12	Physiographic study of body parameters of clinically recovered animals	1
	Total	**16**

I. Course Title : Neuromuscular Physiology
II. Course Code : VPY 608
III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge of coordination of body functions and regulation of brain functions and sense organs.

V. Theory

Unit I

Functional anatomy, types and classification of muscles, of muscles. Properties of skeletal muscle, Contractile elements, Membrane and action potential, Molecular mechanism of muscle contraction, Myoneuronal junction and transmission of impulse, Smooth muscle contraction.

Unit II

Length and tension relationship, Force and velocity relationship. Skeletal muscle energetics, Metabolism and lactate shuttle. Exercise, adaptation to training and performance.

Unit III

Classification of nervous system. Neuron and its classification, Properties. Development of action potential and transmission of nerve impulse in nerve and synapse. Regulatory centres in brain. Reflexes. Functions of Cerebrum, Cerebellum, Hypothalamus, Limbic system.

Unit IV

Receptors and its types. Special senses.

- *Guyton and Hall Textbook of Medical Physiology* 13th Edn John E Hall Ph.D. 2015.
- *Ganong's Review of Medical Physiology*, 26th Edn Kim E Barrett , Susan M Barman, Scott Boitano, Heddwen Brooks, 2019.
- *Dukes' Physiology of Domestic Animals*, 13th Edn. William O Reece, Howard H Erickson, Jesse P Goff, Etsuro E Uemura. 2015.
- *Cunningham's Textbook of Veterinary Physiology* 5th Edn. Bradley G. Klein. 2012.
- *Fundamentals of Neurophysiology*. Smith RF Springer Verlag. 1978.

S. No.	Topic	No. of Lectures
1.	Introduction, Organisation of Nervous system	1
2.	Cellular communication- concept of membrane potential	1
3.	Synapse and its properties, Synaptic transmission	1
4.	Neurotransmitters	1
5.	Sensory systems and Receptors	1
6.	Pain Physiology	1
7.	Cerebral cortex –Anatomy and Physiology	1
8.	Interbrain, thalamus and hypothalamus	1
9.	Midbrain – Physiological capability	1
10.	Brain stem – Physiological anatomy	1
11.	Sleep and EEG	1
12.	Memory and its types	1
13.	Pons and medulla – Anatomy and Physiology	1

S. No.	Topic	No. of Lectures
14.	Cerebellum – Anatomy and Physiology	1
15.	Spinal cord - Anatomy and Physiology	1
16.	Spinal reflexes and properties	1
17.	Postural reflexes	1
18.	Peripheral nervous system	1
19.	Autonomic nervous system – Sympathetic nervous system	1
20.	Autonomic nervous system – Parasympathetic nervous system	1
21.	Enteric nervous system	1
22.	Overall motor control	1
23.	Sensory Physiology – Photoreception	1
24.	Sensory Physiology – Auditory and equilibrium maintenance	1
25.	Sensory transduction – Gustation and olfaction	1
26.	Muscle structure and types	1
27.	Physiological properties of muscle	1
28.	Mechanism of muscle contraction	1
29.	Properties of muscle contraction	1
30.	Muscle metabolism	1
31.	Anatomy of Neuromuscular junction	1
32.	Smooth muscle physiology	1
	Total	**32**

I. Course Title : Endocrinology of Domestic Animals

II. Course Code : VPY 609

III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge of chemical integration of body functions.

V. Theory

Unit I

Methods of study of bioregulation including methods of endocrine analysis. Manipulation and disruption of biorhythms in homeostatic and natural ecosystem.

Unit II

Hormonal relationship in animal production. Concepts in hormone function, classification and methods of study, Hormonal assay, Mechanism of hormone synthesis, Release and transport. Mechanisms of hormone action, Target cell interactions.

Unit III

Genetic and genomic approaches in endocrinology. Animal models and alternate uses of animal model. Regulation and metabolism of hypothalamic, hypophyseal, thyroid and adrenal hormones.

Unit IV

Gonadal and placental hormones, their regulation and mechanism of action. Hormonal principles of pineal gland and its role in production.

Unit V

Endocrine control of carbohydrate and calcium homeostasis. Hormones and adaptation to environment. Hormonal regulation of gastro-intestinal activity. Prostaglandins. Hormones in fertility regulation and production augmentation. Avian endocrinology.

VI. Suggested Reading

- *McDonald's Veterinary Endocrinology*, Pineda and Doley. Iowa State University Press, Ames, 2003
- *General Endocrinology*. Turner CD and Bagnara JT, WB Saunders. 1976
- *Canine and Feline Endocrinology and Reproduction*, 3rd Edition, Edward C Feldman, Richard W Nelson. 2003.
- *Applied Animal Endocrinology* 2nd Edn. E James Squires. 2010

S. No.	Topic	No. of Lectures
1	Introduction to bioregulation – Scientific methods – Controlled experimental testing – Representative sampling – Dose response Relationship – Biological Rhythm – Endocrine–Nervous -Immune system interaction	1
2	Methods of endocrine secretion analysis – Extirpation -observation: Replacement –observation – Imaging – Radioimmunoassay – Enzyme immunoassay – High Performance Liquid Chromatography/ spectroscopy – Immunohistochemistry – Bioassays – Techniques for determining the number and characteristics of hormone receptor	1
3	Disruption of biorhythms in homeostatic and natural ecosystem – Endocrine disruptors or modulators – Assessment of endocrine disruptor activity – Sources of endocrine disruptors – Xenobiotics – Environmental pollutants altering endocrine secretions	1
4	Concepts in hormone function – Morphological functions Biological functions – Physiological functions – Molecular functions	1
5	Mechanism of hormone synthesis of – Protein hormones – Steroid hormones – Eicosanoids – Thyroid hormones – Monoamines	1
6	Release and transport in blood Mechanisms for regulating release – In response to Trophic hormone – In response to Nervous stimuli (environmental cues) – In response to levels of various metabolites	

S. No.	Topic	No. of Lectures
	Transport – Carrier proteins – Half life – Control of hormone release – Pulsatile release – Sustained release – Feed back mechanism	1
7	Mechanisms of hormone action Extracellular receptors – G protein coupled receptors – Catalytic receptors Intracellular receptors – cytoplasmic – intranuclear Target cell interactions – Upregulation – Down regulation	2
8	Genomic approaches in endocrinology. – Use of transgeneic animals – Knockout animals – Proteomics – Two dimensional gel electrophoresis – X ray crystallography – Tomography – MRI	2
9	Animal models to study endocrine disorder – Whole animal model – Isolated organs or tissues – *In vitro* models	2
10	Hypothalamic, hypophyseal hormones – Structure – function relationship of pituitary and hypothalamus Anterior pituitary hormones **Growth hormone** – structure, production, biological functions, disorders of growth hormone production **Prolactin** – structure, production, biological – functions, disorders of growth hormone production **ACTH** – structure, production, biological – functions **FSH** – structure, production, biological functions **LH** – structure, production, biological functions Posterior pituitary hormones **Oxytocin** – structure, production, biological functions **Vasopressin** – structure, production, biological functions	

S. No.	Topic	No. of Lectures
	Hypothalamic releasing and release inhibiting hormones	
	– Growth hormone inhibiting hormone	
	– Gonadotropin releasing hormone	2
11	Thyroid hormones	
	– Transport	
	– Receptors	
	– Metabolism	
	– Metabolic effects	
	– Effect on growth, development, fertility and milk production	2
12.	Adrenal hormones	
	• Structure of adrenal and synthesis of cortical hormones	
	• Physiological roles of	
	– Glucocorticoids	
	– Mineralocorticoids	
	• Physiological role of medullary hormones	2
13.	Pineal gland and its role in production.	
	• Melatonin	
	• Photoperiodism	
	• Seasonal breeding	
	• Manipulation of breeding cycle	
	– Implants	
	– Sustained release bolus	1
14.	Endocrine control of carbohydrate homeostasis	
	– Insulin	
	– Glucagon	
	– Epinephrine	
	– Growth hormone	
	– Glucocorticoids	
	– Thyroxine	2
15.	Endocrine control of calcium homeostasis	
	– Parathyroid hormone	
	– Calcitonin	
	– Calcitriol (Vitamin D3)	
	– Estrogens/ Androgens	
	– Glucocorticoids	
	– Thyroid hormones	
	– Insulin like growth factors	2
16.	Hormonal regulation of gastro-intestinal activity	
	– Gastrin	
	– Secretin	
	– Gastrin releasing peptide	
	– Cholecystokinin	
	– Gastric inhibitory peptide	
	– others	1
17.	Prostaglandins-Synthesis, types, release and mode of action	1
18.	Hormones in fertility regulation	
	• Manipulation of reproduction	
	• Regulation and manipulation of oestrous cycle	
	• Use of hormone agonists to control fertility	
	• Detection and synchronization of oestrusMethods for detection oestrus	
	• Strategies for synchronizing oestrusProstaglandin $F_2\alpha$ based systems Progestin and other hormones based systems	
	• Superovulation and embryo transfer	

S. No.	Topic	No. of Lectures
	• *In-vitro* production of embryos • Recognition and maintenance of pregnancy • Induction of abortion/ parturition • Advancing cyclicity in seasonal breeders, and puberty in animals • Immunological manipulation of reproduction	3
19.	Hormones in production augmentation • Somatotrophin • Adipokines • Leptin • Anabolic steroids and Analogues –mechanism of action delivery systems and safety aspects • β Adrenergic Agonists –mechanism of action delivery systems and safety aspects • Dietary supplements – chromium, PUFA and CLA • Regulation of feed intake – Orexigenic hypothalamic neurohormones – Anorexigenic hypothalamic neuropepetides – Hormonal regulation of mammary gland development and milk secretion Artificial induction of lactation	2
20	Avian endocrinology – Reproductive hormones – Hormonal manipulation of egg production – Control of broodiness in poultry – Manipulation of moulting	2
	Total	**32**

I. Course Title : Instrumentation and Research Techniques in Veterinary Physiology

II. Course Code : VPY 610

III. Credit Hours : 0+2

IV. Aim of the course

Training in various techniques for application in research in AnimalPhysiology

V. Suggested Reading

- *Hawk's Physiological Chemistry*. Oser BL Tata McGraw-Hill. 1976.
- *Varley's Practical Clinical Biochemistry* Alan H Gowenlock
- *Handbook of Radioimmunoassay*. Abraham GE Marcel Dekker. 1977.
- *Electrocardiograms: A Systematic Method of Reading Them* Armstrong ML. 1978
- *Rumen Microbiology*, Burk A Dehority 2003 Nottingham University Press

S. No.	Topic	No. of Lectures
1.	Design and types of research laboratory	1
2.	Maintenance of research equipments	1
3.	Imparting knowledge about preparation of various solutions	1
4.	Basic principles and concepts of pH	1
5.	Determination of pH of various solutions and biological samples	1
6.	Basic principles and concepts of ECG	1
7.	Recording of ECG in animals	1

S. No.	Topic	No. of Lectures
8.	Basic principles and concepts of physiograph and its accessories for *in-vitro* live tissue experiments	1
9.	Recording of blood pressure by physiograph and sphygmomanometer	1
10.	Recording of pulse rate by physiograph	1
11.	Recording of respiratory volumes by spirometer	1
12.	Neuro muscular experimental physiology using physiograph	1
13.	Physical and chemical principles of chromatography	1
14.	Extraction of active compounds from biological samples	1
15.	Protein separation and isolation methods – basic concepts	1
16.	Methods of protein determination	1
17.	Electrophoresis	1
18.	Thin layer chromatography	1
19.	Gas liquid chromatography	1
20.	Basic concepts of mineral estimation	1
21.	Flame photometry	1
22.	Laws of colorimetry	1
23.	Spectrophotometry	1
24.	Organ bath – Applications in experimental physiology	1
25.	Experiments using organ bath	1
26.	Enumeration of ruminal microflora	1
27.	Estimation of VFA	1
28.	Estimation of ammonia nitrogen	1
29.	Estimation of body water	1
30.	*In-vitro* rumen studies	1
31.	ELISA for estimation of various hormones	1
32.	RIA for estimation of various hormones	1
	Total	32

I. Course Title : Physiology of Wild Life

II. Course Code : VPY 611

III. Credit Hours : 1+0

IV. Aim of the course

To impart the knowledge on physiology of wild animals. The course content refers to wild animals related to Indian forests restricted to small and large animals. This course does not cover insects and other species for which veterinarian are not usually called for.

V. Theory

Unit I

Overview of Indian forests – Identification of sex in wild animals and birds - Blood collection methods in wild animals – Hematology - Common clinical biochemical estimations.

Unit II

Body temperature measurement techniques – Measurement of stress - Measuring senescence.

Unit III

Reproduction management in wild animals - Understanding sound mechanics and communication methods – Ethology of wild animals - Government policies for wild life protection.

VI. Suggested Reading

Standard text books and Government policies pertaining to wild life.

S. No.	Topic	No. of Lectures
Theory		
1.	Animal Species Overview of Indian forests.	1
2.	How to identify the sex of wild animals and birds.	1
3.	Collection of Clinical materials for laboratory examination; methods	1
4.	Heamtology	1
5.	Common clinical biochemical estimations.	1
6.	Methods of measuring body temperature of wild animals	1
7.	Measuring capture and immobilization stress in wildlife	1
8.	Measuring senescence in wild animal populations	1
9.	Reproduction management in wild animals	2
10.	Understanding sound mechanics and communication methods	1
11.	Wild animal ethology	2
12.	Government policies for wild life protection (respective state)	1
13.	Lecture by wildlife vet or conservationist	2
	Total	16

Course Title with Credit Load
Ph.D. in Veterinary Physiology

Course Code	Course Title	Credit Hours
RPE 700	Research and Publication Ethics*	1+1
VPY 701	Applied physiology of body fluidsand electrolytes	2+1
VPY 702	Physiology of animal behaviour	2+0
VPY 703	Recent trends in ruminant digestion	2+1
VPY 704	Recent trends in neuroendocrinology	2+1
VPY 705	Myophysiology and kinesiology	2+0
VPY 706	Avian physiology	2+1
VPY 707	Physiology of lactation	2+1

VPY 712	Recent trends in reproductive physiology	2+1
VPY 713	Doctorate Seminar-I	1+0
VPY 714	Doctorate Seminar-II	1+0
VPY 715	Doctorate Research	0+75

*Compulsory Major course for Doctorate programme. The other 10 credits can be registered from remaining 700 Series courses listed above.

Suggested list of specified Minor subjects (Departments)

Major Subject	Minor subjects (Departments)*
Veterinary Physiology	Animal Nutrition, Biochemistry, Gynaecology and Obstetrics, Animal Genetics and Breeding, Biotechnology, Surgery and Radiology, Livestock Production Management, Pharmacology and Toxicology, Anatomy, Medicine, poultry science, pathology.

*The Minorl courses may be taken from any number of disciplines/ departments listed against major discipline limiting to credits prescribed as decided by the Chairman of Advisory Committee of the student.

Minor courses may also be taken from the disciplines/ departments other than those listed above on the recommendations of advisory committee, if essentially required as per the research problem with the concurrence of Head of the Department and Concerned Authorities.

Course Contents
Ph.D. in Veterinary Physiology

I. Course Title : Applied Physiology of Body Fluids and Electrolytes

II. Course Code : VPY 701

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge regarding physiology of body fluids and electrolytes in relation to homeostasis.

V. Theory

Unit I

Volume and composition of body fluids, Exchange of water and electrolytes between body compartments and transport mechanisms, Blood and external environment. Osmolarity and osmolality of body fluids.

Unit II

Regulation of volume and osmolarity of extracellular fluid. Regulation of pH and acid base balance. Formation and composition of cerebrospinal fluid and lymph.

Unit III

Clinical implications of change in electrolytes and body fluids. Functional consideration of plasma volume and its composition. Diuresis and endocrine control of renal functions.

Unit IV

Clinical feature in fluid and electrolyte imbalances, clinicopathological indictors of fluid and electrolyte imbalances. Physiological basis of fluid therapy.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1.	Body fluid compartments-Extracellular and Intracellular fluid compartment (ECF and ICF), Volume of ECF and ICF. Composition of various body fluids	1
2.	Total Body water, Water requirement, daily intake and loss of water from the body	1
3.	Different transport mechanisms for exchange of water and electrolytes-Active and passive transport, filtration, diffusion and osmosis	1
4.	Exchange of nutrients and other substances between blood and interstitial fluid. Capillary pressure, interstitial fluid pressure, exchange of fluids through capillary membrane	1
5.	Principles of osmosis and osmotic pressure, osmotic equilibrium between ICF and ECF, Tonicity of body fluids	1
6.	Composition of synovial fluid and peritoneal fluid	1

S. No.	Topic	No. of Lectures/ Practicals
7.	Osmolarity and Osmolality of ICF and ECF, regulation of volume and osmolarity of ECF	1
8.	Contribution of different molecules viz glucose, sodium and urea towards osmolarity of ECF	1
9.	pH of different body fluids, factors affecting pH of body fluids, Physiology of acid base balance, buffer systems of ICF and ECF	1
10.	Different types of Acidosis and Alkalosis, their etiology and compensation	1
11.	Evaluation of acid–base status- Siggaard–Andersen alignment nomogram, Anion gap, base excess and deficit	1
12.	Role of Respiratory system and Kidneys in maintenance of Acid base balance	1
13.	Formation and composition of Cerebrospinal fluid and lymph	1
14.	Clinical disorders resulting into loss of electrolytes from body fluids.	1
15.	Changes in plasma volume and its composition under different clinical conditions-vomition and diarrhoea	1
16.	hypervolemia and hypovolemia, Implications of hypovolemic and hemorrhagic shock	1
17.	Dehydration - its types and causes. Water intoxication	1
18.	Role of kidneys in regulation of water balance. Renin-angiotensin system	1
19.	Role of kidneys in formation and excretion of concentrated and diluted urine	1
20.	Hormonal regulation of important electrolytes in plasma	1
21.	Role of Hormones in renal regulation of water and electrolytes	1
22.	Diuresis and pressure natriuresis, polyuria and oligouria	1
23.	Clinical considerations in fluid and electrolyte imbalances	1
24.	Clinicopatholiogical indicators of fluid and electrolyte imbalance	1
25.	Clinical Physiology of Dehydration – Signs, symptoms, evaluation of intensity of dehydration	1
26.	Clinical Physiology of vomition and diarrhoea- Signs and symptoms	1
27.	Clinical Physiology of edema Signs and symptoms, causes and prevention	1
28.	Role of serum sodium, hyponatremia, hypernatremia; Role of serum potassium, hypokalemia, hyperkalemia	1
29.	Role of serum chloride, hypocholeremia and hypercholeremia, bicarbonate ions	1
30.	Principle and indications of fluid therapy	1
31.	Types of solution used for fluid therapy, role of their components and their use in different clinical conditions	1
32.	Effect of adding different saline, glucose solutions to ECF-isotonic, hypertonic and hypotonic solutions	1
	Total	**32**

Practical

1.	Estimation of pH of different body fluids and evaluation of acid base status.	1
2.	Determination of sodium in serum sample of farm animals (by flame photometry/ colorimetric method)	1
3.	Determination of potassium in serum sample of farm animals (by flame photometry/ colorimetric method)	1
4.	Determination of chloride in serum sample of farm animals (by flame photometry/ colorimetric method)	1

S. No.	Topic	No. of Lectures/ Practicals
5.	Determination of bicarbonate in serum sample of farm animals	1
6.	Determination of Calcium in serum sample of farm animals	1
7.	Determination of Magnesium in serum sample of farm animals	1
8.	Determination of phosphate in serum sample of farm animals	1
9.	Determination of total body water (simulated demonstration)	1
10.	Determination of blood volume (simulated demonstration)	1
11.	Determination of plasma volume (simulated demonstration)	1
12.	Determination of Interstitial Fluid Volume (simulated demonstration)	1
13.	Estimation of osmolarity and osmolality of urine of farm animals	1
14.	Estimation of osmolarity and osmolality of milk	1
15.	Estimation of osmolarity and osmolality of blood of farm animals	1
16.	Evaluation of dehydration in animal and choosing the fluid type, its volume and rate for fluid therapy	1
	Total	**16**

I. Course Title : Physiology of Animal Behaviour

II. Course Code : VPY 702

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint the students about physiology of animal behaviour in different species of domestic animals.

V. Theory

Unit I

Introduction to animal ethology. Neurophysiological basis of animal behaviour.

Unit II

Behaviour in relation to changes in the environment. Feeding, Grazing, Stall feeding and rumination behaviour.

Unit III

Sexual behaviour in female and male animals. Maternal behaviour. Milk let down.

Unit IV

Social behaviour, Communication in animals, Animal temperament. Responses of dogs and horses to training.

S. No.	Topic	No. of Lectures
Theory		
1.	Introduction to ethology and its importance in Veterinary Science.	1
2.	Ethology-definition and its importance in animal welfare	1
3.	Types of animal behaviour	2
4.	Behavioural Ecology, evolutionary basis for animal behavior	2
5.	Ecological pressures, ontogeny and phylogeny of behaviour	1
6.	Physiological concept of behaviour, neuro-endocrine integration for behavioural manifestation	2
7.	The concept of instinct, Habituation, imprinting, reinforcement, conditioning, reasoning and intelligence. Temperament scoring	2

S. No.	Topic	No. of Lectures
8.	Ingestive/ feeding behaviour in ruminants: Prehension, grazing behaviour in cattle, sheep and goats, rumination behaviour	2
9.	Ingestive behaviour in dogs	1
10.	Ingestive behaviour in swine	1
11.	Special feeding patterns; Abnormal feeding behaviour	2
12.	Precopulatory behavior (Searching, Courtship, Sexual arousal, Erection, Penile protrusion): Species differentiation	1
13.	Copulatory behaviour (Mounting, intromission and ejaculation): Species differentiation	2
14.	Post copulatory behaviour (Dismounting and refractory period)	1
15.	Manifestation of behavioural estrus, estrus intensity scoring	1
16.	Role of pheromon in sexual behaviour manifestation	1
17.	Abnormal sexual behavioural pattern	1
18.	Maternal behaviour: Formation of bond between mother and fetus, concept of critical period, vocalization	1
19.	Maternal behaviour in different species, abnormal maternal behaviour	1
20.	Milking behaviour: Milking temperament, milk let down reflex and the factors affecting milking behaviour	1
21.	Social behaviour: Dominance, Social hierarchy	1
22.	Agonistic (combat or aggressive) behaviour, Gregarious, Peck order in chicken	1
23.	Communicating behaviour: Attraction, Repulsion and Submission	1
24.	Mode of communication (visual, auditory, chemical) in different species.	1
25.	Responses of dogs and horses to training	1
	Total	**32**

I. Course Title : Advances in Ruminant Digestion

II. Course Code : VPY 703

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge about advances in digestion of ruminant animals.

V. Theory

Unit I

Introduction to rumen bacteria, protozoa and fungi. Development and natural fluctuation in rumen microbial population. Salivary secretion and its regulation.

Unit II

Microbial ecology and physiology of feed degradation within the rumen. Metabolism of nitrogen containing compounds.

Unit III

Degradation of carbohydrate, fat and protein by rumen microbes, Microbe- microbe interaction. Protected nutrients and other feed additives.

Unit IV

Genetics and biotechnology of rumen microbes, rumen anaerobic fungi, their role and interaction with other rumen microbes. Probiotics supplementation, etc. Rumen flow rate and rumen volume.

