Wrap up

I. **Course Title : Adult Development**

II. **Course Code : HDFS 506**

III. **Credit Hours : 2 (2+0)**

IV. **Rationale**

Adulthood is a critical period in the life course involving vibrant transitions in roles and responsibilities in biological, psychological, social, carrier and economic spheres. If adults make needed adjustments and alterations in life, there will be sustainable, happy and healthy society. Students get oriented to adulthood concerns, issues, challenges and different ways to cope up with them.

V. **Aim of the course**

- To acquaint the students with developmental perspectives in relation to adult life stages and theoretical perspectives of the ageing process.
- To develop an understanding of the changes and adjustments at various stages of adulthood aging.

VI. **Theory**

Unit I: Theoretical and ecological perspectives of adult development

Adulthood- transition to adulthood, stages of adulthood. Psychosocial theories of ageing - Erikson's Psychosocial theory, Identity Process Theory, Activity Theory, Socio-emotional Selectivity Theory. Theoretical perspectives in adult development - Bio-psychosocial perspective, Ecological perspective, Life Course perspective. Klaus Riegel's Dimensions of Development Theory. Four principles of adult development and aging.

Unit II: Models and stereotypes in adulthood

Models of development- biological model of aging, psychological models of adulthood development, socio-cultural models of development, nature and nurture in adulthood-individual and environment interactions. Reciprocity in development. Themes and issues in adult development and aging. Ageism and stereotyping the elderly.

Unit III: Developmental changes during adulthood

Developmental changes in adulthood – biological changes, cognitive changes, sensory changes, psychological and social interactional changes associated with aging. ageing and health. Factors affecting health. Lifestyle and health. Key concepts in health and prevention of chronic diseases, physical and neuro-cognitive disorders and others. Risk factors and preventive measures, supportive services.

Unit IV: Adulthood Adjustment

Demographics of an ageing population. Gender differences in aging. Menopause and its effects on women. Cessation of sexual prowess and its effect on men. Issues and adjustments related to occupation, self and family. Retirement, leisure and adjustment. Causes of morbidity and mortality across the life cycle. Human longevity - the influence of genetic and environmental factors. Death, dying and bereavement. Attitude towards death, grief and bereavement.

VII. **Teaching Methods/ Activities**

- Lecture cum discussion
- Interviews with individuals in different phases of adulthood.
- Adult case study analysis- report presentation.

- Related video clips and films.
- Assignments and class reports on current research trends.

VIII. Learning Outcome

After successful completion of this course, students are able to

- Realize age related transitions and challenges in life of adults and measures to cope up with them.
- Understand gender related developmental perspectives in adulthood and build up empathy to guide them well.

IX. Suggested Reading

- Dacey JS and Travers JF. 2002. *Human Development - Across the Lifespan*. McGraw Hill, Boston.
- Dandekar K. 1996. *The Elderly in India*. Sage Publications, New Delhi.

- Sigelman CK. 1999. *Life Span Human Development*. 3rd Ed., Brooks/Cole Publishing Company, London.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Adulthood – Definition, phases/ stages of Adulthood, related concepts of biological, psychological, social, legal, and functional age, characteristics of emerging adulthood, physical and social indicators of adulthood.
2	Psychosocial theories of ageing - Erikson's Psychosocial Theory. Identity Process theory, Activity theory, Socio- emotional Selectivity theory.
3	Theoretical perspectives in adult development - Bio-psychosocial perspective. Ecological Perspective, Havighurst's Developmental Tasks Theory, Jane Loevinger's theory of Ego Development.
4	Theories of Aging, theories of successful Aging, biological theories of ageing - programmed theories, evolutionary theories and random damage theories.
5	Life-Course Theories - Erik Erikson's Eight Stages of Life, Klaus Riegel's Dimensions of Development Theory. Four Principles of Adult Development and Aging.
6	Models of development- biological model of ageing in adulthood, psychological models of development in adulthood. Socio-cultural models of development.
7	Nature and nurture in adulthood. Individual–environment interactions, reciprocity in development.
8	Themes and issues in adult development and aging. Ageism & Stereotyping the elderly.
9	Theoretical perspectives on developmental changes in adulthood. Changes at different stages of adulthood – biological changes, cognitive changes- ageing and memory, ageing and intelligence, sensory changes, psychological and social interactional changes associated with aging.
10	Aging and health. Factors affecting health.

Duration (weeks)	Topics
11	Lifestyle changes needed for secure health, Key concepts in health and prevention– cardiovascular diseases, cancer, disorders of the musculoskeletal system, diabetes, neuro-cognitive disorders and others.
12	Risk factors and preventive measures, supportive services.
13	Demographics of an ageing population. Gender differences in aging. Menopause and its effects on women. Cessation of sexual prowess among men and its effects.
14	Issues and adjustments related to occupation, self and family. Retirement, leisure and adjustment.
15	Causes of morbidity & mortality across the life cycle.
16	Human longevity -the influence of genetic & environmental factors. Death, dying and bereavement. Attitude towards death, grief and bereavement.

I. Course Title : Management of Differently Abled

II. Course Code : HDFS 507

III. Credit Hours : 3 (2+1)

IV. Rationale

Despite advanced scientific technologies in health and education domains, the number and types of differently abled persons is still alarming. It is necessary for students to learn about persons with various different ablilities, their causes, characteristics, needs, management, assistive technologies and rights. This input is required for the effective guidance and counseling of such individuals, their families and teachers. This course is useful for making efforts for prevention, management and rehabilitation of differently able.

V. Aim of the course

- To orient the students to the etiology and developmental characters of differently abled individuals and develop empathy for working with differently abled persons.
- To develop knowledge and skills in students about how to conduct case studies and surveys of differently abled individuals, analyzing and report writing about it.

VI. Theory

Unit I: Classification and statistics of differently abled

Concept and classification of differently abled individuals. Their current statistics. It's implications on the quality of life. Social, emotional, and economic aspects of exceptionality for both children and families. Multi disciplinary view of differently abled individuals.

Unit II: Characteristics, etiology and issues of differently abled

Different abilities- mental deficiency, learning disabilities, visual impairment, hearing impairment, communication disorders, neurological disorders - definition, types, characteristics, etiology, prevalence in India for all above different abilities. Associated psychological and behavioural problems, educational provisions, management considerations and remedial programmes for different types of special needs.

Unit III: Educational & vocational interventions for differently abled

Physical impairment or loco-motor disabilities (Orthopedic and neurological impairment)- definition, classification, assessment and etiology. Psychological and behavioural characteristics of physically challenged children. Educational and vocational interventions. Remedial programmes for physically challenged. Psycho-social disturbances and social maladjustment - definition, classification, types, characteristics and etiology of emotionally disturbed and socially maladjusted. Management considerations and remedial programmes for psycho-socially disturbed and socially maladjusted. Gifted children - definition, types, characteristics, assessment and prevalence in India. Inclusive education and special programmes for the gifted.

Unit IV: Government support services

Preventive measures. Assistive technologies for different developmental challenges. Inclusive education policies and programmes for differently abled persons. Government provisions, concessions, facilities, rights and legislations for differently abled. Community based rehabilitation. Rehabilitation Council of India. National and International agencies for differently abled individuals.

VII. Practical

- Case studies of differently abled persons- etiology, characteristics, assessment of their different Abilities
  - Mentally subnormal children
  - Visually impaired children
  - Hearing impaired children
  - Speech impaired children
  - Orthopedically handicapped
  - Learning disabled children
  - Gifted children

2. Collaborative work with professionals in development of intervention packages for differently abled children (for any one category)
3. Conducting home based interventions
4. Conducting center based interventions at schools/ child clinics/ pediatric wards/ special schools and so on.
5. Report writing and presentation
6. Collaborative work with professionals in development of intervention packages for differently abled children (for any second category)
7. Conducting home based interventions
8. Conducting center based interventions at schools/ clinics/ pediatric wards/ special schools, etc.
9. Report writing and class presentation
10. End term assessment

VIII. Teaching Methods/ Activities

- Lectures.
- Field visits to various institutions of differently abled.
- Viewing of related educational video films-report writing and discussion.
- Case studies –Analysis & discussion.
- Demonstrations of special accessories & materials.
- Study and analysis of reports.
- Demonstrations on planning, execution and evaluation of intervention packages.

IX. Learning Outcome

After successful completion of this course, students become

- Sensitive and empathetic to the needs, conditions and circumstances of differently abled.
- Capable of conducting case studies and planning and executing activities for differently abled.

X. Suggested Reading

Weekly Lecture Schedule

Duration(Weeks)	Topics
1	Classification of differently abled individuals. Their current statistics. Implications of special needs on quality of life.
2	Social, emotional, and economic aspects of exceptionality for both children and families. Preventive measures.
3	Multi disciplinary view of differently abled individuals in their care and coping with them. Screening and early identification. Methods and benefits
4	Mental deficiency (low intelligence or *mental retardation*), etiology, characteristics, associated psychiatric problems, special education and welfare services for their management. Managing child in school.
5	Learning disabilities (LD) – definition, causes, types and characteristics. Educational considerations, remedial programmes and managing LD students in schools.
6	Visual impairments - development of visual skills, common visual defects among partially blind. Causes and characteristics. Vision tests. Educational provisions and management considerations.
7	Special education and welfare services for their management. Remedial programmes for visually impaired.
8	Hearing impairment- etiology, early identification and characteristics of hearing impaired. Psychological and behavioural characteristics, special education and welfare services for their management.
9	Communication (speech & language) disorders – speech production, language & communication development. Classification of speech defects, identification and causes.
10	Psychological and behavioural characteristics associated with communication disorders. Educational provisions and management considerations. Remedial programmes for speech problems.
11	Physical impairment or loco-motor disabilities (Orthopedic and neurological impairment)- definition, classification, assessment and etiology. Psychological and behavioural characteristics of physically challenged children. Educational and vocational interventions. Remedial programmes for physically challenged.

Duration (weeks)	Topics
12	Psychosocially disturbed (emotionally disturbed and socially maladjusted) - definition, classification, types, characteristics and etiology of emotionally disturbed and socially maladjusted. Management considerations and remedial programmes for psychosocially disturbed and socially maladjusted.
13	Gifted children - definition, types, characteristics, assessment, prevalence in India. Inclusive education and special programmes for the gifted.
14	Preventive measures. Assistive technologies for different types of challenges. Inclusive education. Community based rehabilitation.
15	Government policies and provisions for differently abled. Concessions, facilities, rights and legislations.
16	Rehabilitation Council of India. National and International agencies for differently abled individuals.

I. Course Title : Adolescent Development and Challenges

II. Course Code : HDFS 508

III. Credit Hours : 3 (2+1)

IV. Rationale

India has more than half of its population below the age of 25 yrs. Adolescence is an age of opportunity. Due to rapid physical, psycho-social changes, adolescents are inclined to be at risk to storm and stress, peer pressure and encounter various challenges. If their development, education, economic empowerment and stability are well taken care, it becomes easy to maintain peace and prosperity in the country. The adolescents need to be studied intensely for proper understanding of the development and challenges of this phase of life, so that they can be guided well.

V. Aim of the course

- To acquaint the students with the important developmental issues and challenges.
- To educate about the contemporary issues in adolescent development and challenges.

VI. Theory

Unit I: Theoretical perspectives of adolescents

Adolescence – definition, significance of the stage. Theoretical perspectives on adolescence – biological, psycho-analytical, psycho-social, social-cognitive and cultural. Physical and sexual development in adolescence - physical transition from child to adult, adolescent growth spurt, puberty causes and changes, psychological impact of puberty, early and late maturation and its psychological implications, adolescent sexuality, causes and correlates of physical development.

Unit II: Cognitive and communication development during adolescence

Cognitive and intellectual development during adolescence- the formal-operational stage, hypothetico-deductive reasoning, thinking like a scientist, complexities of adolescent thoughts, information-processing view of adolescent cognitive development, gender differences in mental abilities. Language development during adolescence- later syntactic development, semantics and meta-linguistic awareness, development of communication skills, learning in school and vocational development.

Unit III: Psycho-social and personality development

Psychosocial development during adolescence- emotional changes, problems, emotional regulation and stability, self-understanding. Role of family, peers, school in psychosocial development. Work, career, heterosexual relationships in adolescence. Personality development- Erikson's theory, identity crisis, identity diffusion, identity foreclosure, identity moratorium, self-concept, gender-role stereotyping. Moral development during adolescence and value orientation. Environmental learning, interactional and cultural context in moral development.

Unit IV: Different challenges of adolescence

Vocational preferences. Transition to adulthood- conflicts with special reference to contemporary socio-cultural changes. Challenges of adolescence- sexuality, aggression, delinquency, AIDS, substance abuse, alcoholism, personality disorders, depression, suicide, eating disorders, health problems, psychological problems, social problems- dating and relationships. Integration of self and psycho-sexual resolution. Resolving identity crisis- reorganization of social life relationship with peers and parents, heterosexual relationships. Risk and resilience during adolescence. Risk and protective factors. Challenges in adolescent's life in the 21st century. Challenges and opportunities for adolescent research. Programs and policies.

VII. Practicals

1. Case studies- interviewing early and late adolescents on issues, problems, pubertal changes, friendships, career aspirations, self and social awareness, mass media references
   - Development of case study format
   - Conducting case study of early adolescent girl and early adolescent boy
   - Conducting case study of late adolescent girl and late adolescent boy
2. Report writing and presentation of case studies
3. Assessment of intellectual abilities of adolescents and class room discussion.
4. Assessment of psycho-social development patterns of adolescents and class room discussion.
5. Depiction of adolescents in mass media: Content analysis of media-
   - Feature films
   - Television serials
   - Literature-magazines, newspapers, advertisements.
6. Report writing and presentation
7. Survey in rural/ semi-urban/ urban communities on challenges faced by adolescents and their Parents.
8. Survey in rural/ semi-urban/ urban communities on challenges faced by teachers of Adolescents
9. Analysis of survey results for adolescent challenges and their need assessment.
10. Planning intervention education programmes for adolescents.
11. Organising intervention education programmes for adolescents about their developmental changes, needs and coping up strategies.
12. End term assessment

VIII. Teaching Methods/ Activities

- Lecture-cum-discussion.
- Adolescent interviews: concerns and challenges.
- Viewing related amazing video clips.
- Class reports on interesting case studies reported in mass media.

- Survey- educational & vocational interests, values and aspirations of adolescents.
- Demonstrations of tests- IQ, EQ,GQ and personality.

IX. Learning Outcome

After successful finishing of this course, students are able to

- Appreciate the scientific foundation of adolescent development and challenges.
- Utilize their knowledge and available services for planning and executing programmes for raising awareness of adolescents about their self care and development.

Weekly Lectute Schedule

Duration (weeks)	Topics
1.	Adolescence – definition, importance of the stage, adolescence in perspectives, adolescents today.
2.	Theoretical perspectives on adolescence- biological, psychoanalytical, social-cognitive and cultural.
3.	Physical, motor and sexual development- motor development in adolescence, physical transition from child to adult, adolescent growth spurt, sexual maturation, adolescent sexuality.
4.	Causes and correlates of physical development. Psychological impact of puberty, psycho-social implications of early and late maturation.
5.	Cognitive and intellectual development during adolescence- the formal-operational stage, hypothetico-deductive reasoning, thinking like a scientist, complexities of adolescent thoughts, information-processing view of adolescent cognitive development, sex differences in mental abilities.
6.	Language development during adolescence- later syntactic development, semantics and meta-linguistic awareness, development of communication skills.
7.	Learning in school, vocational and career development
8.	Psychosocial development -emotional changes, problems and emotional regulation, self-understanding. Role of family, peers, school, work and career, heterosexual relationships in psychosocial development. Environmental learning, interactional and cultural context in psychosocial development
9.	Personality development- Erikson's theory, identity crisis, identity diffusion, identity foreclosure, identity moratorium, self-concept, gender-role stereotyping

10. Moral development during adolescence and value orientation. Environmental learning, interactional and cultural context in moral development. Vocational preferences, training and work, transition to adulthood- conflicts with special reference to contemporary socio – cultural changes.
11. Challenges of Adolescence- sexuality, aggression, delinquency, AIDS, substance abuse, alcoholism, personality disorders, depression, suicide, eating disorders, health problems, psychological problems
12. Social problems- dating and relationships. Integration of self and psycho-sexual resolution and resolving identity crisis- reorganization of social life relationship with peers and parents, heterosexual relationships.
13. Risk and resilience in adolescence. Risk and protective factors. Transition to adulthood- conflicts with special reference to contemporary socio-cultural changes
14. Challenges in adolescent's life in the 21st century
15. Challenges and opportunities for adolescent research. Programs and policies
16. Researchable and current issues in adolescent development

I. Course Title : Guidance and Counselling

II. Course Code : HDFS 509

III. Credit Hours : 3 (2+1)

IV. Rationale

Family systems, roles and responsibilities are under great transformation, which has lead the society towards various problems and challenges. Rapidly changing socio-cultural & economic scenario has affected family systems. As a result, families are encountering for its sustainability and in discharging its role and responsibilities. Child guidance and family counseling is a big boon in uprooting/ solving problems and empowering families to encounter their challenges through professional services for leading quality and successful life.

V. Aim of the course

- To acquaint the students about guidance and counselling.
- To orient the students about different techniques of guidance and counselling for different problems.

VI. Theory

Unit I: Areas and types of guidance and counselling

Guidance and Counselling – Meaning, history, goals, levels and techniques. Areas of guidance and Counselling. Types of guidance and counseling services - educational, vocational, personal, marriage and family, leisure time. Assessment and diagnostics in counselling.

Unit II: Contemporary trends and ethical issues

Counselling and therapy relationships. Counselling children - goals, child-counsellor relationships. History about counselling children. Contemporary issues. Play therapy. Integrated counselling for children. Guidance and counselling in schools and colleges. Group guidance. Couple, pre-marital, marriage and family counselling. Current trends in counselling, computerized therapy programs. Research trends in guidance and counseling in India and abroad.

Unit III: Essentials of conducting guidance and counselling sessions

Competencies and role of guidance and counselling professionals. Modes and methods of counselling. Essentials of conducting guidance and counselling session. Understanding the process of guidance and counseling. Ethical issues in guidance and counselling. Knowledge and skills to handle assessment tools. Effective communication and documentation skills. Networking with allied professionals and institutions. Counselling with special concerns, Children with developmental challenges, ambivalent and oppositional type, crisis counselling, guidance in adolescence, counselling elderly.

Unit IV: Approaches and theories of counselling

Approaches and theories of counselling: Affective Counselling theory- concept, key principles. Humanistic approaches- Roger's Client centered approach, Gestalt approach. Psychoanalytic -Psychodynamic approaches by Sigmund Freud, Carl Jung, Alfred Adler and Melanie Klien. Skinner's Behaviouristic approach, Bandura's Behaviour Modification approach. Rational emotive behaviour therapy. Reality therapy. Beck's Cognitive –Behaviour approach.

VII. Practicals

1. Compiling research reviews on various aspects of guidance and counselling.
2. Preparing a checklist to observe and analyze guidance and counselling centers – their organizational structure, objectives, types of services provided, available facilities, staff competencies and problems experienced by them, etc.
3. Survey of guidance and counselling centers by using prepared observation check list.
4. Visit to observe and conduct interviews to get information about the counselling services provided by these institutions such as-Women welfare & child development
5. Family court
6. Women cell, etc.
7. Preparation and presentation of report
8. Visit to observe career guidance centers
9. Feed back of the clients towards the services, financial management/budget, support of other professionals/agencies to different types of centers.
10. Simulation exercises of guidance and counselling children and parents.
11. Content analysis of problems addressed by the leading counselling centers.
12. Content analysis of prevailing psychosocial problems reported in print and electronic media.
13. Identification of characteristics and skills of the counsellors by watching recorded videos on child and adolescent counselling.
14. Understanding techniques used by counsellors by watching recorded videos on child and parent guidance, child counselling, adolescent counselling, couple counselling.
15. Writing reports on films and videos related to the course and its presentation.
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures.
- Case studies of guidance & counselling institutions/ clinics–analysis & discussion.
- Viewing related video clips-report writing and discussion.

- Field visits to different guidance and counselling centers/ institutions.
- Interviews with clients of such centers and counselors.
- Observations and analysis of profile & issues of clients.

IX. Learning Outcome

After successful completion of this course, students

- Learn about essentials and skills of child guidance and family counselling.
- Appreciate different approaches to child guidance and family counselling.
- Understand the various needs of families and children for giving appropriate guidance and counselling services.

X. Suggested Reading

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Counselling- definitions, difference between guidance and counselling. Goals, stages and conditions for guidance and counselling, levels of counselling, types of counselling. History of Counselling, evolution of guidance and counselling movement in India.
2	Counselling strategies and techniques. Role of Assessment and diagnosis in counselling.
3	Areas of counselling- school counselling, college counselling, career counselling, vocational counselling, social guidance and counselling, mental health. Counselling and therapy relationships.
4	Current trends in counseling, computerized therapy programs. Counselling children – history, goals for counselling children, child counsellor relationship.
5	Types of guidance and counselling services - educational, vocational, personal, marriage and family, leisure time. Couple counselling, premarital and marital counselling, family counselling.
6	Research trends in guidance and counselling in India and abroad. Counselling children – goals of child counselling. Child- counsellor relationships. History of child counselling.
7	Contemporary issues in counselling children. Play therapy - Goals, theories and Working with children and their parents.Child Counselling skills, play therapy, use of media, strategies and activities. Child counselling. Counselling process, general model for counselling.Integrated counselling for children – child counselling, observation, active listening, dealing with resistance & transference, self destructive behavior patterns.

Duration (weeks)	Topics
8	Guidance and counselling in schools and colleges. Group guidance.Student counselling – counselling and psychotherapy, objectives of student Counselling.
9	Group guidance – definition, importance, objectives and advantages of group guidance. Tools and techniques, career conferences, vocational, recreational, educational, occupational information.
10	Competencies and role of guidance and counselling professionals. Modes and methods of counselling. Essentials of conducting guidance and counselling session. Understanding the process of guidance and counselling.
11	Ethical issues in counselling. Knowledge and skills to handle assessment tools.
12	Effective communication and documentation skills. Networking with allied professionals and institutions.
13	Counselling special groups. Counselling children with developmental challenges. Counselling ambivalent, different and oppositional type children. Crisis counselling - death, financial, suicidal, academic failure, illness, etc. Guidance for adolescence. Counselling elderly.
14	Approaches and theories of counselling: Affective Counselling theory- concept, key principles. Humanistic approaches- Roger's Client centred approach, Gestalt approach.
15	Psychoanalytic -Psychodynamic approaches by Sigmund Freud, Carl Jung, Alfred Adler and Melanie Klien. Skinner's Behaviouristic approach, Bandura's Behaviour Modification approach.
16	Rational emotive behaviour therapy. Reality therapy. Beck's Cognitive–Behaviour approach.

I. Course Title : Interventions for Diffrerently Abled Children

II. Course Code : HDFS 510

III. Credit Hours : 2 (1+1)

IV. Rationale

Differently able children and their families encounter various physical, psychological, educational and career problems. They are in need of expertise support and guidance to develop right attitudes towards their differently abled children and skills for their effective care and management of. Timely and early interventions for differently abled children yield analyzing results. This course is useful for the students specializing in human development as they need to have knowledge and skills for planning & executing interventions for the rehabilitation and mainstreaming differently abled children.

V. Aim of the course

- To make the students aware about significance and strategies of imparting intervention for differentally abled children.

VI. Theory

Unit I: Significance and types of intervention services

Intervention services- concept, need and significance. Prevention of avoidable health problems. Early intervention –concept, need and significance. Therapies and services-types and contents. Family centred, Child focused intervention, supportive and structured intervention. Speech therapy, occupational therapy, play based intervention.

Unit II: Intervention Strategies and steps

Guidelines for intervention programmes for differently abled. Problems and strategies. Process and steps of intervention- identification, assessment and diagnosis of differently abled and at-risk children, planning and designing intervention, implementation and evaluation. Curriculum planning for differently abled children.

Unit III: Development of intervention programme

Developing need based intervention programmes and strategies for different categories of developmentally challenged children and their parents. Understanding key elements for successful interventions- tailoring for individual needs, providing normality and integration, provision of optimal environment for developmental progress, environmental compatibility and remedial services.

Unit IV: Executing intervention and multi disciplinary approach

Executing child and parent focused interventions and evaluating its effectiveness. Multi disciplinary approach-significance, strategies to include parents and community and overcoming barriers. Planning interventions for inclusion. Involving parents and community.