S. No.	Topic	No. of Lectures
Theory		
1.	Functional development of ruminant stomach	1
2.	Microbial ecosystem of fermentative digestion	1
3.	Fluctuation in rumen microbial population	1
4.	Substrates for fermentative digestion	1
5.	Salivary secretion and its regulation	1
6.	Role of saliva on fermentative digestion	1
7.	Rumen motility and its regulation	1
8.	Rumen bacteria	2
9.	Rumen protozoa – its importance and its interaction with other group	2
10.	Anerobic fungi	1
11.	Polysaccharide degradation by rumen microbes	2
12.	Metabolism of nitrogen containing compounds	1
13.	Lipid metabolism in rumen	1
14.	Rumen metabolites and their assimilation	1
15.	Microbe-microbe interaction	1
16.	Comparative efficiency of rumen function in different species.	2
17.	Protected nutrients	1
18.	Digestive disorders of rumen	1
19.	Nutritional toxicity and strategy to address it	1
20.	Stoichiometry of fermentative digestion	1
21.	Approaches to modification of ruminal fermentation	2
22.	Modifiers of ruminal microbial activity	1
23.	Biological models of rumen function	2
24.	Rumen simulation technique	2
25.	Rumen flow rate and rumen volume	1
	Total	**32**
Practical		
1.	Reticulo-ruminal motility	1
2.	Total volatile fatty acids and their fractions	2
3.	Culture of rumen bacteria	3
4.	Protozoal counting	1
5.	Culture of rumen fungi	3
6.	Demonstration of effect of defaunation	2
7.	Flow rates of ruminal contents	2
8.	Artificial rumen techniques	2
	Total	**16**

I. Course Title : Advances in Neuro-endocrinology

II. Course Code : VPY 704

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students about advances in neuro-endocrinology of domestic animals.

V. Theory

Unit I

Neuroendocrine integrating mechanism. Structure of hypothalamus, pituitary gland, limbic and other neural pathways and endocrine functions.

Unit II

Neural control of oxytocin, adrenocorticotropic hormone, aldosterone, thyrotropic hormone, growth hormone, gonadotrophins, Hypothalamic releasing factors and the neuro-vascular link between brain and anterior pituitary.

Unit III

Role of afferent impulses from genitals and other regions in reproductive system. Influence of hormones on brain activity.

Unit IV

Effects of drugs on neuro-endocrine system. Neuro-endocrine mechanisms in birds. Interaction of nervous, endocrine and immune system in animal production and reproduction.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1	Evolution and theory of hormones	1
2	Development of endocrine glands	1
3	Neuroendocrine integrating mechanism	1
4	Homeostatic regulation by hormones; Feedback regulation of hormones	1
5	Biorhythms, manipulation and disruption of biorhythms in homeostatic and natural ecosystem	1
6	Hormones and adaptation to environment	1
7	Endocrine methodologies in study of bioregulation	1
8	Animal models and alternate uses of animal model in endocrine studies	1
9	Methods of hormonal assays - Radioimmunoassay, Immunorediometric assay, Radioceptors assay, enzyme linked immunosorbent assay, chemi-luminiscence assay	2
10	Hormone secretion, transport and clearance	1
11	Cellular receptors for hormone; Hormones and target cells	1
12	Genomic and non genomic effects of hormones	1
13	Second messenger system; Receptor signal transduction; Hormone receptor interaction – protein and peptide hormones; Hormone receptor interaction – steroid and other hormones	2
14	Half-life of hormones, pattern of hormone release;	1
15	Types and family of hormones	1
16	Hormones regulating growth	1
17	Hormones regulating energy metabolism	1
18	Hormones regulating digestion	1
19	Hormones regulating calcium and phosphorus	1
20	Hormones regulating electrolytes – Na and K	1
21	Hormones regulating hyper and hypoglycemia	1
22	Hormones regulating blood volume and blood pressure	1
23	Alleviation of stress by hormones	1
24	Endocrine role of pineal gland	1
25	Hormones and behavior	1
26	Endocrine pathophysiology	2
27	Avian endocrinology	1
28	Synthetic hormones	1
29	Application of nanotechnology in endocrine studies	1
	Total	**32**

S. No.	Topic	No. of Lectures/ Practicals
Practical		
1.	Extraction of hormones	1
2.	Immunohistochemistry of hormones	2
3.	Radio-immuno assay of hormones	3
4.	Enzyme linked immunosorbent assay of hormones	2
5.	Bioassy of hormones	2
6.	Induction of atherosclerosis	1
7.	Induction of hypoglycemia in laboratory models by allaxon and streptozotocin	2
8.	Induction of hyperglycemia in laboratory models by administration of epinephrine and glucagon, etc.	1
9.	*In-vitro* effects of certain hormones such as adrenaline, histamine and acetyl choline on excised intestine	1
10.	Hormone assay in fecal samples	1
	Total	**16**

I. Course Title : Myophysiology and Kinesiology

II. Course Code : VPY 705

III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge to the students about myophysiology and kinesiology.

V. Theory

Unit I

Morphology of muscle; Chemical composition of muscle; Electrical phenomena and iron influxes; Muscle contraction and irritability; Neuromuscular transmission; Excitation contraction coupling; Mechanical properties of skeletal muscle; Types of chemical muscle fibres; Coordination among muscles.

Unit II

Thermal properties of muscles; Chemical correlates of contraction.

Unit III

Molecular basis of muscular contraction of skeletal muscle; Energetics of Muscle Contraction; Electromyogram; Pathophysiology of muscles; Myocardium – electrical properties; Myocardium – mechanical properties; Pacemaker tissue; Endurance of muscle.

Unit IV

Lever systems of body joints; Synovial fluid formation and its physiology; Principles of Kinesiology and its application in work physiology.

S. No.	Topic	No. of Lectures
1.	Morphology of muscle	1
2.	Chemical composition of muscle	1
3.	Electrical phenomena and iron influxes	2
4.	Muscle contraction and irritability.	2

S. No.	Topic	No. of Lectures
5.	Neuromuscular transmission	2
6.	Excitation contraction coupling	2
7.	Mechanical properties of skeletal muscle	1
8.	Types of chemical muscle fibres	1
9.	Coordination among muscles.	1
10.	Thermal properties of muscles.	1
11.	Chemical correlates of contraction.	1
12.	Molecular basis of muscular contraction of skeletal muscle	2
13.	Energetics of Muscle Contraction	2
14.	Electromyogram	1
15.	Pathophysiology of muscles	1
16.	Myocardium – electrical properties	2
17.	Myocardium – mechanical properties	2
18.	Pacemaker tissue	1
19.	Endurance of muscle	1
20.	Lever systems of body joints,	2
21.	Synovial fluid formation and its physiology.	1
22.	Principles of Kinesiology and its application in work physiology	2
	Total	**32**

I. Course Title : Avian Physiology

II. Course Code : VPY 706

III. Credit Hours : 2 + 1

IV. Aim of the course

To teach physiology of birds.

Unit I

Digestive and urinary system.

Unit II

Blood, cardiovascular and respiratory system.

Unit III

Reproductive and endocrine system.

Unit IV

Nervous system and musculo-skeletal system.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1.	Digestive system Comparative Functional Anatomy of the Digestive Tract -Gastrointestinal Function	1
2.	Food Intake Regulation GI Motility, Neural and Hormonal Control of Motility	1
3.	Secretions and Digestion	1
4.	Absorption - Carbohydrates, Amino Acids and Peptides, Fatty Acids and Bile Acids, Volatile Fatty Acids	1
5.	Urinary system Functional anatomy of The Kidneys- Intake of Water and Solutes	1

S. No.	Topic	No. of Lectures/ Practicals
6.	Formation of Urine- Osmoregulation	1
7.	Postrenal Modification of Ureteral urine	1
8.	Salt Glands - Evaporative Water Loss	1
9.	Blood, Cardiovascular Blood -Components – Effects of Altitude	1
10.	Gross Structure and Function	1
11.	General Circulatory Hemodynamics	1
12.	Control of the Cardiovascular System	1
13.	Integrative Neural Control	1
14.	Respiratory system Anatomy of the Avian Respiratory System-Air Sacs	1
15.	Ventilatory Reflexes -Respiratory System Volumes	1
16.	Gas Exchange -Ventilation and Respiratory Mechanics	1
17.	Basic Principles of Oxygen Transport - Cross-Current Gas Exchange	1
18.	High-Altitude Flight -Control of Breathing	1
19.	Reproductive system Anatomy of the Female Reproductive Breeding and Ovulation–Oviposition Cycles	1
20.	Ovarian Hormones Hormonal and Physiologic Factors Affecting Ovulation	1
21.	Effect of Light on the Ovary and Ovulation PhotorefractorinessMolt	1
22.	Incubation Physiology	1
23.	Male Reproductive Tract Anatomy Hormonal Control of Testicular Function, Spermatogenesis Extragonadal Sperm Transport and Maturation	1
24.	Endocrine system. Synthesis, Release of Hormones and functions of endocrine glands	1
25.	Hypothalamus and Pituitary Hormones	1
26.	Pancreatic and Adrenal hormones	1
27.	Secretions of Thyroid gland, parathyroid gland	1
28.	Nervous system and musculo-skeletal system Sensory Physiology - Uniqueness of avian brain	1
29.	Functional Organization of the Spinal Cord	1
30.	The Autonomic Nervous System of Avian Species	1
31.	Skeletal MuscleMuscle Fiber Types, Electrical Properties of Muscle Fibers -Contractile Properties	1
32.	Neurotransmission, Smooth muscle	1
	Total	**32**
Practical		
1.	Collection of blood from the birds and blood processing.	1
2.	Study of blood cells RBC count	1
3.	WBC count	1
4.	DLC	1
5.	Thrombocyte count	1
6.	Haemoglobin concentration	1
7.	Packed cell volume (haematocrit)	1
8.	Erythrocyte sedimentation rate	1
9.	Determination of feed passage rate in birds	1
10.	Enzymatic profile under various physiological states of birds	1
11.	Collection of semen and its evaluation	1
12.	Demonstration of cold shock resistant of avian spermatozoa and sperm stimulatory and inhibitory agents	1
13.	Determination of glucose and calcium in blood	1
14.	Determination of uric acid and urea in blood	1
15.	Electrophoretic separation of plasma proteins and egg proteins	1
16.	Localization of different endocrine glands	1
	Total	**16**

I. Course Title : Physiology of Lactation

II. Course Code : VPY 707

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on physiology of lactation in dairy animals.

Unit I

Functional anatomy, histology and cytology of mammary gland in domestic animals.

Unit II

Development of mammary gland, Hormonal control of mammogenesis.

Unit III

Process of lactation, Initiation of milk secretion, Hormonal control of lactation. Biochemical and histological changes in mammary gland during lactation. Mechanism of galactopoiesis.

Unit IV

Neural control of lactation, Milk let down, Milk ejection and inhibition of milk ejection. Induced lactation. Composition of milk in animals.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1.	Introduction to the mammary gland and milk production	1
2.	Mammary gland anatomy - macrostructure	1
3.	Mammary gland anatomy - microstructure	1
4.	Mammary gland anatomy – blood supply, nerve supply and lymphatic network	1
5.	Comparative anatomy and physiology of mammary gland of different domestic animals	1
6.	Basic histology of parenchyma and cellular organization of the mammary epithelial cell	1
7.	Mammary growth and development I: fetal through puberty	1
8.	Mammary growth and development II: Post-puberty through involution	2
9.	Hormonal control of mammogenesis	1
10.	Lactogenesis	1
11.	Lactation	2
12.	Biochemical changes in mammary gland during lactation	1
13.	Histological changes in mammary gland during lactation	1
14.	Galactopoiesis	1
15.	Neuro endocrine control of lactation	1
16.	Milk letdown and its inhibition	1
17.	Factors affecting milk yield	1
18.	Dry period – importance, different strategies and beliefs	1
19.	Mammary involution	1
20.	Milk properties and composition	1
21.	Colostrum	1
22.	Milk carbohydrate synthesis and secretion	1
23.	Milk protein synthesis and secretion	1
24.	Milk lipids synthesis and secretion	1
25.	Mammary gland immunology	1

S. No.	Topic	No. of Lectures/ Practicals
26.	Other important milk components	1
27.	Contaminants and pollutants in milk	2
28.	Manipulation of milk production	1
29.	Diseases associated with mammary gland	1
	Total	**32**
Practical		
1.	External structure of cow's udder	1
2.	Internal structure of cow's udder	2
3.	Histological examination of udder in cows	1
4.	Milk letdown response in dairy animals	2
5.	Composition of colostrum	1
6.	Composition of milk during different phases of lactation	2
7.	Artificial induction of lactation	3
8.	Estimation of lactogenic hormones	4
	Total	**16**

I. Course Title : Advances in Ecosystem, Environmental Physiology and Growth

II. Course Code : VPY 708

III. Credit Hours : 2+1

IV. Aim of the course

To teach physiology of growth process in animals and effect of environmental factors on homeostasis of animals.

V. Theory

Unit I

Ecology of farm animals, Biological rhythms, Mammalian circadian rhythms, their regulation. Components of physical environment, Biometeorology and principles of thermoregulation in mammals and birds.

Unit II

Physiological response of farm animals to heat and cold. Effect of various climatic components on health and production (growth and egg production), reproduction and climatic adaptation.

Unit III

Concept and definitions of cellular, prenatal and postnatal growth - Patterns in animals.

Unit IV

Factors affecting growth - Nutrition, Hormones, Vitamins, Antibiotics, Environment. Ageing and senescence. Growth anomalies.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1	Ecology and its scope in livestock productivity;	1
2	Disciplines of ecology; fundamental principles of ecology	1

S. No.	Topic	No. of Lectures/ Practicals
3	Biosphere and biodiversity	1
4	Ecosystem and Components of Ecosystem; Types of Species Found in Ecosystems; Principal Ways Species Interact	2
5	Adaptation, Acclimation and Acclimatization	1
6	Temperature Regulation -*Thermoregulators and Thermoconformer*	1
7	Principles of Heat gains and losses in animals	1
8	Warm-blooded versus cold-blooded animals and its relevance to survival	1
9	Heat production in birds and mammals	
10	Hibernation, Estivation and Daily Torpor; Cold Habitation	1
11	Body Temperature of Homeotherms - concept of core temperature measurements -Rectal Temperature of different animal species; Diurnal Variations	1
12	Physiological responses to heat in animals and birds	1
13	Temperature regulation in birds	1
14	Bioclimatology with respect to livestock and poultry farming	1
15	Surface temperature of earth- its measurements	1
16	earth's atmosphere-Geographic Belts, Composition of the Atmosphere	1
17	Climatic elements- components – measurements	2
18	Cold stress, Heat stress- impact on animal health and production	2
19	Adaptation to atmospheric pressure differences [altitude]-physiological changes and phenotypic characters;	1
20	Physiology of growth and its measurements	1
21	Periods of growth- prenatal and postnatal	2
22	Pattern of growth	1
23	Factors affecting growth	1
24	Recent concepts in manipulation of growth	1
25	Growth promoters	2
26	Ethical issues in use of growth promoters	2
27	Growth anomalies	1
28	Ageing and senescence	1
	Total	**32**
Practical		
1	Atmosphere definition- understanding the globe	1
2	Temperature Recording in animal house, poultry house, and laboratory	1
3	Calculation of RH	1
4	Calculation of THI	1
5	Calculation of Heat Loading index	1
6	Measurement of sweating rate in cattle	2
7	Stress assessment- different methods and indicators	2
8	Weather forecast models followed in India	1
9	Date analysis of rain and temperature for 20 years in the respective region	2
10	Assessing impact of different shades and houses on milk production in the college farms	1
11	Measurements of growth rate and chart of crossbred calves, native breed calf, etc.	1
12	Visit to meteorology stations	1
13	Purpose and role Satellites of ISRO related to the course (invited lecture)	1
	Total	**16**

I. Course Title : Cellular and Molecular Physiology

II. Course Code : PHY 709

III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge about cellular and molecular physiology.

V. Theory

Unit I

Cell membrane, Organelles and their functions. DNA synthesis and replication.

Unit II

Physiology of cell signaling. Basic classification and characterization of membrane receptors. Intracellular/ nuclear receptors.

Unit III

Major signaling pathways: SPs associated with second messengers; Cell signaling and apoptosis.

Unit IV

Cell cycle and Checkpoints in Cell Cycle Regulation. Regulators of the Cell cycle, cyclin-dependent kinases (CDKs) Signaling defects. Modern methods to study signaling.

S. No.	Topic	No. of Lectures
Theory		
1.	Cell and its organelles – structure and function, difference between prokaryotic and eukaryotic cell	2
2.	Structural organization of bimembranes	1
3.	Transport of molecules through cell membrane	1
4.	Membrane proteins and their functions	1
5.	Cell adhesion molecules and their functions	1
6.	Transmembrane signalling pathways	2
7.	Cell signaling and apoptosis	1
8.	Modern methods to study signaling	1
9.	Cell cycle-stages, mitosis and meiosis and regulatory molecules	3
10.	Organization of eukaryotic and prokaryotic genome	3
11.	DNA replication in prokaryotes and eukaryotes	4
12.	Transcription in prokaryotes and eukaryotes	2
13.	Translation in prokaryotes and eukaryotes	2
14.	Techniques in molecular biology – PCR, DNA sequencing, DNA micro-array, DNA finger printing in situ hybridization	4
15.	Recombinant DNA technology and its applications	2
16.	Gene silencing by RNA interface technology	2
	Total	**32**

I. Course Title : Advances in Immuno Physiology

II. Course Code : VPY 710

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge regarding physiology of immune system.

V. Theory

Unit I

Introduction, History, Body defense, Organs of immune system, Ontogeny and phylogeny of immune system, Vertical transmission of immunity in animals.

Unit II

Immunoglobulins – Basic structure and functions, Hematopoiesis, T-cell and B-cell-evolution, Development and their functions, Cytokines-sources and actions, MHC, genetic organization of immunoglobulin, MHC and complement system.

Unit III

Immune-endocrine interactions, Immune-reproduction, Ageing, Stress and other physiological functions, Immune modulation.

Unit IV

Hypersensitivity, diseases related to immune system, dysfunction, autoimmune disorders and their genesis, immunodeficiency.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1.	Types of immunity	1
2.	Host cell receptors of innate immunity	1
3.	Passive immunity.	1
4.	Acute phase reactant proteins (APRs) – positive APRs and negative APRs	1
5.	Significance of CRPs	1
6.	Antigen	1
7.	Factors influencing immunogenicity of antigens	1
8.	Heterophile antigens	1
9.	Antibody	1
10.	Functions of immunoglobulin	1
11.	Isotypes	1
12.	Hybridomas	1
13.	Monoclonal antibodies (mAB)	1
14.	Antigen antibody reaction	1
15.	Neutralisation	1
16.	Western blotting technique	1
17.	Complement pathways	1
18.	Leucocytopoiesis	1
19.	Central lymphoid organs I	1
20.	Central lymphoid organs II	1
21.	Characteristics and functions of different T and B lymphocytes	1
22.	NK cells	1
23.	Major histocompatibility	1
24.	Cytokines: interleukins, interferons, TNF, CSF	1
25.	Antigen presenting cells	1
26.	Cell mediated immunity	1
27.	Humoral/ Ab mediated immunity	1
28.	Immediate type	1
29.	Hypersensitivity type III – mechanism	1
30.	Autoimmunity	1

S. No.	Topic	No. of Lectures/ Practicals
31.	Immunological tolerance	1
32.	Transplant immunology	1
	Total	**32**
Practical		
1.	Isolation of lymphocytes from blood by density gradient centrifugation	1
2.	Determination of live and dead lymphocytes in the separated sample	1
3.	Estimation of CRP in serum by immunoturbidimetric assay	1
4.	Hyperimmuneseum production	1
5.	Haemagglutination test	1
6.	Haemagglutination inhibition assay	1
7.	Immunoprecipitation test	1
8.	Complement fixation test	1
9.	ELISA methodology	1
10.	ELISA diagnostic test	1
11.	RIA methodology	1
12.	RIA diagnostic test	1
13.	Antibody-dependent cell-mediated cytotoxicity methodology	1
14.	Immunofluorescence- Immunohistochemistry	1
15.	Western blotting methodology	1
	Total	**15**

I. Course Title : Physiology of Stress

II. Course Code : VPY 711

III. Credit Hours : 2+0

IV. Aim of the course

To understand impact of various stress factors on the physiology of animals.

V. Theory

Unit I

Definition of stress, Various types of stresses, Their effect on animal production and reproduction.

Unit II

Physico-chemical changes of blood composition due to exercise and work. Energy utilization and requirement of muscles during work and exercise.

Unit III

Capacity of work under field and controlled laboratory conditions, Factors that regulate it.

Unit IV

Effect of various stresses on endocrine status of animals, Endurances in animals.

Unit V

Energy partitioning in lactating animals under stress, Physiological basis of ameliorative measures to combat stress in lactating animals.

S. No.	Topic	No. of Lectures
Theory		
1.	Definition of Stress, distress and eustress - Concept of Stressors – types of stressors – Acute and chronic stress - Broad measures of stress in animals – Behavioral, Physiological and molecular measures of stress	1
2.	Neuroendocrinology of stress response - sympathetic-adrenal-medullary (SAM) pathway - the hypothalamic-pituitary-adrenal (HPA) axis	1
3.	Effect of stress on musculoskeletal system – Exercise and Draft associated stress - Physiological assessment and indices for evaluating work load – concept of acceptable work load.	1
4.	Effects of stress on reproduction (including birds) – pregnancy, prenatal growth, lactation and Egg production	1
5.	Effect of stress on lactation - Energy partitioning in lactating animals under stress - Physiological basis of strategies to combat stress in lactating animals	1
6.	Effect of stress on immune system – altered cellular responses and cytokine production patterns and their consequences	1
7.	Effect of Stress on learning and memory – Areas of brain associated with stress induced alterations in learning and memory	1
8.	Environmental characteristics affecting animals – Role of Temperature, Humidity, wind, Rainfall and solar radiation on animals	1
9.	Concept of Homeothermy and Thermal stress in animals – Thermoneutral and Thermocomfort Zone – Upper and lower critical temperatures	1
10.	Thermal exchanges between animal and environment – Conduction, Convection, Radiation and Evaporation	1
11.	Physical and biological measures of thermal stress – Temperature Humidity Index (THI), The Livestock Weather Safety Index (LWSI), A wind chill index (WCI), Comprehensive climate index (CCI), Tunica Dartos Index (TDI), Infra-red thermography (IRT) based measures	1
12.	Effect of other environmental stressors like Solar UV radiation, high altitude, pollution related stressors	1
13.	Concept of Adaptation, Acclimatization, Acclimation - Types and levels of Adaptation	1
14.	Morphological, Anatomical Adaptation of Animals and Birds to various kinds of environments – Theories associated with such adaptations	1
15.	Physiological adaptations to heat stress – circulatory, respiratory, endocrine adjustments – Panting and Sweating in animals –	1
16.	Physiological adaptations to cold stress – circulatory, respiratory, endocrine adjustments – Thermogenesis in cold – Tissues associated with thermogenesis	1
17.	Cellular and Molecular adaptations to thermal stress – Heat shock response – Chaperones and their role in thermotolerance	1
18.	Behavioral adaptations to thermal stress in Animals and Birds – Individual and Group adaptation behaviors	1
19.	Special adaptations to Extreme environments like Deserts, polar regions – Estivation, hibernation and torpor	1
20.	Physiology of thermal reception and processing – Central and peripheral thermo receptors – Fever, Hyperthermia and Hypothermia	1
21.	Overview of all thermal adaptation features in Farm animals including camel and donkeys, Yak	1
22.	Special thermal adaptation features in birds – Thermal adaptation during flight	1

S. No.	Topic	No. of Lectures
23.	Measures of thermotolerance in animals – Rhoads, Gaala's, Benezra's, Iberian heat tolerance indices and cooling efficiency test of Dowling	1
24.	Adaptation of animals to High Altitude Stress – Pulmonary circulation changes adjustments in blood–O_2 affinity with change in altitude	1
25.	Concept of Global warming and climate change – Approaches to alleviate the adverse effects of climate change induced heat stress.	1
26.	Concept of redox biology, oxidative eustress and oxidative distress– History of oxidative stress concept	1
27.	Kinds and forms of Oxidative stress – Classification of oxidative stress (Basal, low intensity, intermediate intensity and high intensity)	1
28.	Reactive Oxygen Species (ROS) and Reactive Nitrogen Species (RNS) – Different types of ROS and RNS– Sources of ROS and RNS generation – Oxidative and Nitrosative damage	1
29.	Concept of Redox signaling – Role of redox signaling in physiological and pathological processes	1
30.	Measuring Reactive Oxygen Species – Direct and indirect assays measuring ROS including chemiluminescence and electron spin resonance	1
31.	Antioxidant defense and their mechanism of cytoprotective actions – Enzymatic and non-enzymatic antioxidants in the body	1
32.	Dietary antioxidants in livestock and poultry production including synthetic and herbal antioxidants	1
	Total	**32**

I. Course Title : Advances in Reproductive Physiology

II. Course Code : VPY 712

III. Credit Hours : 2+1

IV. Aim of the course

To understand recent developments in physiology of reproduction in domestic animals.

V. Theory

Unit I

Estrus synchronization, Superovulation and Embryo transfer in farm animals.

Unit II

Seminal plasma proteins; Sexing of spermatozoa; Cryopreservation of semen.

Unit III

Collection and grading of oocytes; IVM, IVF and IVC; Cryopreservation of embryos; sexing of embryos; Micromanipulation of gametes and embryos.

Unit IV

Transgenic animals; applications of stem cells and nano technology in reproduction.

S. No.	Topic	No. of Lectures/ Practicals
Theory		
1.	Estrus synchronization in farm animals (Cattle, Buffalo, Sheep and Goat)	3
2.	Superovulation and Embryo transfer in farm animals(Cattle, Buffalo, Sheep and Goat)	3

S. No.	Topic	No. of Lectures/ Practicals
3.	Collection of Semen in farm animals	1
4.	Seminal plasma proteins and their importance in determining male fertility	2
5.	Sexing of spermatozoa	1
6.	Cryopreservation of semen in farm animals	1
7.	Collection of oocytes from live animals and slaughter house specimens	1
8.	Grading of oocytes	1
9.	*In-vitro* maturation of oocytes	2
10.	*In-vitro* fertilization of oocytes	2
11.	*In-vitro* culture of embryos	1
12.	Cryopreservation of embryos in farm animals	2
13.	Sexing of embryos	2
14.	Micromanipulation of gametes and embryos (Intracytoplasmic sperm injection and somatic cell nuclear transfer) and their applications	3
15.	Transgenic animal production and its importance	2
16.	Stem cell production and its clinical applications	3
17.	Nanotechnology and its use in farm animal breeding and reproduction	2
	Total	**32**
Practical		
1.	Semen analysis – Fructolytic index, zona free ovum test, Acrosomal integrity test	2
2.	Synchronization and superovulation protocols.	1
3.	Ovum pick up from superovulated animals	1
4.	Collection of oocytes from slaughter house derived ovaries, grading and evaluation	1
5.	Capacitation of spermatozoa	1
6.	*In-vitro* fertilization, *In-vitro* embryo production	1
7.	Collection of embryos using non-surgical procedures, Transferring embryos using non- surgical procedures.	2
8.	Oocyte/ Embryo/ ovarian/ testicular tissue freezing protocols.	1
9.	Demonstration on Intracytoplasmic sperm injection	1
10.	Micromanipulation of early embryos.	2
11.	Isolation and identification of embryonic stem cells	3
	Total	**16**

Note: The course teachers shall conduct the above practicals by utilizing facilities from semen/ IVF lab in the university/ college, if not available in the department.

I. Course Title : Research and Publication Ethics

II. Course Code : RPE 700

III. Credit Hours : 1+1

IV. Overview

This course has total 6 units focusing on basics of philosophy of science and ethics, Research integrity, Publication ethics. Hands-on-sessions are designed to identify research misconduct and predatory publications. Indexing and citation databases, open access publications, Research metrics (citations, h-index, Impact Factor, etc.) and plagiarism tools will be introduced in this course.

V. Pedagogy

- Class room teaching, Guest lectures, Group discussions and practical sessions.

VI. Evaluation

- Continuous assessment will be done through tutorials, assignments, quizzes, and group discussions. Weightage will be given for active participation. Final written examination will be conducted at the end of the course.

VII. Course Structure

- The course comprises of six modules listed in table below. Each module has 4-5 units.

VIII. Theory

RPE 01: Philosophy and Ethics

- Introduction to philosophy: definition, nature and scope, concept, branches
- Ethics: definition, moral philosophy, nature of moral judgements and reactions

RPE 02: Scientific Conduct

- Ethics with respect to science and research
- Intellectual honesty and research integrity
- Scientific misconducts: Falsification, Fabrication, and Plagiarism (FFP)
- Redundant publications: duplicate and overlapping publications, salami slicing
- Selective reporting and misrepresentation of data

RPE 03: Publication Ethics

- Publication ethics: definition, introduction and importance
- Best practices/ standards setting initiatives and guidelines: COPE, WAME, etc.
- Conflicts of interest
- Publication misconduct: definition, concept, problems that lead to unethical behavior and vice versa, types
- Violation of publication ethics, authorship and contributorship
- Identification of publication misconduct, complaints and appeals
- Predatory publishers and journals

IX. Practice

RPE 4: Open Access Publishing

- Open access publications and initiatives
- SHERPA/ RoMEO online resource to check publisher copyright and self-archiving policies
- Software tool to identify predatory publications developed by SPPU
- Journal finder/ journal suggestion tools, viz., JANE, Elsevier Journal Finder, Springer Journal Suggested, etc.

RPE 05: Publication Misconduct

A. Group Discussions

- Subject specific ethical issues, FFP, authorship
- Conflicts of interest
- Complaints and appeals: examples and fraud from India and abroad

B. Software tools

- Use of plagiarism software like Tumitin, Urkund and other open source software tools

RPE 06: Databases And Research Metrics

A. Databases

- Indexing databases
- Citation databases: Web of Science, Scopus, etc.

B. Research Metrics

- Impact Factor of journal as per Journal Citation Report, SNIP, SIR, IPP, Cite Score
- Metrics: h-index, g index, i10 index, altmetrics

Common Courses

I. Course Title : Technical Writing and Communications Skills
II. Course Code : PGS 601
III. Credit Hours : 0+1
IV. Aim of the course

- To equip the students/ scholars with skills to write dissertations, research papers, etc.
- To equip the students/ scholars with skills to communicate and articulate in English (verbal as well as writing).

V. Theory

Scientific Writing - Various forms of scientific writings- theses, technical papers, reviews, manuals, etc; Various parts of thesis and research communications (title page, authorship contents page, preface, introduction, review of literature, material and methods, experimental results and discussion); Writing of abstracts, summaries, précis, citations, etc.; commonly used abbreviations in the theses and research communications; illustrations, photographs and drawings with suitable captions; pagination, numbering of tables and illustrations; Writing of numbers and dates in scientific write-ups; Editing and proof-reading; Writing of a review article. Communication Skills - Grammar (Tenses, parts of speech, clauses, punctuation marks); Error analysis (Common errors); Concord; Collocation; Phonetic symbols and transcription; Accentual pattern: Weak forms in connected speech: Participation in group discussion: Facing an interview; presentation of scientific papers. Plagiarism – importance in scientific writing.

VI. Practicals

- Exercises on Various forms of scientific writings - theses, technical papers, reviews, manuals
- Writing of abstracts, summaries, précis, citations
- Various parts of thesis and research communications (title page, authorship contents page, preface, introduction, review of literature, material and methods, experimental results and discussion)
- Editing and proof-reading
- Writing of a review article
- Communication Skills
- Exercises on plagiarism

VII. Suggested Reading

I. Course Title : Agricultural Research, Research Ethics and Rural Development Programmes

II. Course Code : PGS 602

III. Credit Hours : 1+0

IV. Aim of the course

To enlighten the students about the organization and functioning of agricultural research systems at national and international levels, research ethics, and rural development programmes and policies of Government.

V. Theory

Unit I

History of agriculture in brief; Global agricultural research system: need, scope, opportunities; Role in promoting food security, reducing poverty and protecting the environment; National Agricultural Research Systems (NARS) and Regional Agricultural Research Institutions; Consultative Group on International Agricultural Research (CGIAR): International Agricultural Research Centres (IARC), Partnership with NARS, Role as a partner in the global agricultural research system, Strengthening capacities at national and regional levels; International fellowships for scientific mobility.

Unit II

Research ethics: research integrity, research safety in laboratories, welfare of animals used in research, computer ethics, standards and problems in research ethics.

Unit III

Concept and connotations of rural development, rural development policies and strategies. Rural development programmes: Community Development Programme, Intensive Agricultural District Programme, Special group – Area Specific Programme, Integrated Rural Development Programme (IRDP) Panchayati Raj Institutions, Co-operatives, Voluntary Agencies/ Non-Governmental Organisations. Critical evaluation of rural development policies and programmes. Constraints in implementation of rural policies and programmes.

I. Course Title : Basic Concepts in Laboratory Techniques

II. Course Code : PGS 603

III. Credit Hours : 0+1

IV. Aim of the course

To acquaint the students about the basics of commonly used techniques in laboratory.

V. Practical

Safety measures while in Lab; Handling of chemical substances; Use of burettes, pipettes, measuring cylinders, flasks, separatory funnel, condensers, micropipettes and vaccupets; washing, drying and sterilization of glassware; Drying of solvents/ chemicals. Weighing and preparation of solutions of different strengths and their dilution; Handling techniques of solutions; Preparation of different agro-chemical doses in field and pot applications; Preparation of solutions of acids; Neutralisation of acid and bases; Preparation of buffers of different strengths and pH values. Use and handling of microscope, laminar flow, vacuum pumps, viscometer, thermometer, magnetic stirrer, micro-ovens, incubators, sandbath, waterbath, oilbath; Electric wiring and earthing. Preparation of media and methods of sterilization; Seed viability testing, testing of pollen viability; Tissue culture of crop plants; Description of flowering plants in botanical terms in relation to taxonomy.

VI. Suggested Reading

- Furr AK. 2000. *CRC Hand Book of Laboratory Safety*. CRC Press.

I. Course Title : Intellectual Property and its Management in Agriculture

II. Course Code : PGS 604

III. Credit Hours : 1+0

IV. Aim of the course

The main objective of this course is to equip students and stakeholders with knowledge of intellectual property rights (IPR) related protection systems, their significance and use of IPR as a tool for wealth and value creation in a knowledge-based economy.

V. Theory

Historical perspectives and need for the introduction of Intellectual Property Right regime; TRIPs and various provisions in TRIPS Agreement; Intellectual Property and Intellectual Property Rights (IPR), benefits of securing IPRs; Indian Legislations for the protection of various types of Intellectual Properties; Fundamentals of patents, copyrights, Geographical indications, Designs and layout, Trade secrets and Traditional knowledge, Trademarks, protection of plant varieties and farmers' rights and bio- diversity protection; Protectable subject matters, Protection in biotechnology, protection of other biological materials, ownership and period of protection; National Biodiversity protection initiatives; Convention on Biological Diversity; International Treaty on Plant Genetic Resources for Food and Agriculture; Licensing of technologies, Material transfer agreements, Research collaboration Agreement, License Agreement.

I. Course Title : Library and Information Services
II. Course Code : PGS 605
III. Credit Hours : 0+1

IV. Aim of the course

To equip the library users with skills to trace information from libraries efficiently, to apprise them of information and knowledge resources, to carry out literature survey, to formulate information search strategies, and to use modern tools (Internet, OPAC, search engines, etc.) of information search.

V. Practical

Introduction to library and its services; Role of libraries in education, research and technology transfer; Classification systems and organization of library; Sources of information- Primary Sources, Secondary Sources and Tertiary Sources; Intricacies of abstracting and indexing services (Science Citation Index, Biological Abstracts, Chemical Abstracts, CABI Abstracts, etc.); Tracing information from reference sources; Literature survey; Citation techniques/ Preparation of bibliography; Use of CD-ROM Databases, Online Public Access Catalogue and other computerized library services; Use of Internet including search engines and its resources; e-resources access methods.

ANNEXURE I

List of BSMA Committee Members for Basic Veterinary Sciences

(Veterinary Anatomy, Veterinary Biochemistry, Veterinary Biotechnology, Veterinary Extension Education, Veterinary Physiology)

(Constituted by ICAR vide Office order No. F. No. Edn 7/6/2017- EQR dated 4-4-2018)

Name	Address	Specialization.
Dr T.S. Chandrasekhara Rao Chairman	Dean, Faculty of Veterinary Science Sri Venkateswara Veterinary University Tirupati	Veterinary Anatomy
Dr Nirmal Sangwan Member	Director, Human Resource Development LUVAS, Hisar	Veterinary Biochemistry
Dr Taru Sharma Member	Principal Scientist and Head-cum-Director Centre of Advanced Faculty Training in Veterinary Physiology, Division of Physiology and Climatology, ICAR-IVRI, Izatnagar	Veterinary Physiology
Dr Sachinandan De Member	Principal Scientist, Animal Biotechnology Centre, ICAR-NDRI, Karnal	Veterinary Biotechnology
Dr P. Selvaraj Member	Professor, Dept. of Veterinary Physiology Veterinary College and Research Institute, Namakkal	Veterinary Physiology
Dr M. Parthiban Member	Professor and Head, Dept. of Animal Biotechnology Madras Veterinary College, Chennai	Veterinary Biotechnology
Dr Naresh Kumar Member	Professor, Dept. of Vety. Physiology and Biochemistry, Khalsa College of Veterinary and Animal Sciences, Amritsar	Veterinary Biochemistry

Name	Address	Specialization.
Dr S.C. Dubal Member	Professor of Anatomy College of Veterinary Science, Anand	Veterinary Anatomy
Dr D. Thammi Raju Member	Principal Scientist, ICAR, NAARM, Hyderabad	Veterinary Extension
Dr B.P. Singh Convener	Principal Scientist, Division of Veterinary Extension. ICAR-IVRI, Izatnagar	Veterinary Extension

Restructured and Revised
Syllabi of Post-graduate Programmes
Vol. 3

Veterinary Clinical Subjects

- Animal Reproduction Gynaecology and Obstetrics
- Veterinary Surgery and Radiology
- Veterinary Medicine

Contents

Acknowledgements

Veterinary Clinical Subjects are considered as 'Mirror' of Veterinary College. Presently, worldover the ecosystem of Veterinary Clinical Subjects is being dominated by technology driven management and treatment of different clinical entities. Under each discipline of clinical subjects, i.e. Medicine, Surgery and Gynaecology, there is need to introduce specialised courses. This will allow each discipline to grow and render treatment of animals with improved protocols at field level. Further, the spectrum of treatment by private practitioners has widened. All this increases responsibility of University Teaching Hospitals to evolve affordable and state-of-the-art treatment protocols with continuous veterinary education programmes.

Amidst limitations and as per the guidelines of ICAR, restructuring of PG Syllabi in Veterinary Clinical Subjects is undertaken, after deliberations held during the meetings and workshops. The contribution of all Stakeholders including Heads of Department of Veterinary Clinical Subjects is duly acknowledged. BSMA Committee Members for Veterinary Clinical Subjects joins us in conveying special thanks to Hon'ble Vice Chancellors of Kamdhenu University, RAJUVAS and MAFSU for permission to organise meetings/ workshops. The cooperation rendered by Deans of Veterinary Colleges at CVAS, Udaipur, BVC, Mumbai and their team is appreciable. Dr G.S. Khandekar from BVC, Mumbai deserves special mention for his efforts.

A scope for refinement exists, which can be undertaken at University level, within the prescribed guidelines of ICAR.

Happy teaching of Clinical Subjects !

Dr D. B. Patil
Convener
Dr Jit Singh
Chairman
ICAR-BSMA Committee for
Veterinary Clinical Subjects

Veterinary Clinical Subjects
– Animal Reproduction Gynaecology and Obstetrics

Preamble
(Animal Reproduction, Gynaecology and Obstetrics)

At Masters' level, BSMA committee members thoroughly examined the existing course contents and deleted those portions which were of repetitive nature and non-pertinent. Also, the titles of many existing courses have suitably been modified. Some of the new chapters, both in theory as well as practical courses, viz., Role of pineal gland, endogenous opioids and neuropeptides in reproduction, Negative energy balance w.r.t. infertility, its prevention and amelioration, White side test, Endometrial cytology, Transition cow, Onset of postpartum ovarian activity, Caesarean section, Anaesthesia for caesarean section, Ovariohysterectomy, Seminiferous epithelial cycle, Spermatogonial wave, Mechanism of sperm motility, Influence of seminal plasma proteins in modulating fertility, Heat stress and it's effect on sperm production, Screening of the breeding bulls to be selected for semen collection, Biosecurity measures in semen production and controlling microbial load, Quality assurance for quality semen production, Instrumentation in semen laboratory, MSP for semen production, Sexed semen production, sexing of embryos, *in-vitro* culture of granulosa cells, cumulus cells, luteal cells and oviductal cells, Recovery of bovine oocytes from abattoir ovaries and live animals, Principles and application of PCR technique in animal reproduction, etc., were suitably added in the different chapters of existing courses. Eight new courses, viz., Canine and feline reproduction, Caprine and ovine reproduction, Equine reproduction, Camel reproduction, Elephant reproduction, Wild and zoo animal reproduction, Porcine reproduction and Ultrasonography in animal reproduction has been introduced at masters level. These new courses will be helpful in introducing new insights to the students. This will increase the wide coverage of area specific courses essentially required with respect to regional prospective of the country. These new courses will also be helpful in enhancing the competency of students in a global prospective.

At doctoral level, different existing courses were examined thoroughly and chapters of repetitive nature were deleted from the course contents. Also, the titles of four existing courses have suitably been modified. Some of the new chapters, viz., Assessment of neonatal viability, Care of the newborn, Care of the postpartum dam, Seminiferous eipithelial cycle, Theory of sperm motility and ultrastructure of sperm. Sperm passage in female reproductive tract; capacitation and acrosome reaction, Karyotyping to identify sperm defect and DNA mapping for parentage, Collection of preputial washings and semen for bacterial load and venereal pathogens, Cryopreservation of embryos, Intracytoplasmic sperm injection (ICSI), Gene expression in oocyte and embryo, identification of cellular organelles of Gamete, Semen sorting for production of sexed semen, Contribution of gonads and accessory sex glands to semen ejaculate. Factors affecting semen production. Morphology of sperm and their defects. Biochemical composition of semen, Metabolism of sperm. Role of seminal plasma proteins. Species variation in seminal characteristics, Commercial extenders used for bovine semen, Microbial contamination of semen and measures for its prevention, Quality control and quality assurance of semen, Antisperm antibodies, Flow cytometric assessment of sperm quality, Sperm vitrification, Freeze drying of sperm and sperm encapsulation, *in-vitro* tests for sperm function, i.e. BCMPT, HOST, etc., Physical and enzymatic changes in semen following cryopreservation, Tests to assess acrosomal integrity, mitochondrial activity, DNA damage, binding assays, etc. Fluorescent probe based assessment of sperm quality. Comet assay, Sperm chromatin structure assay, TUNEL assay, etc. were added in different units of revised courses of both in theory and practical portions. The revised courses will be helpful in introducing new insights and improve competency in the students in a global context.

*Core Courses

Course Contents
M.V.Sc. in Animal Reproduction Gynaecology and Obstetrics

I. Course Title : General Gynaecology

II. Course Code : VGO 501

III. Credit Hours : 2+1

IV. Aim of the course

To understand the basics of physiology of female reproduction and it's hormonal regulation/ manipulation/ control.

V. Theory

Unit I

Functional anatomy, puberty and sexual maturity, Role of hypothalamic-pituitary-gonadal axis in attainment of puberty and sexual maturity, Endocrine regulation of estrous cycle. Role of pineal gland, endogenous opioids and neuropeptides in reproduction.

Unit II

Folliculogenesis, Oogenesis and ovulation and associated endocrine pattern, manipulation of follicular waves, Synchronization of estrus and ovulation and induction of ovarian activity.

Unit III

Gamete transport, Fertilization, Implantation and maternal recognition of pregnancy.

Unit IV

Embryonic and fetal development, Placentation, Fetal circulation and gestation, position of fetus in the uterus, age characteristics of fetus.

Unit V

Pregnancy diagnosis: Clinical, Ultrasonographic, Endocrinological and other diagnostic laboratory tests.

Unit VI

Lactation and artificial induction of lactation.

VI. Practical

Clinical examination of female genitalia. Biometry of female genital organs. Rectal and vaginal examination to diagnose cyclic phases of estrous cycle. Fern pattern of cervical mucus and exfoliated vaginal cytology. Pregnancy diagnosis in large and small animals by various methods. Estimation of age of the fetus. Use of ultrasound/ RIA/ ELISA in gynaecology. Synchronization of estrus and ovulation in farm animals.

VII. Suggested Reading

- Perry T Cupps. 2009. *Reproduction in Domestic Animals*. Academic Press.
- Hafez ESE and B Hafez. 2013. *Reproduction in Farm Animals*. Wiley-Blackwell.
- Mauricio Pineda and Michael P Dooley. 2008. *McDonald's Veterinary Endocrinology* and Wiley-Blackwell.

- David Noakes, Timothy Parkinson and Gary England 2018. *Veterinary Reproduction and Obstetrics*. Saunders Ltd.
- Roberts SJ. 2005. *Veterinary Obstetrics and Genital Diseases*. Scientific Book Agency.

I. Course Title : Female Infertility in Farm Animals

II. Course Code : VGO 502

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training in diagnosis and treatment of infertility in female domestic animals.

V. Theory

Unit I

Introduction to infertility, classification, economic impact. Anatomical causes of infertility, congenital and hereditary causes and acquired defects.

Unit II

Nutritional causes of infertility. Importance of body condition score. Negative energy balance, its prevention and amelioration.

Unit III

Managemental and environmental causes of infertility. Out of season breeding.

Unit IV

Infectious causes of female infertility, Specific and non-specific infections; It's diagnosis, treatment, prevention and control.

Unit V

Ovarian dysfunction; Anoestrus, Cystic ovarian degeneration, Anovulation, Delayed ovulation and luteal insufficiency; causes, diagnosis and treatment.

Unit VI

Repeat breeding; its causes, diagnosis and treatment.

Unit VII

Early embryonic death (EED); it's causes, Diagnosis and therapeutic management.

Unit VIII

Abortion; causes, diagnosis and prevention of abortion.