VII. Practicals

1. Identification of families having children with specific disability
2. Based on selected families, developing need assessment checklist of differently abled children and their families.
3. Need assessment of differently abled children and their families, report presentation and enlisting the needs of family and differently abled child care & development.
4. Designing and developing intervention modules/ programme based on needs of differently abled children and their families.
5. Presentation of intervention modules/ programme, its evaluation and enhancement.
6. Intervention programme: Material selection from department and market survey of required Material/ toys/ tools/ books, etc.
7. Presentation of student's ideas for development of educational and development oriented material/ tools for intervention, discussion on it and finalizing the intervention material and tools.
8. Understanding and experiencing purchase procedure for required material- Seeking permissions of the authorities for purchases, drawing advances (Money indent), submission of vouchers and entry of material in registers.
9. Preparation and up gradation of intervention activities, material and tools.
10. Part-1: Implementation and monitoring of intervention programme in families of differently abled child
11. Part-II: Implementation and monitoring of intervention programme in families of differently abled child.
12. Part-III: Implementation and monitoring of intervention programme in families of differently abled child.
13. Part-IV: Implementation and monitoring of intervention programme in families of differently abled child.
14. Evaluation of effectiveness of intervention programme in catering the identified needs of families and their differently abled children.

15. Conducting parents/ community workshops for publicity of benefits of need based intervention programmes for creating awareness and motivation in families for the welfare of differently abled children.
16. End term assessment.

VIII. Teaching Methods/Activities

- Lectures.
- Case studies –success stories .
- Viewing of amazing intervention video clips.
- Review reports on different types of interventions.
- Field visits to Govt. and Non- Govt. institutions implementing various intervention programmes.
- Demonstrations on preparation & use of innovative learning & teaching materials.

IX. Learning Outcome

After successful completion of this course, students are well equipped to

- Understand the dos & don’ts in designing & executing interventions for the welfare and enhancing of differently abled children.
- Analyze the government programmes and home environments differently abled children and suggest concrete measures for improvement in it.

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Concept, need and significance of intervention services. Prevention of avoidable health problems.
2	Early intervention –concept, benefits, eligibility criteria for early intervention. Role of early intervention specialist
3	Therapies and services- types and contents. Family centred, Child focused intervention, Supportive and structured. Play based intervention.
4	Speech and language therapy, physical or occupational therapy, psychological services, home visits, medical, nursing or nutrition services, hearing (audiology) or vision services, social work services.
5	Guidelines for planning and implementation of intervention programmes for differently abled. Problems and strategies for planning and implementation of intervention programmes for differently abled
6	Process and steps of intervention. Screening, assessment and diagnosis of differently abled and at-risk children.
7	Curriculum planning for differently abled children.

Duration (weeks)	Topics
8	Understanding key elements for successful interventions- tailoring for individual needs, providing normality and integration, environmental compatibility and remedial services.
9	Developing need based intervention programmes and strategies for different categories of developmentally challenged children (continued)….
10	Developing need based intervention programmes and strategies for different categories of developmentally challenged children.
11	Implementation of need based intervention programmes for different categories of developmentally challenged children.
12	Provision of optimal environment for developmental progress. Environmental compatibility and remedial services.
13	Multi disciplinary approach-significance, strategies to include parents and community and overcoming barriers.
14	Need, significance and strategies to counsel parents of differently abled
15	Planning interventions for inclusive education.
16	Guidelines for involving parents and community in interventions and evaluating its effectiveness.

I. Course Title : Family Ecology

II. Course Code : HDFS 511

III. Credit Hours : 2 (2+0)

IV. Rationale

Family is a child's first context and as a social system plays a vital role in human development. From ecological perspective, children cannot be understood properly outside the context of their families, as interactions within the family and other social settings outside family play a vital role in individual's development. Families' roles, relationships and functioning have undergone dramatic transition. It is essential to the students to get exposed to different aspects of family ecology.

V. Aim of the course

- To orient the students regarding family as an institution.
- To impart knowledge about family transitions and impact of social change and development

VI. Theory

Unit I: Family relationships

Family as a social system. Socialization within the family. Models of parenting. Parent child relationships- functional and dysfunctional dyads. Family cohesion, conflict and family disorganization –impact on parenting. Children as family agents. Children and marital life. Child abuse. Bidirectionality in parent child relations. Family interactions and delinquency. Improving family communication and interpersonal relations.

Unit II: Family under transition

Family transitions. Change and continuity over life cycle. Needs and problems of families at different developmental stages. Impact of social change on family and changing family patterns in India. Religion and family. Family social class and ethnic variations in child rearing.

Unit III: Family stressors and resilience

Family as an institution under stress. Family crisis. Poverty and children. Stressors and family relations - with special reference to family disruption, sickness, divorce, substance abuse and disability. Stress Process Model. Family's adaptation to stress. Family resilience and protective factors for promotion of family resilience. Family environment and social support as a source of risk and resilience for vulnerable children/youth. Intergenerational family dynamics in management of family conflicts and negative patterns.

Unit IV: Impact of consumerism, emigration and multiculturalism on families

Impact of consumerism on rural and urban families. Impact of emigration and multiculturalism on families. Two culture children and their psycho-social dilemmas. Contemporary issues related to family.

VII. Teaching Methods/ Activities

- Lecture cum discussion.
- Observations and interviews with different types of families.
- Case study of families in crisis.
- Class reports- based on mass media narratives.
- Seminars- Review of research studies .

VIII. Learning Outcome

After successful completion of this course, students are able to

- Students develop deep insight into role of family in individuals' development and different issues of family systems.

IX. Suggested Reading

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Family as a social system, ecological perspective of family. Family as an agent of Socialization.
2	Models of parenting. Parent child relationships- functional and dysfunctional dyads.

Duration (weeks)	Topics
3	Family cohesion and adaptability. Family cohesion, conflict and family disorganization –impact on parenting.
4	Children as family agents. Children and marital relations.
5	Child abuse- understanding abusive families. Bi-directionality in parent child relations.
6	Family interactions and delinquency. Improving family communication and interpersonal relations.
7	Family transitions- continuity and change over life cycle. Needs and problems of families at different developmental stages.
8	Religion and family. Impact of social change on family and changing family patterns in India.
9	Family disorganization. Family Social class and ethnic variations in child rearing.
10	Family as an institution under stress. Family crisis. Stress Process Model.
11	Poverty and children. Stressors and family relations - with special reference to family disruption, sickness, divorce, substance abuse and disability. Stress Process Model.
12	Family resilience and protective factors for promotion of family resilience. Family and social support as a source of resilience for vulnerable children/youth.
13	Intergenerational family dynamics in management of family conflicts and negative patterns.
14	Impact of consumerism on rural and urban families.
15	Impact of emigration and multiculturalism on families. Two culture children and their psycho-social dilemmas.
16	Contemporary –researchable issues related to family.

I. Course Title : Family and Cultural Diversities

II. Course Code : HDFS 512

III. Credit Hours : 2(2+0)

IV. Rationale

Family values and functions are determined by its cultural milieu. Families must be studied in diverse cultures to understand variations in its members' status, development, interactions, relationships, concerns and their challenges in cross-cultural context. It helps to dispel negative stereotypes and personal biases about different groups. As this course deals with different elements of families in western and eastern cultures cutting across different communities, the students get an intellectual perspective of families with cultural diversities.

V. Aim of the course

- To sensitize the students, regarding the theories and issues pertaining to cultural difference in family studies.
- To orient students about families across India in diversified cultural context with special reference to the farming community and their quality of living and concerning issues

VI. Theory

Unit I: Culture and family

Culture- definition, components and characteristics of culture. Agents of cultural influences- school, family, community and other social groups. Cultural factors and impact on families. Western versus Eastern family culture. Cultural diversities in India. Elements of India's diverse culture – religion, philosophy, cuisine, language, fine arts, dance, music.

Unit II: Families in India and abroad

Families in India and abroad - communal, nuclear, joint, extended, polyamorous, polyandrous, polygynous, single parent families, unrelated families. Indian family culture-values and issues concerning families and its stability. Factors determining social status of families. Families in rural and tribal agrarian community – status of women, children, elderly and men in the families.

Unit III: Cross-cultural variations in family functioning

Cross-cultural variations in different aspects of family functioning across different West and East countries/ cultures *vis-à-vis* – marriage, parenthood, relationships, care of elderly and status of women. Cross cultural variations in family functioning, roles and responsibilities, cohesion, interpersonal communication patterns, conflict resolution. Parenting across cultures – child rearing, socialization and socialization practices. Family crisis and adaptations across cultures. Unique family experiences across cultures, some classic examples like Kibbutz in Israel.

Unit IV: Diversities in family life and challenges

Diversities in family life – ethnic, linguistic, regional, etc. Effect of urbanization, secularization, westernization, technological advancement, globalization and other such developments on families in general and agrarian in particular. Challenges before families across cultures. Legal provisions – emerging cultural trends. Research trends in cross-cultural family studies, methodological issues.

VII. Teaching Methods/ Activities

- Lectures.
- Viewing video films on national & international families.
- Case studies of families in diverse cultures.
- Book review
- Class reports & seminars.

VIII. Learning Outcome

After successful completion of this course, students are enable to

- Understand different elements of families in international perspective.
- Comprehend individual's development and issues differently in families of various cultural settings.
- Recognize and respect "Ways of being"that are not be our own.

IX. Suggested Reading

Weekly Lecture Schedule

Duration (weeks)	Topics
1	Culture- definition, components and characteristics of culture.
2	Agents of cultural influences- school, family, community and other social groups.
3	Cultural diversities in India and abroad. Elements of India's diverse culture – religion, philosophy, cuisine, language, fine arts, dance, music.
4	Cultural factors and impact on families. Western versus Eastern family culture.
5	Families in India and abroad - communal, nuclear, joint, extended, polyamorous, polyandrous, polygynous, single parent families, unrelated families.
6	Indian family culture-values and issues concerning families and its stability.
7	Factors determining social status of families. Families in rural and tribal agrarian community – status of Women, children, elderly and men in the families.
8	Male headed and female headed families in agrarian community – causes and concerns.
9	Cross cultural variations in different aspects of family across different West and East countries/ cultures viz marriage, parenthood, care of elderly and status of women and other functions of family, roles and responsibilities.
10	Parenting across cultures – child rearing, socialization and socialization practices. Some classic examples like Kibbutz in Israel.
11	Cross cultural variations in family cohesion, interpersonal communication patterns, conflict resolution. Family crisis and adaptations.
12	Diversities in family life – ethnic, linguistic, regional, etc. Unique family experiences across groups.
13	Effect of urbanization, secularization, westernization, technological advancement, globalization and other such developments on families in general and agrarian in particular.
14	Challenges before families across cultures.
15	Interventions on ideals and practice of families
16	Legal provisions – emerging cultural trends in different societies/ countries. Research trends in cross-cultural family studies, methodological issues.

I. Course Title : Family Therapy

II. Course Code : HDFS 513

III. Credit Hours : 3 (2+1)

IV. Rationale

The family as an institution is envisaging ever increasing stress, disruption and dysfunction. Family therapy is useful for resolving various vertical and horizontal issues of individuals. Family therapy helps in better functioning of individuals and creates happy home environments. In the current scenario of increasing number of nuclear type families, single parent families, atypical families, the course is very beneficial for social well being.

V. Aim of the course

- To orient the students regarding various methods and techniques of family therapy.
- To help students know their abilities as counselors and equip them with family therapies.
- To enable application of therapies in different case studies.

VI. Theory

Unit I: Family therapy - orientation and theoretical perspectives

Family Therapy – concept, need, significance, areas, scope, goals and application of marriage and family therapies. Evolution of family therapy. Early models and basic techniques of family therapy- group process and communications analysis. Theoretical developments in marital and family therapy. Approaches in family therapy - Social Learning approach, Psychoanalytic, Behavioural, Systems approach. Social Constructionism theory. Attachment theory.

Unit II: Types of family therapy

Classic schools of family therapy- Bowenian Family Systems therapy, Strategic, Structured, Communication and Experiential therapies, Psychodynamic Therapy, Cognitive- Behaviour family therapy and integrated family therapy. Contemporary marital therapies. Family therapy in the 21st century and its application to multicultural, single parent and disorganized families, solution focused therapy, narrative therapy and integrative models. Application of family therapy in depression, substance abuse, schizophrenia and eating disorders.

Unit III: Concerns for family therapy

Signs and symptoms of family in need of therapies- psychosomatic symptoms, psychiatric disorders, marital distress, alcoholism, drug dependence, juvenile offences, problems of adolescence, conduct problems, work and school phobias.

Unit IV: Prospects of family therapy

Qualities of marriage and family therapists. Techniques of marriage and family therapy. Advances in clinical assessment, preventive and enrichment programmes. Future direction for marriage and family therapy- bridging research, theory and practices.

VII. Practical

1. Observational visits and screening families in need of therapy (in various settings) andpreparation of format for it. Visiting and screening of urban families in need of therapy
2. Visiting and screening of slum families in need of therapy
3. Visiting and screening of rural families in need of therapy
4. Report presentation and discussion
5. Case studies of different areas of marriage and family therapy (alcoholism, drug, dependence, juvenile offences, problems of adolescence).
6. Preparation of format. Case study of alcoholic de-addiction.
7. Case study of drug dependence and de-addiction.
8. Case study of juvenile offences and rehabilitation.
9. Case study of socio-emotional problems of adolescents.
10. Report presentation and discussion.
11. Case studies of different methods and techniques of marriage and family Therapy (one from each).
12. Visit to marriage and family therapy centre
13. Observation of sessions for knowing the methods and techniques used in marriage and family therapy (actual).
14. Observation of sessions for knowing the methods and techniques used in marriage and family therapy (recorded ones).

15. Report presentation and discussion.
16. End term assessment.

VIII. Teaching Methods/ Activities

- Lectures.
- Survey of families with different issues.
- Viewing of related films/ video clips.
- Field visits to family therapy/ family counselling clinics.
- Technical interactions with family therapists
- Class reports on current issues of families therapy impact.
- Case studies of beneficiaries of family therapy.

IX. Learning Outcome

After successful completion of this course, students are enlightened to

- Deal with family issues more scientifically in light of acquired knowledge and skills.
- Develop confidence to deal with a range of family issues under the professional guidance experts.

Course Contents
Ph.D. in Human Development and Family Studies

I. Course Title : Advanced Human Development
II. Course Code : HDFS 601
III. Credit Hours : 3(3+0)

IV. Rationale

Development as a dynamic phenomenon in life course of all human beings is an integrated, multifaceted and interdependent process. Human development as a subject has also undergone a lot of revolution. There is a great need to understand the recent orientation and advances in nature, developmental perspective, processes and the latest trends in human development throughout the life span.

V. Aim of the course

- To create awareness among students regarding the model of human development as a science and as a process, its orientation and nature.
- To impart knowledge regarding theoretical foundations, issues and research trends in human development

VI. Theory

Unit I: Human development – a science and a process

Classical and contemporary theoretical orientation to human development. Relational developmental systems and developmental science. Developmental psychology to developmental science from deficit to diversity in development. Regulation of development and differentiation. Constructing general model for development – developmental behaviour genetics. Multilevel nature and analysis of developmental processes.

Unit II: Developmental diversity and regularity

Concept of Consistency vs. change in development. Developmental diversity and regularity. Developmental diversity and consequences for Human Development. Dynamics of stability and variability in development – role of experience in development, Optimal Experience theory. Human action perspective to developmental diversity and regularity. Abnormal behaviour vs. individual differences. Intentional personal development and personal control over development.

Unit III: Development through life span

Life span theory in development, five levels of analysis – Life cause theory, basic concepts, life transitions and historical change. Continuity vs. discontinuity in different developments across stages of life. Cognitive and emotional development-development of children's thinking and emotions. Dynamic development of thinking, feeling and acting- infancy through adulthood. Emotional development and consciousness. Dynamic structure in cognitive and emotional development - growth cycle and brain activity. Unravelling the processes underlying social, emotional and personality development.

Unit IV: Psycho-social perspective

Dialectical models of socialization. Development of self-regulation and morality. Pro-social behaviour development-development across lifespan and correlates. Religious and spiritual development through life span – positive and negative correlates. Issues concerning children in difficult circumstances. Multilevel perspective on child maltreatment. Resilience in the face of adversities. Socio-emotional development in diverse family contexts. Gendered development. Future directions for life course and behaviour genetics.

Weekly Teaching Schedule

Duration (weeks)	Topics
1	Classical and contemporary theoretical orientation to human development. Relational developmental systems and developmental science.
2	Developmental psychology to developmental science from deficit to diversity in development. Regulation of development and differentiation.
3	Constructing general model for development – developmental behaviour genetics. Capability_approach in studying human development.
4	Multilevel nature of developmental processes
5	Consistency vs. change in human development. Consistency of concepts and phenomenon.
6	Developmental diversity and regularity. Developmental diversity and Consequences for Human Development
7	Dynamics of stability and variability in development – role of experience in development, Optimal Experience theory.
8	Human action perspective to developmental diversity and regularity. Abnormal behaviour vs. individual differences Intentional personal development and personal control over development.
9	Life span theory in development, five levels of analysis – life cause theory, basic concepts, life transitions and historical change. Continuity vs. discontinuity in different developments across stages of life.
10	Cognitive development across life span. Development of children's thinking and emotions. Dynamic development of thinking, feeling and acting- infancy through adulthood.
11	Emotional development across life span. Emotional development and consciousness.
12	Dynamic structure, growth cycle and brain activity in cognitive and emotional development.
13	Dialectical Models of Socialization. Development of self-regulation and morality across life span. Pro-social behaviour development across lifespan and its correlates.
14	Unravelling the processes underlying social, emotional and personality development. Religious and spiritual development through life span – positive and negative correlates.
15	Issues concerning children in difficult circumstances. Socio-emotional development in changing family contexts. Multilevel perspective on child maltreatment.
16	Resilience in the face of adversities. Socio-emotional development in changing family contexts. Gendered development. Future directions for life course and behaviour genetics

VII. Teaching Methods/ Activities

- Lecture and classroom discussion
- Group discussion
- Case specific discussions

- Assignment (Reading/Writing), Book/Publication Review
- Student presentation
- Case studies and analysis
- Guest Lectures

VIII. Learning Outcome

After this course, the students will be able to

- Understand the concepts, complex system, process and sequence of human development.
- Comprehend the nature of development by getting oriented to phenomenon of diversity, regularity, continuity and stability in development.
- Recognize the current trends and issues of human development.

I. Course Title : Ecology and Human Development

II. Course Code : HDFS 602

III. Credit Hours : Credits: 3(3+0)

IV. Rationale

Each human being is like others in some ways and also remains unique in others. The uniqueness rests upon the ecological settings of the individual one experiences in varied forms in biological, psychological sociological and cultural contexts. The students getting expertise in Human Development need to understand the diverse array of ecological modelling and the environmental complexities that influence human developmental processes.

V. Aim of the course

- To help students understand the process of interaction between human development and ecological systems.
- To provide in-depth knowledge about physical, economic, socio-cultural and socio-political role of ecology in life course development.
- To make the students realise research and assessment of human development based on ecological perspective.

VI. Theory

Unit I: Ecological modelling in human development

Human ecology – concept and relevance in understanding human development. Ecological modelling, ecology of developmental processes, bio-ecological model of Bronfenbrenner. Developmental ecology through space and time. The Process–Person–Context–Time (PPCT) Model . An Integrated model of individual development based on PPCT Model. Life course development through ecological perspective.

Unit II: Physical ecology and human development

Developmental tasks through lifespan – role of ecology, social roles and structural role of ecology. Behavioural development – role of physical ecological factors, terrain, climatic changes, demographics and their effect on human development. Children's physical environment, housing, overcrowding, neighborhood and development. Economic factors and their impact on human development.

Unit III: Socio-cultural ecology and human development

Building blocks in the environment. Interpersonal structures as context of human development. Dyads- types, nature and function of joint and molar activities, affective relations, balance of power. Race, class, ethnicity and development. Socio-cultural and sub-cultural context of human ecology and development- differences in child's ecological systems and their impact on parenting and development. Socio-cultural imbalances and their impact on human development. Contemporary child rearing and implications for human development. Impact of time factor and cultural history on development.

Unit IV: Role of systems and policies

Children's institutions, day care and preschools as context of human development. Children in war and disaster. Socio-political, legal systems and policies and human development. Religion, caste, minority and deprived states and their effects. Community support and its value for human development. Impact of media, technology and social networking. Policies, programmes based on ecological factors impacting human development. Research and assessment of human development based on ecological perspective.

Weekly Teaching Schedule

Duration (weeks)	Topics
1	Human ecology – its concept and relevance in understanding human development. Life course development through the ecological perspective.
2	Ecology of developmental processes. Bio-ecological model of Bronfenbrenner
3	Developmental ecology through space and time: referred to as process–person–context–time (PPCT) model.
4	An Integrated model of Individual Development based on PPCT Model.
5	Developmental tasks through lifespan –role of ecology, social roles and structure role of ecology.
6	Physical ecological factors, Terrain, climatic changes, demographics and their effect on human development.
7	Behavioural development –role of ecology, physical, environmental impact on behaviour. Environmental aspects - Children's physical environment, housing, overcrowding, neighbourhood and development. Economic factors and their impact on human development.

Duration (weeks)	Topics
8	Interpersonal structures as context of human development. Building blocks in the environment. Dyads, nature and function of joint and molar activities Impact of affective relations, balance of power.
9	Race and ethnicity and human development. Socio-cultural and sub-cultural differences in child's environment and their impact on childrearing practices and development. Socio-cultural imbalances and their impact on development.
10	Impact of time factor and cultural history on development. Contemporary child rearing practices and their implications for human development.
11	Children's institutions, day care and preschools as context of human development.
12	Children in war and disaster. Socio-political, legal systems and policies impact on human development.
13	Religion and caste systems, minority and deprived states and their effects on human development.
14	Community support and its value for human development. Impact of media, technology and social networking.
15	Policies, programmes based on ecological factors impacting human development.
16	Research and assessment of human development based on ecological perspective.

VII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion
- Case specific discussions
- Assignment (Reading/Writing)
- Book/publication Review
- Student presentation
- Case studies and analysis
- Guest Lectures

VIII. Learning Outcome

After studying this course, the students would be able to

- Have gained the knowledge of both the various ecological structural factors that can impact upon developmental pattern and the processes that underlie it.
- Acquire information about how complex combinations of biological and socio-cultural events produce development.
- Appreciate the impact of context and culture on children's development.
- Describe, explain, and optimize the course of human life for diverse individuals living within diverse contexts.

IX. Suggested Reading

I. Course Title : Programme Development for Vulnerable Families

II. Course Code : HDFS 603

III. Credit Hours : 3(2+1)

IV. Rationale

A family that is suffering from its own disadvantages, vulnerabilities and problems is likely to produce problem children. It is conceptualised that families have the ability to bounce back from difficult circumstances or stressful experiences to make a good adaptation to life if they participate in supportive programmes and thus diminish the chances of causing damage to its incumbents. The students seeking expertise in human development need to understand and gain skills in designing intervention programmes for vulnerable families, to step in when appropriate, to help people live happier and have more fulfilled lives.

V. Aim of the course

- To make the students learn to identify vulnerable population in rural and urban areas.
- To develop an understanding regarding techniques of planning, implementing and evaluating development and programmes and projects for vulnerable families.

VI. Theory

Unit I: Family Vulnerabilities

Vulnerable families- meaning, categories, forms of vulnerability, characteristics. Family vulnerability factors - poverty, alcohol and drug abuse, AIDS, prostitution, delinquency, social disadvantages, mental disorders, chronic serious health issues, destitute women and children, street children, abused children, women and senior citizens. Impact of family vulnerabilities on children and families.

Unit II: Programmes for vulnerable families

Developmental programmes for vulnerable families – concept, history and five year plans. Types of programmes and projects for vulnerable families. Different approaches to develop programmes for families. Inter disciplinary approach to research project management. National and international research projects for vulnerable families. National and International programmes and policies for vulnerable children and families. UNICEF framework for protection, care and support of orphans and vulnerable children. National Plan of Action for protection and care of children.

Unit III: Programme development – elements and process

Need assessment of vulnerable families. Developing need based multiple programmes for vulnerable families and children - project proposal, principles of project design, steps, guidelines, process involved, aspects of appraisal, basic considerations, risks and returns in project proposal development. Elements of effective programmes for families. Project sustainability- factors, components and action plan. Scientific values and professional ethics in development of programmes for vulnerable population. Donors and funding agencies- types, National and International donors funding projects. Role of public and private donors in funding projects.