Unit IX

Interactions in immunological mechanisms and infertility.

VI. Practical

Record keeping, herd fertility assessment and management, diagnosis and treatment of infertility in female animals, use of uterine swabs for bacterial and fungal culture, histo-pathological evaluation of uterine biopsy, white side test, endometrial cytology and hormone assay. Use of ultrasonography in diagnosis of infertility. Immuno- diagnostic techniques.

- Roberts SJ. 2005. *Veterinary Obstetrics and Genital Diseases*. Scientific Book Agency.

I. Course Title : Veterinary Obstetrics

II. Course Code : VGO 503

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training on problems of pregnancy and parturition and their management in domestic animals.

V. Theory

Unit I

Parturition; stages of parturition, Mechanism of initiation of parturition, Hormonal profiles associated with parturition, Transition cow, Onset of postpartum ovarian activity.

Unit II

Principles of handling of dystocia, Obstetrical procedures: Mutations, Fetotomy, caesarean section. Obstetrical anaesthesia and analgesia, epidural anesthesia.

Unit III

Fetal and maternal dystocia; causes, diagnosis and management.

Unit IV

Uterine torsion; causes, diagnosis and its correction. Caesarean section, anaesthesia for caesarean section, ovariohysterectomy.

Unit V

Diseases and accidents during gestation and around parturition.

Unit VI

Etiology, diagnosis and treatment of ante-partum and post-partum uterine and vaginal prolapse.

Unit VII

Induction of parturition and elective termination of pregnancy.

Unit VIII

Involution of uterus following normal and abnormal parturition.

Unit IX

Care of dam and the newborn.

VI. Practical

Pelvimetry of different species of farm animals. Diagnosis and correction of abnormal fetal presentation, position and posture in phantom box. Epidural anesthesia, episiotomy, ovariohysterectomy and caesarean operation. Management of incomplete cervical dilation. Fetotomy operations. Detorsion of uterus. Management of cervico-vaginal and uterine prolapse. Handling of clinical cases of dystocia.

VII. Suggested Reading

- Sloss V and Dufty JH. 1980. *Handbook of Bovine Obstetrics*. Williams and Wilkins.

I. Course Title : Andrology and Male Infertility

II. Course Code : VGO 504

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about male reproduction and treatment of male infertility in domestic animals.

V. Theory

Unit I

Structure and function of reproductive tract of male.

Unit II

Sexual behavior and examination of bulls for breeding soundness.

Unit III

Spermatogenesis, Seminiferous epithelial cycle, Spermatogonial wave, Structure of spermatozoa, Semen and its composition. Mechanism of sperm motility.

Unit IV

Diseases transmitted through semen. Factors affecting semen quality, semen culture, tests for assessment of sperm motility, sperm survival and fertilizing capacity of spermatozoa.

Unit V

Causes of infertility; hereditary, congenital, infectious, nutritional and hormonal. Pathological and functional disturbances of epididymis, vas deferens and accessory sex glands.

Unit VI

Impotentia coeundi and impotentia generandi. Testicular hypoplasia and degeneration; causes and affect on semen and fertility. Coital injuries and vices of male animals.

Unit VII

Influence of seminal plasma proteins in modulating fertility. Heat stress and it's effect on sperm production.

Unit VIII

Screening of the breeding bulls to be selected for semen collection.

VI. Practical

General and rectal examination for biometrics of male genitalia and accessory sex glands. Breeding soundness evaluation of male animals. Semen evaluation for sperm abnormalities, fertility and determination of other biochemical constituents of seminal plasma, Microbiological load of semen. Examination, diagnosis and treatment of infertile male animals.

VII. Suggested Reading

- Salisbury GW, VanDemark NL and Lodge JR. 1978. *Physiology of Reproduction and Artificial Insemination of Cattle*. WH Freeman and Co.

I. Course Title : Semen Preservation and Artificial Insemination

II. Course Code : VGO 505

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about collection, evaluation and preservation of semen and artificial insemination in domestic animals.

V. Theory

Unit I

History of artificial insemination. Methods of semen collection.

Unit II

Semen evaluation; macroscopic, microscopic, biochemical and microbiological tests.

Unit III

Semen preservation. Extenders for preservation of semen at different temperatures. Semen additives for enhancement of motility and fertilizing capacity of spermatozoa. Dilution of semen.

Unit IV

Cryopreservation of semen. Effect of cryopreservation on spermatozoa, semen quality and fertility. Liquid Nitrogen (LN2) cylinders; it's handling, care and maintenance.

Unit V

Thawing protocols of frozen semen. Factors affecting post-thaw semen quality.

Unit VI

Ideal protocol for AI in different species of animals. Factors affecting success of AI.

Unit VII

Biosecurity and biosafety guidelines for frozen semen stations, semen processing laboratories and quarantine stations. Minimum standards and standard operating procedures for artificial insemination, Quality testing of straws and sheath for use in artificial insemination.

VI. Practical

Instrumentation in semen laboratory, Minimum standards of protocols and Standard operating procedures for semen production, Computer assisted semen analysis (CASA), Collection and evaluation of semen. Preparation of extenders. Preservation of semen; room temperature, refrigeration and cryopreservation. Handling and evaluation of processed semen. Practice of AI techniques.

I. Course Title : Basics of Reproductive Biotechnology

II. Course Code : VGO 506

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training on biotechniques in animal reproduction.

V. Theory

Unit I

Embryo transfer technology: selection of donors and recipients.

Unit II

Synchronization, super-ovulation, surgical and non-surgical collection of embryos and evaluation of embryos.

Unit III

Cryopreservation of embryos, transfer of embryos to donors. Sexed semen production, sexing of embryos. Guidelines for export and import of bovine germplasm. Guidelines and standards regarding embryo production.

Unit IV

In-vitro culture of granulosa cells, cumulus cells, luteal cells and oviductal cells. Recovery of bovine oocytes; from abattoir ovaries and live animals, *in-vitro* fertilization, *in-vitro* maturation, micromanipulation of embryos.

Unit V

Immuno-neutralization of hormones. Immunomodulation of fertility.

VI. Practical

Synchronization of estrus in donors and recipients, superovulation, surgical and non-surgical collection and transfer of embryos. Collection of oocytes from slaughter house genitalia. *In-vitro* fertilization, *in-vitro* maturation and cryopreservation of embryos. Sexing of embryos.

I. Course Title : Clinical Practice-I

II. Course Code : VGO 507

III. Credit Hours : 0+3

IV. Aim of the course

Hands-on training on diagnosis and treatment of reproductive disorders in animals at VCC.

V. Practical

Clinical examination of animals affected with reproductive disorders, Use of diagnostic techniques for diagnosis and institution of required therapy. Acquaintance with different equipment used for handling reproductive disorders, Client management, Public relations, Code of conduct, Database management, Maintenance of case records.

VI. Suggested Reading

- Morrow DA. 1986. *Current Therapy in Theriogenology*. WB Saunders.

I. Course Title : Canine and Feline Reproduction

II. Course Code : VGO 509

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about reproduction in canine and feline.

V. Theory

Unit I

Development of reproductive system. Anatomy of male and female reproductive system. Canine and feline estrous cycle, endocrinology of estrous cycle.

Unit II

Breeding management, pregnancy, pregnancy diagnosis; clinical, ultrasonographic, endocrinological and other diagnostic laboratory tests.

Unit III

Parturition, fetal and maternal dystocia; causes, diagnosis and management. Induction of parturition and caesarean section, periparturient disorders.

Unit IV

Medical termination of pregnancy in dogs and cats, management of psudopregnancy, pyometra and it's management. Infertility and it's management in dogs and cats.

Unit V

Postpartum care of dam and lactation. Neonatal care.

Unit VI

Population control in dogs; surgical and non surgical methods.

Unit VII

Reproductive physiology of male dogs, semen collection techniques, semen evaluation, freezing of semen, artificial insemination techniques, male reproductive disorders and it's management.

VI. Practical

Exfoliative vaginal cytology, determination of ovulation time, demonstration of semen collection and artificial insemination, predicting time of parturition using hormonal assay, management of dystocia using clinical cases, castration, ovariohystrectomy, caesarean section, surgical procedure related to reproductive disorders in both male and female dogs and cats.

I. Course Title : Caprine and Ovine Reproduction

II. Course Code : VGO 510

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about reproduction in sheep and goat.

V. Theory

Unit I

Caprine and ovine estrous cycle, endocrinology of estrous cycle, Seasonal breeding activity in sheep and goat, Artificial control of oestrus in sheep and goat.

Unit II

Breeding management, methods for advancing sheep breeding season, Induction of multiple births in sheep. Artificial insemination, pregnancy and parturition, Dystocia and it's management.

Unit III

Reproductive disorders and it's management.

Unit IV

Reproductive physiology of males, semen collection techniques, semen evaluation, freezing of semen, male reproductive disorders and it's management.

VI. Practical

Demonstration of semen collection and artificial insemination, management of dystocia using clinical cases, castration, ovariohystrectomy, caesarean section, surgical procedure related to reproductive disorders in both male and females.

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Equine Reproduction

II. Course Code : VGO 511

III. Credit Hours : 2+1

IV. Aim of the course

To encompass the fundamentals of equine reproductive anatomy and physiology. This will help in understanding the care and management of the breeding stallion and the broodmare.

V. Theory

Unit I

Anatomy and physiology of the mare and stallion.

Unit II

Manipulation of estrus in the mare, estrous cycle, broodmare management, Use of ultrasound in breeding management.

Unit III

Infertility and it's management.

Unit IV

Pregnancy diagnosis and management of the pregnant mare. Fetal development, abortion, induced parturition and dystocia.

Unit V

Neonatal management and common neonatal diseases, orphan foal management, foal management during the first six months.

Unit VII

Semen collection, semen preservation, artificial insemination and embryo transfer.

VI. Practical

Visit of equine/ stud farm, overall management of an equine breeding program, handling the cases of reproductive disorders, artificial insemination, semen collection, semen preservation, breeding record keeping and analysis.

VII. Suggested Reading

I. Course Title : Camel Reproduction
II. Course Code : VGO 512
III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about reproduction in camels.

V. Theory

Unit I

Male reproductive organs, male reproductive physiology and sexual behavior, puberty and sexual maturity, seasonal changes, copulation, semen collection and it's characteristics.

Unit II

Female reproductive organs, female reproductive physiology and sexual behavior, oestrous cycle, external signs of oestrus, pregnancy and foetal development, pregnancy diagnosis and parturition.

Unit III

Age of sexual maturity, breeding season, conception rate, calving interval, reproductive longevity.

Unit IV

Early embryonic mortality, reproductive problems in the female, reproductive problems in the male.

Unit V

Artificial insemination, nutrition and reproduction, embryo transfer in camel.

VI. Practical

Management of dystocia in clinical cases, castration, ovariohystrectomy, caesarean section, surgical procedure related to reproductive disorders in both male and females.

VII. Suggested Reading

- H Merkt, D Rath, B Musa, MA El-Naggar. 1990. *Reproduction in Camels*. FAO.
- Muhammad Jamshed Khan. 2011. *Equine and Camel Production: An Approach towards Better Management*. LAP LAMBERT Academic Pub.
- Selected articles from journals.

I. Course Title : Elephant Reproduction

II. Course Code : VGO 513

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about reproduction in elephant.

V. Theory

Unit I

General introduction, Elephas maximus, domestic and wild elephants.

Unit II

Male genital system, Accessory sex glands, Hormonal control and semenology.

Unit III

Female reproductive system, Ovaries, fallopian tubes, Uterus, vagina and external genitalia. Oestrous cycle, Hormonal regulation of estrous cycle, Mating behaviour and act of copulation.

Unit IV

Pregnancy, Gestation length and parturition. Neonatal care of elephant calves.

Unit V

Musth in elephants, behavioral patterns, pre-musth, violent- musth and post-musth phases, controlling elephants in musth using drugs/ hormones, anti androgens. Artificial insemination and cryopreservation of gametes.

VI. Practical

Management of dystocia in clinical cases, surgical procedure related to reproductive disorders in both male and females.

VII. Suggested Reading

I. Course Title : Wild and Zoo Animal Reproduction
II. Course Code : VGO 514
III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge and training about reproduction in Wild and zoo animals.

V. Theory

Unit I

Introduction to reproduction, Pattern of estrous cycle, Optimal breeding time with emphasis on tiger, deer, monkey and crocodile.

Unit II

Gestational length, parturition and pregnancy diagnosis.

Unit III

Sexual behavior and major reproductive disorders in wild and zoo animals, contraception techniques for deer.

VI. Practical

Management of dystocia in clinical cases, castration, observation of estrus behavior, pregnancy diagnosis, surgical procedure related to reproductive disorders in both male and females.

VII. Suggested Reading

- GR Smith, JP Hearn and Wellcome Trust (London, England). 1988. *Reproduction and disease in captive and wild animals*, New York: Oxford University Press.

- Selected articles from journals.

I. Course Title : Porcine Reproduction
II. Course Code : VGO 515
III. Credit Hours : 2+1

IV. Aim of the course

To acquire knowledge about the fundamentals of reproductive anatomy, physiology and advances in fertility management in swine.

V. Theory

Unit I

Anatomy and physiology of boar and sow.

Unit II

Oestrus cycle in sow, manipulation of oestrus cycle, methods for detection of oestrus, endocrinology of pregnancy and parturition.

Unit III

Infertility in sow and its management.

Unit IV

Pregnancy diagnosis and management of pregnant sow.

Unit V

Fetal development, abortion, induced parturition, dystocia, stages of parturition and mastitis-metritis complex in sow.

Unit VI

Neonatal management and common neonatal diseases, care of piglets.

Unit VII

Breeding boar selection and management, semen collection, semen preservation, natural service, artificial insemination, embryo transfer and IVF.

VI. Practical

Visit of swine farm, breeding management in sows, handling the cases of reproductive disorders, caesarean section, castration, sexual behaviour, vaginal cytology, pregnancy diagnosis, dystocia, semen collection, semen preservation, artificial insemination, embryo transfer and record keeping.

VII. Suggested Reading

I. Course Title : Ultrasonography in Animal Reproduction

II. Course Code : VGO 516

III. Credit Hours : 1+2

IV. Aim of the course

To impart knowledge and training about application of ultrasonography in diagnosis of conditions associated with animal reproduction.

V. Theory

Unit I

Basic principle of ultrasonography, physics of ultrasonography, A-mode, B-mode and M-mode ultrasonography, artifacts, principle of Doppler ultrasonography.

Unit II

Trans-abdominal ultrasonography, transrectal ultrasonography, follicular dynamics and luteal characteristics in large and small ruminants, luteal blood flow studies.

Unit III

Use of ultrasonography in pregnancy diagnosis, infertility management, uterine involution, luteal cyst and follicular cyst, blood flow studies in uterine and foetal arteries. Determination of gestational age in small animals by measuring gestational sac diameter, crown rump length and body diameter. Detection of foetal resorption and mummification. Prediction of parturition time, fetal viability by detecting fetal heart rate, foetal number and sex determination.

Unit IV

Testicular and male accessory sex gland ultrasonography.

VI. Practical

Use of ultrasonography in different stages of reproductive cycle. Use of ultrasonography in diagnosis of clinical cases associated with reproductive disorders in both male and females.

VII. Suggested Reading

- MAM Taverne and AH Willemse. 1989. *Diagnostic ultrasound and animal reproduction*. Dordrecht; Boston: Kluwer Academic.
- J Ginther. 1998. *Ultrasonic imaging and animal reproduction*. Cross Plains, Wis.: Equiservices Pub.
- Selected articles from journals.

I. Course Title : Special Problem
II. Course Code : VGO 590
III. Credit Hours : 0+1

IV. Aim of the course

To expose students to research techniques related to sub discipline of the subject and submission of written project with references.

V. Practical

Student will carry out research on allotted project and submit the project report.

VGO 591 Master's Seminar 1+0
VGO 599 Master's Research 30

Course Outline: Lecture wise

VGO 501: General Gynaecology (2+1)

Theory Lectures

1. Functional anatomy reproductive organs, puberty and sexual maturity in farm animals.
2. Endocrine regulation of estrous cycle in farm animals.
3. Role of hypothalamic-pituitary-gonadal axis in attainment of puberty.
4. Role of pineal gland, endogenous opioids and neuropeptides in reproduction.
5. Folliculogenesis, follicular waves and its manipulation, oogenesis and ovulation.
6. Synchronization of estrus and ovulation in farm animals.
7. Artificial induction of ovarian activity.
8. Transport of gametes in the reproductive tract, fertilization and implantation.
9. Maternal recognition of pregnancy in farm animals.
10. Embryonic and fetal development during gestation.
11. Placentation and fetal circulation.
12. Gestational changes in the fetus w.r.t. to position in the uterus, age, etc.
13. Pregnancy diagnosis in farm animals. Pregnancy diagnosis using clinical method.
14. Pregnancy diagnosis using endocrinological and other diagnostic laboratory methods.
15. Pregnancy diagnosis using ultrasonographic method.
16. Lactation and artificial induction of lactation in cattle and buffaloes.

Practicals

1. Clinical examination of female genitalia.
2. Biometry of female genital organs using slaughter house specimen.
3. Rectal and vaginal examination to diagnose cyclic phases of estrous cycle.
4. Fern pattern of cervical mucus and exfoliated vaginal cytology.
5. Pregnancy diagnosis in large and small animals by various methods.
6. Estimation of age of the fetus.
7. Pregnancy diagnosis using Ultrasonography method.
8. Pregnancy diagnosis using endocrinological method.
9. Synchronization of estrus and ovulation in farm animals.

VGO 502: Female Infertility In Farm Animals (2+1)

Theory Lectures

1. Infertility, its classification and economic impact.
2. Anatomical, congenital/ hereditary and acquired causes of infertility.
3. Nutritional causes of infertility.
4. Importance of body condition score. Negative energy balance, its prevention and amelioration.
5. Managemental and environmental causes of infertility.
6. Out of season breeding.
7. Infectious causes of female infertility, specific and non-specific infections; it's diagnosis, treatment, prevention and control.

8. Anoestrus; causes, diagnosis and treatment.
9. Cystic ovarian degeneration; causes, diagnosis and treatment.
10. Anovulation and delayed ovulation; causes, diagnosis and treatment.
11. Luteal insufficiency; causes, diagnosis and treatment.
12. Repeat breeding; its causes, diagnosis and treatment.
13. Early embryonic death (EED); it's causes, diagnosis and therapeutic management.
14. Abortion; Infectious and non infectious causes of abortion.
15. Diagnosis and prevention of abortion.
16. Immunological mechanisms leading to infertility.

Practicals

1. Record keeping w.r.t. herd fertility assessment and management.
2. Diagnosis and treatment of infertility in female animals.
3. Uterine swabbing for bacterial and fungal culture.
4. Histo-pathological evaluation of uterine biopsy.
5. White side test, endometrial cytology and hormone assay.
6. Use of ultrasonography in diagnosis of infertility.
7. Immuno- diagnostic techniques.

VOG 503: Veterinary Obstetrics (2+1)

Theory Lectures

1. Parturition; stages of parturition.
2. Mechanism of initiation of parturition, hormonal profiles associated with parturition.
3. Transition cow, onset of postpartum ovarian activity.
4. Dystocia and principles of handling of dystocia.
5. Obstetrical procedures: mutations, fetotomy, caesarean section.
6. Obstetrical anesthesia and analgesia, epidural anesthesia.
7. Fetal dystocia; causes, diagnosis and management.
8. Maternal dystocia; causes, diagnosis and management.
9. Uterine torsion; causes, diagnosis and its correction.
10. Caesarean section and ovariohysterectomy.
11. Diseases and accidents during gestation
12. Diseases and accidents around parturition.
13. Etiology, diagnosis and treatment of ante-partum vagino-cervical prolapse.
14. Etiology, diagnosis and treatment of post-partum uterine and vaginal prolapse.
15. Induction of parturition and elective termination of pregnancy.
16. Involution of uterus following normal and abnormal parturition.
17. Care of dam and the newborn.

Practicals

1. Pelvimetry of different species of farm animals.
2. Diagnosis and correction of abnormal fetal presentation, position and posture in phantom box.
3. Epidural anesthesia, episiotomy, ovariohysterectomy.
4. Caesarean operation.
5. Management of incomplete cervical dilation.
6. Fetotomy operations.
7. Detorsion of uterus.
8. Management of cervico-vaginal and uterine prolapse.
9. Handling of clinical cases of dystocia.

VGO 504: Andrology and Male Infertility (2+1)

Theory Lectures

1. Structure and function of reproductive tract of male.
2. Sexual behavior in males.
3. Examination of bulls for breeding soundness.
4. Spermatogenesis, seminiferous epithelial cycle and spermatogonial wave.
5. Structure of spermatozoa, semen and its composition.
6. Mechanism of sperm motility.
7. Diseases transmitted through semen.
8. Factors affecting semen quality.
9. Tests for assessment of sperm motility, sperm survival and fertilizing capacity of spermatozoa.
10. Causes of male infertility; hereditary, congenital, infectious, nutritional and hormonal.
11. Pathological and functional disturbances of epididymis, vas deferens and accessory sex glands.
12. Impotentia cocundi and impotentia generandi.
13. Testicular hypoplasia and degeneration; causes and affect on semen and fertility.
14. Coital injuries and vices of male animals.
15. Influence of seminal plasma proteins in modulating fertility.
16. Heat stress and its effect on sperm production.
17. Screening of the breeding bulls to be selected for semen collection.

Practicals

1. General and per-rectal examination for biometrics of male genitalia and accessory sex glands.
2. Breeding soundness evaluation of male animals.
3. Semen evaluation for sperm abnormalities, fertility.
4. Determination of biochemical constituents of seminal plasma.
5. Microbiological load assessment of semen.
6. Examination, diagnosis and treatment of infertile male animals.

VGO 505: Semen Preservation and Artificial Insemination (2+1)

Theory Lectures

1. History of artificial insemination.
2. Methods of semen collection.
3. Semen evaluation; macroscopic and microscopic examination.
4. Biochemical and microbiological tests of semen.
5. Semen dilution and preservation.
6. Extenders for preservation of semen at different temperatures.
7. Semen additives for enhancement of motility and fertilizing capacity of spermatozoa.
8. Cryopreservation of semen.
9. Effect of cryopreservation on spermatozoa, semen quality and fertility.
10. Liquid Nitrogen (LN2) cylinders; its handling, care and maintenance.
11. Thawing protocols of frozen semen.
12. Factors affecting post-thaw semen quality.
13. Ideal protocol for AI in different species of animals. Factors affecting success of AI.
14. Biosecurity and biosafety guidelines for frozen semen stations, semen processing laboratories and quarantine stations.

15. Minimum standards and standard operating procedures for artificial insemination.
16. Quality testing of straws and sheath for use in artificial insemination.

Practicals

1. Instrumentation in semen laboratory.
2. Minimum standards of protocols of semen laboratory.
3. Standard operating procedures for semen production.
4. Computer assisted semen analysis.
5. Collection and evaluation of semen for its quality.
6. Preparation of semen extenders.
7. Preservation of semen; room temperature, refrigeration and cryopreservation.
8. Handling and evaluation of processed semen.
9. Practice of AI techniques.

VGO 506: Basics of Reproductive Biotechnology (2+1)

Theory Lectures

1. Embryo transfer technology: selection of donors and recipients.
2. Synchronization of estrus in donors and recipients.
3. Super-ovulation, surgical and non-surgical collection of embryos.
4. Evaluation and cryopreservation of embryos.
5. Transfer of embryos to donors.
6. Sexed semen production.
7. Sexing of embryos.
8. Guidelines for export and import of bovine germplasm.
9. Guidelines and standards regarding embryo production.
10. *In-vitro* culture of granulosa cells, cumulus cells, luteal cells and oviductal cells.
11. Recovery of bovine oocytes; from abattoir ovaries and live animals.
12. *In-vitro* maturation, *in-vitro* fertilization and micromanipulation of embryos.
13. Immuno-neutralization and immunomodulation of fertility.

Practicals

1. Synchronization of estrus in donors and recipients.
2. Superovulation, surgical and non-surgical collection and transfer of embryos.
3. Collection of oocytes from slaughter house genitalia.
4. *In-vitro* maturation and *in-vitro* fertilization of embryos.
5. Sexing of embryos.

VGO 509: Canine and Feline Reproduction (2+1)

Theory Lectures

1. Development of reproductive system. Anatomy of male and female reproductive system.
2. Canine and feline estrous cycle, endocrinology of estrous cycle.
3. Breeding management.
4. Pregnancy and pregnancy diagnosis; clinical method of pregnancy diagnosis.
5. Ultrasonographic, endocrinological and other diagnostic laboratory tests of pregnancy diagnosis.
6. Parturition and periparturient disorders in dogs and cats.
7. Dystocia; fetal and maternal causes, diagnosis and management.
8. Induction of parturition and caesarean section.
9. Medical termination of pregnancy in dogs and cats.

10. Management of psudopregnancy and pyometra.
11. Infertility and it's management in dogs and cats.
12. Postpartum care of dam and lactation. Neonatal care.
13. Population control in dogs; surgical and non surgical methods.
14. Reproductive physiology of male dogs.
15. Semen collection techniques and semen evaluation.
16. Freezing of semen and artificial insemination techniques.
17. Male reproductive disorders and its management.

Practicals

1. Exfoliative vaginal cytology.
2. Determination of ovulation time.
3. Demonstration of semen collection and artificial insemination.
4. Predicting time of parturition using hormonal assay.
5. Management of dystocia in clinical cases.
6. Castration, ovariohystrectomy and caesarean section.
7. Surgical procedure related to reproductive disorders in both male and female dogs and cats.

VGO 510: Caprine and Ovine Reproduction (2+1)

Theory Lectures

1. Caprine and ovine estrous cycle.
2. Endocrinology of estrous cycle.
3. Seasonal breeding activity in sheep and goat.
4. Artificial control of oestrus in sheep and goat.
5. Breeding management.
6. Methods for advancing sheep breeding season, induction of multiple births in sheep.
7. Artificial insemination.
8. Pregnancy and parturition.
9. Dystocia and its management.
10. Reproductive disorders and its management.
11. Reproductive physiology of males.
12. Semen collection techniques and semen evaluation.
13. Freezing of semen.
14. Male reproductive disorders and its management.

Practicals

1. Demonstration of semen collection.
2. Demonstration of artificial insemination.
3. Management of dystocia in clinical cases.
4. Castration.
5. Ovariohystrectomy and caesarean section.
6. Surgical procedure related to reproductive disorders in both male and females.

VGO 511: Equine Reproduction (2+1)

Theory Lectures

1. Reproductive anatomy and physiology of Mare.
2. Reproductive anatomy and physiology Stallion.
3. Estrous cycle, manipulation of estrus in Mare.
4. Broodmare management.

5. Use of ultrasound in breeding management.
6. Infertility in Mare and it's management.
7. Pregnancy diagnosis.
8. Management of the pregnant mare.
9. Fetal development.
10. Abortion.
11. Parturition, induced parturition.
12. Management of dystocia.
13. Neonatal management.
14. Common neonatal diseases, orphan foal management.
15. Foal management during the first six months.
16. Semen collection.
17. Semen preservation.
18. Artificial insemination.
19. Embryo transfer.

Practicals

1. Visit of equine/ stud farm.
2. Overall management of an equine breeding program.
3. Handling the cases of reproductive disorders.
4. Artificial insemination.
5. Semen collection.
6. Semen preservation.
7. Breeding record keeping and analysis.

VGO 512: Camel Reproduction (2+1)

Theory Lectures

1. Male reproductive organs, male reproductive physiology.
2. Sexual behavior, puberty and sexual mamturity.
3. Seasonal changes and copulation.
4. Semen collection and it's characteristics.
5. Female reproductive organs, female reproductive physiology.
6. Sexual behavior, oestrous cycle, signs of oestrus.
7. Pregnancy and foetal development.
8. Pregnancy diagnosis.
9. Parturition.
10. Age of sexual maturity, breeding season.
11. Conception rate, calving interval, reproductive longevity.
12. Early embryonic mortality, reproductive problems in the female.
13. Reproductive problems in the male.
14. Artificial insemination.
15. Nutrition and reproduction.
16. Embryo transfer in camel.

Practicals

1. Management of dystocia in clinical cases.
2. Castration and ovariohystrectomy.
3. Caesarean section.
4. Surgical procedure related to reproductive disorders in both male and females.

VGO 513: Elephant Reproduction (2+1)

Theory Lectures

1. General introduction, Elephas maximus, domestic and wild elephants.
2. Male genital system, accessory sex glands.
3. Spermatogenesis and hormonal control.
4. Semen characteristics.
5. Female reproductive system, ovaries, fallopian tubes, uterus, vagina and external genitalia.
6. Oestrous cycle, hormonal regulation of estrous cycle.
7. Mating behaviour and act of copulation.
8. Pregnancy, gestation length.
9. Parturition.
10. Neonatal care of elephant calves.
11. Musth in elephants, bahavioural patterns, pre-musth, violent- musth and post-musth phases.
12. Controlling elephants in musth using drugs/ hormones, anti androgens.
13. Artificial insemination.
14. Cryopreservation of gametes.

Practicals

1. Management of dystocia in clinical cases.
2. Surgical procedure related to reproductive disorders in both male and females.

VGO 514: Wild and Zoo Animal Reproduction (2+1)

Theory Lectures

1. Introduction to reproduction in wild animals.
2. Pattern of estrous cycle in tiger, deer, monkey and crocodile.
3. Optimal breeding time with emphasis on tiger, deer, monkey and crocodile.
4. Gestational length and pregnancy diagnosis in wild and zoo animals.
5. Parturition in wild and zoo animals.
6. Sexual behavior in wild and zoo animals.
7. Major reproductive disorders in wild and zoo animals.
8. Contraception techniques for deer.

Practicals

1. Management of dystocia in clinical cases.
2. Castration in wild and zoo animals.
3. Observation of estrus behavior.
4. Pregnancy diagnosis.
5. Surgical procedure related to reproductive disorders in both male and females.

VGO 515: Porcine Reproduction (2+1)

Theory Lectures

1. Anatomy and physiology of Boar
2. Anatomy and physiology of Sow.
3. Oestrus cycle, manipulation of oestrus cycle in sow.
4. Methods for detection of oestrus.
5. Endocrinology of pregnancy.
6. Endocrinology of parturition.

7. Infertility in sow and its management.
8. Pregnancy diagnosis and management of pregnant sow.
9. Fetal development.
10. Abortion and induced parturition.
11. Parturition and its stages.
12. Dystocia in Sow.
13. Mastitis-metritis complex in sow.
14. Neonatal management and common neonatal diseases, care of piglets.
15. Breeding boar selection and management.
16. Semen collection and preservation.
17. Natural service and artificial insemination.
18. Embryo transfer and IVF.

Practicals

1. Visit and record keeping of swine farm.
2. Breeding management in sows.
3. Handling the cases of reproductive disorders.
4. Caesarean section and castration.
5. Sexual behaviour and vaginal cytology.
6. Pregnancy diagnosis in Sow.
7. Semen collection, semen preservation and artificial insemination.
8. Embryo transfer in Sow.

VGO 516: Ultrasonography in Animal Reproduction (1+2)

Theory Lectures

1. Basic principle of ultrasonography, physics of ultrasonography, A-mode, B-mode and M-mode Ultrasonography. Artifacts and principle of Doppler ultrasonography.
2. Trans-abdominal and transrectal ultrasonography.
3. Follicular dynamics and luteal characteristics in large and small ruminants, luteal blood flow studies.
4. Use of ultrasonography in pregnancy diagnosis and infertility management.
5. Studies on uterine involution, luteal cyst and follicular cyst, blood flow studies in uterine and foetal arteries ultrasonography.
6. Determination of gestational age in small animals by measuring gestational sac diameter, crown rump length and body diameter. Detection of foetal resorption and mummification.
7. Prediction of parturition time, fetal viability by detecting fetal heart rate, foetal number and sex determination.
8. Testicular and male accessory sex gland ultrasonography.

Practicals

1. Practicing trans-abdominal and trans-rectal ultrasonography.
2. Use of ultrasonography in follicular dynamics study.
3. Use of ultrasonography in luteal characteristics study.
4. Use of ultrasonography in pregnancy diagnosis.
5. Prediction of parturition time using ultrasonography.
6. Use of ultrasonography in diagnosis of clinical cases associated with reproductive disorders in females.
7. Testicular studies using ultrasonography.
8. Male accessory sex gland studies using ultrasonography

9. Use of ultrasonography in diagnosis of clinical cases associated with reproductive disorders in male.

Minor Courses for M.V.Sc. Degree programme

Courses of any one department/ discipline from the list given below:

- Veterinary Pathology
- Veterinary Pharmacology
- Veterinary Physiology
- Veterinary Biochemistry
- Veterinary Bacteriology
- Veterinary Immunology

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ guide concerned.

Common Courses

The following courses (one credit each) will be offered to all students undergoing Master's degree programme.

- Library and Information Services
- Technical Writing and Communications Skills
- Intellectual Property and its management in Agriculture
- Basic Concepts in Laboratory Techniques
- Agricultural Research, Research Ethics and Rural Development Programmes

Course Title with Credit Load
Ph.D. in Animal Reproduction Gynaecology and Obstetrics

Course Code	Course Title	Credit Hours
VGO 601	Advances in Gynaecology and Infertility* Management	2+1
VGO 602	Advances in Veterinary Obstetrics	1+1
VGO 603	Advances in Andrology and Male Infertility*	2+1
VGO 604	Reproductive Biotechnology	1+1
VGO 605	Semenology	1+1
VGO 606	Clinical Practice-I*	0+3
VGO 607	Clinical Practice-II*	0+3
VGO 690	Special Problem	0+2
VGO 691	Doctoral Seminar-I	1+0
VGO 692	Doctoral Seminar-II	1+0
VGO 699	Doctoral Research	75

*Core Courses

Course Contents
Ph.D. in Animal Reproduction Gynaecology and Obstetrics

I. Course Title : Advances in Gynaecology and Infertility Management

II. Course Code : VGO 601

III. Credit Hours : 2+1

IV. Aim of the course

To learn about advances in endocrine, ovarian and uterine functions and effect of nutrition, season and immunological factors on female fertility.

V. Theory

Unit I

Neuro-endocrine control of reproduction, follicular development, ovulation fertilization and implantation. Embryonic and fetal development.

Unit II

Maternal recognition of pregnancy advances in early diagnosis of pregnancy.

Unit III

Embryonic losses, abortion and their prevention.

Unit IV

Seasonal breeders, Synchronization and induction of estrus and ovulation in seasonal breeders, Assisted Reproductive Technology (ART) to increase reproductive efficiency in farm animals.

Unit V

Effect of stress, nutrition and immunological factors on fertility.

Unit VI

Onset of postpartum ovarian activity and factors affecting it.

Unit VI

Diagnostic and therapeutic approaches in infertility; principles of hormone therapy in reproductive disorders, laparoscopy, ultrasonographic diagnosis of ovarian/ uterine dysfunction, reproductive disorders, vaginal and uterine cytology.

VI. Practical

Clinical examination of female animals. Use of ultrasonography in ovarian function (follicular image pattern, follicular dynamics) and in early pregnancy diagnosis and infertility. Utility of uterine culture, uterine cytology and uterine biopsy (histopathological examination) in infertility investigation. Laparoscopy in diagnosis of ovarian and uterine dysfunction. ELISA/ RIA of hormones and interpretation of results. Use of assisted reproductive technology (ART) to enhance reproductive efficiency in farm animals.

VII. Suggested Reading

- Hafez ESE and B Hafez. 2013. *Reproduction in Farm Animals*. Wiley-Blackwell.

- Mauricio Pineda and Michael P Dooley. 2008. *McDonald's Veterinary Endocrinology* and Wiley-Blackwell.
- David Noakes, Timothy Parkinson and Gary England. 2018. *Veterinary Reproduction and Obstetrics*. Saunders Ltd.
- Roberts SJ. 2005. *Veterinary Obstetrics and Genital Diseases*. Scientific Book Agency.
- Morrow DA. 1986. *Current Therapy in Theriogenology*. WB Saunders.
- Selected articles from journals.

I. Course Title : Advances in Veterinary Obstetrics

II. Course Code : VGO 602

III. Credit Hours : 1+1

IV. Aim of the course

To learn current developments in diagnosis and management of dystocia, accidents of gestation and peri-parturient disorders in domestic animals.

V. Theory

Unit I

Conceptus and its development. Factors influencing gestation period and birth weight.

Unit II

Anomalies of conceptus, teratogens and effect of stress on conceptus development.

Unit III

Mechanism of initiation of parturition. Use of tocolytic drugs.

Unit IV

Induction of parturition and termination of abnormal pregnancies. Obstetrical analgesia and anesthesia.

Unit V

Pre-treatment evaluation of the dam suffering from dystocia. Management of maternal and fetal dystocia, hydrallantois, hydramnion, fetal mummification, fetal maceration, uterine inertia and uterine torsion.

Unit VI

Fetotomy, caesarean section and ovairo-hysterectomy. Retention of fetal membranes and management.

Unit VII

Neo-natal physiology and post-natal adaptations. Assessment of neonatal viability, care of the newborn.

Unit VIII

Involution of uterus, post-partum ovarian dysfunction and their manipulation. Care of the postpartum dam.

VI. Practical

Obstetrical operations in fetal dystocia; mutations, fetotomy, cesarean section, ovario-hysterectomy; induction of parturition, obstetrical analgesia and anaesthesia.

VII. Suggested Reading

- David Noakes, Timothy Parkinson and Gary England. 2018. *Veterinary Reproduction and Obstetrics*. Saunders Ltd.
- Roberts SJ. 2005. *Veterinary Obstetrics and Genital Diseases*. Scientific Book Agency.
- Sloss V and Dufty JH. 1980. *Handbook of Bovine Obstetrics*. Williams and Wilkins.
- Selected articles from journals.

I. Course Title : Advances in Andrology and Male Infertility

II. Course Code : VGO 603

III. Credit Hours : 2+1

IV. Aim of the course

To learn advances in male reproduction and treatment of male infertility in domestic animals.

V. Theory

Unit I

Spermatogenesis, Spermatogenic waves, Sperm passage in male genitalia, biochemical milieu of male genitalia. Correlation between motility and fertilizing capacity of spermatozoa. Seminiferous eipithelial cycle, Theory of sperm motility and ultrastructure of sperm. Sperm passage in female reproductive tract; capacitation and acrosome reaction.

Unit II

Separation of motile and immotile spermatozoa.

Unit III

Sperm plasma membrane and its permeability and binding properties: acrosome and lysosomal enzymes, sperm nucleus and nuclear proteins. Mitochondria and their role in sperm metabolism. Flagellum and the mechanochemical basis of motility and cyclic nucleotides.

Unit IV

Biochemistry of seminal plasma and accessory sex gland secretions. Electrolytes, proteins, Enzymes and amino acids in seminal plasma. Fructose and other sugars, Lipids, Cholesterol, Steroid hormones and Prostaglandins in seminal plasma.

Unit V

Fructolysis index. Aerobic and anaerobic metabolism of spermatozoa.

Unit VI

Markers of fertility in males, sperm chromatin structure assay, Anti-sperm antibodies. Karyotyping to identify sperm defect and DNA mapping for parentage.

VI. Practical

Breeding soundness evaluation of bulls, biochemical tests of semen for evaluation of fertility, semen culture for diagnosis of venereal diseases, diagnosis and treatment of genital pathological condition. Computer assisted semen analysis (CASA), Semen evaluation for assessment of fertilizing capacity of spermatozoa: cervical mucus penetration test, sperm capacitation test, hypo osmotic swelling test and zona free hamster egg penetration test. Anti-sperm antibody assay. Collection of preputial washings and semen for bacterial load and venereal pathogens.

I. Course Title : Reproductive Biotechnology

II. Course Code : VGO 604

III. Credit Hours : 1+1

IV. Aim of the course

To learn advances and recent developments in biotechnology in reproduction for the production of desired elite animals.

V. Theory

Unit I

Micromanipulation, Intracytoplasmic Sperm Injection (ICSI), Sexing of embryos.

Unit II

Stem cell biotechnology, Semen sorting for production of sexed semen.

Unit III

Cloning, Biopharming, Transgenic Animals and Chimeras.

Unit IV

Transgenic animals and chimeras. Gene expression in oocyte and embryo, Identification of cellular organelles of Gamete.

Unit V

Principle and application of PCR technique in animal reproduction.

VI. Practical

Micromanipulation of embryos, Sexing of embryos, Stem cell production.

VII. Suggested Reading

I. Course Title : Semenology

II. Course Code : VGO 605

III. Credit Hours : 1+1

IV. Aim of the course

To learn advances in processing and cryopreservation of semen and insemination techniques to obtain high fertility.

V. Theory

Unit I

Contribution of gonads and accessory sex glands to semen ejaculate. Factors affecting semen production. Morphology of sperm and their defects. Biochemical composition of semen.

Unit II

Metabolism of sperm. Role of seminal plasma proteins. Species variation in seminal characteristics. Factors affecting motility and fertilizing capacity of spermatozoa.

Unit III

Use of semen additives and activators. Sperm cryodamage, Commercial extenders used for bovine semen. Microbial contamination of semen and measures for its prevention. Transmission of venereal diseases through semen and their prevention.

Unit IV

Thawing protocols for frozen semen. Post-thaw evaluation of motility and fertilizing capacity of spermatozoa. Quality control and quality assurance of semen, antisperm antibodies. Flow cytometric assessment of sperm quality.

Unit V

Sperm vitrification, freeze drying of sperm and sperm encapsulation.

Unit VI

Criteria for gradation of semen stations.

VI. Practical

Semen evaluation. Estimation of bacterial load and enzymes in semen. Morphological defects of sperm. *In-vitro* tests for sperm function i.e. BCMPT, HOST, etc. Physical and enzymatic changes in semen following cryopreservation. Tests to assess acrosomal integrity, Mitochondrial activity, DNA damage, binding assays, etc. Fluorescent probe based assessment of sperm quality. Comet assay, Sperm chromatin structure assay, TUNEL assay.

VII. Suggested Reading

I. Course Title : Clinical Practice-I

II. Course Code : VGO 606

III. Credit Hours : 0+3

IV. Aim of the course

Hands-on training on diagnosis and treatment of reproductive disorders in animals

V. Practical

Clinical examination of animals affected with reproductive disorders, use of diagnostic techniques for diagnosis and institution of required therapy. Acquaintance with different equipment used for handling reproductive disorders, client management, public relations, code of conduct, database management, Maintenance of case records.

VI. Suggested Reading

- Morrow DA. 1986. *Current Therapy in Theriogenology*. WB Saunders.
- Zemjanis R. 1970. *Diagnostic and Therapeutic Techniques in Animal Reproduction*. Williams and Wilkins; Second Edition.
- Selected articles from journals.

I. Course Title : Clinical Practice-II
II. Course Code : VGO 607
III. Credit Hours : 0+3

IV. Aim of the course

Hands-on training on diagnosis and treatment of reproductive disorders in animals.

V. Practical

Clinical examination of animals affected with reproductive disorders, use of diagnostic techniques for diagnosis and institution of required therapy. Acquaintance with different equipment used for handling reproductive disorders, client management, public relations, code of conduct, database management, Maintenance of case records.

VI. Suggested Reading

- Morrow DA. 1986. *Current Therapy in Theriogenology*. WB Saunders.
- Zemjanis R. 1970. *Diagnostic and Therapeutic Techniques in Animal Reproduction*. Williams and Wilkins; Second Edition.
- Selected articles from journals.

I. Course Code : VGO 690
II. Course Title : Special Problem
III. Credit Hours : 0+2

V. Aim of the course

To expose students to research techniques related to sub discipline of the subject and submission of written project with references.

VI. Practical

Student will carry out research on allotted project and submit the project report.

VGO 691 DOCTORAL SEMINAR-I 1+0
VGO 692 DOCTORAL SEMINAR-II 1+0
VGO 699 DOCTORAL RESEARCH 75

Course Outline: Lecture wise

VGO 601: Advances in Gynaecology and Infertility Management (2+1)

Theory Lectures

1. Neuro-endocrine control of reproduction.
2. Follicular development.
3. Ovulation, fertilization and implantation.
4. Embryonic and fetal development.
5. Maternal recognition of pregnancy.
6. Advances in early diagnosis of pregnancy.
7. Embryonic losses, abortion and their prevention.
8. Seasonal breeders, synchronization and induction of estrus and ovulation in seasonal breeders.
9. Assisted reproductive technology (ART) to increase reproductive efficiency in farm animals.
10. Effect of stress and nutritional factors on fertility.
11. Effect of immunological factors on fertility.
12. Onset of postpartum ovarian activity and factors affecting it.
13. Diagnostic and therapeutic approaches in infertility.
14. Principles of hormone therapy in reproductive disorders.
15. Laproscopy.
16. Ultrasonographic diagnosis of ovarian/ uterine dysfunction.
17. Vaginal and uterine cytology.

Practicals

1. Clinical examination of female animals for reproductive soundness.
2. Use of ultrasonography in ovarian function (follicular image pattern, follicular dynamics).
3. Use of ultrasonography in early pregnancy diagnosis.
4. Use of ultrasonography in infertility management.
5. Uterine culture, uterine cytology and uterine biopsy (histopathological examination) in infertility investigation.
6. Laparoscopy in diagnosis of ovarian and uterine dysfunction.
7. Use of ELISA/ RIA in reproductive parameters study and interpretation of results.
8. Use of Assisted reproductive technology (ART) to enhance reproductive efficiency in farm animals.

VGO 602: Advances in Veterinary Obstetrics (1+1)

Theory Lectures

1. Conceptus and its development.
2. Factors influencing gestation period and birth weight.
3. Anomalies of conceptus, teratogens and effect of stress on conceptus development.
4. Mechanism of initiation of parturition. Use of tocolytic drugs.

5. Induction of parturition and termination of abnormal pregnancies.
6. Pre-treatment evaluation of the dam suffering from dystocia. Obstetrical analgesia and anesthesia.
7. Management of maternal and fetal dystocia, hydrallantois, hydramnion, fetal mummification, fetal maceration, uterine inertia and uterine torsion.
8. Fetotomy, caesarean section and ovaro-hysterectomy.
9. Retention of fetal membranes and management.
10. Neo-natal physiology and post-natal adaptations. Assessment of neonatal viability, care of the newborn.
11. Involution of uterus, post-partum ovarian dysfunction and their manipulation. Care of the postpartum dam.

Practicals

1. Performing obstetrical operations.
2. Performing obstetrical mutations.
3. Fetotomy.
4. Cesarean section and ovario-hysterectomy.
5. Induction of parturition.
6. Obstetrical analgesia and anaesthesia.