Unit IV: Working with vulnerable families

Working with vulnerable families- need, goals and significance. Developing strategies to support vulnerable children and their families. Strategies for increasing participation and retention. Ethics in working with vulnerable families. Working with children in vulnerable families- need, goals, strategies. Family resilience in the face of adversities- concept, risk and protective factors. Strengthening family relations. Including fathers in work with vulnerable families. Implementing the stimulating management techniques- Programme Evaluation and Review Technique (PERT), Critical Path Method (CPM), Line of Balance (LOB), Gantt Chart and SWOT analysis.

VII. Practicals

1. Review of the national international projects and programmes for vulnerable families.
2. Discussion on programmes and research projects
3. Developing need assessment performa
4. Learning to use selected PRA techniques –
   – Focus group discussions/ interviews
   – Transit walk, social mapping and time line
5. Interviewing families with need assessment
6. Developing need based programme for vulnerable families
7. Class discussion on developed programme and enhancement
8. Programme implementation – Working with families and execution of developed programmes- home based approach
9. Working with families and execution of developed programmes- child centred approach
10. Programme Evaluation by using- Programme Evaluation and Review Technique (PERT), Critical Path Method (CPM)
11. SWOT analysis
12. Developing concept note for research project on vulnerable families
13. Developing Multiple Programs for promoting family health with vulnerable Children
14. Dissemination/ publishing of success stories, popular articles.
15. End term assessment

Weekly Teaching Schedule (Theory)

Duration (Weeks)	Topics
1	Vulnerable families- meaning, categories, forms of vulnerability and characteristics.
2	Family vulnerability factors and family vulnerability processes - poverty, alcohol and drug abuse, AIDS, prostitution, delinquency. Impact of family vulnerabilities on children and families.
3	Other vulnerability factors and their impact- social disadvantages, mental disorders, chronic serious health issues.
4	Vulnerable groups - destitute women and children, street children, abused children, women and senior citizens.
5	Developmental programmes for vulnerable families – concept, history and five year plans. Types of programmes and projects for vulnerable families.

Duration (Weeks)	Topics
6	Different approaches to develop programmes for families. Inter disciplinary approach to research project management.
7	National and international research projects for vulnerable families. National and international programmes and policies for vulnerable children and families.
8	UNICEF framework for the protection, care and support of orphans and vulnerable children. National Plan of Action for protection and care of children.
9	Need assessment of vulnerable families. Developing need based multiple programmes for vulnerable families and children - project proposal, principles of project design, steps, guidelines.
10	Process involved, aspects of appraisal, basic considerations, risks and returns in project proposal development. Elements of effective programmes for families.
11	Project sustainability, factors, components and action plan. Scientific values and professional ethics in development of programmes for vulnerable population.
12	Donors and funding agencies- types, National and International donors funding projects. Role of public and private donors in funding projects.
13	Working with vulnerable families- need, goals and significance. Developing strategies to support vulnerable children and their families.
14	Strategies for increasing participation and retention. Ethics in working with vulnerable families. Working with children in vulnerable families- need, goals, strategies. Social context of children in difficult circumstances and developmental vulnerabilities.
15	Family resilience in the face of adversities- concept, risk and protective factors. Strengthening family relations. Including fathers in work with vulnerable families.
16	Implementation/ stimulating management techniques- Programme Evaluation and Review Technique (PERT), Critical Path Method (CPM) Line of Balance (LOB) Gantt Chart and SWOT analysis

VIII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion
- Assignment (Reading/Writing)
- Surveys and community work
- Classroom and field practicals
- Case specific discussions
- Student presentation
- Case Analysis and case studies
- Guest Lectures

IX. Learning Outcome

After completion of this course, the students will be able to

- Develop a knowledge base into family vulnerabilities and will learn to identify vulnerable population in different settings. .
- Gain hands-on training in planning, designing, management and monitoring need based programmes and projects to make a positive impact on families in difficult circumstances

I. Course Title : Strategic Developmental Intervention

II. Course Code : HDFS 604

III. Credit Hours : 3(2+1)

IV. Rationale

The dysfunctional families and their children who have unmet needs deviate from the normal development pattern and are in need of intervention during different phases of life. Early intervention services can change their developmental path and improve outcomes for families and communities. The human development specialists need to be professionally equipped with competencies and hands-on skills to design and implement macro and micro level situation specific customized interventions. Further, their resourcefulness in utilizing available expertise in allied areas and networking with them needs to be strengthened.

V. Aim of the course

- To make the students aware about the significance, scope, issues and current trends in interventions.
- To develop insight into different strategies and approaches of developmental intervention.
- To provide hands-on learning in designing, implementing, and evaluating developmental intervention package in various settings.

VI. Theory

Unit I: Developmental intervention – concept and significance

Intervention – definition, need and importance. Early intervention for promoting children's development - principles, assumptions, eligibility and success criteria, theory and practice, biosocial developmental contextualism. Current orientation towards developmental intervention for children from birth to early school years. Children with developmental vulnerablilities and their characteristics. Sources of developmental vulnerabilities and resources. Risk - biological, other personal and contextual risks, impact of social inequality. Protective factors - influences on children's development. Neurological basis for developmental intervention needs- importance of early years, sensitive periods and factors influencing brain development.

Unit II: Intervention approaches and framework

Need assessment for intervention, Contemporary issues and current trends in intervention. Intervention principles strategies and process. Theoretical frameworks in early intervention. Intervention models. Multi-disciplinary approaches to early intervention and programmes for motor, cognitive, language and social development. Characteristics of effective Intervention strategies. Framework for developing and implementing programs for children with developmental delays.

Unit III: Intervention procedural guidelines

Early intervention therapy program- guidelines, purpose, program goals and objectives, program description, service delivery and role of other supportive team members. Types of early intervention therapies. Service delivery models in early intervention- child centred, parent centred, family centred, home based, center/ school based. Role of personnel in intervention – role of physiotherapist, speech pathologist, audiologist, occupational therapist, behaviour therapist and developmental therapist. Developing network with other agencies. Resource Generation. Role of family and community in implementation of intervention programmes. Family as developmental context.

Unit IV: Strategic planning and implementation

Planning and implementation of intervention programme. Utilisation of other local level services offered to children and families – screening, referral, assessment, family education and support. Arranging services and family support, collaboration and teamwork with families and professionals. Collaboration and interdisciplinary practices. Professional and ethical behavior. Early intervention - operational standards, accountability and quality assurance, accreditation, program resources and service delivery. Evaluation of developmental intervention programmes – basic concepts, effectiveness, efficiency and economics. Government policies and provisions. Early intervention policies – an international perspective.

VII. Practical

Week	Topics
1	Compilation of research reviews on various developmental Interventions for young children.
2	Observational visits to intervention unit to understand the organizational structure, objective, types of services provided, facilities available, frequency, duration & cost of the Intervention, etc.
3	Observational visit to Paediatric Intervention unit to understand the process/ steps followed in Intervention programme
4	Observational visits to any National Institute offering Intervention programmes for children with developmental delays
5	Observational visits to any NGO offering intervention programmes for children with developmental delays
6	Identification of groups for intervention and Developmental assessment
7	Conducting need based assessment to identify target groups in need of intervention using Developmental Screening test/ appropriate psychological tests
8	Preparing developmentally appropriate intervention package for the selected group
9	Involving parents in the intervention programme, offering home based parent education programmes for managing children with developmental delays.
10	Field testing the developed intervention package at– – Day care centers/ pediatric wards
11	– Clinics/ special schools

Week	Topics
12	Conducting home based intervention programme for children with developmental delays
13	Conducting center-based interventions at – Day care centers/ pediatric wards/ Clinics/ special schools
14	Developing a checklist for assessing the quality & effectiveness of the intervention packages.
15	Evaluation of developed intervention programmes
16	End term assessment

Weekly Teaching Schedule (Theory)

Duration (weeks)	Topics
1	Introduction to early childhood intervention – definition, need and importance. Early intervention for promoting children's development – aims, principles, assumptions, eligibility and success criteria, theory and practice, biosocial developmental contextualism.
2	Current orientation towards developmental intervention for children from birth to early school years. Children with developmental and their characteristics. Sources of developmental vulnerabilities and resources.
3	Risk factors for developmental vulnerabilities among children- biological, other personal and contextual risks, impact of social inequality. Protective factors - influences on children's development.
4	Neurological basis for developmental intervention needs- importance of early years, sensitive periods and factors influencing brain development.
5	Need assessment for intervention, Contemporary issues and current trends in intervention, cultural considerations in children's wellbeing and development. Intervention principles strategies and process.
6	Theoretical frameworks in early intervention. Types of early childhood interventions. Ecological framework, transactional theory, developmental systems model, psychoanalytic perspective, behavioural and educational approaches to early intervention; behavioural perspective.
7	Intervention models – Guralnick's early developmental and risk factors model, Dunst & Trivette's resource based approach**.** Early Intervention approaches and programmes- relationship based approach, early intervention therapy team approach, multidisciplinary, interdisciplinary and trans-disciplinary approaches for promoting development of children.
8	Characteristics of effective Intervention strategies. Framework for developing and implementing programs for children with developmental delays.
9	Early intervention therapy program- guidelines, purpose, program description, program goals and objectives, service delivery, other supportive team member roles. Types of early Intervention therapies **-** play therapy, behavior modification, speech & auditory therapy, hydro therapy, physio-therapy, cognitive therapy.
10	Service delivery models in early intervention- child centred, parent centred, family centred, home based, school/ center based, home-cum-centre based programmes. Developing network with agencies.
11	Role of personnel in intervention – role of physiotherapist, speech pathologist, audiologist, occupational therapist, behaviour therapist, developmental therapist.
12	Developing network with agencies and generating resources. Role of family and community in implementation of early intervention programme. Families as developmental contexts. Generating resources.
13	Planning and implementation of intervention programme. Utilisation of other local level services offered to children and families – screening, referral, assessment,

Duration (weeks)	Topics
	family education and support. Arranging services and family support, collaboration and teamwork with families and professionals.
14	Professional and ethical behavior. Early intervention - operational standards, accountability and quality assurance, accreditation, program resources, service delivery.
15	Evaluation of developmental intervention programmes – basic concepts. Economics of developmental intervention– cost - benefit analysis in early intervention, programme effectiveness.
16	Government policies and provisions.Early intervention policies – an international perspective.

VIII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion, Case specific discussions
- Assignment (Reading/Writing)
- Surveys
- Classroom and field practicals
- Community work
- Student presentation
- Case studies and analysis

IX. Learning Outcome

After studying this course, the students will

- Gain an understanding of the concept, significance, strategies and approaches of developmental intervention.
- Be able to design, implement, and evaluate need based developmental intervention package for assisting children and families in various settings.

X. Suggested Reading

- Berk LE. 1996. *Child Development*. Prentice Hall.
- Chandra P. 1995. *Project Planning, Analysis, Selection, Implementation and Review*. Tata McGraw, New Delhi.

I. Course Title : Family Studies

II. Course Code : HDFS 605

III. Credit Hours : 3 (3+0)

IV. Rationale

Numerous frame-works and perspectives about families have been developed by several theorists and researchers which have contributed towards the knowledge building of families. It is very pertinent to understand the family as a social system and its transformed patterns, structure, roles, and ecological phenomenon that lay foundation for human development.

V. Aim of the course

- To develop an in-depth understanding among students regarding various approaches and frameworks for understanding families.
- To give them exposure to the various family issues in the current scenario and to orient them to psycho-social analysis of the changing family roles, responsibilities and relations in the context of human development.

VI. Theory

Unit I: Theoretical frameworks and perspectives

Different frameworks to understand families-conceptual framework, institutional, developmemtal and interactional framework. Family theories- Family Systems theory, human ecology theory, life course perspectives, social-cognitive-behavioral theory, biosocial theory and family communication theories. Family perspectives- Parson's sociological perspective, Marxist perspective, feminist perspectives, modern perspective.

Unit II: Family assessment

Different approaches to Family research- demographic, psychological, psychiatric, ethnographic and inter disciplinary approach. Measurement of family roles and relationships. Ethics in family research. Current issues for research in Indian families in different communities- rural and urban.

Unit III: Family under transition

Indian family system and changing patterns. Fatherhood- changing role of parents. Global migration- demographics, nature, contemporary migration patterns and effects. Cultural identity, family change and transnational mothering. Influence of globalization on children, youth, aged and families. Work and family interface - changing nature of work, feminization of the labour force and changing nature of family life and family roles. Diverse families -single parent families, female headed households, dual career families, one child family, adoptive families. Marital distress, family disorganisation.

Unit IV: Family therapy

Evolution of family therapy. Early models and basic techniques of family therapy- group process and communications analysis. Classic schools of family therapy- Bowenian family systems therapy, strategic, structured and experiential therapies, solution focused therapy, narrative therapy, psychodynamic therapy and integrative models. Cognitive behaviour family therapy. Application of family therapy in mental disorders. Family resilience- concept, developmental systems perspective, advances and challenges in family resilience research.

Weekly Teaching Schedule

Duration (weeks)	Topics
1	Different frameworks to understand families-conceptual framework, institutional, developmemtal and interactional.
2	Family theories- Family Systems theory, human ecology theory, life course perspectives, social-cognitive-behavioral theory.

Duration (weeks)	Topics
3	Biosocial theory and family communication theories.
4	Family perspectives- Parson's sociological perspective, Marxist perspective, feminist perspectives, modern perspective.
5	Different approaches to Family research- demographic approach, psychological approach and psychiatric approach.
6	Ethnographic and inter disciplinary approach. Measurement of family roles and relationships.
7	Ethics in family research. Current issues for research in Indian families in different communities- rural and urban.
8	Indian family system and changing patterns. Fatherhood and changing role of parents. Global migration- demographics, nature, contemporary migration patterns and effects- cultural identity, family change and transnational mothering.
9	Influences of globalization on children, youth, aged and families. Vulnerability of young people in a globalizing environment. Work and family interface - changing nature of work, feminization of the labour force and changing nature of family life and family roles.
10	Diverse families -single parent families, female headed households, dual career families, one child family, adoptive families. Marital distress, family disorganisation.
11	Evolution of family therapy-Palo Alto, Murray Bowen, Carl Whittaker and Minuchin
12	Early models and basic techniques of family therapy- group process and communications analysis, fundamental concepts such as systems theory, social constructionism and attachment theory.
13	Classic schools of family therapy- Bowenian family systems therapy, strategic, structured and experiential therapies. Psychodynamic therapy and cognitive behaviour family therapy.
14	Solution focused therapy, narrative therapy and integrative models
15	Family therapy in the 21st century and its application. Application of family therapy in mental disorders like depression, substance abuse, schizophrenia and eating disorders.
16	Family resilience- concept, developmental systems perspective, advances and challenges in family resilience research. Ecology of the family and healthy functioning.

VII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion
- Assignment (Reading/Writing)
- Case specific discussions
- Student presentation
- Case Analysis
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course students will gain

- Comprehensive knowledge of different approaches to study families including explanations of major family theories, and their applications.
- Ability to reflect significant advances in the field of family studies and researchable issues including reconceptions of theories and cultural concerns.

- Reflects the paradigm shift that involves families, process of family transition and impact of its changing patterns on human development.

I. Course Title : Adulthood and Aging

II. Course Code : HDFS 606

III. Credit Hours : 3 (3+0)

IV. Rationale

Population ageing phenomenon is widely observed across the world. The scholars need to have a wide understanding of the implications of this for the society at large and families in particular. Resonant, theoretical and empirical, understanding of adulthood and ageing from various biological, social and psychological perspectives with a specific focus on development in family context can empower students to develop a vision and contribute to the society in creating an environment for optimizing the quality of life of seniors in the prevailing socio-cultural circumstances.

V. Aim of the course

- To orient the students about the theoretical perspectives and current issues of aging.
- To inculcate knowledge regarding the methods and techniques in conducting researches in gerontology among students.

VI. Theory

Unit I: Ageing perspectives and developmental changes

Socio demographic profile of the aged in Indian context. Biological theories of aging, programmed ageing theories, random damage theories. Stochastic theories, evolutionary theories . The Ageing body - physical, sensory, cardiovascular, brain and central nervous system changes. Changes in bodily systems - muscular and skeletal system, respiratory system, immune system. Cognition during adulthood-fluid and crystallized intelligence, decline/ stability in intelligence, dialectic operations, memory, multidimensional changes. Cognitive neuroscience and aging. Healthy aging.

Unit II: Ageing personality

Personality changes during late adulthood. Personality types among the elderly. The Five-factor Model of dispositional traits by Tupes and Christal. Neugarten's Personality Styles. Levinson's theory of Social development, Carl Jung's theories-personality, psyche & dreams. Peck's theory of personality adjustment in late adulthood. Erikson's theory. Disengagement theory. Information-processing in old age- attention, memory, pathological changes in memory. Cognitive disorders-dementia, Parkinson's disease and Alzheimer's disease. Ageing and sexuality, illness and sexuality.

Unit III: Ageing in the family context

Aged in the family milieu- family relationships, problems, prospects and support systems. Attachment and relationships in late adulthood. Ageing and mental health, Mental health risks and disorders. Loneliness, depression and sociability in old age. Indicators of successful and positive aging. Ageing and financial status. Elderly abuse. Stress among the aged and coping strategies. Grief and bereavement- patterns of bereavement and stages of grief. Dying with dignity.

Unit IV: Ageing in the current scenario

Contemporary socio-cultural changes and aging. Ageing in the current scenario-impact of urbanisation, globalisation and migration. Dual career families and aging, stress among caretakers and sandwich generation. International scenario of the aged. Critical issues around global aging. Reconceptualising aging. Researchable issues related on aging. Welfare of the aged- policies and programmes. Research trends in gerontology and methodological issues.

Weekly Teaching Schedule

Duration (weeks)	Topics
1	Socio demographic profile of the aged in Indian context. Theories of aging-Stochastic theories, programmed theories, evolutionary theories and random damage theories.
2	Biological theories of ageing - programmed ageing theories, random damage theories. Stochastic theories, evolutionary theories . Changes in bodily systems - muscular and skeletal system, respiratory system, immune system.
3	The Ageing body - physical, sensory, cardiovascular, brain and central nervous system changes. Changes in bodily systems - muscular and skeletal system, respiratory system, immune system. Cognition during adulthood- fluid and crystallized intelligence, decline/ stability in intelligence, dialectic operations, multidimensionality and multi-directionality. Cognitive neuroscience and aging.
4	Cognitive changes - the selection, optimization, and compensation theory (SOC theory), wisdom. Information-processing - attention, memory, pathological changes in memory.
5	Personality changes during late adulthood. Personality types among the elderly. The Five-factor Model of dispositional traits by Tupes and Christal.
6	Neugarten's Personality Styles. Levinson's stages of adult development theory. Disengagement theory.
7	Carl Jung's theories- personality, psyche and dreams, Peck's Views of Personality Adjustments. Erikson's theory.
8	Neuro -Cognitive disorders-dementia, Parkinson's disease and Alzheimer's disease.
9	The aged in the family context- family relationships, problems, prospects and support systems. Loneliness, depression and sociability in old age. Attachment & relationships in late adulthood.
10	Ageing and mental health, Mental health risks, indicators of successful and positive aging. Ageing and financial status. Elderly abuse.
11	Stress among the aged and coping strategies. Grief and bereavement- patterns of bereavement and stages of grief. Dying with dignity.

Duration (weeks)	Topics
12	Contemporary socio-cultural changes and aging. Ageing in the current scenario-impact of urbanisation, globalisation and migration.
13	Dual career families and aging, stress among sandwich generation and caretakers. International scenario of the aged.
14	Critical issues around global aging- reconceptualising aging. Researchable issues related on aging.
15	Welfare of the aged- policies and programmes.
16	Class discussions on Research trends in gerontology and methodological issues.

VII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion, - Case specific discussions
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Case studies and analysis
- Guest Lectures

VIII. Learning Outcome

After this course, the students will be able to

- Develop an insight into the individual, interpersonal and broader social contexts that influence adult development and changes from young adulthood through mid life and old age impacting quality of life.
- Gain understanding of the social and psychological issues and challenges of ageing for individuals and families and further for society in a broader context.

I. Course Title : Mental Health

II. Course Code : HDFS 607

III. Credit Hours : 3(3+0)

IV. Rationale

Although the general perception of mental illness has improved over the past decades, studies show that stigma against mental illness is still persistent, due to stereotypes and unawareness. Untreated, mental illness can contribute to higher medical issues, expenses, under-performance at school, college and at work, fewer employment opportunities and also to increased risk of suicide. Hence, the professionals dealing with human beings need to have basic understanding about the types, symptoms and diagnostic measures of various mental health issues and the therapies for behavior modification.

V. Aim of the course

- To develop an insight into the issues related to mental health in varied contexts, theoretical perspectives and its relevance to individual functioning.
- To make them aware about various mental health disorders, their etiology, contemporary intervention techniques, therapies and programmes and policies for promotion of mental health.

VI. Theory

Unit I: Mental health - Issues and theories

Mental health – concept, biological and psychological basis, historical perspectives. Concept, criteria and measurement of normality and abnormality. Cognitive functions - normal and pathological. Theories of mental health - behavioural, biological, humanistic, existential, psychoanalytical and related theories. Family and mental health. Gender and mental health. Sociology of mental health. Culture and mental health.

Unit II: Mental health disorders

Types, etiology and behavioural symptoms of various mental health disorders and maladjustments- psychosomatic problems, anxiety disorders, mood disorders, schizophrenia and multiple-personality disorders. Clinical manifestation and effects/ consequences of mental disorders- cognitive disturbances, affective disturbances, functional impairments, addictions, alcoholism, substance abuse, gambling, other addictions and social networking.

Unit III: Behaviour assessment and modification

Identification and assessment of mental disorders – approaches to diagnosis of mental disorders, techniques, steps in mental health assessment. Diagnostic and Statistical Manual of Mental Disorders (DSM) IV and DSM V. Psychological assessment - Role of mental health professionals. Strategies for behaviour modification - behaviour therapy, cognitive therapy, psycho therapy and family therapy.

Unit IV: Mental health programme and policy

Status of mental health in vulnerable population – children, adolescents, women and senior citizens in India and abroad. Contemporary intervention techniques. Mental Health Policy – legislations, programmes and policies for the promotion of mental health in India.

Weekly Teaching Schedule

Duration (weeks)	Topic
1	Mental Health – Concept, definitions, Biological basis, Psychological basis. Historical perspectives of mental health.
2	Definition of normality and abnormality- criteria and measurement. Cognitive functions-normal and pathological
3	Theories of Mental Health- Behavioural theories, Biological theories, Humanistic and existential theories, Psychoanalytical and related theories

Duration (weeks)	Topic
4	Family and mental health, Gender and Mental Health, Sociology of mental health, Culture and mental health.
5-6	Types, etiology and behavioural symptoms of various behavioural disorders and maladjustments- psychosomatic problems, anxiety disorders, mood disorders, schizophrenia and multiple-personality disorders.
7-9	Clinical Manifestations, effects/consequences of mental disorders- cognitive disturbances, affective disturbances, functional impairments, addictions-alcoholism, substance abuse, tobacco addiction, Gambling, other addictions and social networking.
10	Identification and assessment of mental disorders – Approaches to diagnosis of mental disorders. Techniques, steps in mental health assessment - psychological assessment
11	Diagnostic and Statistical Manual of Mental Disorders (DSM) IV and DSM V
12	Role of mental health professionals. Strategies of behaviour modification
13	Psycho therapy, behaviour therapy, cognitive behaviour therapy and family therapy.
14	Status of Mental Health in vulnerable population – Children, adolescents, women and senior citizens in India and abroad. Contemporary intervention techniques.
15	Mental Health Policy- legislations on Mental Health. Programmes and policies for the promotion of mental health in India.
16	Wrap up

VII. Teaching Methods/ Activities

- Lecture and class room discussions
- Group discussion
- Case specific discussions
- Assignment (reading/writing)
- Book/publication Review
- Student presentation
- Case studies and analysis
- Guest Lectures

VIII. Learning Outcome

After successful completion of this course, the students will

- Be aware of the issues related to mental health, theoretical perspectives on mental health its significance in life and trends of mental health in varied contexts.
- Develop an insight into various mental health disorders, their etiology, symptoms, assessment and diagnostics, contemporary intervention techniques and therapies and the ongoing mental Health programmes and policies.

IX. Suggested Reading

I. Course Title : Qualitative Research Methods

II. Course Code : HDFS 608

III. Credit Hours : 2 (1+1)

IV. Rationale

Qualitative research opens avenues for giving in-depth understanding of impact of socio-historical factors and life course variables on human beings. It also helps in developing competency for utilizing multiple research methods, simultaneously. This can guide in generating intensive data and critical analysis of human development and behaviour and action to be taken in various natural settings. Such research can provide a base for developing new theoretical inputs and for developing interactions for fruitful outcomes.

V. Aim of the course

- To orient the students regarding the need and scope of qualitative research.
- To impart knowledge and training in methods and techniques of qualitative research.

VI. Theory

Unit I: Introduction to qualitative research

Qualitative research design- concept, need and scope of qualitative research methods. Types, contribution, overview and practical applications of qualitative research methods.

Unit II: Qualitative research methods

Case studies, naturalistic design, historical methods, content analysis, ethnography, single cases experimental design, grounded theory, phenomenology.

Unit III: Qualitative data analysis and interpretation

Coding procedures, analysis and interpretation of qualitative data. Report writing. Evaluation of qualitative research.

Unit IV: Issues in qualitative research

Trends, challenges, limitations and constraints of various qualitative research methods. Ethical issues in conduct of research.

VII. Practical

Week	Topics
1	Critical review of research papers using qualitative methods
2	Critical analysis of research papers using qualitative methods
3	Extensive review of the empirical research works using qualitative method
4	Preparing any one review paper using qualitative methods
5	Identifying researchable issues that can be researched for qualitative methods
6	Designing qualitative research, site selection, sampling. Data collection by using qualitative methods- i) Conducting in-depth interviews ii) Focused group interviews iii) Naturalistic design iv) Historical method v) Ethnography vi) Single cases experimental design vii) Grounded theory
13	Coding procedures, data analysis

Week	Topics
14	Report writing and presentation
15	Ethical issues in qualitative methods
16	End term assessment

Weekly Teaching Schedule (Theory)

Duration (weeks)	Topics
1	Qualitative research design- concept, need and significance of qualitative research methods.
2	Scope of qualitative research.
3	Types of qualitative research and its contribution.
4	Overview and practical applications of qualitative research methods.
5	Case studies.
6	Naturalistic design, Historical methods, content analysis
7	Ethnography, single cases experimental design
8	Grounded theory, Phenomenology.
9	Coding procedures and analysis of data.
10	Interpretation of qualitative data
11	Report writing
12	Evaluation of qualitative research
13-14	Trends, challenges, limitations and constraints of various qualitative research methods
15	Ethical issues in conduct of research
16	Wrap up

VIII. Learning Outcome

After studying this course, the students will

- Gain deep understanding of the qualitative *research, various methods* and its practical applications.
- Will develop competency for utilizing *Qualitative* research methods by designing, . data generation, interpretion and writing report using qualitative analysis.

IX. Suggested Reading

- Barbour R. 2008. *Introducing Qualitative Research*. Sage Publications, New Delhi.
- Corbin J and Strauss A. 2008. *Basics of Qualitative Research*. Sage Publications, New Delhi.

Vol. 6

Community Science
– Resource Management and Consumer Science

Preamble
(Resource Management and Consumer Science)

Professionals in the field of Resource Management and Consumer Sciences are required to understand the interactions among humans and other elements of a system and allocate resources to maximize efficiency. The courses in the discipline should promote proficiency among students to apply theory, principles, and methods to optimize human well-being and overall system performance. Resource management is the efficient and effective development of consumer resources when they are needed.Thus the discipline of resource management and consumer science is linked with ergonomics, a major component of the human resources management and space planning which is an important factor in determining the productivity and safety in workplace. Management education provides knowledge on features and methods of contemporary management practices

The new education policy of India envisages systemic and structural changes in higher education system to enhance essential learning and critical thinking among students with a focus on experiential learning. By engaging students in hands-on experiences they are better able to connect theories and knowledge learned in the classroom to real-world situations.

Therefore, the courses are designed to give intense training to students in the field of ergonomics, space planning and management. Some of the exiting courses were modified to suit to the needs of present society. In the area of ergonomics focus was laid on understanding interactions among humans and other elements of system Upgraded the content integrating the human factor into workplace design. A new course on product design was introduced with a focus on generating and developing new product ideas. The concept of outsourced product development was introduced to establish linkages with industry. In the area of space planning and interior enrichment, upgraded the content of some of the existing courses as per the requirements of contemporary interior design profession and added new courses to enhance the architectural drawing skills of students.

The courses are upgraded to provide on hand skill training to student. Innovative methodologies were suggested to improve the understanding and vision of the students. Orientation towards research was given to enhance the aptitude for research among students. New initiatives like professional practice and industrial attachment give scope for developing professionalism among students.

Modifications Suggested in Courses in the Revised Curricula

M.Sc. (Community Science) in Resource Management and Consumer Science

Course Code	Course Title	Credit Hours	Remarks
	Major Courses		
RMCS 501*	Resource Management: Principles and Practices	3 (3+0)	Changed the title and modified the content to provide knowledge on features and methods of contemporary management practices.
RMCS 502*	Human Factors and Ergonomics	3 (2+1)	Changed the title and included content on human physiology and interactions among humans and other elements of system.
RMCS 503*	Interior Space Planning	3(1+2)	Changed the title and upgraded the content as per the requirements of contemporary interior design profession.
RMCS 504*	Consumer Economics	3 (2+1)	Upgraded the content in light of changing consumer behaviours.
RMCS 505	Work and Work Station Design	3(1+2)	Upgraded the content integrating the human factor into workplace design.

Course Code	Course Title	Credit Hours	Remarks
RMCS 506	Colour and Lighting in Interiors	3 (2+1)	Modified the content taking onto consideration the changing trends in interior colour and lighting developments.
RMCS 507	Consumer Issues and Legislations	2 (2+0)	Three existing consumer courses are merged and modified the content in light of modifications in consumer legislations.
RMCS 508	Product Design	3(1+2)	New course is added with a focus on generating and developing new product ideas. The concept of outsourced product development was introduced.
RMCS 509	Ergonomic Research Techniques	3(1+2)	New course is added to expose students to the developments in ergonomic research methodologies.
RMCS 510	Housing and Energy Efficient Building Design	3 (2+1)	Two courses are merged and modified the content.
RMCS 511	Technical Drawings	3(1+2)	New course is added to enhance the architectural drawing skills of students.
RMCS 512	Interior Design Business Management	3(1+2)	Increased the practical credits and decreased the theory credits.

Course Code	Course Title	Credit Hours	Remarks
RMCS 513	Environmental Resource Management	2(1+1)	New course is added to expose students to emerging scientific and policy issues.
RMCS 514	Special Project	2(0+2)	
	Minor Courses		
FN 505	Nutrition and Physical fitness	3(2+1)	Proposed minor courses from subjects closely related to a student's major subject. Apart from these courses a student can register any other course offered by any other departments.
FN 509	Food Safety and Standards	3(2+1)	
FN 513	Human Physiology	3(3+0)	
EECM 502	Development communication	3(2+1)	
EECM 505	Dynamic communication skills	2(0+2)	
EECM 507	Organisational development and HRD	2(1+1)	
EECM511	Climate Change Management	2(1+1)	
HDFS 503	Methods and Techniques of Assessment in Human Development	3(2+1)	
HDFS 506	Management of differently abled	3(2+1)	
ATS 512	Apparel and Textile Product Development	2(1+1)	
ATS 513	Laboratory Techniques in Textiles Research	2(0+2)	
	Supporting Courses		
	Research methodology	3(2+1)	Course numbers will be assigned by the departments that offer these courses.
	Statistics	3(2+1)	
	Common Courses		
	Library and Information Services	1(0+1)	Common to all disciplines. The course numbers will be assigned by the departments that offer these courses.
	Technical Writing and Communication Skills	1(0+1)	
	Intellectual Property and its management in Agriculture	1(0+1)	
	Basic Concepts in Laboratory Techniques	1(0+1)	
	Agricultural Research, Research Ethics and Rural Development Programmes	1(0+1)	
	Total	**5(0+5)**	
RMCS 591	Seminar	1(0+1)	
RMCS 599	Thesis/ Reseach	30	
	Total	**70 credits**	

*Core curses/ compulsory courses

Ph.D. (Community Science) in Resource Management and Consumer Science

Course Code	Course Title	Credit Hours	Remarks
	Major Courses		
RMCS 601*	Trends in Resource Management	3 (3+0)	Changed the title and added content on skills and tools for better resource management.
RMCS 602*	Occupational Biomechanics	3 (2+1)	Modified the content focusing on biomechanical analysis for designing work environment that minimizes load on worker's body
RMCS 603	Globalization and Consumer Economics	3 (2+1)	Content modified to focus on changes in consumer pattern.
RMCS 604	Space Designing and Managerial Dimensions for Special needs	3(1+2)	Changed the title and included recent developments and transitions in space designing for special needs.
RMCS 605	Physical Ergonomics	3(1+2)	New course is added to make the students understand the potential effects of physical load on human body.
RMCS 606	Environmental Issues and Challenges	2 (2+0)	Added challenges due to recent environmental issues.
RMCS 607	Family Dynamics and Women Power	3 (2+1)	No major changes made.
RMCS 608	Special Project	2(0+2)	

Course Code	Course Title	Credit Hours	Remarks
	Minor Courses		
FN 604	Global Nutrition Problems	2(2+0)	Proposed minor courses from subjects closely related to a student's major subject. Apart from these courses a student can register any other course offered by any other departments.
FN 608	Energy Metabolism	2(2+0)	
EECM 602	Impact Assessment of Development Programmes	3(1+2)	
EECM 603	Scaling Techniques for Behavioural Research	3(1+2)	
EECM 607	Media application and product promotion	4(2+2)	
HDFS 608	Qualitative research methods	3(2+1)	
ATS 602	Technical Textiles	3(2+1)	
ATS 605	Functional Clothing	3(2+1)	
ATS 607	Operational Management in Textiles and Apparel	2(2+0)	

Supporting Courses

A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM/ MOOCS or other online courses up to a maximum of 5 credits.

RMCS 691	Doctoral Seminar I (Core Field)	1 (1+0)	
RMCS 692	Doctoral Seminar II (Optional Field)	1 (1+0)	
RMCS 699	Research	75	
	Total	**100 Credits**	

*Compulsory core curses

Course Title with Credit Load M.Sc. in Resource Management and Consumer Science

Course No	Course Title	Credit Hours
	Major Courses	
RMCS 501*	Resource Management: Principles and Practices	3 (3+0)
RMCS 502*	Human Factors and Ergonomics	3 (2+1)

*Core curses/ compulsory courses. **A student can also choose a course from other fields related to the student's research

Course Contents
M.Sc. in Resource Management and Consumer Science

I. Course Title : Resource Management: Principles and Practices

II. Course Code : RMCS 501

III. Credit Hours : 3(3+0)

IV. Rationale

Global scenario presents tremendous challenges at the forefront of upcoming managers. Management education provides a potential productive ground to develop entrepreneurial skills and abilities. There is a need to facilitate students in developing competencies related to the role of managers as required in today's competitive environment. This course will nurture the students in a way that their abilities can be sharpened to take up managerial responsibilities in future.

V. Aim of the course

- To impart knowledge on the multifarious concepts, principles and processes of management
- To enable students to develop skills in the application of managerial skills in an organizational setup.

VI. Theory

Unit I: Nature and functions of management

Importance of management; Management functions; Management principles; Management levels; Functional areas of management; Managerial skills; Managerial roles.

Unit II: Evolution of management thought

Early classic approaches- Scientific management, administrative management and bureaucracy; Neo-classic approaches- human relation approach and behavioral approach; Modern approach; Quantitative approach; Systems approach; Contingency approach.

Unit III: Managerial competencies

Planning and administrative competencies; Decision making- Introduction, nature of managerial decision making, approaches to decision making; Types of decisions; Process of decision making; Tools and techniques of decision making; Creativity and rationality in decision making; Models of decision making behaviour; Risk and certainty in decision making; Authority and responsibility in decision making; Communication- Functions, factors and features, process, barriers and principles, types and channels; Leadership-Meaning, importance, characteristics and styles.

Unit IV: Management process

Steps in management process; Planning- types and dimensions, planning in systems perspective, factors affecting planning; Organizing- Departmentalization, line and staff relationship; Coordinating – need, types, principles, techniques and problems of coordination; Directing; Controlling.

Unit V: Human behaviour and organization

Introduction to organizational behaviour; Values; Attitudes and performance; Motivation-Importance, contemporary theories of motivation, approaches, elements of sound motivation; Stress management- concepts, causes, consequences, stress managing techniques.

VII. Teaching Methods/ Activities

- Lectures
- Assignments
- Publication review
- Students' presentations
- Case studies
- Guest lectures
- Online learning

VIII. Learning Outcome

After successful completion of the course, the students will be able to:

- Identify managerial activities that contribute to managerial effectiveness
- Observe and evaluate the influence of historical forces on the current practice of management
- Explain how organizations adapt to an uncertain environment and identify techniques that managers apply to influence and control the internal environment

IX. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Nature and functions of management-definition and importance of management, management and administration; Management functions- Planning, organizing, staffing, directing, motivating, controlling and coordinating; Management principles- Importance, Fayol's principles of management.
2	Management levels-administrative level, executor level, supervisory level; Functional areas of management; Human resource management; Production management; Office management; Financial management and marketing management; Managerial skill- Roles and effectiveness.

Duration (week)	Topics
3	Evolution of management thought- Early classic approaches, scientific management, and Taylor's contribution, contributions of Gantt and Gilbreth, criticism of scientific management; Administrative management- Fayol's contribution, Principles of administration.
4	Limitations of administrative management; Bureaucracy- Important features, limitations; Classic approaches- Human relation approach, Hawthorne study.
5	Contributions and limitations of human relations approach; Behavioral approach- Emergence, key ideas, contributions and weaknesses; Modern approach- Contributions and limitations.
6	Quantitative approach-Contributions and limitations; Systems approach – Introduction, system's vocabulary, features of system, system's framework; Contingency approach-contributions and limitations.
7	Managerial competencies; Planning and administrative competencies; Decision making-Introduction, nature of managerial decision making; Approaches to decision making; Types of decisions; Process of decision making.
8	Tools and techniques of decision making; Creativity and rationality in decision making; Models of decision making behaviour; Risk and certainty in decision making; Authority and responsibility in decision making.
9	Communication-Functions, factors and features; Communication Process; Barriers of communication; Principles of communication; Types and channels.
10	Leadership- Meaning and importance, characteristics and styles of leadership; Management process; Steps in management process; Planning- Nature, types, importance and dimensions.
11	Strategic planning process; Planning in systems perspective; Factors affecting planning, limitations of planning.
12	Organizing-Process, departmentalization, organization structure, line and staff relationship; Coordinating-Need, types, principles.
13	Techniques and problems of coordination; Difference between coordination and cooperation; Directing- Elements of directing; Controlling- Need, steps, benefits and problems of controlling, controlling techniques.
14	Human behaviour and organization; Introduction to organizational behaviour; Values; Attitudes and performance; Motivation- definition, process, nature and importance of motivation.
15	Contemporary theories of motivation; Approaches and elements of sound motivation; Stress management- concepts and causes.
16	Signs and symptoms of stress; Sources and consequences of stress; Stress managing techniques.

I. Course Title : Human Factors and Ergonomics

II. Course Code : RMCS 502

III. Credit Hours : 3(2+1)

IV. Rationale

Ergonomics is an applied science that coordinates the design of devices and physical working conditions with the capacities and requirements of the worker. Human factors and ergonomics is the application of physiological and psychological principles to design of products, processes, and systems. The course is intended to train the students to reduce human error, increase productivity, and enhance safety and comfort with a specific focus on the interaction between the human and the thing of interest.

V. Aim of the course

- To acquaint students with basic principles of human anatomy, physiology, human anthropometry and its relation to ergonomics
- To enable the students, understand the human factors and its relation to ergonomic design.

VI. Theory

Unit I: Introduction to ergonomics

Definition, aim, objectives and scope of ergonomics; Domains of ergonomics; Historical development of ergonomics and human factor; Interface between man machine and environment; Ergonomics in design.

Unit II: Human body systems

Structure and functions of major body systems- parts and basic functions of skeletal system; Properties and functions of muscular system; Components of circulatory system; Parts and functions of respiratory system; Structure and functions of digestive system and nervous system.

Unit III: Human anthropometry

Human anthropometry; Static and dynamic anthropometry; Anthropometric measurements; Normal distribution and percentiles; Anthropometry in ergonomics and design.

Unit IV: Body movement and postures

The functions and movements of skeletal system - functional classification of bones, joints, ligaments and tendons; Neuromuscular aspects of movement; Joints and movements; Classification of joints on the basis of function; Movement at synovial joints; Skeletal muscle as levers; Posture- Work posture, postural discomfort and its impact on work and human health, posture analysis tools.

Unit V: Work physiology

Fundamentals of work physiology; Muscular efforts; Energy consumption; Physical fitness-Measuring physical fitness using different techniques; Physical work capacity and its measurement; Determination of cardiac cost of work; Factors influencing energy requirements and energy costs for various activities.

VII. Practical

1. Collection of anthropometric measurements of school children
2. Analysis of data on school children anthropometry
3. Presentation of report on school children anthropometry
4. Designing study table based on the anthropometric data
5. Measuring the work posture of a worker involved in manual work using RULA/ REBA/OWASA
6. Analysis of work posture data
7. Presentation of report on work posture of person involved in manual work
8. Determination of physical fitness using any one of the technique
9. Analysis of data and presentation of report on physical fitness
10. Measurement of cardiac cost of selected activity
11. Analysis of data on cardiac cost of selected activity
12. Presentation of report on cardiac cost of selected activity
13. Assessment of ergonomic cost of work in terms of physiological indices

14. Analysis of data on ergonomic cost of work
15. Presentation of report on ergonomic cost of work
16. End of Term Assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Student presentations
- Group and individual research work
- Field visits
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Appreciate the role of ergonomics in reducing human error in designing and increase productivity
- Understand the importance of people in work systems, their abilities and limitations for designing tasks and work for effectiveness, efficiency, health and safety
- Contribute to new thinking and innovation processes within human factors and ergonomics

- Salvendy (Ed). 2006. *Handbook of Human Factors and Ergonomics*. Third edition, John Wiley and Sons, Hoboken, NJ.

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction to ergonomics- Definition, aim, objectives and scope of ergonomics; Physical, cognitive and organizational domains of ergonomics; History and status of ergonomics; Developments in the field of ergonomics; Approaches, characteristics, classification and interface between man, machine and environment system.
2	Ergonomics in designing for human comfort and safety; Human body systems; Components of human skeleton -bones, cartilage, joints.
3	Parts of human skeleton-Skull, vertebral column, rib cage, shoulder girdle, skeleton of upper limb, pelvic girdle, skeleton of lower limb; Functions of human skeletal system- Strength, support and shape, protection of delicate organs, leverage for movements, production of red blood cells.

Duration (week)	Topics
4	Introduction to muscular system; Properties of muscles- irritable, contractible, extensible, elastic and adaptability; Types of muscles-Skeletal muscles, cardiac muscles, smooth muscles.
5	Functions of the muscular system- Mobility, stability, posture, circulation, respiration, digestion, urination, childbirth, vision, organ protection, temperature regulation; Components of the human circulatory system- Heart, blood, red and white blood cells, platelets, and the lymphatic system.
6	Respiratory system-Upper respiratory tract, nose, mouth, and the beginning of the trachea; Lower respiratory tract-The trachea, the bronchi, bronchiole and the lungs.
7	The act of breathing– inhalation and exhalation and involvement of muscles; Measurements of lung function.
8	Structure and functions of digestive system and nervous system; Human anthropometry- Static and dynamic anthropometry.
9	Anthropometric measuring techniques; Normal distribution and percentiles; Anthropometry in ergonomics and design-designing for extremes, designing for adjustability, designing work heights.
10	The skeletal system- Functions and movements; Functional classification of bones, joints, ligaments, tendons.
11	Neuromuscular aspects of movement; Joints and skeletal movement; Classification of joints on the basis of structure-Fibrous joints, cartilaginous joints, synovial joints.
12	Classification of joints on the basis of function- synarthrosis, amphiarthroses, diarthroses; Movement at synovial joints- Gliding movement, angular movement, rotational movement, special movements.
13	Skeletal muscles as levers and their role in body movement; Posture- Workplace posture, posture and muscle activity, postural discomfort and its impact on work and human health.
14	Posture analysis tools- Rapid Upper Limb Analysis (RULA); Rapid Entire Body Analysis (REBA); Ovako Working Posture Analysis (OWASA); Fundamentals of work physiology- Muscular efforts, energy consumption, body size and movements.
15	Physical fitness- Techniques to measure physical fitness; Physical work capacity and its measurement.
16	Determination of cardiac cost of work; Factors influencing energy requirements and energy costs for various activities.

I. Course Title : Interior Space Planning

II. Course Code : RMCS 503

III. Credit Hours : 3(1+2)

IV. Rationale

Space planning either in residential or commercial buildings is the most imperative aspect of interior design profession. The interior designer is expected to develop a space plan for either residential or commercial buildings with its space allocations and divisions, arrangements and organizations to accommodate the functional, special and occupancy requirements in the form of space layout and final planning. The course is designed to expose students to advances in interior space designing process.

V. Aim of the course

- To gain insight into the process of interior design and the various aspects and considerations involved in practice of both residential and commercial design
- To exposes the students to advanced space planning techniques of residential and commercial buildings.

VI. Theory

Unit I: Interior design and user comfort

Residential buildings- Types and its characteristics; Commercial buildings- Types and its characteristics; Effect of interior design on user comfort- residential, commercial, special needs.

Unit II: Building planning principle

Functional and aesthetic considerations in the use of elements of design; Functional and aesthetic considerations in the use of principles of design; Housing principles for designing public private and circulation spaces; Advances in design process of residential interiors-Personal space, public space, utility space; Advances in design process of commercial interiors- Service institutions, marketing institutions; Recent trends in interior space management.

Unit III: Space standards

Space standards for various rooms in residential and commercial buildings; Building materials and their standards; Space saving furniture.

Unit IV: Building services

Electrical and safety fittings; House wiring; Plumbing systems for residential and commercial buildings; Sanitary fittings and fixtures for residential and commercial buildings.

VII. Practical

1. Preparation of a schedule to collect information regarding the characteristics of residential and commercial buildings
2. Visits to identify the characteristics of residential buildings
3. Visits to identify the characteristics of commercial buildings
4. Presentation of report on characteristics of residential and commercial buildings
5. Designing a residential house as per space standards –development of conceptual drawings
6. Designing a residential house as per space standards –development of design details and working drawings
7. Designing a residential house as per space standards –portfolio preparation
8. Designing a residential house as per space standards –presentation and group discussion
9. Designing any commercial building as per space standards- development of conceptual drawings
10. Designing any commercial building as per space standards- development of design details and working drawings
11. Designing any commercial building as per space standards- portfolio preparation
12. Designing any commercial building as per space standards- presentation and group discussion
13. Market survey on electrical and sanitary fittings and fixtures

14. Market survey on space saving furniture suitable
15. Presentation of report on sanitary fittings, fixtures and space saving furniture for residential and commercial buildings available in market
16. Cost estimation of residential building (apartment/condominium/row house)
17. Cost estimation of commercial building (Ice cream parlor/Tiffin centre/beauty salon/ restaurant, etc.)
18. Designing space saving furniture for residential buildings
19. Portfolio preparation on space saving furniture for residential buildings
20. Presentation of report on space saving furniture for residential buildings
21. Design and development of space saving furniture for commercial buildings
22. Portfolio preparation on space saving furniture for commercial buildings
23. Presentation of report on space saving furniture for commercial buildings
24. Project on renovation of a residential building with cost estimation
25. Portfolio preparation on renovation of a residential building with cost estimation
26. Presentation of report and group discussion on renovation of a residential building with cost estimation
27. Project on renovation of a commercial building with cost estimation
28. Portfolio preparation on renovation of a commercial building with cost estimation
29. Presentation of report and group discussion on renovation of a commercial building with cost estimation
30. Preparation of material board and presentation for a residential project
31. Preparation of material board and presentation for a commercial project
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Field visits
- Assignments
- Preparation of manuals
- Market survey
- Students' presentation
- Group and individual research work
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Understand the effect of interior design on user comfort and plan interiors for residential, commercial and special needs
- Get acquainted with recent trends in interior space management
- Develop plans as per space and building materials standards
- Update knowledge on building services

Weekly Lecture Schedule

Duration (week)	Topic
1	Types and characteristics of residential buildings; Types and characteristics of commercial buildings-Public and private educational institutions, health related buildings, recreational buildings, market buildings, etc.
2	Effect of interior design on user comfort in residential, commercial and buildings for people with special needs in terms of colour, space, texture, and light.
3	Functional and aesthetic considerations in the use of elements of design- Line, form, texture, colour, pattern and space.
4	Functional and aesthetic considerations in the use of principles of design – Proportion, balance, emphasis, harmony and rhythm.
5	Housing principles for designing public spaces and private spaces like living room, dining room, porticos, drawing room, media room, bedrooms, pooja room, bathrooms, bar area, etc.
6	Housing principles for designing circulation and utility spaces – kitchen, laundry, stair cases, path ways and corridors.
7	Advances in design process of residential interiors- Personal space, public space, utility space.
8	Advances in design process of commercial interiors- Service institutions, marketing institutions.
9	Recent trends in interior space management with reference to colour, architectural features, building materials, etc.
10	Space standards for public, private, utility and circulation spaces in residential and commercial buildings.
11	Building materials and their standards.
12	Space saving and multipurpose furniture suitable for residential and commercial interiors and their standards.
13	Electrical and safety fittings; Wiring system in residential and commercial buildings.
14	Plumbing systems for residential buildings in terms of fittings and fixtures.
15	Plumbing systems for commercial buildings in terms of fittings and fixtures.
16	Sanitary fittings and fixtures for residential and commercial buildings.