VGO 603: Advances in Andrology and Male Infertility (2+1)

Theory Lectures

1. Spermatogenesis and spermatogenic waves.
2. Sperm passage in male genitalia, biochemical milieu of male genitalia.
3. Correlation between motility and fertilizing capacity of spermatozoa.
4. Seminiferous eipithelial cycle, theory of sperm motility and ultrastructure of sperm.
5. Sperm passage in female reproductive tract; capacitation and acrosome reaction.
6. Separation of motile and immotile spermatozoa.
7. Sperm plasma membrane and its permeability and binding properties: acrosome and lysosomal enzymes, sperm nucleus and nuclear proteins.
8. Mitochondria and their role in sperm metabolism.
9. Flagellum and the mechanochemical basis of motility and cyclic nucleotides.
10. Biochemistry of seminal plasma and accessory sex gland secretions.
11. Electrolytes, proteins, enzymes and amino acids in seminal plasma. Fructose and other sugars, lipids, cholesterol, steroid hormones and prostaglandins in seminal plasma.
12. Fructolysis index. Aerobic and anaerobic metabolism of spermatozoa.
13. Markers of fertility in males.
14. Sperm chromatin structure assay.
15. Anti-sperm antibodies.
16. Karyotyping to identify sperm defect and DNA mapping for parentage.

Practicals

1. Breeding soundness evaluation of bulls.
2. Biochemical tests of semen for evaluation of fertility.
3. Semen culture for diagnosis of venereal diseases.
4. Diagnosis and treatment of genital pathological condition.
5. Studies on sperm motility using Computer assisted semen analysis (CASA).
6. Cervical mucus penetration test, sperm capacitation test and hypo-osmotic swelling test.

7. Zona free hamster egg penetration test.
8. Anti-sperm antibody assay.
9. Collection of preputial washings and semen for bacterial load and venereal pathogens.

VGO 604: Reproductive Biotechnology (1+1)

Theory Lectures

1. Micromanipulation and Intracytoplasmic sperm injection (ICSI).
2. Sexing of embryos.
3. Stem cell biotechnology.
4. Semen sorting for production of sexed semen.
5. Cloning and biopharming.
6. Transgenic animals and chimeras.
7. Gene expression in oocyte and embryo, identification of cellular organelles of Gamete.
8. Principle and application of PCR technique in animal reproduction.

Practicals

1. Micromanipulation of embryos.
2. Sexing of embryos.
3. Stem cell production.

VGO 605: Semenology (1+1)

Theory Lectures

1. Contribution of gonads and accessory sex glands to semen ejaculate. Factors affecting semen production.
2. Morphology of sperm and their defects. Biochemical composition of semen.
3. Metabolism of sperm. Role of seminal plasma proteins. Species variation in seminal characteristics.
4. Factors affecting motility and fertilizing capacity of spermatozoa. Commercial extenders used for bovine semen.
5. Use of semen additives and activators. Sperm cryodamage.
6. Microbial contamination of semen and measures for its prevention. Transmission of venereal diseases through semen and their prevention.
7. Thawing protocols for frozen semen. Post-thaw evaluation of motility and fertilizing capacity of spermatozoa.
8. Quality control and quality assurance of semen.
9. Antisperm antibodies assay.
10. Flow cytometric assessment of sperm quality.
11. Sperm vitrification, freeze drying of sperm and sperm encapsulation.
12. Criteria for gradation of semen stations.

Practicals

1. Semen evaluation for its quality.
2. Estimation of bacterial load in semen.
3. Estimation of enzymes in the semen.
4. *In-vitro* tests for sperm function i.e. BCMPT, HOST, etc.
5. Tests to assess acrosomal integrity, mitochondrial activity and DNA damage.
6. Tests to assess binding assays.
7. Fluorescent probe based assessment of sperm quality.
8. Comet assay, Sperm chromatin structure assay, TUNEL assay.

Minor Courses for Ph.D. Degree programme

Courses of any one department/ discipline from the list given below:

- Veterinary Pathology
- Veterinary Pharmacology
- Veterinary Physiology
- Veterinary Biochemistry
- Veterinary Bacteriology
- Veterinary Immunology

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ guide concerned.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Veterinary Clinical Subjects
– Veterinary Surgery and Radiology

Preamble
(Veterinary Surgery and Radiology)

The subjects under surgical discipline have undergone sea change, except for 'Tenets of Halstead', since the introduction of 'Key Hole' surgery and newer imaging techniques. In fact, the technological advancements demand creation of two separate disciplines - Surgery and Imaging. Further, to start with there is need of separate speciality courses involving Imaging, Orthopaedics, Anaesthesia and Ophthalmology. Scope also exists for addition of Avian Surgery, etc. However, in view of BSMA guidelines, efforts have been made to tune the Syllabus as per the existing infrastructure catering futuristic societal needs and to remain relevant and purposeful.

To encourage clinical practice in the veterinary clinics, courses on clinical practice, each at M.V.Sc. and Ph.D. level have been made mandatory. To focus on learning of research methodology, scientific thinking, planning and experimentation, a course on special problems has been introduced.

The new and restructured postgraduate curricula and syllabi in Surgery and Radiology contains several innovative and practically applicable courses. Credit hours for Clinical Practice have been increased from 0+3 to 0+4, as maximum time of the postgraduate scholars of clinical disciplines is spent in clinics. Small animal anaesthesia (2+1) and Large animal anaesthesia (2+1) courses are merged together and a new course on Veterinary Anaesthesia and Analgesia (2+1) is proposed. Small Animal Soft Tissue Surgery (2+1) and Large Animal Soft Tissue Surgery (2+1) courses are merged together and a new course Soft Tissue Surgery (2+1) is proposed. As per the advances in Ophthalmology and Dentistry, Veterinary Ophthalmology and Dentistry (1+1) is bifurcated into two separate courses, Veterinary Ophthalmology (1+1) and Veterinary Dentistry and Oral Surgery (1+1) to give more emphasis in two different distinct subjects.

New Courses were added to M.V.Sc. degree programme to gain thorough knowledge in areas like Anaesthesia of zoo, wild, exotic and laboratory animals (1+1), Urogenital Surgery (1+1), Cardiovascular Surgery (1+1). Clinical Case Conference (0+1) was added to encourage the students to do thorough case study of a single patient. In few states of India, certain species of animals are more prevalent, hence, we have developed species specific courses for those dealing with majority of cases in that particular region. Thus two new courses, viz., Camel surgery (1+1) and Elephant surgery (1+1) are added.

At Ph.D. level, courses on experimental surgical techniques in animals (1+1) is deleted in view of new CPCEA guidelines of unnecessary experimentation on animals to be discouraged and new methods be designed for teaching. Few new courses in Ph.D. degree programme were added, viz., Advances in orthopaedics (2+1), Reconstructive and regenerative surgery (1+1), Cardiovascular surgery (1+1), Special problems in diagnostic imaging (0+2), Advances in soft tissue surgery (2+1), Advances in veterinary ophthalmology (1+1), Veterinary surgical oncology (1+1), Clinical case conference (0+1), Advances in radiology (2+1) and Advances in diagnostic imaging techniques (2+1). These new courses are designed in such a way to keep pace with the development of new technologies and recent advances in these areas.

Under existing clinical ecosystem, the implementation of the new and restructured postgraduate course curricula is expected to build clinical knowledge and skill portfolio of the students so as to enhance their employability and marketability as multi-service providers with hands on skills and comprehensive knowledge of the entire subject after Masters degree. The doctorates should, in turn, prove as specialists, in the field of their specialization.

Course Title with Credit Load
M.V.Sc. in Veterinary Surgery and Radiology

Course Code	Course Title	Credit Hours
VSR 501	Clinical Practice-I*	0+3
VSR 502	Clinical Practice-II*	0+3
VSR 503	Principles of Surgery*	2+1
VSR 504	Anaesthesia And Analgesia*	2+1
VSR 505	Diagnostic Imaging Techniques*	2+1
VSR 506	Soft Tissue Surgery	2+1
VSR 507	Orthopaedic Surgery*	2+1
VSR 508	Anaesthesia of Zoo, Wild, Exotic and Laboratory Animals	1+1
VSR 509	Urogenital Surgery	1+1
VSR 510	Ophthalmology	1+1
VSR 511	Dentistry and Oral Surgery	1+1
VSR 512	Camel Surgery	1+1
VSR 513	Elephant Surgery	1+1
VSR 587	Clinical Case Conference	0+1
VSR 588	Special Problem in Radiology	0+2
VSR 589	Special Problem in Anaesthesia	0+2
VSR 590	Special Problem in Surgery	0+2
VSR 591	Masters Seminar	1+0
VSR 599	Masters Research	0+30

*Core Courses

Course Contents
M.V.Sc. in Veterinary Surgery and Radiology

I. Course Title : Clinical Practice-I
II. Course Code : VSR 501
III. Credit Hours : 0+3
IV. Aim of the course

To learn techniques and procedures in anaesthesia, diagnostic imaging techniques and surgery

V. Practical

Basic requirements and designing surgical and general veterinary hospital, Developing different proformas required in hospital facility, Assessing surgical patients and documentation, Preparation of surgical team and duties of team members, Surgical suite maintenance and sterilization, Acquaintance with different equipment like inhalant anaesthesia machine, Radiography systems, Ultrasonography, Endoscopy, Electro-surgery, Cryosurgery and physiotherapy equipment, Client management, Public relations, code of conduct, Management of surgical affections, Hospital database management, Attending surgical cases, Disaster management.

I. Course Code : VSR 502
II. Course Title : Clinical Practice-II
III. Credit Hours : 0+3
IV. Aim of the course

To learn techniques and procedures in anaesthesia, diagnostic imaging techniques and surgery

V. Practical

Application of different equipment like inhalant anaesthesia machine, Computerized radiography system, Ultrasonography, Electro-surgery, Cryosurgery, Physiotherapy and endoscopy and Physiotherapy equipment, Client management and Counselling, public relations, Code of conduct, Management of surgical affections, Hospital management, Database management, Attending surgical cases, Disaster management.

I. Course Title : Principles of Surgery
II. Course Code : VSR 503
III. Credit Hours : 2+1
IV. Aim of the course

To learn basic and advance principles and standards of practice in veterinary surgery

V. Theory

Unit I

Classification of wounds, wound healing, mechanism of wound repair, local and systemic factors affecting wound healing, current concepts of inflammation and management, thermal, electrical and chemical injuries and their management.

Unit II

Asepsis, sterilization and disinfection and principles and practice of antimicrobial therapy in surgical patients.

Unit III

Shock, classification, pathophysiology, diagnosis, treatment and monitoring, surgical stress and its systemic effects, haemorrhage and haemostasis, acid-base balance, fluid therapy and blood transfusion, metabolism of the surgical patient.

Unit IV

Principles and clinical applications of laser surgery, cryosurgery, electrosurgery, physiotherapy.

Unit V

Minimally invasive surgical procedures which includes laproscopy and endoscopy, principles of microscopic surgery-vessel and nerve anastomosis, application of computers in surgery.

VI. Practical

Identification and handling of surgical instruments, preparation of surgical pack, surgical team and surgical patients, surgical facilities and equipment, introduction to clinical skill laboratory, practice of different suturing patterns and repair of different wounds, using drains, bandages and bandaging techniques, monitoring of traumatized surgical patient, operation theatre conduct.

I. Course Title : Anaesthesia And Analgesia

II. Course Code : VSR 504

III. Credit Hours : 2+1

IV. Aim of the course

To gain the basic and practical knowledge of principals of companion and farm animals anaesthesia and pain management

V. Theory

Unit I

Introduction and history of anaesthesia, General consideration for anaesthesia in animals, Properties of ideal anaesthetic agent, Types of anaesthesia, Anaessthetic triad, Preanaesthetic evaluation of patient and selection of anaesthesia.

Unit II

Preanaesthetic medication (anticholinergics, sedatives, tranquilizers, alpha-2 agonist, narcotics), Muscle relaxants and neuromuscular blocking agents.

Unit III

General anaesthetics and factors affecting their uptake, Distribution and metabolism; Injectable anaesthetic agents (properties, dosage and usage); Combinations of injectable agents and neuroleptanalgesia, Inhalation anaesthetic agents (properties, methods of administration, dosage and usages), Inhalation anaesthesia equipment and breathing circuits, artificial ventilation.

Unit IV

Post-operative care of the surgical patient, operating room emergencies, cardio-pulmonary arrest and resuscitation, monitoring of anaesthetic recovery.

Unit V

Local anaesthetics, their mechanisms, local and regional nerve blocks, spinal analgesia, intravenous regional anaesthesia, peri-operative and post-operative pain and its management.

VI. Practical

Inhalation anaesthesia equipment, circuits and vaporizers, artificial ventilation, use of various pre-anaesthetic and anaesthetic agents in small and large animals, anaesthetic triad, balanced anaesthesia, total intravenous anaesthesia, regional and local nerve blocks using local anaesthetics, alpha-2 agonists and their combinations in domestic animals, monitoring of anaesthesia, reversal of sedation and analgesia induced by alpha-2 agonists, practice of anaesthesia in clinical cases; record keeping in anaesthesia and euthanaia.

I. Course Title : Diagnostic Imaging Techniques

II. Course Code : VSR 505

III. Credit Hours : 2+1

IV. Aim of the course

To learn the basic principles and gain practical knowledge of diagnostic imaging techniques and interpretation

V. Theory

Unit I

Regulations regarding establishment and handling of x-ray units. Requirements for establishment of x-ray units, conventional and digital x-ray machine, x-ray films, Cassettes, screen, x-ray production, Qualities of x-rays, Image formation and dark room procedures, Image plate, Formation of radiograph technique chart, Artifacts and their prevention, Radiographic quality Contrast, Density and details), radiographic accessories, radiographic positioning for different organs/ parts in small and large animals.

Unit II

Plain and contrast radiographic techniques of small and large animals, fluoroscopy/ C-arm, principles of radiographic interpretation,

Unit III

Principles of radiation therapy, medical radioisotope curves, radiation laws and regulations. Radiation hazards and monitoring of radiographic exposure to personnel and protection.

Unit IV

Basic physics of ultrasound waves and image formation, scanning principles of ultrasound, transducers, equipment controls, modes of display, terminology used for echotexture and USG artifacts, application of ultrasound in small and large animals.

Unit V

Doppler techniques echocardiography and its application, introduction to nuclear imaging techniques, computerized tomography, magnetic resonance imaging, positron emission tomography technique.

VI. Practical

Acquaintance with imaging equipment, computed radiography and digital radiography systems, dark room processing techniques and x-ray film handling, formulation of technique chart with fixed kVp and variable mAs, radiographic artefacts and their prevention, basics of radiographic interpretation of diseases, PACS, radiography positioning of different regions in domestic animals, contrast radiographic techniques, interpretation of radiographs, practice of ultrasonographic imaging and report writing.

I. Course Title : Soft Tissue Surgery

II. Course Code : VSR 506

III. Credit Hours : 2+1

IV. Aim of the course

To learn about soft tissue surgical skills and various surgical affections of different body systems in companion and farm animals

V. Theory

Unit I

Skin, adnexa, integument, appendages, horn, tail, sinus affections of equine and bovine, teat affections, principles of plastic and reconstructive surgery, different types of skin grafts.

Unit II

Surgical approaches/ affections of ear, oral cavity, larynx and pharynx, salivary glands, oesophagus, abdomen, rumen, reticulum, omasum, abomasum, stomach, intestines, rectum, anus, liver and biliary system, pancreas and porto-systemic shunts.

Unit III

Abdominal hernia, diaphragmatic hernia, perineal hernia, ventral, femoral and umbilical hernia, ritcher hernia, hiatal hernia, omental hernia, pre-pubic tendon rupture, use of biological and synthetic grafts for hernia repair, laparoscopic repair of hernia.

Unit IV

Principles of thoracic surgery, Functional anatomy of respiratory system, diseases of upper and lower respiratory system, functional anatomy of cardiovascular system and common affections of heart.

Unit V

Affections of pituitary, adrenals, thyroid, parathyroid glands, Principles of neurosurgery and common surgical affections of nervous system and special sense organs.

Unit VI

Haemolymphatic system, bone marrow, spleen, tonsils, lymph nodes and lymphatics, thymus.

VII. Practical

Practice of various surgical techniques of skin and adnexa, alimentary system, hernias, respiratory system, affections of horn, tail and teat, endoscopy techniques, instrumentation, use of rigid/ flexible endoscopes in companion and farm animals.

I. Course Title : Orthopaedic Surgery

II. Course Code : VSR 507

III. Credit Hours : 2+1

IV. Aim of the course

To learn about various affections of bones, joints, tendons, ligaments and foot and their treatment in companion and farm animals.

V. Theory

Unit I

Bone structure and function, growth, Response to injury, Fractures and luxations, classification of fracture, Fracture healing.

Unit II

Biomechanics of fracture healing, Considerations for selection of fixation techniques, Treatment of fractures of different bones in companion and farm animals, Diseases of bone.

Unit III

Various affections of the joints, ligaments and tendons and their treatment.

Unit IV

Spinal affections and injury to axial skeleton.

Unit V

Conformation of the limb, anatomy of hoof, anatomical, conformational and pathological causes of lameness and allied surgical conditions of fore and hind limbs, rehabilitation of orthopaedic patient.

VI. Practical

Application of Plaster of Paris cast, fiberglass cast, Roberts Jones bandage, modified Schroeder Thomas splint, Coaptation splint, sling application, practice of IM pinning, wiring, bone plating, inter locking nailing, external skeletal fixation, arthrotomy, tenotomy, examination of limbs for lameness, desmotomy, nerve blocks, injections in joints, operations for arthritis, hoof surgery and corrective shoeing.

I. Course Title : Anaesthesia of Zoo, Wild, Exotic and Laboratory Animals

II. Course Code : VSR 508

III. Credit Hours : 1+1

IV. Aim of the course

To learn about basic and practical knowledge of chemical immobilization, sedation and anaesthesia of laboratory animals, exotic, captive and free ranging wild animals.

V. Theory

Unit I

General consideration in chemical restraint of captive and free ranging wild animals, handling of birds with minimum stress, physical examination, blood sampling, crop washes, faecal sampling.

Unit II

Methods of administration of anaesthesia in captive, free ranging animals, birds and laboratory animals.

Unit III

Local and general anaesthesia in exotic species, wild animals, birds, zoo animals and laboratory animals.

Unit IV

Anaesthetic emergencies and complications.

Unit V

Diagnostic interpretation, haematology and biochemistry analysis, avian diagnostic endoscopy

VI. Practical

Familiarization with capture and anaesthetic equipments, local anaesthetic techniques, use of various preanaesthetic and anaesthetic agents in laboratory animals, birds, monitoring of patient during general anaesthesia, familiarization of various diseases in exotic birds like tumours, foreign body, crop stasis, crop tear, crop fistula, toe necrosis, feather cyst, excision of uropygieal gland, rhinolith, pharyngostomy, ingluviotomy, ventriculotomy and orthopedic injuries, visits to zoos and wild life sanctuaries for practical on wild and zoo animals.

I. Course Title : Urogenital Surgery

II. Course Code : VSR 509

III. Credit Hours : 1+1

IV. Aim of the course

To learn about various surgical affections of urinary and genital tract and their treatment in companion and farm animals.

V. Theory

Unit I

Surgical anatomy of urinary and reproductive tract in male and female animals, Congenital anomalies of organs of male and female urinary and reproductive system.

Unit II

Principals of urinary tract surgery, Pathophysiology, Diagnosis and surgical management of affections of kidney, ureter, urinary bladder and urethra, Medical dissolution and prevention of Canine uroliths, Feline urologic syndrome, Surgical management of urolithiais in ruminants and its prevention, management of uroperitoneum and renal failure.

Unit III

Pathogenesis, Clinical symptoms, Diagnosis and surgical management of vaginal and uterine prolapse, Rectovaginal fistula, Pneumovagina, Vaginal tumours, pyometra, Cysts of Gartner's canal and vestibular glands.

Unit IV

Surgical conditions of penis, Prepuce, Prostate and testicles, Cryptorchidism, Inguinal and scrotal hernia, Affections of teat and udder.

Unit V

Indications, Techniques and postoperative complications of episiotomy, Ovariectomy, ovariohysterectomy and caesarean section, Pyomerta and its surgical treatment.

Unit VI

Castration, Vasectomy, Cauda epididymectomy and penile deviation.

VI. Practical

Hands-on-training of techniques of centesis of urinary bladder in companion and farm animals, Different types of catheters used in urogenital surgery, Retrograde catheterization of urethra and urinary bladder, Normograde catheterization of urethra on clinical cases of urinary retention, Pudendal nerve block for penis examination in ruminants, Diagnostic techniques and surgical management of the affections of kidney, Ureters, Urinary bladder, Urethra, Uro-hydropropulsion, Restraint and anaesthesia for urogenital tract surgery, Cystotomy, Tube cystostomy, Nephrotomy, Ureterocolostomy, Urethrotomy, Urethrostomy, Castration, Vasectomy, Penile deviation, Epididymectomy, Amputation of penis, Episiotomy, Ovariohysterectomy, Tubectomy, Caesarean section, Management of phimosis, Paraphimosis, Venereal granuloma, Vaginal and uterine prolapse, Rectovaginal fistula and pneumovagina, Bladder and uterine marsupialization.

I. Course Title : Ophthalmology

II. Course Code : VSR 510

III. Credit Hours : 1+1

IV. Aim of the course

To learn basic principles and gain practical knowledge of diagnosis and treatment of diseases of eye.

V. Theory

Unit I

Anatomy and physiology of eye and its adnexa, Ophthalmic examination and diagnosis, Diagnostic instrumentation, Anaesthesia and surgery.

Unit II

General consideration for eye surgery in companion and farm animals, Therapeutic agents for eye diseases and surgery of eye lids, lacrimal apparatus, naso-lacrimal duct.

Unit III

Diseases of conjunctiva, cornea, sclera, iris, orbit, lens, vitreous and aqueous humor, retina and optic nerve, eye tumours, enucleation, exenteration.

Unit IV

Ocular manifestations of systemic diseases.

Unit V

Neuro-ophthalmology and ocular emergencies

VI. Practical

Ophthalmic instrumentation, examination of the eye and its adnexa, anaesthesia, preparation of patient, suture materials for eye surgery, canthotomy, tarsorrhaphy, keratoplasty, anterior chamber paracentesis, flushing of naso-lacrimal duct, iridectomy, phacoemulsification and implantation of foldable lens, surgical treatment of entropion and ectropion, cherry eye, Schirmer tear test, use of fluorescein dye in corneal ulcer, glaucoma surgery, eye worm removal.

I. Course Title : Dentistry and Oral Surgery

II. Course Code : VSR 511

III. Credit Hours : 1+1

IV. Aim of the course

To learn the basic and practical knowledge of diagnosis and treatment of diseases of teeth and oral cavity.

V. Theory

Unit I

Anatomy, development of teeth (odontogenesis), dentition and ageing of different species.

Unit II

Clinical examination of oral cavity, Dental anesthesia and pain management, Dental radiography.

Unit III

Diseases of oral cavity and teeth, Congenital and developmental anomalies of oral cavity, Abnormal tooth eruption, Irregular wear of teeth in companion and farm animals, occlusion and malocclusion, Mandibular fracture, Malformation of mandible, maxilla (cleft palate).