I. Course Title : Consumer Economics

II. Course Code : RMCS 504

III. Credit Hours : 3(2+1)

IV. Rationale

Consumer economics is a broad field, principally concerned with microeconomic analysis behaviour in units of consumers, families, or individuals. Students need to develop in-depth understanding of the functioning of domestic and global economies and to develop the necessary and portable skills to perform economic analysis. The course will provide an insight to understand the role of consumption in shaping India's economy

V. Aim of the course

- To provide a comprehensive study of the basic institutions, concepts, principles, and practices of economics
- To impart knowledge about consumer behaviour with reference to micro and macroeconomic systems and its impact on consumption behavior.

VI. Theory

Unit I: Consumer behaviour

Consumer behavior; Environmental influences on consumer behaviour; Individual determinants of consumer behavior; Models of consumer behavior - Micro economic model, Nicosia model, Howard-Sheth model, Engel- Block well-Miniard model; Application of consumer behaviour knowledge in marketing; Consumer decision process- Problem recognition, search and evaluation, purchasing process, post purchasing behavior; Researching consumer behaviour.

Unit II: National income

Definition and significance; Concepts of national income; Methods of measurements of national income - value added method, income method, expenditure method, reconciliation of the three measures of national income; Difficulties in measurement of national income- Conceptual difficulties and practical difficulties; National income and Economic welfare.

Unit III: Consumption economics

Concept of consumption economics; Theories of consumption- Engels law of consumption, relative income theory of consumption, life cycle theory of consumption, permanent income theory of consumption; Budget and economy; Fiscal policy; Annual financial statement of the government and budget; Revenue receipts and revenue expenditure; Capital receipts and capital expenditure; Overall budget; Concepts of deficits in government budget; Revenue deficits and fiscal deficit; Taxation- India's tax structure; Tax as a source of public revenue; Direct and indirect taxes; Merits and demerits of taxes; Role of indirect tax in a developing economy; Incidence and effects of taxes; Inflation- Meaning of inflation, types of inflation, causes, effects, measures to check inflation; Deflation- Meaning, deflation and disinflation, causes, effects, measures to control deflation.

Unit IV: Financial systems of India

Introduction to financial system of India; Financial institutions; Financial services; Financial markets; Structure of Indian financial system; Importance of financial system for the economic development; Banking-Types of banking institutes; Functions; Types of loans and advances; Indian money market; Indian capital market; Financial intermediaries and services; Insurance and its regulations.

VII. Practical

1. Project work: Study of consumer buying behaviour while buying a selected commodity –Collection of review
2. Formulation of objectives of the study
3. Selection of sample, and study location
4. Designing the data collection tool

5. Pre testing and finalization of data collection tool
6. Collection of data
7. Data analysis
8. Report writing
9. Finalization of report
10. Presentation of the report on "Consumer buying behaviour while buying a selected commodity"
11. Discussion on the findings of the research
12. Visit to any one financial institute
13. Preparation of documents required for applying for a loan
14. Study the trends of stock market index given in magazines or news papers
15. Critical analysis of National Budgets through panel discussion.
16. End of Term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Students' presentation
- Group work
- Student's interview of key policy makers
- Case analysis and case studies
- Guest lecture
- Review of policy documents

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Understand how markets organize core economic activities, such as production, distribution, consumption, and the growth of productive resources
- Appreciate the role of factors that influence consumer decisions in consumer buying behaviour
- Gain knowledge on the determinants of macroeconomic conditions , causes of business cycles, and interactions of monetary and fiscal policy

Weekly Lecture Schedule

Duration (week)	Topic
1	Introduction to consumer behaviour, consumer and customer, buyers and users, organization of buyers, development of marketing concept. Environmental influences on consumer behaviour- Culture, social class, family, personal influences; Diffusion of innovations.
2	Individual determinants of consumer behaviour- personality and social concept, motivation and involvement, information processing, learning and memory, attitudes; Models of consumer behaviour-Micro economic model, Nicosia model.
3	Models of consumer behaviour- Howard-Sheth model, Engel- Block well-Miniard model; Application of consumer behaviour knowledge in marketing; Consumer behaviour and marketing management; Consumer behaviour and non-profit and social marketing; Consumer behaviour and government decision making; Consumer behaviour and consumer research process.
4	Consumer decision process-Problem recognition, search and evaluation, purchasing process, post purchasing behaviour; Researching consumer behaviour-Consumer research strategies, methods of gathering information, measuring consumer characteristic.
5	National income-definition and significance; Concepts of national income- Gross Domestic Product (GDP), Gross National Product (GNP), Net Domestic Product (NDP), Net National Product (NNP).
6	Concepts of national income- Net national product at market price, net domestic product at factor cost, income from domestic product occurring to private sector, private income, personal income, personal disposable income, inter-relationship between different concepts of national income; Methods of measurements of national income-value added method, income method.
7	Methods of measurements of national income- Expenditure method, reconciliation of the three measures of national income; Difficulties in measurement of national income-Conceptual difficulties and practical difficulties.
8	National income and economic welfare- Changes in the composition of national income and economic welfare, changes in the distribution of national income and economic welfare; Consumption economics-Definition, terms and concepts.
9	Theories of consumption- Engels law of consumption, relative income theory of consumption,life cycle theory of consumption, permanent income theory of consumption.
10	Budget and economy- Fiscal policy, objectives, annual financial statement of the government and budget; The Budget-revenue receipts and revenue expenditure, capital receipts and capital expenditure, overall budget, concepts of deficits in government budget, revenue deficits and fiscal deficit.
11	Taxation; India's tax structure; Tax as a source of public revenue, direct and indirect taxes, merits and demerits of taxes, role of indirect tax in a developing economy, incidence and effects of taxes; Inflation- Introduction, meaning of inflation, types of inflation, causes, effects, measures to check inflation.
12	Deflation- Meaning, deflation and disinflation, causes, effects, measures to control deflation; Introduction to financial system of India- Financial institutions, financial services, financial markets.
13	Meaning of financial services, structure of Indian financial system, importance of financial system for the economic development; Definition of Bank, Functions of Reserve Bank of India, Commercial Banks, Regional Rural Banks, Cooperative Banks, Micro Finance, Priority Sector Lending, NABARD, Development Financial Institutions SFC, SIDBI.
14	Types of loans and advances, principles of sound lending policies, credit appraisals of various forms of loans and advances; Modes of creating charges-lien, pledge,

Duration (week)	Topics
	mortgage and hypothecation; Indian money market- Characteristics, structure, composition; Problems and reforms in Indian money markets.
15	Indian capital market- Composition and growth of primary and secondary markets, difference between primary and secondary markets, capital market reforms and NBFC in capital markets, stock exchange, NSE, OTCEL, Online trading and role of SEBI; Financial intermediaries and services- Merchant banker, mutual funds, leasing companies, venture capital funds, forfeiting, loan syndication, factoring, custodial services, depository services and depository by participants.
16.	Meaning of insurance and reinsurance; Principles and advantages of insurance; Globalization of insurance and insurance sector reforms in India; Types of insurances; Regulations of insurance in India; Insurance act 1938.

I. Course Title : Work and Workstation Design

II. Course Code : RMCS 505

III. Credit Hours : 3(1+2)

IV. Rationale

Workplace design has a profound impact on the productivity of workers. Making the best use of space through optimum placement of equipment, integrating the human factor into workplace design, and effectively aligning the workplace into the surrounding environment are important aspects of ergonomics. This course prepares students to develop work stations as per the requirements of the organizations and its technologies that satisfy the workers individual requirements.

V. Aim of the course

- To acquaint students with the interrelatedness of work, worker and workstation environments
- To infuse an interdisciplinary approach to workstation engineering and techniques to reduce human cost of work.

VI. Theory

Unit I: Work, worker and workplace

Work, worker and workplace-definition, types and interrelationship**;** Classification of work based on energy consumption and nature of work; Time and energy requirements of work; Introduction to components of worker input- affective, cognitive, temporal and physical.

Unit II: Work measurement techniques

Work measurement techniques- Subjective judgment, Record of past performance, Scientific methods; Tools for work analysis-charts, diagrams, models and photographic aids.

Unit III: Workplace layout and equipment design

Principles of workstation and system design; Design and arrangement of different work centers; Work reaches; Working heights; Visual design parameters- Work surface, space allowance and storage; Design considerations for different workstation designs-Seated work, Standing work, Sit stand work; Controls, displays and information; Visual, auditory and other displays; Quantitative and qualitative information; Methodologies for studying workplace design; Hazards of ill designed workstation.

Unit IV: Physical factors of the work environment

Environmental factors in workplace and their measurement-Heat, light, sound and noise, vibration, radiation, humidity; Effect of environmental parameters on worker and work performance.

VII. Practical

1. Selection of workplace unit for taking the anthropometric measurements of worker and dimensions of equipment and furniture used in a selected workplace units
2. Measuring and recording the anthropometric measurements of worker in the selected workplace unit
3. Measuring and recording the dimensions of equipment and furniture used in the selected workplace unit
4. Working on developing design for a workplace unit as per data collected in previous exercise
5. Determining the space relationships as per workers anthropometry
6. Determining the space relationships as per workers posture and movement at selected workstations
7. Developing the 2D design of selected workplace unit
8. Developing the 3D design of selected workplace unit
9. Work measurement in the selected workstation using two hand process charts
10. Analysis of data collected
11. Presentation of report on work done in the selected workstation using two hand process charts
12. Work measurement in the selected workstation using photographic aid
13. Analysis of data on work measurement collected in the selected workstation using photographic aid
14. Presentation of report on work done in the selected workstation using photographic aid
15. Measuring environmental factors in the workplace: Heat
16. Measuring environmental factors in the workplace: Light
17. Measuring environmental factors in the workplace: Noise
18. Measuring environmental factors in the workplace: Vibration
19. Measuring environmental factors in the workplace: Radiation
20. Measuring environmental factors in the workplace: Humidity
21. Analysis of data collected on environmental parameters
22. Presentation of report on environmental parameters
23. Developing a design layout of a selected commercial workplace: Preparation of check list
24. Collection of data on design features, space relationships, dimensions of equipment and furniture, and environment control parameters in the workplace
25. Analyzing the data
26. Finalizing the dimensions of selected commercial workplace
27. Developing a design layout of the selected commercial workplace based on the DATA.
28. Presentation and group discussion on the design layout of the selected commercial workplace
29. Finalization of design layout of the selected commercial workplace

30. Developing 2D plan of the selected commercial workplace
31. Developing 3D workplace design of the selected commercial workplace
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Reading assignment
- Photographic technique for recording posture at workplace
- Hands on experience on measuring ergonomic parameters
- Students' presentation
- Group discussions
- Guest lectures
- Visits to industries

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Asses the workers requirements in a workplace
- Determine the space relationships as per workers anthropometry, posture and movement at any workstations
- Develop workplace design for various occupations

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic

1. Definition, types and interrelationship of work, worker and workplace.
2. Classification of work-Based on the amount of physical exertion that the work requires as sedentary, light, medium, heavy, and very heavy; Based on the nature of work as manual repetitive, cognitive repetitive, manual non repetitive and cognitive non repetitive work; Time and energy requirements of work.
3. Introduction to components of worker input- affective, cognitive, temporal and physical.
4. Affective component- job satisfaction, task performance and goal of work; Cognitive component- Knowledge, thinking and mental skill.
5. Temporal component- Techniques of organizing work; Physical Component-Productivity.
6. Work measurement techniques- Subjective judgment, record of past performance, scientific methods.

7. Tools for work analysis (i) Charts indicating sequence of events, flow process chart, two hand process chart; (ii) Charts indicating sequence of events happening in the order in which they occur on a time scale-Multiple activity chart, man-machine chart, simo chart; (iii) Diagrams indicating movements along the events happening in the order in which they occur- Flow diagram, string diagram, cycle graph, chrono-cycle graph, travel chart.
8. Tools for work analysis- (i) Models indicating the actual layout on a dimensional scale, two dimensional models, three dimensional model; (ii) Photographic aids.
9. Principles of workstation and system design.
10. Design and arrangement of different work centres, work reaches, working heights.
11. Design considerations for different workstation designs- Seated work, standing work, sit stand work.
12. Controls and displays- Visual, auditory and other displays, quantitative and qualitative information.
13. Methodologies for studying workplace design- Formal and informal techniques.
14. Hazards of ill designed workstation.
15. Environmental factors in workplace and their measurement- Heat, light, sound and noise, vibration, radiation, humidity.
16. Effect of environmental parameters on worker and work performance.

I. Course Title : Colour and Lighting in Interiors

II. Course Code : RMCS 506

III. Credit Hours : 3(2+1)

IV. Rationale

Colour and lighting influence and manipulate space through strategic lighting designs. The study of the relationship between light, colour and spaces is an essential element of the whole interior design process. The course provides an opportunity for students to learn principles of lighting and investigate lighting for contemporary lifestyle and luxury interiors and correctly interpret the 'light' atmosphere of a space and translate this into creative and technical lighting solutions.

V. Aim of the course

- To gain insight into the use of colour and lighting in various buildings and its significance
- To assess the technical aspects and interrelationship of colour and light and their effect on interior spaces.

VI. Theory

Unit I: Colour as an interior design element

Historical perspective of colour as an interior design element; Properties of colour - Hue, value and intensity; Approaches and theories of colour.

Unit II: Applications of colour in various elements of interiors

Cultural and psychological effects of colour; Types of colour schemes-Related colour schemes, contrast colour schemes; Factors to consider while choosing colour schemes for buildings; Suitable colour schemes for residential, commercial, public, educational and religious building interiors.

Unit III: Introduction to lighting in interior

Importance and sources of lighting; Cultural and social aspects of lighting; Physiology of vision; Properties of lighting - Reflection, absorption, transmission and diffusion; Types of lighting; Safety and emergency lighting; Lighting requirements for household activities; Lighting requirements in commercial buildings.

Unit IV: Quantity and quality of lighting

Measurement of light and its units; Types of lamps from animal fat lamps to LEDs, their characteristics and suitability to various rooms; Types of lighting based on direction of use, place of use, purpose and portability; Lighting controls- Type, selection, care, maintenance and economic use; Lamp holders; Lighting switches; Motion sensors; Factors affecting the quantity of illumination in a room- Room proportion, colour, texture and cleanliness of room surface, lamp lumen, lamp lumen depreciation; Method of calculating lighting requirements for various rooms; Lighting for outdoor living and gardens.

Unit V: Effect of colour on lighting

Colour rendition; Use of colour and lighting in architecture, materials and finishes from 16th century to the date; Use of colour and lighting in problematic areas to disguise and camouflage.

VII. Practical

1. Study of types of colour schemes in residential interiors
2. Study of types of lamps and lighting used in residential interiors
3. Group discussion on use of colour and lighting in interiors
4. Study of types of colour schemes in commercial interiors
5. Study of types of lamps and lighting used in commercial interiors
6. Presentation on use of colour and lighting in commercial interiors
7. Suggesting suitable colour schemes for residential buildings and its cost estimation
8. Suggesting suitable colour schemes for commercial buildings and its cost estimation
9. Group discussion on suitable colour schemes for residential and commercial buildings
10. Suggesting suitable lighting fixtures for residential buildings and its cost estimation
11. Suggesting suitable lighting fixtures for commercial buildings and its cost estimation
12. Group discussion on suitable lighting fixtures for residential and commercial buildings
13. Prepare a colour and lighting plan for problematic areas like space below stair case and estimate the cost
14. Prepare a colour and lighting plan for problematic areas like, irregular shape rooms or narrow areas and estimate the cost
15. Market survey to understand the available safety and emergency lighting systems and presentation of report
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Preparation of manuals

- Students' presentation
- Visits to institutes
- Group research work
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Develop a detailed lighting plan for different context
- Successfully create a project outline on lighting installation for residential and commercial interiors, events and exhibition
- Design suitable colour scheme for residential and commercial building interiors

X. Suggested Reading

Weekly Lecture Schedule

Duration (Week)	Topic
1	Historical perspective of colour as an interior design element- Definition, origin, old theories of colour; Properties of colour -Hue, value and intensity and their effect on space and texture in different rooms.
2	Approaches to the concept of colour- Physicist, physiologist, chemist, artist, and psychologist; Theories of colour –Prang and Munsell colour theories.
3	Theories of colour – Ostwald colour theory; Cultural and psychological effects of primary, secondary and tertiary colours.
4	Related colour schemes- Monochromatic, analogous, neutral colour schemes; Characteristics and applicability of related colour schemes in interiors; Contrast colour schemes- Single, double and split complementary, triad and tetrad colour schemes; Characteristics and applicability of contrast colour schemes in interiors.
5	Factors to consider while choosing colour schemes for buildings -Age, gender, orientation of the room, climate, personal preferences, mood, occasion, etc.; Suitable colour schemes for residential, commercial, public, educational and religious building interiors.
6	Importance and sources of lighting - Natural and manmade; Cultural and social aspects of lighting -Usage for different occasions.
7	Physiology of vision with reference to the perception of colour; Properties of lighting- Reflection, absorption, transmission and diffusion.
8	Types of lamps for household and commercial interiors- Low intensity and high intensity discharge lamps; Safety and emergency lighting needs in residential and commercial buildings.
9	Lighting requirements in residential buildings for cooking, reading, washing, sewing, cleaning, watching, grooming, etc.; Lighting requirements in commercial buildings like banks, bus stations, air ports, stadiums, theatres, restaurants, etc.
10	Measurement of light and its units- Lumen, candle power, lux, foot candle; Types of lamps from past to present, their characteristics and suitability to various rooms.

Duration(Week)	Topic
11	Types of lighting based on direction of use, place of use, purpose and portability; Types of architectural lighting -. Luminous, recessed, valance, cove, cornice, etc.
12	Lighting Controls- Type, selection, care, maintenance and economic use- lamp holders, lighting switches, motion sensors; Factors affecting the quantity of illumination in a room-Room proportion, colour, texture and cleanliness of room surface, lamp lumen, lamp lumen depreciation.
13	Method of calculating lighting requirements for various rooms by lamp lumen method; Lighting for outdoor living like terraces, balconies, patios, decks, etc. and gardens in residential and commercial buildings.
14	Meaning of colour rendering, types of glare and visual illusions; Use of colour and lighting in Roman, English, French and Indian architecture from 16^{th} century to the date.
15	Use of colour and lighting in materials (wall, floor, ceiling, furnishings) and in finishes (wall, floor, ceiling) from 16^{th} century to the date.
16	Use of colour and lighting in problematic areas to disguise - Low height rooms, high ceiling rooms, narrow rooms, tiny rooms, projections and recesses, spaces below stair cases, awkward shape windows, irregular shaped rooms.

I. Course Title : Consumer Issues and Legislations

II. Course Code : RMCS 507

III. Credit Hours : 2(2+0)

IV. Rationale

Globalization of trade, market-dominated economy, information revolution and emergence of e-commerce has contributed towards development of consumer protection measures. The subject has received tremendous importance among the contemporary legal fraternity in India. The legal experts are emphasizing on the need for teaching consumer law to present generation for making them equipped to handle issues relating to this branch of law. In this background the present course will introduce the students to the existing law and practice relating to consumer protection.

V. Aim of the course

- To acquaint the students with various consumer issues and legislative framework available for consumer protection
- To make students approach the subject from a multifaceted erspectives such as changing trends in consumerism, legal and non-legal consumer protection measures, consumer and communication tools.

VI. Theory

Unit I: Consumer issues

Changing trends in consumerism; Profile of consumers in India and abroad; Consumer issues and challenges; Social media management; Consumer finance; Multiple tax structure: Gender issues in consumerism; Gender division of labour; Access to decision making; Marketing and gender consumerism; Wealth and gender consumerism; Green consumerism- Definition, objectives and necessity of green consumerism; Agriculture credit in India; Agriculture marketing in India.

Unit II: Consumer legislations

Significance of consumer guidance and counseling; Consumer protection measures- Legal and non-legal consumer legislations; The Contract Act 1982; The Sale of Goods Act 1930; The Essential Commodities Act 1955; The Agricultural Produce (Grading and Marking) Act 1937; The Standard of Weights and Measures Act 1976; The Trade Mark Act 1999; The Competition Act 2002; The Bureau of Indian Standard Act 1986; Consumer Protection Act1986; Consumer protection Bill 2018; Right to Information Act 2005; Information Technology Act 2000; Food Safety and Standards Act,2016.

Unit III: Consumer and communication tools

Consumer communication- Significance, history and types; Communication media and social change; Trends in consumer communication; Media and consumer demand; Advertising as a mode of communication; Trends and impact of advertising on consumers; Social media- chats, Blogs, Face book, LinkedIn, Twitter, Instagram, Pinterest, YouTube.

Unit III: On line marketing

E-marketing in India- Evolution; Growth and challenges; Legislative frame work.

VII. Teaching Methods/ Activities

- Lectures
- Assignments
- Book/Publication Review
- Students' presentation
- Group work
- Guest lectures
- Review of policy documents

VIII. Learning Outcome

After successful completion of the course, the students will be able to

- Understand challenges faced by consumers in the economy because of changing trends in consumerism
- Conversant with major national and international instruments on consumer protection.
- Recognize common problems involving consumer transactions; identify relevant statutes and regulations; and apply them to specific problems

IX. Suggested Reading

- Sparks C. 2008. *Globalization, Development and Mass Media*. Sage Publ.

Weekly Lecture Schedule

Duration (week)	Topic
1	Changing trends in Consumerism; Changing economy, rapid urbanization, increasing income levels, digital marketing, shift in approach towards family systems; Profile of consumers in India and abroad- socially connected, environmentally aware, style –conscious, low brand loyalty, informed purchases, spends on leisure, health conscious; Consumer issues and challenges- on line marketing, social media management, consumer finance, multiple tax structure.
2	Gender issues in consumerism- gender division of labour, access to decision making, marketing and gender consumerism, wealth and gender consumerism; Green consumerism-definition, objectives and necessity of green consumerism.
3	Consumer guidance and counseling: Significance, aims and objectives, major areas of guidance and counseling; Agriculture credit in India ,Agriculture marketing in India.
4	Unfair trade practices in India- Introduction, types of unfair trade practices, false representation, false offer of bargain price, free gifts offers and prize scheme, non-compliance of prescribed standards, hoarding, destruction, etc.; Provisions and remedies for unfair trade practices in legal system- Removal of defects, replacement of goods, refund of price, removal of deficiency in service, discontinuance of unfair trade practice, stopping of sale and withdrawal of hazardous goods, payment of adequate cost.
5	Consumer protection against unfair trade practices- The monopolistic and restrictive trade practices Act, 1969 and The Competition Act, 2002; Authorities and agencies for settling unfair trade practices in India- District Forum, State Commission, National Commission, Supreme Court, Competition Commission of India
6	Non-legal Consumer Protection Measures; Types of alternate dispute resolution techniques- mediation, arbitration, ombudsman, peer review, early neutral evaluation, settlement conference, facilitation, adjudication; Provisions for consumer protection and welfare under The Contract Act 1982 and The Sale of Goods Act 1930.
7	Provisions for consumer protection and welfare under The Essential Commodities Act 1955; The Agricultural Produce (Grading and Marking) Act 1937; The Standard of Weights and Measures Act 1976 and The Trademark Act 1999.
8	Provisions for consumer protection and welfare under The Competition Act 2002 The Bureau of Indian Standard Act 1986; and Consumer Protection Act 1986 and Consumer protection Bill 2018.
9	Provisions for consumer protection and welfare under Right to Information Act 2005; Information technology Act 2000 and Food Safety and Standards Act, 2016.
10	Consumer communication media- significance, history and types; Communication media and social change.
11	Trends in consumer communication and their role in creating consumer demand; Advertising as an effective mode of consumer communication- History, target audience, impact of advertising on consumers.
12	Legal and ethical aspects of advertising in India; Social media and new trends in consumer communication.
13	Types of social media; Chats, Blogs, Face book, Link din, Twitter, Instagram, Pinterest, Youtube; Communication through blog- Origin, types, communication through personal blogs, collaborative blogs, corporate and organizational blogs.
14	Effective methods of communication through face book and link din; Communication through Twitter, Instagram, Pinterest, YouTube.
15	Online marketing- Definition, evolution and benefits; Online marketing tools- Types, merits and demerits.
16	Challenges of On line marketing; On line marketing and legislative frame work.

I. Course Title : Product Design

II. Course Code : RMCS 508

III. Credit Hours : 3(1+2)

IV. Rationale

Product design is highly customized and user centered. The purpose of every product is to increase safety, comfort and performance. An integrated approach to management of product design and development is required to create better quality products with enhanced capabilities. This course is designed with focus on theory and practical applications in the product design and development for all purposes not undermining the environment in which it will be used.

V. Aim of the course

- To present an overview of the product designing and development process.
- To facilitate for gaining hands on experience in design and development of consumer product.

VI. Theory

Unit I: Introduction to product design

Product Design- Definition, significance and essentials of product design and consumer demand; Product attributes-usability, contextual needs, compatibility, product aesthetics.

Unit II: Approaches to product designing

Concepts in product designing; User-centered design; Universal design; Accessible design; Usable design; Anthropometry in product design; Design consideration in product for geriatrics; Design consideration in product for people with special needs.

Unit III: Outsourced product development (OPD)

Introduction; Importance; Concept and need; Major differentiating factors- technology related, people related, process related; Emerging models of product development.

Unit IV: Product development process

Stages of product development process; Market analysis; Product analysis; Identification and innovation; User-Product relationship and ergonomics; Cognitive and social engineering issues; User interface designing.

Unit V: Product testing

Product testing- definition, purpose, role of government, Industry and consumer organizations; Product testing techniques and devices-product evaluation, quality control and standardization.

VII. Practical

1. Checklist for evaluation of a selected consumer product against the manufacturer's guidelines-Literature survey
2. Designing a checklist for evaluation of a selected consumer product against the manufacturer's guidelines
3. Evaluation of the selected consumer product against the manufacturer's guidelines
4. Presentation and group discussion

5-9. Exposure to Outsourced product development (OPD)

10. Conceptualization and development of consumer products with functional alternatives

11. Product Idea generation through brainstorming
12. Evaluation of the product idea generated; Group participation
13. Finalization of product
14-18. Working on design criteria
19. Collection of feedback from market
20. Analyzing the user's option on the design of the consumer product
21-26 Developing the prototype of the product
27. Evaluation of the product developed for identifying the problems through brain storming
28. Proposing design solutions to rectify identified lacunas in the product design
29-31. Finalization of product design
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Students' presentation
- Exposure to outsourced product development
- Guest lectures
- Visits to industries

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Understand the technical and business aspects of the product development
- Analyze and apply methodologies for product design and development
- Undertake a meticulous approach to the management of product development to satisfy consumer needs

X. Suggested Reading

- Cross N. 2000. *Engineering Design Methods: Strategies for Product Design*. Reiters Publications.
- Dumas JF and Redish JC. 1993. *A Practical Guide to Usability Testing*. Greenwood Publications.
- Meilgaard M, Civille GV and Carr BT. 2006. *Sensory Evaluation Techniques*. CRC Press.
- Otto KN and Wood KL. 2001. *Product Design: Techniques in Reverse Engineering*. New Age International.
- Parker G and Alstyne MV. 2005. *Management Science: The Theory of Information Product Design*. INFORMS Publications.
- Roozenburg NFM and Eekels J. 1995. *Product Design: Fundamentals and Methods*. Wiley.
- Sharma DD. 2000. *Total Quality Management*. Sultan Chand and Sons.
- Stone H and Sidel JL. 2004. *Sensory Evaluation Practices*. Academic Press.
- Ulrich KT and Eppinger SD. 1995. *Product Design and Development*. Irwin McGraw Hill.

Weekly Lecture Schedule

Duration (week)	Topic
1	Product Design- definition, significance and essentials of product design.
2	Consumer behaviour considerations in product design.
3	Product attributes- Usability, contextual needs, compatibility, product aesthetics.
4	Design considerations and product design process.
5	User-centered design- need, models, elements and process.

Duration (week)	Topic
6	Universal design, Accessible design, Usable design- concept, design for improving product accessibility, need identification and process.
7	Definition and application of anthropometry in product design- design diversity, Design for extreme individuals, design for adjustable range, design for average.
8	Functional limitations and design consideration in designing product for geriatrics.
9	Disabilities, specific barriers and design consideration in designing products for people with special need.
10	Outsourced product development (OPD) - introduction, importance, concept and need. Major differentiating factors-Technology related, people related, process related; Emerging models of product development.
11	Stages of product development process- market analysis, product analysis, identification and innovation.
12	User-Product relationship and ergonomics; Cognitive and social engineering issues in product development.
13	User Interface designing- definition, requirements and process.
14	Product testing- definition, purpose, role of government, industry and consumer organizations.
15	Product testing techniques and devices.
16	Product evaluation, quality control and standardization.

I. Course Title : Ergonomic Research Techniques

II. Course Code : RMCS 509

III. Credit Hours : 3(1+2)

IV. Rationale

The use of established, documented research tools, techniques and methods is important when conducting any research as it ensures that investigations are conducted in a standardized, repeatable way. This course will introduce a number of constructive tools, techniques and methods to conduct research in the area of ergonomics which enable the student to analyze and evaluate humans while they are carrying out work tasks.

V. Aim of the course

- To equip students with the ergonomic research methods
- To provide hands on experience in the application of ergonomic research methods.

VI. Theory

Unit I: Approaches to research methods in ergonomics

Measurement and information gathering; Ergonomic standards; Observational techniques; Rating scales; Questionnaires and checklist; Digital models and simulation.

Unit II: Subjective assessment tools

NIOSH discomfort survey; The Dutch Musculoskeletal Nordic Questionnaire (DMQ); Nordic Musculoskeletal Questionnaire (NMQ); Cornell Musculoskeletal Discomfort Questionnaire; University of Michigan Upper Extremity Questionnaire (UMUEQ); Job stress Questionnaire; Work Style Questionnaire; NIOSH Generic Job Stress Questionnaire.

Unit III: Postural evaluation tools

Ovako Working Posture Analyzing System(OWAS); Quick Exposure Checklist(QEC); Concise Back Screening Instrument(CBSI); Rapid Upper Limb Assessment (RULA); Plan for Identifying av Belastnings faktorer (PLIBEL); Rapid Entire Body Assessment (REBA); Model for Comprehensive Evaluation of Risks of Musculoskeletal Disorders (MODSI).

Unit IV: Measurement of work effort and fatigue

Borg Rating of Perceived Exertion Scale; Muscle Fatigue Assessment Method; Hand Activity Level (HAL); The Occupational Repetitive Action (OCRA); NIOSH Lifting Equation); The Strain Index.

VII. Practical

1. Collection of literature on occupational disorders in any one occupation such as Construction Industry/ Manufacturing industry
2. Review of collected literature to understand the type of disorders prevailing in the selected industry
3. Elicit information on musculoskeletal disorders experienced by workers from a selected field using Nordic Musculoskeletal Questionnaire -Data collection
4. Discuss the merits and demerits of the tool
5. Propose modifications in light of demerits of the tool
6. Gain hands on experience on the use of a selected postural evaluation tool
7. Evaluation of posture adopted by sweepers using a selected postural evaluation tool
8. Identify the level of risk
9. Group discussion on the use of postural evaluation tool
10. Gain hands on experience on the use of a selected muscle fatigue assessment tool
11. Measure the muscle fatigue experienced by workers involved in manual work using the selected muscle fatigue assessment tool
12. Group discussion on the use of muscle fatigue assessment tool
13. Gaining hands on experience on the use of OCRA checklist
14. Identify the risk of upper extremity work related musculoskeletal disorders among workers involved in repetitive work using OCRA checklist
15. Develop a measuring scale to measure work stress: Collection of literature
16. Identifying the parameters to be included in the scale
17. Item collection
18. Identifying the items to be included in the scale
19. Validation of the tool
20. Collection of expert remarks on the items included in the scale
21. Modifying the scale as per the remarks of experts
22. Testing reliability of the tool- test retest method
23. First phase data collection.
24. Second phase data collection
25. Testing the reliability
26. Finalization of scale
27. Pre testing of scale
28. Modifications as per the identified lacunas
29. Data collection in the field
30. Data analysis

31. Critical evaluation and finalization of the scale
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Hands on experience on different assessment tools
- Preparation of manuals
- Students' presentations
- Group research work
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Get acquaint with the subjective assessment tools
- Gain confidence in conducting ergonomic research and identifying risk factors
- Develop measuring instruments for conducting research

X. Suggested Reading

- *Ergonomic Workplace Analysis Course Manual* compiled by RECOUP Neuromuscloskeletal Rehabilitation Centre, Bangalore.
- Helmut Strasser. 2009. *Principles, Methods and Examples of Ergonomics Research and Work Design* https://link.springer.com/chapter/10.1007/978-3-642-01293-8_28

Weekly Lecture Schedule

Duration (week)	Topic
1	Measurement and information gathering; Literature search, strategies for gathering data on physical work-related strain, qualitative and quantitative data, methods of quantification of data.
2	Ergonomic standards, OSHA's ergonomic standards, legal provisions and guidelines.
3	Observational techniques-Rating scales, questionnaires and checklist.
4	Digital human models and simulation in ergonomic research.
5	Subjective assessment tools- NIOSH discomfort survey, The Dutch Musculoskeletal Questionnaire (DMQ), Nordic Musculoskeletal Questionnaire (NMQ).
6	Subjective assessment tools- Cornell Musculoskeletal Discomfort Questionnaire, University of Michigan Upper Extremity Questionnaire (UMUEQ).
7	Subjective assessment tools- Job stress Questionnaire, Work Style Questionnaire, NIOSH Generic Job Stress Questionnaire.
8	Postural evaluation tools- Ovako Working Posture Analysing System (OWAS),Quick Exposure Checklist (QEC).

Duration (week)	Topic
9	Postural evaluation tools- concise Back Screening Instrument (CBSI), Rapid Upper Limb Assessment (RULA), Rapid Entire Body Assessment(REBA).
10	Postural evaluation tools- Plan for Identifying av. Belastnings faktorer (PLIBEL).
11	Postural evaluation tools- Model for Comprehensive Evaluation of Risks of Musculoskeletal Disorders (MODSI).
12	Measurement of work effort and fatigue-Borg Rating of Perceived Exertion Scale.
13	Muscle Fatigue Assessment Method.
14	Measurement of work effort and fatigue, Hand Activity Level (HAL), The Occupational Repetitive Action (OCRA).
15	Measurement of work effort and fatigue, NIOSH Lifting Equation.
16	Measurement of work effort and fatigue, The Strain Index.

I. Course Title : Housing and Energy Efficient Building Design

II. Course Code : RMCS 510

III. Credit Hours : 3(2+1)

IV. Rationale

There is an immense need in the field of interior design to be aware of the environmental impacts of the built environment on the natural environment and to reduce the negative environmental impacts by designing buildings based on the concept of energy efficiency and sustainability. As interior design professionals, students need to develop skills to plan energy efficient buildings. This course train students to develop skills in planning eco friendly buildings

V. Aim of the course

- To provide an understanding of the concept of reduction in energy consumption through low energy building design
- To impart knowledge on strategies to integrate day lighting and low energy heating/ cooling in building.

VI. Theory

Unit I: Socio cultural and economic issues in housing

Historical perspective of the architectural features of buildings; Ancient science of house design; Role of housing in developing economies; Economic impact of housing; Housing markets and housing policies in India; Housing finance; Role of Government and non-government organizations in providing and regulating housing needs.

Unit II: Recent trends in building design

Emerging techniques in the house construction; Building design- need and scope for energy use and conservation; Design parameters for visual comfort; Day lighting and artificial lighting; Recent developments in building bye-laws; Low-cost building materials and fabrication technologies; Estimation of construction cost and housing finance; Housing research in energy efficient building design.

Unit III: Energy and climate

Structural features of residential buildings in different geo-climatic conditions; Environmental and architectural characteristics and energy consumption; Design parameters for climate and energy control; Eco and Ergo friendly house design; Low and zero carbon buildings and energy infrastructure.

Unit IV: Energy efficient building design

Green building design- Concept; Need and scope for energy use and conservation in building design; Energy efficient design principles and guidelines; Techniques for improving energy efficiency in residential and commercial buildings; Energy efficient building materials and construction technology; Energy flow audit and economy; Energy economy in residential and commercial buildings; Energy efficiency building regulations; Housing and energy models-Residential and commercial.

VII. Practical

1. Collection of information on building forms in different geo-climatic regions
2. Presentation and group discussion on building forms in different geo-climatic regions
3. Visits to organizations promoting green building technology
4. Collection of information on green building technology through literature search
5. Presentation and group discussion on green building technology
6. Analysis of research trends in energy efficient building design
7. Panel discussion on energy efficient building design
8. Assessment of existing house plan in terms of energy efficiency
9. Suggesting suitable renovations to improve energy efficiency
10. Evolving Eco friendly housing plan for selected geo-climatic region - development of conceptual drawings
11. Evolving Eco friendly housing plan for selected geo-climatic region- development of design details
12. Presentation and group discussion
13. Housing research in energy efficient building design-review of literature
14. Estimation of cost of construction
15. Energy audit of a residential building
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Institutional visits
- Students' presentation
- Group research work
- Guest lectures

IX. Learning Outcome

After successful completion of the course the student will be able to:

- Apply design parameters for climate and energy control in buildings
- Develop eco and ergo friendly building designs
- Plan energy efficient buildings

X. Suggested Reading

- Ambadker SN. 2000. *Rural Housing: Agro-socio-economic Impact*. Special Indian Ed. Agrobios.
- Hawkes D and Forster W. 2002. *Energy Efficient Buildings: Architecture, Engineering and Environment*. WW Norton & Co.
- Jefferis A and Madsen DA. 2004. *Architectural Drafting and Design*. Thomas Delmar Co.
- Lal AK. 1999. *Handbook of Low Cost Housing*. New Age International.
- Mahadeva M. 2002. *Housing in India: The Situation, Development and Challenges*. Orient Longman Publ.

- Morris EW. 1979. *Housing Family and Society*. John Wiley & Sons.
- RajaRao YN and Subrahmanyam Y. 2002. *Planning and Designing of Residential Buildings*. Standard Publ.
- Steffy GR. 2002. *Architectural Lighting Design*. John Wiley & Sons.
- Stitt FA. 1999. *Ecological Design handbook: Sustainable Strategies for Architecture*. McGraw Hill.
- University of Calgary. 2007. *Energy Efficient Building Design* https://energyeducation.ca/encyclopedia/Energy_efficient_building_design

Weekly Lecture Schedule

Duration (week)	Topics
1	Historical perspective of the architectural features of buildings; Ancient science of house design.
2	Role of housing in developing economies; Economic impact of housing.
3	Housing markets and housing policies in India; Housing finance- Sources, types and financial institutions.
4	Role of Government and non-government organizations in providing and regulating housing needs; Emerging techniques in the house construction.
5	Building design- need and scope for energy use and conservation; Design parameters for visual comfort- day lighting.
6	Design parameters for visual comfort-artificial lighting; Recent developments in building bye-laws.
7	Low-cost building materials; Low-cost building fabrication technologies.
8	Estimation of construction cost and housing finance; Housing research in energy efficient building design.
9	Structural features of residential buildings in different geo-climatic conditions in India; Structural features of residential buildings in different geo-climatic conditions in western countries.
10	Environmental and architectural characteristics and energy consumption; Design parameters for climate and energy control.
11	Eco friendly house design; Low carbon buildings and energy infrastructure.
12	Zero carbon buildings and energy infrastructure; Green building design- concept, need and scope for energy use and conservation in building design.
13	Energy efficient design principles and guidelines- Site analysis, building orientation and layout, fenestration and shading, insulation, thermal mass and building material, ventilation, landscape; Techniques for improving energy efficiency in residential and commercial buildings.
14	Energy efficient building materials and construction technology; Energy flow audit and economy.
15	Energy economy in residential and commercial buildings; Energy efficient building regulations.
16	Housing and energy models – residential and commercial.

I. Course Title : Technical Drawings

II. Course Code : RMCS 511

III. Credit Hours : 3(1+2)

IV. Rationale

Technical drawings are tools for communication in the interior design field. There is a great demand from the client for clarity on the output of the interior design project. The designers need to provide with virtual interiors before the actual project is executed. The course will enable students mastering in interior design to equip with design skills and presentation techniques to communicate effectively with clients.

V. Aim of the course

- To acquaint students with architectural drafting and their application in developing interior design plans
- To gain hands on experience in using computer programmes for drawing architectural plans and 3D representation of spaces for interior design.

VI. Theory

Unit I: Drafting fundamentals

Measurement and scaling; Lines-Types, quality and weights; Lettering styles; Sheet format and layout; Blocks and layout; Legend and dimension; Conventions and preliminary drawings.

Unit II: Presentation techniques

Orthographic plans- Plan, elevations and sections; Design drawings; Projection drawings; Isometric drawings; Perspective drawings; Rendering and hatching techniques; Presentation boards.

Unit III: Introduction to AutoCAD

Introduction to AutoCAD as 2D drafting tool; Digital drawings tools; Drawing lines and shapes; Modifying lines and shapes; Drawing with accuracy and speed; Organizing plans; Sections and elevations; Drawing and printing to scale; Text styles and sizes; Hatches and dashed lines; Stencils and blocks; Advanced editing tools and Dimensioning drawings.

Unit IV: 3D Modelling using AutoCAD

Introduction to 3D-modelling technique using AutoCAD; 3D basics– axes, Planes and Faces; 3D Object Modification– Rotate, Mirror, Array and Scale; 3D Boolean operations–Union, Subtract, Intersect; 3D Primitive objects– Box, Wedge, Cone, Sphere, Cylinder, Torus and Pyramids; Solid modeling – Revolve, Shell, Taper, Loft, Path extrusion and Sweep.

Unit V: Introduction to 3D Modelling and Rendering

Introduction to 3D Modelling and Rendering; Building Modelling and basic rendering techniques; Using 3DSMax or equivalent; Advanced 3D Modelling-Advanced modeling; Ray rendering engine.

Unit VI: Auto CAD and its application in interior design

Orientation to AutoCAD Main screen and menus; Coordinate systems; Use of Draw and edit menus; Hatching inquiry tools; Layers; 3D Modelling; Co-ordinate system; Primitive tools: Boolean operation; Editing 3D objects; Rendering; Printing; Introduction to ADT- creation of plans, sections, elevations, title marks and dimensioning, schedule table of doors and windows; Create still camera views; Creating a movie file; Walk through; Introduction to 3D Max -standard tool bar command panel; Concept of import and export of objects from ADT and Auto CAD to 3D Studio MAX; Creating objects in 3D Max using standard primitives; Using transforms; Introduction of material; Light; Colour; Render the images and save; Camera animation of walk through.

VII. Practical

1. Drawing a detailed floor plan showing the use of different lines, lettering styles, sheet format and layout, blocks and layout, legend and dimension, section drawing
2. Drawing a detailed floor plan showing the use of blocks and layout, legend and dimension, section drawing
3. Scale drawing of building components in plan and elevation
4. Preparation of electrical layout for a small building
5. Preparation of plumbing layouts for a small building
6. Working on presentation details for the above plans
7. Evolving floor plans for an existing residential building
8. Drawing views of brick arrangement to scale in two dimensions (Plan, elevation) and three dimension (isometric, oblique and axonometric)
9. Study of buildings and interiors in two and three dimensions
10. Drawing one/single perspectives of interiors
11. Drawing two point perspectives of interiors
12. Creation of texture effects in interior objects
13. Pencil rendering of interiors
14. Colour rendering of interiors
15. Developing a private project and presenting with views
16. Use of Presentation techniques

17-31 Project work: Application of CAD in developing plans and presentation details of any one residential and commercial building

32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Site visits
- Hands on experience
- Students' presentation
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Create orthographic plans and projection drawings
- Apply AUTOCAD in developing interior design plan
- Solve design problems using sketching and remodeling software
- Read and understand/pictorial drawings and advanced orthographic projections

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Drafting fundamentals-Measurement and scaling; Lines; types, quality and weights; Lettering styles; Sheet format and layout; Blocks and Layout- Legend and Dimension; Conventions and Preliminary Drawings.
2	Orthographic plans- plan, elevations and sections; Design drawings.
3	Projection drawings- Isometric drawings; Perspective drawings; Rendering and Hatching techniques; Presentation boards.
4	Introduction to AutoCAD as 2D drafting tool; Digital drawings tools; Drawing lines and shapes; Modifying lines and shapes; Drawing with accuracy and speed.
5	Organizing plans; Sections and elevations; Drawing and printing to scale; Text styles and sizes; Hatches and dashed lines; Stencils and blocks.
6	Advanced editing tools and dimensioning drawings.
7	Introduction to 3D-modelling technique using AutoCAD; 3D basics- Axes, Planes and Faces.
8	3D Object Modification-Rotate, Mirror, Array and Scale; 3D Boolean operations-Union, subtract, intersect.
9	3D primitive objects- Box, Wedge, Cone, Sphere, Cylinder, Torus and Pyramids.
10	Solid modelling- Revolve, Shell, Taper, Loft, Path extrusion and Sweep.
11	Introduction to 3D Modelling and Rendering; Building modelling and basic rendering techniques, using 3DSMax.
12	Advanced 3D Modelling- Advanced modelling, V-Ray rendering engine, or equivalent.
13	Orientation to AutoCAD main screen and menus; Coordinate systems; Use of Draw and edit menus; Hatching inquiry tools; Layers; 3D Modelling; Co-ordinate system; Primitive tools; Boolean operation; Editing 3D objects; Rendering; Printing.
14	Introduction to ADT- Creation of plans, sections, elevations, title marks and dimensioning, schedule table of doors and windows; Create still camera views.
15	Creating a movie file; Walk through-Introduction to 3D Max -standard tool bar command panel, Concept of import and export of objects from ADT and Auto CAD to 3D Studio MAX, Creating objects in 3D Max using standard primitives, Using transforms.
16	Introduction of material, light, colour; Render the images and save; Camera animation of walk through.

I. Course Title : Interior Design Business Management

II. Course Code : RMCS 512

III. Credit Hours : 3(1+2)

IV. Rationale

Interior designing business is one of the upcoming professions and has lot of potential for business opportunities. This course justifies the natural affinity to style, fashion, glamour, painting, creativity, etc. and will enhance great imagination skills for interior designer. This is also a flourishing industry wherein a career and start-up in India and abroad can be taken up

V. Aim of the course

- To impart knowledge about profession and principles of interior design business management
- To build confidence among students for establishing a interior design firm.

VI. Theory

Unit I: Introduction to professional management

Definition of a profession; Principles of interior design business management; Ethics and professional conduct; Establishing interior design practice.

Unit II: Professional components of managing interior work

Legal issues of business; Business management applications; Marketing; Scale of professional fee and charges; Duties of employer under labour welfare provisions; Structure of interior designers office; Conditions of engagement; Risk management.

Unit III: Estimating and costing for interior work

Definition; Importance and types of estimation; Units and mode of measurement; Rate analysis; Bills of quantities; Contract design.

Unit IV: Professional practice

Professional portfolios; Resumes and business cards; Web page and e-service; Professional associations and support systems.

VII. Practical

1. Case study of an established interior design firm
2. Cost estimation for projects
3. Contracting and sub-contracting procedure for the estimated projects
4. Strategic plan for presentation of project for a tender call
5. Working on modalities for establishing an interior design firm
6. Preparation of financial plan for a design firm
7. Working on portfolio and resume design for job in professional firm

8-31. Working with an interior designer for work experience

32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Students' presentation
- Work experience
- Group work
- Guest lectures

IX. Learning Outcome

After successful completion of the course, the students will be able to:
- Take up interior designing as a profession
- Launch an Interior Design firm and run successfully

XI. Suggested Reading

- Christine MP. 2001. *Interior Design Management: A Handbook for Owners and Managers*. ASID, IIDA.
- Christine MP. 2002. *Professional Practice for Interior Designer*. John Wiley & Sons.
- Cindy C. 2002. *Interior Design Handbook of Professional Practice*. McGraw Hill.