Unit IV

Acquired diseases of teeth (halitosis, dental caries, fracture of teeth, dental materials and dental radiography), Oronasal fistula, Maxilla and mandibular fractures repair, Orthodontics, Tumors and Other acquired condition of oral cavity.

Unit V

Exodontics, Restorative dentistry, Periodontal disease, Tooth extraction, Gum diseases. Endodontics, Pulpectomy, Root Canal therapy (RCT), Current techniques in dentistry.

VI. Practical

Oral examination, Modified triadian system of tooth numbering in various species, Dental chart for companion and farm animals, Dentistry instrumentation, Dental radiography procedure, Periodontal probing, Scaling/ teeth cleaning, Tooth extraction, Malpractices in equine dentistry, Periodical maintenance of oral hygiene, Corrective procedures, Malocclusion, Treatment strategies congenital malformations of maxilla and mandible, oral surgery.

I. Course Title : Camel Surgery

II. Course Code : VSR 512

III. Credit Hours : 1+1

IV. Aim of the course

To learn the basic principles and gain practical knowledge of diagnosis and treatment of surgical diseases of camel.

V. Theory

Unit I

Introduction to special surgical anatomy of important parts, i.e. Mandible, Soft palate, Chest pad, saddle region, Male urinary system, tail, etc., Restraint and positioning for various surgical procedures and radiography of different parts.

Unit II

Use of local anaesthesia, Various nerve blocks and regional anaesthesia used to treat diverse surgical disorders, Preanaesthetics, Tranquilizers, Sedatives and general anaesthetics used for camel surgery.

Unit III

Surgical affections of head and neck region: Laceration and infected wounds of nostril skin, Infection of turbinate, Actinobacillosis, Dental affections, Removal of canines in furious camels, Torticollis, Fracture of mandible and maxilla, Soft palate injuries, Ophthalmic affections, Salivary fistula, Stenson's duct ligation, Oesophageal obstruction.

Unit IV

Surgical affections of thorax and abdominal region: Saddle gall, Hernia, Chest pad wounds and enlargements, Foreign bodies in compartment, Intestinal obstruction, Obstructive urolithiasis, Rupture of urethra, Subcutaneous infiltration of urine, Cystorrhexis.

Unit V

Surgical affections of musculo-skeletal system: diagnosis of lameness in camels, management of long bone and digital fractures, upward fixation of patella, sprains, arthritis.

Unit VI

Sheath abscess, Necrosis of penis, Phimosis, Paraphimosis, Preputial prolapse, Various types of tumours, Gangrene and tumours of udder, Necrosis of tail, Punctured foot, prolapse of digital cushion, Foot injuries, Kumri, Kapali, etc.

VI. Practical

Restraint and anaesthesia (Local, regional, sedation and general anaesthesia), Preparation of sites, Surgical anatomy of important surgical affections, Special instruments used for camel restraining and surgery, Observing and assisting in diverse surgical procedures on clinical cases in camels, Practice of interdental wiring for repair of mandibular fractures in specimen mandibles, Clinical and radiographic diagnosis of lameness, Protection of wounds of chest pad and foot using special bandages, Radiography of different part of camels and postoperative care of diverse surgical affections of camels.

I. Course Title : Elephant Surgery
II. Course Code : VSR 513
III. Credit Hours : 1+1
IV. Aim of the course

To learn the basic principles and gain practical knowledge of diagnosis and treatment of surgical diseases of elephant.

V. Theory

Unit I

Basic surgical anatomy of Asian elephants and comparison with other farm animals.

Unit II

Drug administration techniques in captive and wild elephants, Anaesthetic management of captive and wild elephants for various surgical and managerial conditions.

Unit III

Principles of soft tissue surgery in elephants, Cyst, Bursitis, Gall, Haematoma, Abscess, etc.

Unit IV

Management and treatment of fractures and arthritis in elephants.

Unit V

Pedicure, corrective foot care and maintenance of healthy feet of captive elephants housed in different establishments in different seasons.

Unit VI

Hoisting of recumbent elephants, Surgical methods of birth control in elephants, limitations and risks of abdominal surgery in elephants (eg. Caesarian section, Castration, Hernia, etc., Soft tissue surgery like episiotomy, vestibulotomy, etc.)

VI. Practical

Familiarity with clinical examination procedures, Body weight estimation, Signs of health and diseases, Signs of localized lesions, etc., Familiarity with physical and chemical restraint procedures, Drug administrations by various routes-IM, IV, SC, sub-conjuctival, oral, per rectal, etc., foot examination and foot care procedures, visit to elephant camps and attending clinical procedures, surgeries, etc.

I. Course Title : Clinical Case Conference
II. Course Code : VSR 587
III. Credit Hours : 0+1
IV. Practical

Present seminar on unusual/ interesting clinical cases done in the semester. Compile them from presentation to follow up and also submit the write up in soft or hard copy.

I. Course Title : Special Problem in Radiology
II. Course Code : VSR 588
III. Credit Hours : 0+2

IV. Practical

Investigative radiological problems in clinical or experimental models, didactic and interpersonal learning-teaching, problem solving self-learning strategies in problems related to radiology.

I. Course Title : Special Problem in Anaesthesia
II. Course Code : VSR 589
III. Credit Hours : 0+2

IV. Practical

Investigative anesthetic problems in clinical or experimental models, Didactic and interpersonal learning-teaching, Problem solving self-learning strategies in problems related to anaesthesia.

I. Course Title : Special Problem in Surgery
II. Course Code : VSR 690
III. Credit Hours : 0+2

IV. Practical

Investigative surgical problems in clinical or experimental models, Didactic and interpersonal learning-teaching, Problem solving self-learning strategies in problems related to surgery.

VSR 591 MASTERS SEMINAR (1+0)
VSR 599 MASTERS RESEARCH (0+30)

Course Outline: Lecture wise

VSR 503: Principles of Surgery (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Classification of wounds	1
2.	Wound healing, mechanism of wound repair	2
3.	Local and systemic factors affecting wound healing	1
4.	Current concepts of inflammation and management	1
5.	Thermal, electrical and chemical injuries and their management	3
	Unit II	
6.	Asepsis, sterilization and disinfection	1
7.	Principles and practice of antimicrobial therapy in surgical patients	2
	Unit III	
8.	Shock, classification, pathophysiology, diagnosis, treatment and monitoring	4
9.	Surgical stress and its systemic effects	1
10.	Haemorrhage and haemostasis	1
11.	Acid-base balance	1
12.	Fluid therapy	2
13.	Blood transfusion	1
14.	Metabolism of the surgical patient	2
	Unit IV	
15.	Principles and clinical applications of laser surgery, cryosurgery, electrosurgery, physiotherapy	4
	Unit V	
16.	Minimally invasive surgical procedures which includes laproscopy and endoscopy	2
17.	Principles of microscopic surgery-vessel and nerve anastomosis	1
18.	Application of computers in surgery	1
Practical		
1.	Identification and handling of surgical instruments	3
2.	Preparation of surgical pack	1
3.	Preparation of surgical team	1
4.	Preparation of surgical patients	1
5.	Surgical facilities and equipment	2
6.	Introduction to clinical skill laboratory	1
7.	Practice of different suturing patterns	2
8.	Repair of different wounds, using drains, bandages and bandaging techniques	2
9.	Monitoring of traumatized surgical patient	2
10.	Operation theatre conduct	1

Suggested Reading

- Fossum TW. (Ed.). 2018. *Small Animal Surgery*. Mosby.
- Slatter DH. 2003. 3rd ed. *Textbook of Small Animal Surgery*. WB Saunders.
- Hendrickson DA and Baird AN. 2013. *Turner and McIlwraiths Techniques in Large Animal Surgery* 4th ed. Wiley Black Well.

VSR 504: Anaesthesia and Analgesia (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Introduction and history of anaesthesia	1
2.	General consideration for anaesthesia in animals	1
3.	Properties of ideal anaesthetic agent, types of anaesthesia	1
4.	Anaesthetic triad, preanaesthetic evaluation of patient and selection of anaesthesia	1
5.	Preanaesthetic evaluation of patient and selection of anaesthesia	2
	Unit II	
6.	Preanaesthetic medication (anticholinergics, sedatives, tranquilizers, alpha-2 agonist, narcotics)	5
7.	Muscle relaxants and neuromuscular blocking agents	1
	Unit III	
8.	General anaesthetics and factors affecting their uptake, distribution and metabolism	2
9.	Injectable anaesthetic agents (properties, dosage and usage)	3
10.	Combinations of injectable agents and neuroleptanalgesia	1
11.	Inhalation anaesthetic agents (properties, methods of administration, dosage and usages)	2
12.	Inhalation anaesthesia equipment and breathing circuits	1
13.	Artificial ventilation	1
	Unit IV	
14.	Post-operative care of the surgical patient	1
15.	Operating room emergencies	1
16.	Cardio-pulmonary arrest and resuscitation	1
17.	Monitoring of anaesthetic recovery	1
	Unit V	
18.	Local anaesthetics, their mechanisms	1
19.	Local and regional nerve blocks	1
20.	Spinal analgesia, intravenous regional anaesthesia	1
21.	Peri-operative and post-operative pain and its management	2
Practical		
1.	Inhalation anaesthesia equipment, circuits and vaporizers	2
2.	Artificial ventilation	1
3.	Use of various pre-anaesthetic and anaesthetic agents in small and large animals	3
4.	Anaesthetic triad	1
5.	Balanced anaesthesia	1

S. No.	Topics	No. of Lectures/ Practicals
6.	Total intravenous anaesthesia	1
7.	Regional and local nerve blocks using local anaesthetics	1
8.	Repair of different wounds, using drains, bandages and bandaging techniques	1
9.	Alpha-2 agonists and their combinations in domestic animals	1
10.	Monitoring of anaesthesia	1
11.	Reversal of sedation and analgesia induced by alpha-2 agonists	1
12.	Practice of anaesthesia in clinical cases	1
13.	Record keeping in anaesthesia and euthanaia	1

Suggested Reading

- Paddleford RR. 1999. *Manual of Small Animal Anesthesia*. 2nd ed. WB Saunders.

VSR 505: Diagnostic Imaging Techniques (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Regulations regarding establishment and handling of x-ray units, requirements for establishment of x-ray units	1
2.	Conventional and digital X-ray machine	1
3.	X-ray films, cassettes, screen	1
4.	X-ray production, qualities of x-rays	1
5.	Image formation and dark room procedures	1
6.	Image plate, formation of radiograph technique chart, artifacts and their prevention	1
7.	Radiographic quality (Contrast, density and details)	1
8.	Radiographic accessories	1
9.	Radiographic positioning for different organs/ parts in small and large animals	1
	Unit II	
10.	Plain and contrast radiographic techniques of small and large animals	3
11.	Fluoroscopy/ C-arm	1
12.	Principles of radiographic interpretation	1
	Unit III	
13.	Principles of radiation therapy, medical radioisotope curves, radiation laws and regulations	2
14.	Radiation hazards and monitoring of radiographic exposure to personnel and pretection	2
	Unit IV	
15.	Basic physics of ultrasound waves and image formation	2

S. No.	Topics	No. of Lectures/ Practicals
16.	Scanning principles of ultrasound	1
17.	Transducers, equipment controls, modes of display	1
18.	Terminology used for echotexture and USG artifacts	4
	Unit V	
19.	Doppler techniques echocardiography and its application	2
20.	Introduction to nuclear imaging techniques, computerized tomography, magnetic resonance imaging, positron emission tomography techniques	3
Practical		
1.	Acquaintance with imaging equipment, computed radiography and digital radiography systems	3
2.	Dark room processing techniques and X-ray film handling	1
3.	Formulation of technique chart with fixed kVp and variable mAs	1
4.	Radiographic artefacts and their prevention	1
5.	Basics of radiographic interpretation of diseases	2
6.	Radiography positioning of different regions in domestic animals	1
7.	Contrast radiographic techniques	2
8.	Interpretation of radiographs	2
9.	PACS, Practice of ultrasonographic imaging and report writing	3

Suggested Reading

VSR 506: Soft Tissue Surgery (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Skin, adnexa, integument, appendages, horn, tail, sinus affections of equine and bovine	3

S. No.	Topics	No. of Lectures/ Practicals
2.	Principles of plastic and reconstructive surgery, different types of skin grafts	2
	Unit II	
3.	Surgical approaches/ affections of ear	1
4.	Surgical approaches/ affections of oral cavity	1
5.	Surgical approaches/ affections of larynx, pharynx, salivary glands and oesophagus	1
6.	Surgical approaches/ affections of abdomen	1
7.	Surgical approaches/ affections of rumen and reticulum	1
8.	Surgical approaches/ affections of omasum and abomasum	1
9.	Surgical approaches/ affections of stomach, intestines, rectum, anus	3
10.	Surgical approaches/ affections of liver and biliary system, pancreas and porto-systemic shunts	1
	Unit III	
11.	Abdominal hernia	1
12.	Diaphragmatic hernia	1
13.	Perineal hernia, ventral, femoral and umbilical hernia	1
14.	Ritcher hernia, hiatal hernia, omental hernia, pre-pubic tendon rupture	1
15.	Use of biological and synthetic grafts for hernia repair, laparoscopic repair of hernia	1
	Unit IV	
16.	Principles of thoracic surgery, functional anatomy of respiratory system	1
17.	Diseases of upper and lower respiratory system	4
18.	Functional anatomy of cardiovascular system and common affections of heart	3
	Unit V	
19.	Affections of pituitary, adrenals, thyroid, parathyroid glands	1
20.	Principles of neurosurgery and common surgical affections of nervous system and special sense organs	1
	Unit VI	
21.	Haemolymphatic system, bone marrow, spleen, tonsils, lymph nodes and lymphatics, thymus	2
Practical		
1.	Practice of various surgical techniques of skin and adnexa	2
2.	Practice of various surgical techniques of alimentary system	5
3.	Practice of various surgical techniques of hernias	2
4.	Practice of various surgical techniques of respiratory system	2
5.	Affections of horn, tail and teat	2
6.	Endoscopy techniques, instrumentation, use of rigid/ flexible endoscopes in companion and farm animals	1
7.	Use of rigid/ flexible endoscopes in companion animals	1
8.	Use of rigid/ flexible endoscopes in farm animals	1

Suggested Reading

- Fossum TW. 2018. *Small Animal Surgery*. 5th ed. Mosby.
- Fubini SL and Ducharme NG. 2016. *Farm Animal Surgery*. 2nd ed. Saunders
- Slatter DH. 2003. *Textbook of Small Animal Surgery*. 3rd ed. WB Saunders.
- Yool DA. 2012. *Small Animal Soft Tissue Surgery*. CABI.
- Tobia KM. 2010. *Manual of Small Animal Soft Tissue Surgery*. Wiley Black Well.

VSR 507: Orthopaedic Surgery (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Bone structure and function, growth, response to injury, fractures and luxations	1
2.	Classification of fracture	1
3.	Fracture healing, Biological osteosynthesis	1
	Unit II	
4.	Biomechanics of fracture healing	1
5.	Considerations for selection of fixation techniques	1
6.	Current trends in treatment of fractures of different bones in companion and farm animals	4
7.	Diseases of bone	2
	Unit III	
8.	Various affections of the joints and their treatment	3
9.	Various affections of the ligaments and tendons and their treatment	3
	Unit IV	
10.	Spinal affections and injury to axial skeleton	3
	Unit V	
11.	Conformation of the limb	3
12.	Anatomy of hoof	1
13.	Anatomical, conformational and pathological causes of lameness and allied surgical conditions of fore and hind limbs	6
Practical		
1.	Application of Plaster of Paris cast	1
2.	Application of fiberglass cast	1
3.	Application of Roberts Jones bandage	1
4.	Application of modified Schroeder Thomas splint	1
5.	Application of Coaptation splint, sling application	1
6.	Practice of IM pinning, wiring	2
8.	Practice of bone plating	1
9.	Practice of inter locking nailing	1
10.	Practice of external skeletal fixation	1
11.	Practice of arthrotomy	1
12.	Practice of tenotomy	1
13.	Examination of limbs for lameness	1
14.	Desmotomy, nerve blocks, injections in joints	1
15.	Operations for arthritis and hoof surgery	1
16.	Corrective shoeing	1

Suggested Reading

VSR 508: Anaesthesia of Zoo, Wild, Exotic and Laboratory Animals (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	General consideration in chemical restraint of captive wild animals	1
2.	General consideration in chemical restraint of free ranging wild animals	1
3.	Handling of birds with minimum stress	1
4.	Physical examination, blood sampling, crop washes, faecal sampling	1
	Unit II	
5.	Methods of administration of anaesthesia in captive animals	1
6.	Methods of administration of anaesthesia in free ranging animals	1
7.	Methods of administration of anaesthesia in birds	1
8.	Methods of administration of anaesthesia in laboratory animals	1
	Unit III	
9.	Local and general anaesthesia in exotic species	1
10.	Local and general anaesthesia in wild animals	1
11.	Local and general anaesthesia in birds	1
12.	Local and general anaesthesia in zoo animals	1
13.	Local and general anaesthesia in laboratory animals	1
	Unit IV	
14.	Anaesthetic emergencies and complications	1
	Unit V	
15.	Diagnostic interpretation, haematology and biochemistry analysis	2
16.	Avian diagnostic endoscopy	1
Practical		
1.	Familiarization with capture and anaesthetic equipments	1
2.	Local anaesthetic techniques	1
3.	Use of various preanaesthetic and anaesthetic agents in laboratory animals	1
4.	Use of various preanaesthetic and anaesthetic agents in birds	1
5.	Monitoring of patient during general anaesthesia	1
6.	Familiarization of various diseases in exotic birds like tumours, foreign body, crop stasis, crop tear, crop fistula, toe necrosis, feather cyst	2
8.	Excision of uropygieal gland	1
9.	Excision of rhinolith	1
10.	Pharyngostomy	1
11.	Ingluviotomy	1
12.	Ventriculotomy	1

S. No.	Topics	No. of Lectures/ Practicals
13.	Orthopedic injuries	2
15.	Visits to zoos for practical on zoo animals	1
16.	Visits to wild life sanctuaries for practical on wild animals	1

Suggested Reading

VSR 509: Urogenital Surgery (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Surgical anatomy of urinary tract in male and female animals	1
2.	Surgical anatomy of reproductive tract in male and female animals	1
3.	Congenital anomalies of organs of male and female urinary system	1
4.	Congenital anomalies of organs of male and female reproductive system	1
	Unit II	
5.	Principels of urinary tract surgery, pathophysiology, diagnosis and surgical management of affections of kidney	1
6.	Pathophysiology, diagnosis and surgical management of affections of ureter and urinary bladder	2
7.	Medical dissolution and prevention of canine uroliths	1
8.	Feline urologic syndrome	1
9.	Surgical management of urolithiais in ruminants and its prevention	1
10.	Management of uroperitoneum and renal failure	1
	Unit III	
11.	Pathogenesis, clinical symptoms, diagnosis and surgical management of vaginal and uterine prolapse, rectovaginal fistula, pneumovagina	1
12.	Pathogenesis, clinical symptoms, diagnosis and surgical management of vaginal tumours, pyometra, cysts of Gartner's canal and vestibular glands	1
	Unit IV	
13.	Surgical conditions of penis, prepuce, prostate and testicles, cryptorchidism, inguinal and scrotal hernia	1
14.	Affections of teat and udder	1
	Unit V	
15.	Indications, techniques and postoperative complications of episiotomy, ovariectomy, ovariohysterectomy and caesarean section, pyomerta and its surgical treatment	1
	Unit VI	
16.	Castration, vasectomy, cauda epididymectomy and penile deviation	1

S. No.	Topics	No. of Lectures/ Practicals
Practical		
1.	Hand-on-training of techniques of centesis of urinary bladder in companion and farm animals	1
2.	Different types of catheters used in urogenital surgery, retrograde catheterization of urethra and urinary bladder	1
3.	Normograde catheterization of urethra on clinical cases of urinary retention	1
4.	Pudendal nerve block for penis examination in ruminants	1
5.	Diagnostic techniques and surgical management of the affections of kidney and ureters	2
6.	Uro-hydropropulsion	1
7.	Restraint and anaesthesia for urogenital tract surgery	1
8.	Cystotomy, tube cystostomy	1
9.	Nephrotomy, ureterocolostomy	1
10.	Urethrotomy, urethrostomy	1
11.	Castration, vasectomy, penile deviation, epididymectomy, amputation of penis, episiotomy	1
12.	Ovariohysterectomy, tubectomy	1
13.	Caesarean section	1
14.	Management of phimosis, paraphimosis, venereal granuloma	1
15.	Vaginal and uterine prolapse, rectovaginal fistula and pneumovagina	1
16.	Bladder and uterine marsupialization	1

Suggested Reading

VSR 510: Ophthalmology (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Anatomy and physiology of eye and its adnexa	1
2.	Ophthalmic examination and diagnosis, diagnostic instrumentation	1
3.	Anaesthesia and surgery	1
	Unit II	
4.	General consideration for eye surgery in companion and farm animals	1
5.	Therapeutic agents for eye diseases and surgery of eye lids, lacrimal apparatus, naso-lacrimal duct	1
	Unit III	
6.	Diseases of conjunctiva	1
7.	Diseases of cornea, sclera, iris, orbit	1
8.	Diseases of lens	1
9.	Diseases of vitreous and aqueous humor	1

S. No.	Topics	No. of Lectures/ Practicals
10.	Diseases of retina and optic nerve	1
11.	Eye tumours, enucleation, exenteration	1
	Unit IV	
12.	Ocular manifestations of systemic diseases	2
	Unit V	
13.	Neuro-ophthalmology and ocular emergencies	3
Practical		
1.	Ophthalmic instrumentation	1
2.	Examination of the eye and its adnexa	2
3.	Anaesthesia, preparation of patient, suture materials for eye surgery	1
4.	Canthotomy, tarsorrhaphy	1
5.	Keratoplasty, anterior chamber paracentesis	1
6.	Flushing of naso-lacrimal duct	1
7.	Iridectomy	1
8.	Phacoemulsification and implantation of foldable lens	1
9.	Surgical treatment of entropion	2
10.	Surgical treatment of cherry eye	1
11.	Schirmer tear test	1
12.	Use of fluorescein dye in corneal ulcer	1
13.	Glaucoma surgery	1
14.	Eye worm removal	1

VSR 511: Dentistry and Oral Surgery (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Anatomy, development of teeth (odontogenesis)	1
2.	Dentition and ageing of different species	1
	Unit II	
3.	Clinical examination of oral cavity, dental anesthesia and pain management	1
4.	Dental anaesthesia and pain management	1
5.	Dental radiography	1
	Unit III	
6.	Diseases of oral cavity and teeth, congenital and developmental anomalies of oral cavity	1

S. No.	Topics	No. of Lectures/ Practicals
7.	Abnormal tooth eruption, irregular wear of teeth in companion and farm animals, occlusion and malocclusion	1
8.	Mandibular fracture, malformation of mandible, maxilla (cleft palate)	1
	Unit IV	
9.	Acquired diseases of teeth (halitosis, dental caries, fracture of teeth, dental materials and dental radiography), oronasal fistula	1
10.	Maxilla and mandibular fractures repair	1
11.	Orthodontics	1
12.	Tumors and other acquired condition of oral cavity	1
	Unit V	
13.	Exodontics, restorative dentistry	1
14.	Periodontal disease, tooth extraction, gum diseases	1
15.	Endodontics, pulpectomy, root canal therapy, current techniques in dentistry	2
Practical		
1.	Oral examination	1
2.	Modified triadian system of tooth numbering in various species	1
3.	Dental chart for companion and farm animals	1
4.	Dentistry instrumentation	1
5.	Dental radiography procedure	1
6.	Periodontal probing, scaling/ teeth cleaning	1
7.	Tooth extraction	1
8.	Malpractices in equine dentistry	1
9.	Periodical maintenance of oral hygiene	1
10.	Corrective procedures, malocclusion	1
11.	Treatment strategies congenital malformations of maxilla	2
12.	Oral surgery	4