- Kailee Helget May. 2019. *How to start an Interior Business* https://www.2020spaces.com/blog-start-an-interior-design-business/
- Terry LP (2002) *Architects Studio Handbook*. McGraw Hill.

Weekly Lecture Schedule

Duration (week)	Topic
1	Definition and meaning of a profession; History of interior design as a profession.
2	Principles, ethics and professional conduct of interior design business management.
3	Establishing interior design practice.
4	Legal issues of business.
5	Business management applications- People management, business information systems, financial management and control, management and economics.
6	Marketing, conditions, strategies, selling techniques, scale of professional fee and charges.
7	Duties of employer under labour welfare provisions.
8	Structure of interior designer's office, conditions of engagement.
9	Risk management plan for interior business.
10	Estimating and costing for interior work- Definition, importance and types of estimation.
11	Units, mode of measurement and standard methods of measurement for building elements.
12	Methods of rate analysis and bills of quantities.
13	Principles, practices and stages of contract design.
14	Need, importance and components professional portfolios, resumes, business cards.
15	Professional web page and e-service.
16	Professional associations and support systems.

I. Course Title : Environmental Resource Management

II. Course Code : RMCS 513

III. Credit Hours : 2(1+1)

IV. Rationale

Environmental resource management is an issue of increasing concern and can be viewed from a variety of perspectives. It involves the management of all components of the biophysical environment, and the relationships among all living species and their habitats. The essential aspects of environmental resource management are ethical, economical, social, and technological. It emphasizes on the sustainability development in future. These underling principles help students to make appropriate decisions.

V. Aim of the course

- To get an insight about the present scenario of global environment, environmental problems and management for sustainable development in future
- To provide an overview of management techniques for waste management and environment protection.

VI. Theory

Unit I: General perspectives

Man, environment and economic growth; Industrialization; Urbanization; Consumerism and environment; Environmental informatics; Environment and bio-technology; Environmental ethics.

Unit II: Ecology, environment and sustainability

Ecological environment and sustainability; Environmental dimensions of sustainable development; Equitable use of resources for sustainable development; Economical, political and cultural influences in the use of environmental resources; Role of government and non-government organizations and communities in sustainable development.

Unit III: Environmental waste management

Waste management; Waste management systems in India; Technologies for waste management; Hazardous waste management and treatment; Physical and chemical treatment; Thermal treatment and biological treatment; Hazardous waste treatment; E-Waste; Management of E-waste; Inventory management; Production process modification; Volume reduction; Recovery and reuse; Laws and regulations concerning waste management in India.

Unit IV: Energy and environment

Energy and environment; Economic growth and energy consumption; Increased energy consumption and climate change; Energy policy of India; Energy and sustainability; Sustainable energy resources.

Unit V: Environmental protection and management

Environmental economics- Concepts, evolution and its development; Important processes and technologies; Environmental protection and management; Environmental quality objectives and standards; Approaches with regard to environmental protection; Institutional and policy framework; Ministry of environment and forest, Pollution control boards.

VII. Practicals

1. Understanding the impact of urbanization and consumerism on resource utilization- Literature search
2. Report preparation on impact of urbanization and consumerism on resource utilization
3. Presentation and discussion on impact of urbanization and consumerism on resource utilization
4. Visit to any one industry to understand the types of wastes generated and their waste management practices
5. Presentation and group discussion
6. Plan awareness programme to educate college students on their role in environmental protection
7. Organizing awareness camp
8. Project work: Household waste management practices among families- Collection of review
9. Planning the research methodology
10. Designing data collection tool for collecting information on household waste management practices among families
11. Finalization of tool
12. Data collection
13. Data analysis
14. Report preparation on household waste management practices among families on household waste management practices among families

15. Presentation and Group discussion
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Book/Publication Review
- Students' presentation
- Group work
- Case studies
- Guest lectures
- Review of policy documents

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Gain knowledge about the present scenario of global environment and develop skills in the management of environmental resources for sustainable development in future
- Understand the essential aspects of environmental resource management and work on innovative solution for conservation of environmental resources
- Gain insight into management of all components of the biophysical environment

Weekly Lecture Schedule

Duration (week)	Topic
1	Interrelation between man, economic growth and environment; Individual rights and responsibilities towards a clean environment; Environmental ethics- meaning, libertarian view, ecological view and conservation view.
2	Impact of industrialization, urbanization and consumerism on environment- Particulate matter concentration, modification of habitat, waste generation, degraded water quality, land contamination, biodiversity loss, etc. Environmental Informatics- concept, application and benefits.
3	Environment and bio-technology, objectives of environmental biotechnology, application of environmental biotechnology for sustainable development; Role of environmental biotechnology in protection and restoration of quality of environment.

Duration (week)	Topics
4	Ecology, Environment and sustainability- meaning, resource conservation, resource preservation, ecological footprints.
5	Environmental dimensions of sustainable development- Linkages and holistic approach in conservation and equitable use of specific indicators of sustainable development such as atmosphere, water and land.
6	Economical, political and cultural influences in the use of environmental resources, Role of government and non-government organizations and communities in sustainable development.
7	Waste management- introduction, classification of wastes, principles of waste management, waste management systems in India.
8	Technologies for waste management- physic, chemical, biological processes for waste treatment; Sanitary landfill Incineration; Gasification; Biodegradation processes; Composting, and anaerobic digestion; Conventional digestion; Dry anaerobic digestion process; Two phase digestion; Water and waste water treatment.
9	Hazardous waste management and treatment, identification and classification, collection, storage, transfer, processing, and disposal; Hazardous waste treatment; Physical and chemical treatment; Thermal treatment; Biological treatment; Hazardous waste treatment in India.
10	E-Waste-Introduction, effects on environment and human health, management of e-waste, inventory management, production process modification, volume reduction, recovery and reuse, management options.
11	Laws and regulations concerning waste management in India-The Water (Prevention and Control of Pollution) Act, 1974, The Air (Prevention and Control of Pollution) Act, 1981, The Environment (Protection) Act ,1986, The Public Liability Insurance Act, 1991, Municipal Solid Wastes (Management and Handling) Rules in 2000, Hazardous Wastes (Management and Handling) Rules in 1989 (amended in 2000 and 2003), The Biomedical Waste (Management and Handling) Rules 1998 (amended in 2000 and 2003), The E-waste (Management & Handling) 2012, "Plastics (Manufacture, Usage and Waste Management) Rules, 2009" (amended in 2003).
12	Energy and environment; Economic growth and energy consumption; Increased energy consumption and climate change; Energy policy of India.
13	Sustainable energy- history and need for sustainable energy, sustainable energy resources, solar energy, wind energy, geothermal energy, ocean energy, biomass energy, hydroelectric power, green energy and green power.
14	Environmental economics- concepts, evolution and its development, important processes and technologies.
15	Environmental protection and management, Environmental quality objectives and standards; Approaches with regard to environmental protection- Voluntary environmental agreement, ecosystem approach, international environmental agreements.
16	Institutional and policy framework- Ministry of Environment and Forest, Pollution control boards.

Course Title with Credit Load Ph.D. in Resource Management and Consumer Science

Course Code	Course Title	Credit Hours
	Major Courses	
RMCS 601*	Trends in Resource Management	3 (3+0)
RMCS 602*	Occupational Biomechanics	3 (2+1)
RMCS 603	Globalization and Consumer Economics	3 (2+1)
RMCS 604	Space Designing and Managerial Dimensions for Special needs	3 (1+2)
RMCS 605	Physical Ergonomics	3 (1+2)
RMCS 606	Environmental Issues and Challenges	2 (2+0)
RMCS 607	Family Dynamics and Women Power	3 (2+1)
RMCS 608	Special Project	2 (0+2)
	Total	22 (13+9)
	Minor Courses	
FN604	Global Nutrition Problems	2 (2+0)
FN 608	Energy Metabolism	2 (2+0)
EECM 602	Impact Assessment of Development Programmes	3 (1+2)
EECM 603	Scaling Techniques for Behavioural Research	3 (1+2)
EECM 607	Media application and product promotion	4 (2+2)
HDFS 608	Qualitative research methods	3 (2+1)
ATS 602	Technical Textiles	3 (2+1)
ATS605	Functional Clothing	3 (2+1)
ATS 607	Operational Management in Textiles and Apparel	2 (2+0)
	Supporting Courses	
A student can opt any course related to the topic of research offered by other faculties of agriculture university or SWAYAM/ MOOCS or other online courses up to a maximum of 5 credits.		
RMCS 691	Doctoral Seminar I (Core Field)	1 (1+0)
RMCS 692	Doctoral Seminar II (Optional Field)	1 (1+0)
RMCS 699	Research	75
	Total	**100 Credits**

*Compulsory core curses

Course Contents
Ph.D. in Resource Management and Consumer Science

I. Course Title : Trends in Resource Management

II. Course Code : RMCS 601

III. Credit Hours : 3(3+0)

IV. Rationale

Continuous changes in technology, economic, social and psychological understandings and structures have influence on resources and their management. In highly competitive and demanding times it is essential to train students in a manner that they are able to display good interpersonal skills by making decisions, allocate resources, and lead and direct others' activities to achieve and attain their goals. The course exposes the student to different functional areas of management to enhance the effectiveness.

V. Aim of the course

- To expose students to the emerging managerial ides, techniques, procedures and practices and their application in the field of resource management
- To impart knowledge, skill and concepts needed to resolve resource management problems or issues.

VI. Theory

Unit I: Significance and scope of family resource management

Introduction and history of family resource management and household trends; Resource management as a process; Influences on management styles; Life management for singles, families, households and non family households; Advances in the discipline of resource management.

Unit II: History and theories of resource management

Managerial practices and concepts from ancient civilization; Early years of family resource management; Household production and consumption systems during pre modern, modern and post modern periods; Theories in resource management; Pre scientific and post scientific approach; Human and non human resource management; Systems theory; Application of systems theory to households; Economic theory; Human ecology and ecosystems; Contemporary management practices.

Unit III: Managerial competencies

Conflict Management- Concepts, types, sources and levels of conflict; Conflict resolution strategies; Conflict management; Behavioural interventions for handling conflicts; Leadership; Theories of leadership; Types of leadership; Likert's four systems of leadership and managerial grid.

Unit IV: Management of resources

Managing time as a resource; Modern tools and techniques of time management; Qualitative and quantitative time measures; Legislations, policies and research in family management.

Unit V: Organizational behaviour

Organizational culture- Concepts, process and implications of organizational culture; Organizational performance-Concept and process, measures for organizational performance, controlling for organizational performance; Overview of control techniques (Scheduling, CPM, PERT, SWOT analysis, etc.); Effective control systems; Performance appraisal-purpose, methods, essentials of good appraisal system; Organizational change- concepts and nature; Kurt Lewin theory of change; Implementing change; Managing resistance to change.

Unit VI: Managerial ethics and social responsibilities

Managerial ethics- Factors affecting ethical choices; Ethical dilemma; Social responsibility- Concept and approaches; Evaluating institutional social performance; Managing institutional ethics and social responsibility.

VII. Teaching Methods/ Activities

- Lectures
- Assignments
- Book/Publication Review
- Students presentations
- Group work
- Case studies
- Guest lectures
- Online learning

VIII. Learning Outcome

After successful completion of the course, the students will be able to:

- Appreciate the importance of resource management as a field of study and as a central management function
- Understand the essentials for effective resource management
- Apply the principles and techniques of resource management to solve major issues and get solutions for typical case problems

Weekly Lecture Schedule

Duration (week)	Topic
1.	Introduction and history of family resource management and household trends; Resource management as a process, influences on management styles; Life management for singles, families, households and non family households.
2.	Advances in the discipline of resource management; Managerial practices and concepts from ancient civilization; Early years of family resource management-Household production and consumption systems during pre modern periods.
3.	Household production and consumption systems during modern and post modern periods; Pre scientific theories in resource management-Contributions made by Robert Owen, Charles Babbage, Henery Venure Poor , Hanery Robinson.
4.	Pre scientific theories in resource management- contributions made by James Watt, Captain Henry Metcalf; Post scientific theories in resource management.
5.	Human and non human resource management- meaning, definition, scope and process; Systems theory; Application of systems theory to households; Family as a system; Family-environment interrelationship.
6.	Economic theory; Human ecology and ecosystems; Contemporary management practices; Conflict- Concept, types and sources; Levels of conflict.
7.	Conflict resolution strategies- Avoidance, De-fusion, containment, confrontation; Conflict management; Behavioural interventions for handling conflicts.
8.	Conflict stimulation techniques; Leadership- definition, meaning and characteristics; Leadership-traits and styles.
9.	Functional leadership characteristics; Theories of Leadership- Trait theory of leadership, behavioural theories of leadership; Theories of Leadership- Contingency theories, transformational leadership theory.
10.	Likert's four systems of leadership and managerial grid; Managing time as a resource; Unit of time and measurement of time.
11.	Modern tools and techniques of time management; Qualitative and quantitative time measures; Legislations, Policies and research in family management.
12.	Organizational culture- Concepts, difference between culture and climate; Process and implications of organizational culture; Components, determinants and types of organizational climate.
13.	Organizational performance-concept and process, measures for organizational performance; Controlling organizational performance; Overview of control techniques, scheduling, CPM; Overview of control techniques PERT.
14.	Controlling organizational performance- Overview of control techniques SWOT analysis; Effective control systems; Performance appraisal- Purpose, methods, essentials of good appraisal system.
15.	Organizational change- concept and nature, need ,process and resistance to organizational change; Kurt Lewin theory of change, implementing change, managing resistance to change; Managerial ethics- factors affecting ethical choices.
16.	Ethical dilemma- Social responsibility; Evaluating institutional social performance; Managing institutional ethics and social responsibility.

I. Course Title : Occupational Biomechanics

II. Course Code : RMCS 602

III. Credit Hours : 3(2+1)

IV. Rationale

Occupational biomechanics is the growing discipline necessary to improve workplace design. It focuses on the rapidly expanding body of biomechanics knowledge on workplace situations that cause musculoskeletal injuries and disabilities. The students in this course will study the physical interaction of workers with their tools, machines and materials as well as several new methods for evaluating the bio-mechanical consequences of workplace designs.

V. Aim of the course

- To acquaint students with occupational hazards and advances in ergonomics for enhancing job fitness compatibility
- To impart knowledge and skills to device injury prevention strategies at work and develop solutions.

VI. Theory

Unit I: Biomechanical concepts

Biomechanics as an area of study; The biomechanics of the human skeletal articulations; The biomechanics of human skeletal muscle; Application of biomechanics to movement-Qualitative and quantitative approach.

Unit II: Biomechanics of the human body

The biomechanics of the human upper extremity- shoulder, elbow wrist and hand; The biomechanics of the human lower extremity- Hip, knee, ankle and foot; The biomechanics of the human spine.

Unit III: Occupational biomechanics

Biomechanical oriented ergonomics in workplace; Activity-related soft tissue disorders (ASTDs); Work-related risk factors; Definition and ergonomic guidelines for controlling risk factors; Risk for back injuries in the workplace; Analysis and ergonomic guidelines for controlling.

Unit IV: Ergonomic task analysis and risk assessment

Ergonomic task analysis- Definition, importance and process; Occupational risk factors; Tools and techniques for identifying posture related risk factors; Tools and techniques for identifying risk factors related to forceful exertion; Tools and techniques for identifying risk factors related repetitive motion; Tools and techniques for identifying risk factors related workstation design; Tools and techniques for identifying risk factors related workplace environment; Ergonomic check points; Development of ergonomic checkpoints for various occupations.

Unit V: Application of biomechanics

Application of biomechanics for occupational safety; Use of SAMMIE (System for Aiding Man Machine Interaction Evaluation) and CAD system in occupational designs.

VII. Practicals

1. Assessing postural risks in a computer workstation
2. Designing ergonomic guidelines to overcome postural risks
3. Designing a tool to identify hazards in construction work
4. Collection of data on hazards in construction work
5. Preparation of report on hazards in construction work
6. Presentation of report and group discussion
7. Identification of hazards in agricultural operations-field level observation
8. Preparation of schedule for identification of hazards in agricultural operations
9. Data collection on hazards in agricultural operations

10. Preparation of report on hazards in agricultural operations
11. Presentation of report and group discussion
12. Designing ergonomic guidelines for risk elimination
13. Measuring occupational stress using a standardized tool
14. Collection of data on occupational stress
15. Preparation and presentation of report on occupational stress
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Publication review
- Students' presentations
- Group work
- Case studies
- On line learning

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Understand concepts of rapidly expanding body of biomechanics and their impact on workplace situations that cause musculoskeletal injuries and disabilities.
- Gain knowledge on physical interaction of workers with their tools, machines and materials as well as several new methods for evaluating the bio-mechanical consequences of workplace designs.

Weekly Lecture Schedule

Duration (week)	Topic
1	Biomechanics as an area of study and its application in occupational health; The biomechanics of the human skeletal articulations- Joint architecture, joint stability, joint flexibility.
2	Joint architecture- immovable joints, slightly movable joints, freely movable joints, articular cartilage, articular fibro cartilage, articular connective tissue; Joint

Duration (week)	Topic
	stability-Shape of the articulating bone surfaces, arrangement of the ligaments and muscles, other connective tissues.
3.	Joint flexibility-Measuring joint range of motion, factors influencing joint flexibility, flexibility and injury; The biomechanics of human skeletal muscle, behavioral properties of the musculotendinous unit, structural organization of skeletal muscle, skeletal muscle function, muscular strength, power, and endurance.
4.	Application of biomechanics to movement- Qualitative and quantitative approach; The biomechanics of the human upper extremity- structure of the shoulder, movements of the shoulder complex, loads on the shoulder.
5.	Structure of the elbow, Movements at the elbow, Loads on the elbow; Structure of the wrist, movements of the wrist, loads on wrist.
6.	Structure of the joints of the hand, movements of the hand; Thebiomechanics of human lower extremity- Structure of the hip, movements at the hip, loads on the hip.
7.	Structure of the knee, movements at the knee, loads on the knee; Structure of the ankle, Movements at the ankle.
8.	Structure of the foot, movements of the foot, loads on the foot; The biomechanics of the human spine- Structure of the spine, movements of the spine, muscles of the spine, loads on the spine.
9.	Biomechanical oriented ergonomics in workplace- Objectives and need; Introduction to Activity-related Soft Tissue Disorders (ASTDs)- Tendinopathies , Bursitis, Carpal Tunnel Syndrome , Carpel Tunnel Syndrome, Plantar Fasciitis and Radial Tunnel Syndrome.
10.	Definition and nature of work-related risk factors- Repetition, awkward posture, forceful exertions, Hand-arm vibration. Ergonomic guidelines for controlling risk factors related to soft tissue disorders.
11.	Analysis of risk for back injuries in the workplace; Back and shoulder over exertion injuries and risk factors such as manual materials handling, awkward postures, prolonged standing and sitting, whole body vibration.
12.	Ergonomic guidelines for controlling risk factors related to back and shoulder; Ergonomic task analysis- Definition and importance, steps in task analysis process, information collection, data recording, data analysis.
13.	Tools and techniques for identifying risk factors related to posture; (i) Rapid Upper Limb Assessment (RULA)(ii) Rapid Entire Body Assessment (REBA), (ii)Ovako Working Posture Analysis System (OWASA) 4. Biomechanical analysis.
14.	Tools and techniques for identifying risk factors related to Forceful Exertion – (i) Manual Handling Assessment Chart (MAC) (ii) Borg Scale (iii).Liberty Manual Material Handling Tables (Snook Table)(iv). NIOSH Lifting Equation.Tools and techniques for identifying risk factors related Repetitive Motion –(i). Assessment of Repetitive Tasks (ART) (ii).Occupational Repetitive Action (OCRA) Checklist (iii).OCRA Index.
15.	Tools and techniques for identifying risk factors related to workstation design – (i).Rapid Office Strain Assessment (ROSA) (ii). Anthropometry Analysis.Tools and techniques for identifying risk factors related workplace environmental –(i) Standards and guidelines as per regulations and industrial code of practice standard, (ii) Designated specific measurement instruments.
16.	Tools and techniques for identifying sources of work stress in an organizational set up; Application of biomechanics for occupational safety and accident protection and release of stress.

I. Course Title : Globalization and Consumer Economics

II. Course Code : RMCS 603

III. Credit Hours : 3(2+1)

IV. Rationale

Globalization may be described as the combined influences of trade liberalization, market integration, international finance and investment, technological change, the increasing distribution of production across national boundaries, and the emergence of new structures of global governance. The global marketplace has totally changed the consumer behaviour. As change agents, young professionals need to equip themselves with knowledge and skill sets required to understand the consumer behaviour in the era of globalization.

V. Aim of the course

- To impart knowledge on consumer concepts in combination with the development of financial literacy and consumer responsibility
- To develop insight into major global economic issues having local impact on market forces and consumers.

VI. Theory

Unit I: The ontology of consumer economics

Consumer motivation- Concept, components of motivation; Maslow's motivational theory and consumer behaviour; Consumer decision process- Problem or need recognition, information search, evaluation of alternatives, purchase decision, post-purchase decision; Models of buyer decision making -Economic model, psychological models, consumer behaviour models; Influence of purchase decision- external and internal; Consumer decision styles; Risk in consumer behavior -functional risk, physical risk, financial risk, social risk, psychological risk, time risk; Adoption and diffusion of innovations; Impulse buying- definition and types; Factors influencing impulse buying behavior -consumer related factors, Situational characteristics, product characteristics, store related factors, consumer behaviour.

Unit II: Global markets

Definition and importance; Features of global marketing; Forces affecting global marketing; Objectives of global marketing; Global marketing environment; Global marketing strategies; Difference between global and international market; Advantages and disadvantages of global marketing.

Unit III: New economic policies

Introduction to new economic policies- Liberalization, privatization, globalization; Privatization-introduction, objectives; Types of privatization; Problems of privatization; Privatization in India; Privatization and global impact; Globalization-meaning, trends, factors influencing globalization; Impact of globalization on Indian economy; Positive and negative impact of globalization in India; World Trade Organization(WTO) –objectives and functions; WTO agreement; Benefits of WTO; WTO and developing countries; WTO agreement on agriculture and subsidies; General Agreement on Tariff and Trade (GATT)-Purpose, implications of GATT agreement in various areas.

Unit IV: The services

Consumer services; Service providers and their obligations towards consumers;

Citizen Charter- Vision, mission objectives, importance in public administration; Goods and Service Tax (GST)- Components of GST, benefits of GST, impact of GST on consumers.

Unit V: Agriculture and Indian economy

Indian agriculture policy; Agriculture credit in India; National agricultural insurance schemes; Agriculture marketing in India; Sustainable agriculture and food security in India; Government programmes for increasing family food security and financial security of consumers.

VII. Practicals

1. Project work: Study on impulse buying behaviour among teenage consumers-collection of review
2. Formulation of objectives for the study
3. Finalization of method of research
4. Designing a data collection tool
5. Data collection on impulse buying behaviour among teenage consumers
6. Data analysis and report writing
7. Presentation of report on impulse buying behaviour among teenage consumers
8. Presentation of the report on impulse buying behaviour among teenage consumers
9. Critical analysis of citizen charter of electricity department
10. Study the crop insurance scheme
11. Conduct farmer awareness camp on crop insurance scheme
12. Study the implementation of any one government programme for increasing family food security and financial security
13. Identify structural and functional aspects of any one agriculture market
14. Observe the functioning of selected agriculture market
15. Group discussion on functional aspects of agriculture market
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Book/Publication Review
- Students' presentation
- Group work
- Field study
- On line learning

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Develop insight into major global economic issues having local impact on market forces and consumers
- Equip them to identify, evaluate and evolve ways to address changing economic scenario due to globalization.

Weekly Lecture Schedule

Duration (week)	Topic
1	Consumer motivation- concept of motivation, components of motivation; Maslow's motivational theory and consumer behaviour; Stages in consumer decision process- Problem or need recognition, information search, evaluation of alternatives, purchase decision, post-purchase decision.
2	Models of buyer decision making- Economic model, psychological models, consumer behaviour models; External and Internal influence on purchase decision.
3	Consumer decision styles; Risk in consumer behaviour- functional risk, physical risk, financial risk.
4	Risk in consumer behavior - social risk, psychological risk and time risk; Impulse buying- Definition and types; Factors influencing impulse buying behaviour- Consumer related factors, situational characteristics, product characteristics, store related factors, consumer behavior.
5	Global markets- Definition, importance and features; Forces affecting global marketing.
6	Forces affecting global marketing; Global marketing strategies.
7	Difference between global and international market; Advantages and disadvantages of global marketing.
8	Introduction to new economic policies; Liberalization-meaning, objectives of liberalization policy; Economic reforms during liberalization, industrial sector reforms, financial sector reforms, tax reforms, foreign exchange reforms, potential benefits, potential risks; Privatization- Introduction, objectives, types of privatization, problems of privatization, privatization in India, privatization and global impact.
9	Globalization- Meaning, trends, factors influencing globalization, impact of globalization on Indian economy; Positive and negative impact of globalization in India.
10	Positive and negative impact of globalization in India; General Agreement on Tariff and Trade (GATT)- Purpose, implications of GATT agreement in various areas.
11	Consumer services- Definition and types of consumer services; Service providers and their obligations towards consumers.
12	Citizen charter- Vision, mission objectives, importance in public administration; Goods and Service Tax (GST)- meaning, need, applicability and mechanism of GST.
13.	Goods and Service Tax (GST) –components of GST, benefits of GST, impact of GST on consumers; Indian Agricultural Policy- Objectives and features.
14.	Agriculture credit in India-Types, sources and credit institutions. National Agricultural Insurance Schemes (NAIS).
15	Crop insurance and livestock insurance; Agriculture marketing in India.
16	Sustainable agriculture and food security in India; Government programmes for increasing family food security and financial security.

I. Course Title : Space Designing and Managerial Dimensions for Special Needs

II. Course Code : RMCS 604

III. Credit Hours : 3(1+2)

IV. Rationale

People with special needs should enjoy the freedom and ease of living in their houses. Accommodating the needs and wishes of every one is a challenge the designers' face. The designer should create living environment for users to experience it and overcome functional limitations. This course gives an opportunity for students to learn designing an environment that supports independent functioning of individuals with special needs.

V. Aim of the course

- To impart theoretical understanding and legislative requirements for universal design
- To expose students to the application of principles of universal design and develop residential and commercial interiors for people with special needs.

VI. Theory

Unit I: Introduction to interiors for special needs

Types of disabilities and their needs; Barriers in residential and commercial buildings; Theoretical perspectives on efficiency; Comfort and safety; Physical environment; Architectural dimensions- Flooring, stairs, storage, workstations, furniture, fixtures, fitments and equipment.

Unit II: Universal design

Adapted; Adaptable; Barrier free; Accessible and Universal design-Meaning, differences and features; Principles to be followed in residential and commercial buildings; Suitability of elements and principles of design- lighting, colours, textures, arrangement of furnishings, floor coverings, window placement, etc. for people with special needs.

Unit III: Managerial dimensions

Managerial dimensions with special reference to time, money and energy for people with special needs; Managerial dimensions with special reference to food and health for people with special needs; External environment support systems for people with special needs; Guidelines for support systems.

Unit IV: Policies and institutional support

Policies and institutional support for people with special needs; Legal provisions; Access standards and regulations; Physical amenities to be provided for people with special needs; Qualities; Roles and responsibilities of special care managers.

VII. Practicals

1. Identifying the existing barriers and accessibility features provided in residential buildings for people with special needs – preparation of check list
2. Data collection
3. Presentation and group discussion
4. Identifying the existing barriers and accessibility features provided in commercial buildings for people with special needs -preparation of check list

5. Data collection
6. Presentation and group discussion
7. Design and development of scale model for residential and commercials buildings for visually impaired people – preparation of conceptual drawings
8. Design and development of scale model for residential and commercials buildings for visually impaired people – preparation floor plan, elevation
9. Design and development of scale model for residential and commercials buildings for visually impaired people – preparation of landscape plans,
10. Design and development of scale model for residential and commercials buildings for visually impaired people – Preparation of scale model
11. Presentation and discussion
12. Design and development of scale model for residential and commercials buildings for hearing impaired people - Preparation of conceptual drawings
13. Design and development of scale model for residential and commercials buildings for hearing impaired people - Preparation of floor plan, elevation
14. Design and development of a scale model for residential and commercials buildings for hearing impaired people - Preparation of landscape plans,
15. Design and development of a scale model for residential and commercials buildings for hearing impaired people - Preparation of scale model
16. Presentation and discussion
17. Design and development of a scale model for residential and commercials buildings for physically challenged people - Preparation of conceptual drawings
18. Design and development of a scale model for residential and commercials buildings for physically challenged people - Preparation of floor plan, elevation
19. Design and development of a scale model for residential and commercials buildings for physically challenged people - Preparation of d landscape plans,
20. Design and development of a scale model for residential and commercials buildings for physically challenged people - Preparation of scale model
21. Presentation and discussion
22. Visit to old age homes– Preparation of observation tool
23. Collection of data on living conditions in old age homes
24. Presentation of information and group discussion
25. Visit to schools for children with special needs
26. Collecting and presenting the information on living conditions in the school
27. Design and development of a scale model of an old age home with universal design features - Preparation of conceptual drawings
28. Design and development of a scale model of an old age home with universal design features - Preparation of floor plan, elevation
29. Design and development of a scale model of an old age home with universal design features - Preparation of landscape plans,
30. Design and development of a scale model of an old age home with universal design features - Preparation of scale model
31. Presentation and group discussion
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Students' presentation
- Field visits

- Group work and case studies
- Guest lectures
- Online learning

IX. Learning Outcome

After successful completion of the course, the students will be able to:

- Understand the diverse needs of people with special needs
- Enforce a conscious application of universal design concepts and principles in designing for special needs
- Create an enabling environment for social inclusion of people with special needs in all fields of life

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Types of disabilities and their needs – Intellectual, learning, mental and physical disability, vision and hearing loss, speech and language disorders, autism, chronic illness, old people, pregnant women, children, etc.
2	Barriers in residential and commercial buildings for visually impaired, physically challenged, hearing impaired and elderly.
3	Theoretical perspectives on efficiency, comfort and safety in physical environment for children, elderly and pregnant women.
4	Architectural dimensions- flooring, stairs, storage, workstations, furniture, fixtures, fitments and equipment and their suitability to people with special needs.
5	Types of design- Adapted, adaptable, barrier free, accessible and universal design; meaning ,differences and design features.
6	Principles to be followed in residential buildings-accessible features for entrance, drawing room, bed room, kitchen, bathroom, stair cases, etc.
7	Principles to be followed in commercial buildings- Accessible features for entrance, toilets, stair cases, meeting rooms, reception areas, cafeteria, etc.
8	Suitability of elements and principles of design-Lighting, colours and textures suitable for visually impaired, physically challenged, hearing impaired, etc.
9	Arrangement of furnishings- Curtains, draperies, cushions, table linen, bed linen, floor coverings, carpets, rugs, durries, floor mats for people with special needs.
10	Window placement, window treatments and architectural features for people with special needs.
11	Managerial dimensions with special reference to time, money and energy for people with special needs.
12	Managerial dimensions with special reference to food and health for people with special needs.
13	External environment support systems for people with special needs- Guidelines for support systems.
14	Policies and institutional support for people with special needs - Legal provisions, access standards and regulations

Duration (week)	Topic
15	Physical amenities to be provided for people with special needs in different institutions - Old age homes, rehabilitation centres, day care centres, retirement homes, nursing homes, therapy clinics, etc.
16	Qualities, roles and responsibilities of special care managers.

I. Course Title : Physical Ergonomics

II. Course Code : RMCS 605

III. Credit Hours : 3(1+2)

IV. Rationale

The process of ergonomics involves studying the user and studying the task, and then designing the processes and products to optimize the user's safety, health, comfort, and performance. The course is designed to provide students with a basic understanding of the principles underlying the place of people in work systems, their abilities and limitations, so that tasks and work generally may be designed for effectiveness, efficiency, health and safety.

V. Aim of the course

- To impart knowledge and skills to implement programs in ergonomics, perform ergonomic job analyses, devise injury prevention strategies and develop solutions
- To enable students to apply participatory ergonomics in various fields of work and plan ergonomic trainings.

VI. Theory

Unit I: Workplace hazards

Workplace hazards; Types, sources and classification; Hazard identification through interactive exercises; Employee survey methods; Injury log assessment; Hazard control methods.

Unit II: Work related musculoskeletal disorders

Workplace risk factors and evidence for work relatedness -posture, force, repetition, vibration, contact stress, environment; Upper limb disorders-Tenosynovitis, Carpal Tunnel Syndrome (CTS) and Tennis elbow, Repetitive Strain Injuries (RSI); Lower limb disorders-Osteoarthritis, Knee bursitis, Meniscal lesions, Stress reaction injuries, Varicose veins.

Unit III: Ergonomic guidelines for occupational health

Ergonomic program for best practices in work place and hazard reduction; Methods for integrating ergonomics into existing occupations; Workplace evaluation; Risk factor checklists; Hazard reduction- engineering control, administrative controls.

Unit IV: Systems approach to ergonomics

Organizational aspects of the human; Work interface to enhance safety; Designing work with systematic procedures to enhance safety; Safety and ergonomics culture.

Unit V: Digital human model for ergonomic analysis

Virtual ergonomics and its advantage; Introduction to digital human modeling and simulation; Techniques of virtual ergonomics evaluation using digital human modeling.

VII. Practicals

1. Identifying common hazards in a selected manufacturing industry through literature search
2. Developing a check list for identifying hazards in a selected manufacturing industry
3. Content validation of the check list
4. Pretesting of check list
5. Establishing the reliability
6. Collection of data on hazards in a selected manufacturing industry
7. Data analysis for identification of occupational hazards
8. Preparation of report on hazards in a selected manufacturing industry

9-12. Identification of ergonomic best practices through literature search to safe guard occupational health in manufacturing industry

13. Planning ergonomic intervention programme

14-28. Implementations of ergonomic interventions in the manufacturing industry

29. Collection of feedback on effectiveness of ergonomic interventions
30. Preparation of report
31. Presentation of report and group discussion
32. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Field experiments
- Students' presentations
- Group research work
- Field visits
- Guest lectures
- On line learning

IX. Learning Outcome

After successful completion of this course, the students will be able to:

- Identify potential occupational health hazards in the workplace relating to ergonomic risk factors
- Apply ergonomic principles to the creation of safer, healthier and more efficient and effective workplace
- Develop appropriate control measures to overcome ergonomic risk factors in workplace

X. Suggested Reading

Weekly Lecture Schedule

Duration (week)	Topic
1	Types, sources and classification of workplace hazards- Chemical hazards, biological hazards, physical hazards, ergonomic hazards, psychosocial factors.
2	Hazard identification through interactive exercises; Employee survey methods and injury log assessment.
3	Hazard control methods.
4	Workplace risk factors and evidence for work relatedness -posture, force, repetition, vibration, contact stress, environment.
5	Work related Upper limb disorders-Tenosynovitis, Carpal Tunnel Syndrome (CTS) and Tennis elbow.
6	Work related Repetitive Strain Injuries (RSI); Work related stress reaction injuries, varicose veins.
7	Work related lower limb disorders- osteoarthritis, knee bursitis, meniscal lesions.
8	Ergonomic best practices in work place for hazard reduction.
9	Methods for integrating ergonomics into existing occupations.
10	Workplace evaluation; Risk factor checklists.
11	Hazard reduction- Engineering control, administrative controls.
12	Organizational aspects of the human-work interface to enhance safety.
13	Designing work with systematic procedures to enhance safety.
14	Safety and ergonomic culture in workplace.
15	Virtual ergonomics and its advantage; Introduction to Digital Human Model technology.
16	Techniques of virtual ergonomics evaluation using digital human modelling.

I. Course Title : Environmental Issues and Challenges

II. Course Code : RMCS 606

III. Credit Hours : 2(2+0)

IV. Rationale

Economic development and technological changes are intimately connected with environmental change and sustainability. The students need to be equipped with an understanding of how human actions impact various plant and animal ecologies. Knowledge developed during the course will help out students to understand their own experience of environmental issues and to critically engage with policy responses to environmental challenges.

V. Aim of the course

- To introduce socio economic factors that contribute to local and global environmental issues
- To explore global environmental strategies to maintain ecological balance in micro and macro environment.

VI. Theory

Unit I: Technology and environment

Technology, environment and sustainable development; Positive and negative effect of technological advancement; Effect of technology on organisms and their habitat; Impact of industrialization on environment; Environmental consequences of agricultural development; Environmental effects of information and communication technologies.

Unit II: Global environmental issues

Global environmental issues; Challenges in building governance mechanism; Efforts at international forums; Climate change and global warming; Conservation of biodiversity and wildlife; Over population and land degradation; Exploitation of natural resources and energy crisis; Depletion of ozone layer; Acid rain; Nuclear power; Oil spill pollution; Dumping of hazardous waste.

Unit III: Environmental management system

Environmental management system; Carbon credits a market based instrument for environmental benefit; Objectives and functioning of national and international organizations in environment conservation; Environmental standards in India; Environmental management approaches; Environment audit; Methodology for environment impact assessment; Environment education.

Unit IV: Environment and human health

The effect of global environmental change on vector-borne diseases and parasites; Health effects of particulate matter in environment; Human health implications of exposure to chemical residues in the environment; Neuro toxic effects of environmental contaminants on human health; Environmental factors influencing puberty onset; Cancer risk correlated to environment, diet and genetic factors, food and fertility; Climate change and Infectious diseases; Environmental health hazards in various occupations.

VII. Teaching Methods/ Activities

- Lectures
- Assignments
- Publication review
- Students' presentations
- Group work
- Case studies

VIII. Learning Outcome

After successful completion of the course, the students will be able to:

- Develop a global perspective on environmental issues which permit them to perceive connections between culturally specific practices and global environmental impacts.
- Apply intellectual skills developed in the course in bringing lifestyle choices into conformity with environmental values.
- Critically evaluate information, analyze scientific data, reason logically, consider multiple viewpoints on environmental issues

IX. Suggested Reading

- Bharucha E. 2017. *Text Book of Environmental Studies*. UGC University Press India Pvt. Ltd.

- Bhatnagar A. 2010. *Ecology and Environment*. Oxford Book Company, Jaipur.
- Chary SN and Vyasula V. 2001. *Environmental Management-An Indian Perspective*. Macmillan India Ltd.
- Joseph K and Nagendran R. 2004. *Essentials of Environmental Studies*. Pearson Education Pvt. Ltd.
- Kumar A and Roy PK. 2008. *Environmental Resource Management*. Daya Publishing House, Delhi.
- Rao VP. 2002. *Text Book of Environmental Engineering*. Prentice Hall.
- Singh K and Sisodia A. 2007. *Environmental Economics: Theory and Applications*. Sage Publ.
- Singh S. 2010. *Disaster Management*. Rajdhani Printers, Delhi.
- Thakur V. 2012. *Text Book of Environmental Science*. Scientific publishers, Jodhpur.
- Tiwari M, Khulbe K and Tiwari A. 2016. *Environmental Studies*. I.K. International Publishing House Pvt. Ltd., New Delhi.

Weekly Lecture Schedule

Duration (week)	Topic
1	Technology, environment and sustainable development; Environmental indicators of development, environmental dimensions of sustainable development, international trade and environmental problems; Positive and negative effect of technological advancement on environment.
2	Effect of technology on organisms and their habitat, life supporting capacity of natural ecosystems and on biodiversity; Impact of industrialization on environment-Industrial pollution, global warming.
3	Environmental consequences of agricultural development- Cropping systems, land use change, ground water quality; Environmental effects of information and communication technologies- Manufacturing operations, disposal of devices and net work equipment, positive effect of economic growth and societal changes.
4	Introduction to global environmental issues- Challenges in building governance mechanism; Efforts at international forums; Climate change and global warming-Causes, The greenhouse effect; Effects of climate change and global sea level rise; Drought and extreme weather; Measures to safeguard the environment- Invest in renewable energy, adopt energy efficient practices, adopt recycling of resources.
5	Conservation of biodiversity and wildlife- Introduction, importance in terms of ecological balance, approaches towards conservation of biodiversity and wildlife; Role of individuals and government in conservation of biodiversity and wildlife; Over population and land degradation.
6	Exploitation of natural resources and energy crisis; Consequences of exploitation of natural resources; Human made energy crisis; Deletion of natural energy resource crisis; Energy policy of India; Depletion of ozone layer; The ozone depletion phenomenon; Causes of Ozone layer depletion, Consequences of ozone layer depletion.
7	Acid rain- definition, formation of acid rain, Causes of acid rain; Natural Sources, Manmade sources, Forms of acid deposits; Wet deposits, Dry deposits; Effects of acid rains; Solutions to acid rains; Alternate energy sources; Individual, national and international actions; Environmental impact of nuclear power- Introduction, problems associated with nuclear power, nuclear energy and climate change.
8	Oil spill pollution- introduction, direct and indirect effects of oil spill pollution, distinct environmental effects; Dumping of hazardous waste- Sources, and types of hazardous wastes; Health effects of hazardous wastes; Affect of hazardous wastes on environment.
9	Concept of environmental management system (EMS) - Goal, features, elements and functions; Carbon credits a market based instrument for environmental benefit-Aim, objectives and role in environment management.

Duration (week)	Topics
10	Objectives and functioning of national and international organisations in environment conservation- World Nature Organisation (WNO), United Nations Environment Programme (UNEP), International Union for Conservation of Nature(IUCN), Intergovernmental Panel on Climate Change (IPCC); Environmental standards in India.
11	Environmental management approaches- Engineering, technological and legal controls; Environment Audit -Objectives, audit tools and technology, environmental auditing in India
12	Methodology for environment impact assessment- Baseline data acquisition, environmental inventory, methodology, data products, environmental baseline monitoring, environmental monitoring network design; Environment education-Goals for curriculum development in environmental education, Guidelines and considerations for curriculum development at various levels.
13	The effect of global environmental change on vector-borne diseases and parasites; Health effects of particulate matter in environment.
14	Human health implications of exposure to chemical residues in the environment; euro toxic effects of environmental contaminants on human health.
15	Environmental factors influencing puberty onset. Cancer risk correlated to environment, diet and genetic factors, food and fertility.
16	Climate change and infectious diseases; Environmental health hazards in various occupations.

I. Course Title : Family Dynamics and Women Power

II. Course Code : RMCS 607

III. Credit Hours : 3(2+1)

IV. Rationale

India is proud of its heritage of united and stable family system. There is emergence of a gradual trend from extended families to nuclear families due to growing urbanization and industrialization. These fast changing trends in the social, cultural, economic and industrial scenario do pose a growing challenge to the institution of the family in India and especially women. The course will be valuable in creating awareness regarding various government programmes. It will also strengthen awareness regarding women rights and laws.

V. Aim of the course

- To analyze the changes brought in family due to developmental programmes
- To create awareness among students about issues related to status of women.

VI. Theory

Unit I: Women and family

Role analysis of Indian home makers during ancient period, medieval period and modern times; Impact of change in the role of women on the family system; Roles and responsibilities of women in various spheres of life; Causes of change in women's role in family and its impact on the family.

Unit II: Family dynamics

Understanding family dynamics; Family dynamics and its influences on family; Theoretical and conceptual framework to study family dynamics; Institutional norms of family; Family structure; Family ecology and family life development programmes; Economic and psychological cost of gainful employment of women in the family.

Unit III: Family stress management

Family stress- meaning, sources and symptoms, causes, effects and consequences of stress; Stress and burnout - definition of burnout, Difference between stress and burnout, major signs of burnout; Stress and coping strategies; Types of coping strategies- appraisal focused, problem focused, emotion focused, occupation focused; Work stress-sources, consequences and coping strategies; Social support systems for facilitating women's work participation in family and society; Quantitative methods for measuring the perception of stress.

Unit IV: Women and law

Status of women in Indian; Women in family; Women and education; Women reservation; Women's economic social and cultural rights; Constitutional provisions and privileges for women in India; Special initiatives for women- National commission for women, reservation for women in local self-government, the national plan of action for the girl child(1991-2000); National policy for the empowerment of women,2001; Indian laws for the protection of women's rights against domestic violence; Women's economic empowerment and the changing world of women work; International initiatives for women's economic empowerment; United nation's bodies for women's rights; Women in the workforce- Organized and unorganized sectors; Women and occupational health and safety; Provisions for health and safety under occupational health laws in India.

VII. Practical

1. Analysis of aspects of family dynamics in different stages of family life cycle through case study
2. Report presentation and discussion
3. Evaluate implementation of any one government programme/scheme through survey-Formulation of guidelines
4. Evaluate implementation of any one government programme/scheme through survey-Field survey
5. Evaluate implementation of any one government programme/scheme through survey-Preparation of report
6. Report presentation and discussion
7. Finding out awareness about constitutional provisions and welfare schemes for women-preparation of data collection tool
8. Finding out awareness about constitutional provisions and welfare schemes for women-data collection
9. Finding out awareness about constitutional provisions and welfare schemes for women-data analysis
10. Finding out awareness about constitutional provisions and welfare schemes for women-report writing
11. Report presentation and discussion
12. Review of stress measuring tools and techniques-Collection of literature
13. Presentation on stress measuring tools and techniques
14. Group discussion on stress measuring tools and techniques
15. Proposing modifications for refinement of tool
16. End term assessment

VIII. Teaching Methods/ Activities

- Lectures
- Assignments
- Publication review
- Field visits
- Students' presentations
- Group work and case studies
- Case analysis and case studies

IX. Learning Outcome

After successful completion of this course, the students will be able to:

- Understand the transition in the role played by women in family and society
- Gain knowledge on various Government and Non- Government incentives for women development
- Understand the legal frame work for women protection

X. Suggested Reading

- Becvar D and Becvar R. 2002. *Family Therapy: A Systemic Integration*. Pearson Education, Australia.

Weekly Lecture Schedule

Duration (Week)	Topics
1	Role analysis of Indian home makers during ancient period and medieval period.
2	Role analysis of Indian home makers during modern times; Impact of change in the role of women on the family system.
3	Roles and responsibilities of women in various spheres of life; Causes of change in women's role in family and its impact on the family.
4	Family dynamics; Family dynamics and Its influences on family.
5	Theoretical and conceptual framework to study family dynamics; Institutional norms of family.
6	Family structure; Family ecology and family life development programmes.
7	Economic and psychological cost of gainful employment of women in the family; Family stress-meaning , sources and symptoms.
8	Causes , effects and consequences of stress; Stress and burnout - Definition of burnout, difference between stress and burnout, major signs of burnout.
9	Stress and coping strategies; Types of coping strategies- appraisal focused, problem focused, emotion focused, occupation focused. Work stress: Sources, consequences and coping strategies.
10	Social support systems for facilitating women's work participation in family and society; Quantitative methods for measuring the perception of stress.
11	Status of women in Indian; Women in family, women and education, women reservation; Women's economic, social and cultural rights.

Duration (Week)	Topics
12	Constitutional provisions and privileges for women in India; Special initiatives for women- National commission for women, reservation for women in local self-government, the national plan of action for the girl child(1991-2000).
13	Indian laws for the protection of women's rights against domestic violence.
14	International initiatives for women's economic empowerment.
15	Women in the workforce-organized and unorganized sectors; Women and occupational health and safety.
16	Occupational health hazards of farm women; Provisions for health and safety under occupational health laws in India.

ANNEXURE I

List of BSMA Committee Members for Community Science

Dr A. Sarada Devi, Former Dean of Home Science, ANGRAU	Chairperson
Dr Neelam Grewal, Member Punjab Public Service Commission, Ludhiana	Convenor
Dr Basanthi Barua, Former Dean of Home Science, AAU, Jorhat	Member
Dr Ritu Singhvi, Dean of Community Science, MPUA&T, Udaipur	Member
Dr T. Neeraja, Dean of Community Science, ANGRAU, Hyderabad	Member
Dr Jatinder Gulati, Dean of Home Science, PAU, Ludhiana	Member
Dr Seema Rani, Professor & Head, Extension Education, HAU, Hisar	Member
Ms Vishala, Dean of Community Science, Maratwada Agri University, Parbhani	Member
Dr Amala Kumar, Former Professor in Extension Education, PJTSAU, Hyderabad	Member
Dr Saroj Jeet Singh, Emeritus Scientist, HAU, Hisar	Member
Dr Kiran Bains, Professor & Head, Dept of Food & Nutrition, College of Community Science, PAU, Ludhiana	Expert- Foods & Nutrition

/icarindia /InAgrisearch /icarindia