Suggested Reading

VSR 512: Camel Surgery (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Introduction to special surgical anatomy of important parts, i.e. mandible, soft palate, chest pad, saddle region, male urinary system, tail, etc.	1
2.	Restraint and positioning for various surgical procedures and radiography of different parts	1

S. No.	Topics	No. of Lectures/ Practicals
	Unit II	
3.	Use of local anaesthesia, various nerve blocks and regional anaesthesia used to treat diverse surgical disorders	1
4.	Preanaesthetics, tranquilizers, sedatives and general anaesthetics used for camel surgery	1
	Unit III	
5.	Surgical affections of head and neck region: laceration and infected wounds of nostril skin, infection of turbinate, actinobacillosis, dental affections	1
6.	Surgical affections of head and neck region: removal of canines in furious camels, torticollis, fracture of mandible and maxilla, soft palate injuries	1
7.	Surgical affections of head and neck region: ophthalmic affections, salivary fistula, Stenson's duct ligation, oesophageal obstruction	1
	Unit IV	
8.	Surgical affections of thorax and abdominal region: saddle gall, hernia, chest pad wounds and enlargements	1
9.	Surgical affections of thorax and abdominal region: foreign bodies in compartment, intestinal obstruction	1
10.	Surgical affections of thorax and abdominal region: obstructive urolithiasis, rupture of urethra, subcutaneous infiltration of urine, cystorrhexis	1
	Unit V	
11.	Surgical affections of musculo-skeletal system: diagnosis of lameness in camels	1
12.	Surgical affections of musculo-skeletal system: management of long bone and digital fractures	1
13.	Surgical affections of musculo-skeletal system: upward fixation of patella, sprains, arthritis	1
	Unit VI	
14.	Sheath abscess, necrosis of penis, phimosis, paraphimosis, preputial prolapse	1
15.	Various types of tumours, gangrene and tumours of udder, necrosis of tail	1
16.	Punctured foot, prolapse of digital cushion, foot injuries, Kumri, Kapali etc	1
Practical		
1.	Restraint and anaesthesia (Local, regional, sedation and general anaesthesia)	2
2.	Preparation of sites	1
3.	Surgical anatomy of important surgical affections	1
4.	Special instruments used for camel restraining and surgery	1
5.	Observing and assisting in diverse surgical procedures on clinical cases in camels	5
6.	Practice of interdental wiring for repair of mandibular fractures in specimen mandibles	1
7.	Clinical and radiographic diagnosis of lameness	2
8.	Protection of wounds of chest pad and foot using special bandages	1
9.	Radiography of different part of camels	1

Suggested Reading

- *Selected Topics on Camelids*, Ed-TK Gahlot, The Camelid Publishers, Bikaner and now marketed by Camel Publishing House, Edition 2000.
- *Medicine and Surgery of Camelids*. Ed-Murray E. Fowler, Wiley-Blackwell, Edition 2010.
- *Advances in Surgery and Diagnostic Imaging of the Dromedary Camel*, Ed- RO Ramadan, King Faisal University, Edition 2016.

VSR 513: Elephant Surgery (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Basic surgical anatomy of Asian elephants and comparison with other farm animals	4
	Unit II	
2.	Drug administration techniques in captive and wild elephants, anaesthetic management of captive and wild elephants for various surgical and managerial conditions	1
3.	Drug administration techniques in captive and wild elephants, anaesthetic management of captive and wild elephants for various surgical and managerial conditions	1
	Unit III	
4.	Principles of soft tissue surgery in elephants, cyst, bursitis, gall, haematoma, abscess, etc.	2
	Unit IV	
5.	Management and treatment of fractures and arthritis in elephants	2
	Unit V	
6.	Pedicure, corrective foot care and maintenance of healthy feet of captive elephants housed in different establishments in different seasons	2
	Unit VI	
7.	Hoisting of recumbent elephants, surgical methods of birth control in elephants	1
8.	Limitations and risks of abdominal surgery in elephants (eg. caesarian section, castration, hernia, etc., soft tissue surgery like episiotomy, vestibulotomy, etc.)	2
Practical		
1.	Familiarity with clinical examination procedures	1
2.	Body weight estimation	1
3.	Signs of health and diseases	1
4.	Signs of localized lesions, etc.	1
5.	Familiarity with physical and chemical restraint procedures	1
6.	Drug administrations by various routes-IM, IV, SC, sub-conjuctival, oral, per rectal, etc.	1
7.	Foot examination and foot care procedures	1
8.	Visit to elephant camps	1
9.	Attending clinical procedures, surgeries etc	7

Suggested Reading

- Fowler ME and Mikota SK. 2006. *Biology, Medicine, and Surgery of Elephants*. Blackwell Publishing

Minor Courses for M.V.Sc. Degree programme

Courses of any one department/ discipline from the list given below or as considered relevant by the Advisory Committee from the BSMA approved subjects:

- Veterinary Physiology
- Veterinary Biochemistry
- Veterinary Biotechnology
- Veterinary Anatomy
- Veterinary Medicine
- Veterinary Pathology
- Animal Reproduction, Gynaecology and Obstetrics

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ Guide concerned.

Common Courses

The following courses (one credit each) will be offered to all students undergoing Master's degree programme.

- Library and Information Services
- Technical Writing and Communications Skills
- Intellectual Property and its management in Agriculture
- Basic Concepts in Laboratory Techniques
- Agricultural Research, Research Ethics and Rural Development Programmes

Course Title with Credit Load
Ph.D. in Veterinary Surgery and Radiology

Course Code	Course Title	Credit Hours
VSR 601	Clinical Practice-I*	0+2
VSR 602	Clinical Practice-II*	0+2
VSR 603	Clinical Practice-III*	0+2
VSR 604	Cardiovascular Surgery	2+1
VSR 605	Advances in Anaesthesiology	2+1
VSR 606	Advances in Radiology	2+1
VSR 607	Advances in Diagnostic Imaging Techniques	2+1
VSR 608	Advances in Orthopaedics	2+1
VSR 609	Neurosurgery	2+1
VSR 610	Reconstructive and Regenerative Surgery	1+1
VSR 611	Advances in Soft Tissue Surgery	2+1

VSR 613	Surgical Oncology	1+1
VSR 687	Clinical Case Conference*	0+1
VSR 688	Special Problem in Diagnostic Imaging	0+2
VSR 689	Special Problem in Anaesthesia	0+2
VSR 690	Special Problem in Surgery	0+2
VSR 691	Doctoral Seminar-I	2+0
VSR 692	Doctoral Seminar-II	2+0
VSR 699	Doctoral Research	0+75

*Core Courses

Course Contents
Ph.D. in Veterinary Surgery and Radiology

I. Course Title : Clinical Practice-I
II. Course Code : VSR 601
III. Credit Hours : 0+2

IV. Aim of the course

To learn clinical techniques and procedures in anaesthesia, diagnostic imaging and surgery

V. Practical

Application of different equipment like inhalant anaesthesia machine, Computerized or digital radiography system, Ultrasonography, Endoscopy, Electro-surgery, Cryosurgery, Operating microscope, Phacoemulsification and physiotherapy, Client management and counseling, Treating surgical cases using advances techniques, managing surgical facilities, ICU equipment and personnel, Planning and formulating clinical research projects using the clinical data and facilities, Data analysis and writing of clinical case reports and success stories about the clinical achievements.

I. Course Title : Clinical Practice-II
II. Course Code : VSR 602
III. Credit Hours : 0+2

IV. Aim of the course

To learn clinical techniques and procedures in anaesthesia, Diagnostic imaging and surgery

V. Practical

Application of different equipment like inhalant anaesthesia machine, Computerized or digital Radiography system, Ultrasonography, Endoscopy, Electro-surgery, Cryosurgery, Operating microscope, Phacoemulsification and physiotherapy, Client management and counseling, Treating surgical cases using advances techniques, managing surgical facilities, ICU equipment and personnel, Planning and formulating clinical research projects using the clinical data and facilities, Data analysis and writing of clinical case reports and success stories about the clinical achievements.

I. Course Title : Clinical Practice-III
II. Course Code : VSR 603
III. Credit Hours : 0+2

IV. Aim of the course

To learn clinical techniques and procedures in anaesthesia, Diagnostic imaging and surgery

V. Practical

Application of different equipment like inhalant anaesthesia machine, Computerized or digital radiography system, Ultrasonography, Endoscopy, Electro-surgery, Cryosurgery, Operating microscope, Phacoemulsification and physiotherapy, Client management and counseling, Treating surgical cases using advances techniques, Managing surgical facilities, ICU equipment and personnel, Planning and formulating clinical research projects using the clinical data and facilities, Data analysis and writing of clinical case reports and success stories about the clinical achievements.

I. Course Title : Cardiovascular Surgery

II. Course Code : VSR 604

III. Credit Hours : 2+1

IV. Aim of the course

To learn the basic principles and and gain practical knowledge of diagnosis and treatment of diseases of cardiovascular system.

V. Theory

Unit I

Surgical anatomy, Pathophysiology, Systolic and diastolic functions, Heart failure.

Unit II

Physical examination, Electrocardiography, Cardiac catheterization.

Unit III

Special preoperative considerations for patients undergoing cardiovascular surgery, Surgical approaches to thorax, Different techniques of thoracotomy. Special instruments required in cardio-thoracic surgery, Defibrillator, Heart lung machine

Unit IV

Surgical management of congenital cardiac disorders: Malpositioning, Atrial septal defect, Endocardial cushion defect, Tricuspid valve disorder, Ventricular septal defect, Pulmonic stenosis, Teratology of fallot, Eisenmenger's complex, Anomalous pulmonary venous return, Mitral valve abnormalities, Aortic stenosis, Aortic regurgitation, transposition of the great vessels, Aortic pulmonary window, Persistent arteriosus, Patent ductus arteriosus, Coarctation of aorta, Persistent right aortic arch, Pericardial diaphragmatic hernia

Unit V

Acquired cardiac disorders: Mitral regurgitation, Tricuspid regurgitation, Dirofilariasis, Acquired aortic regurgitation, Endocarditis, Heart block, Cardiomyopathy, Pericarditis, Heart tumours, Hypothermia, Extracorporeal circulatory support, Cardiopulmonary bypass, Artificial heart transplant, Post operative management, Basic peripheral vascular procedures arteriotomy, Venotomy, anastomosis, Portocaval shunts and anomalies

VI. Practical

Instrumentation and suture techniques for cardiovascular surgery, Vascular prostheses, Anticoagulants, Surgical approaches to thorax, Different techniques of thoracotomy, Hand-on-training of different techniques of centesis of thoracic cavity on cadavers, Thoracic drain placement, Demonstration of basic Cardiac procedures, Pericardiocentesis, Pericardiotomy, Cardiac catheterization, and various surgical conditions, Pericardiectomy, on cadaver and clinical cases of constructive pericarditis, Biopsy techniques, Use of IPPV in thoracic surgery.

I. Course Title : Advances in Anaesthesiology
II. Course Code : VSR 605
III. Credit Hours : 2+1
IV. Aim of the course

To learn advance concepts and techniques of veterinary anaeathesia.

V. Theory

Unit I

Cellular and molecular mechanisms of anaesthesia, Effects of anaesthesia on different systems.

Unit II

Drug interactions with anaesthetics, Pharmacokinetics and pharmacodynamics of anaesthetics, CRI and TCI, Computer assisted anaesthesia.

Unit III

Opioids, alpha-2 agonists and ketamine for epidural anaesthesia, Acupuncture and electroanaesthesia.

Unit IV

Critical acre in ICU, Pain transmission and processing, Methods for pain assessment in animals, Multimodal and preemptive analgesia, Techniques and drugs for pain managements.

Unit V

Anaesthesia for selected diseases (cardiovascular dysfunction, pulmonary dysfunction, Neurologic diseases, Renal diseases, Hepatic diseases, Gastrointestinal diseases, Endocrine diseases, Airway diseases).

Unit VI

Anaesthesia for special patients (ocular patients, heart patients, caesarian section patients, trauma patients, neonatal and geriatric patients).

VI. Practical

Various procedures for catheterization of heart and great vessels, Central venous line, Haemodynamic changes and pulmonary function tests during trials of anaesthetics, Electrocardiographic, Encephalographic evaluation of central nervous system activity, Cybernetics, Data acquisition and retrieval, Administration and monitoring of newer anaesthetics combinations.

I. Course Title : Advances in Radiology
II. Course Code : VSR 606
III. Credit Hours : 2+1
IV. Aim of the course

To learn advance theoretical and practical knowledge in radiology.

V. Theory

Unit I

Biological effects of radiations (alpha, beta, X-ray and gamma rays) in vivo and *in-vitro* cellular response following radiation as an immunosuppressive agent.

Unit II

Different kind of projections and positioning, Contrast material, Different contrast techniques, PACS.

Unit III

Radiography of head and neck region, Radiography of thorax, Lung patterns, Radiography of abdominal and pelvic region

Unit IV

Radiography of limbs for lameness and fracture diagnosis, Application of image intensifiers in veterinary practice, Different types of screens.

Unit V

Computerized radiography (CR), Digital radiography (DR), Contrast CT and contrast MRI, PETCT, Advances in scintigraphy.

Unit VI

Radiation therapy in cancer patients, Biological effects of radiation physics, Physics of radiation, Electromagnetic radiations, Hazards of electromagnetic Radiations and protection and bio-safety.

VI. Practical

Radiographic positioning, Radiation safety measures, Handling radioactive material, Clinical radiological diagnosis at Radiology Unit, Demonstration of advanced radiological techniques.

I. Course Title : Advances in Diagnostic Imaging Techniques
II. Course Code : VSR 607
III. Credit Hours : 2+1

IV. Aim of the course

To learn advance theoretical and practical knowledge of ultrasonography, Diagnostic imaging techniques and their interpretations.

V. Theory

Unit I

Techniques of ultrasonography for diagnosis of different affections of neck, thorax (echocardiography, Doppler techniques), Abdomen and pelvis (Urinary bladder and prostrate), Synovial joints, Muscle and tendons, Eye.

Unit II

Interpretation of ultrasonogram of different body organs/ vessels (normal and abnormal), Therapeutic applications of ultrasonography for physiotherapy.

Unit III

Imaging modalities like, MRI, CT scan, Nuclear medicine, Positron emission tomography technique, Single-photon emission computed tomography, etc.

Unit IV

Nuclear Scintigraphy-isotopes (natural and man-made); Cyclotron reactor, Half-life, decay pattern, Storage and handling of radioactive material,

Unit V

Methods in the detection of isotopes, Geiger-Mullar tubes, Photo-multiplier tube, medical use of isotope, Dosimetry, Nuclear medicine and its use in diagnosis of thyroid, Kidney, bone and liver function studies, Labelling of isotope and biological uses, Detonation and fission products, Image storage and transfer, DICOM, PACS and teleinterpretation.

VI. Practical

Hands-on-practice on different visceral organs collected from slaughter house for ultrasonographic scanning in water tub, dry and wet lab training, Demonstration and practice on different clinical cases reported for ultrasonography, Visit to places with facility of other alternate imaging techniques.

I. Course Title : Advances in Orthopaedics

II. Course Code : VSR 608

III. Credit Hours : 2+1

IV. Aim of the course

To learn advance concepts and techniques of treatment of various affections of bones, joints, tendons, ligaments and foot in companion and farm animals.

V. Theory

Unit I

Biomechanics of bone, Fracture etiology, Fracture reduction and different fracture fixation techniques like IM pinning, plating, nailing (inter locking nailing) and external skeletal fixation.

Unit II

Types, Properties, Biomechanics and use of different orthopaedic Implants, Bone grafts and their collection, Preservation, Indications and limitations, Bone graft substitutes like ceramics and composites, Their usage and limitations.

Unit III

Principles of osteogenesis, Osteoinduction and Osteoconduction.

Unit IV

Advances in internal fixation and external skeletal fixation techniques in veterinary orthopaedics.

Unit V

Metabolic bone diseases like rickets, osteomalacia, osteodystrophy and secondary hyperparathyroidism, etc. Classification, diagnosis and treatment of arthritis.

Unit VI

Advances in the management of congenital and acquired disorders of joints like traumatic dislocations, luxations and dysplasia. etiopathology and management of equine lameness including Laminitis, Navicular disease, Quitter, Canker and thrush, Sand cracks, Ring bone, Hygromas, Bursitis, Spavin and Splint.

Unit VII

Affections of muscles, tendons and ligaments, joint prosthesis and transplantation.

Unit VIII

Postoperative management of orthopaedic patients including the role of movement restriction, Weight bearing, Nutritional therapy, Physiotherapy and rehabilitation, Introduction to recovery assessment using lameness score, Gait analysis using computerized software.

VI. Practical

Hands on practice for different internal fixation techniques on cadaver, Management of different types of long bone fractures in different species of domestic animals, with special reference to practice of bone plating, Interlocking nailing and external skeletal fixation, Treatment of metabolic bone diseases in growing animals, Correction of antebrachial deformities including osteotomies and limb lengthening procedures, preservation of bone grafts, practice of bone grafting and use of osteoinducers in Clinical situation, Clinical and radiographic evaluation of various joint affections, Reduction and fixation of different joint luxations like coxo-femoral, Patellar, femoro-tibial, hock, scapulo-humeral, elbow and temporomandibular, Techniques of osteotomy, arthrodesis and joint replacement, Repair of tendon and ligament injuries, Diagnosis and treatment of various conditions causing lameness in equines and bovines.

I. Course Title : Neurosurgery
II. Course Code : VSR 609
III. Credit Hours : 2+1

IV. Aim of the course

To learn principles and techniques of treatment of surgical affections of nervous system in animals

V. Theory

Unit I

Nervous system – anatomy, physiology and pathological manifestations.

Unit II

Clinical neurology, Therapeutic Neurectomy, Nerve anastomosis, Pathogenesis of disease of the central nervous system.

Unit III

Diagnostic methods – Electrodiagnostic methods, Neuro radiology.

Unit IV

Fundamentals of neurosurgery, Surgical approaches to brain, Surgical diseases of peripheral nerves, Surgical affections and approaches to the spine, Diseases of the spinal column, Intervertebral disc diseases.

Unit V

Surgical approaches to brain and intracranial surgery.

VI. Practical

Methods for clinical and neurological examination including electro-encephalography, electromyography and electro-diagnostic testing, Collection of CSF and its evaluation, Techniques of myelography, Vertebral venography, Pneumoventriculography, Cerebral arteriography and cavernus sinus venography, Management of vertebral fractures and luxations with stabilization, Treatment of spinal cord compression, viz., Disc fenestration, Hemilaminectomy, Dorsal laminectomy and ventral slot, Techniques of peripheral nerve anastomosis and reconstruction of peripheral nerves.

I. Course Title : Reconstructive And Regenerative Surgery

II. Course Code : VSR 610

III. Credit Hours : 1+1

IV. Aim of the course

To learn principles and techniques of reconstructive and regenerative surgery.

V. Theory

Unit I

Principles of regenerative medicine, Tissue homeostasis, Tissue and organ transplantation, Histo-compatibility matching, Transplantation immunity and host graft reaction, Immunosuppression

Unit II

Classification, Isolation, Characterization, Storage and application of stem cells, Extracellular matrix, Microenvironment and growth factors for tissue repair and regeneration.

Unit III

Synthetic and biological scaffols, Preparation of biological scaffold and its role in Tissue regeneration, Whole organ decellularization and its application, Biomimetic scaffolds.

Unit IV

Designing for 3D printing, Bio-fabrication of organ and Tissue substitutes and its applications, Ethical concerns in regenerative medicine, GMP protocols and its applications in regenerative medicine

Unit V

Current techniques in designing and clinical application of biomaterials, Mechanical and functional testing of biomaterials, Biocompatibility testing

VI. Practical

Collection of bone marrow derived stem cells from different species of animals, Growth and differentiation of stem cells in different lineages, Decellularization of different tissues and organs, cell growth on different scaffolds, Clinical application of stem cells

I. Course Title : Advances in Soft Tissue Surgery

II. Course Code : VSR 611

III. Credit Hours : 2+1

IV. Aim of the course

To learn advanced concepts and practical techniques of treatment of soft tissue surgery, laparoscopic and minimally invasive surgery

V. Theory

Unit I

Advances in surgeries of ENT affections of small and large animals, Rhinoscopy-rhinotomy, Tumors of turbinates, Cheiloplasty, Hare lip correction, Salivary duct ligation, Parotid gland abalation, Bullaosteotomy, Buccotomy procedures, Glossophagia, Self suck correction.

Unit II

Upper respiratory tract affection in small and large animals, Barchiochephalic air way syndrome, Laryngeal paralysis, Tracheal collapse, Tracheostomy (temporary/ permanent), Chest trauma, Chest tube placement, Thoracocentesis, Pneumectomy, (partial/ unilateral), Heart lung transplant, Thoracic duct ligation, Trans tracheal intubation, Thoracoscopic procedure.

Unit III

Esophageal affections in small and large animals, Dilatation, Diverticulum, PRAA-Mullers surgery, Gastroesophageal intussception, Short bowel syndrome, Colostomy, megacolon, Rectal tube placement, Rectal diverticulum, Gastroscopy techniques

Unit IV

Pyelolithotomy, Lithotripsy, Renal transplantation, Ectopic ureter, Prostatectomy, Urinary incontinence, Penile urethosotomy, Urethroscopic retrival of urolith, Endoscopic ureter stunt placement.

Unit V

Thyroidectomy in cats, Liver lobectomy, Cholelithiasis, Cholecystectomy, Cholecystoduo denostomy, Porto caval shunt, Adrenalectomy.

Unit VI

Skin grafting, Subdermal, Axial skeletal, Omocervical axial pattern flap, Thoracodorsal axial pattern flap, Superficial brachial axial pattern flap, Caudal superficial epigastric axial pattern flap, Cranial superficial epigastric axial pattern flap, Deep circumflex iliac dorsal axial pattern flap, Deep circumflex iliac ventral axial pattern flap, Genicular axial pattern flap, Reverse saphenous conduit flap, Caudal auricular axial pattern flap, Split thickness and full thickness grafts, Reconstructive surgical procedures.

VI. Practical

Endoscopic surgical procedures in small and large animals, Chest tube placement, Rhinoscopy, Thoracoscopy, Broncoscopy, Gastroscopy, Colonoscopy, Urethrocystoscopy, Laproscopic surgical techniques, Skin flap and grafting techniques, Tracheaostomy, Renal graft cystoplasty.

I. Course Title : Advances in Ophthalmology

II. Course Code : VSR 612

III. Credit Hours : 1+1

IV. Aim of the course

To learn advanced concepts and practical techniques in ophthalmology.

V. Theory

Unit I

Embryology of the eye, study of ocular physiology and biochemistry, structure and function of eye and adenexa, Physiology of vision, Electrophysiology of visual system

Unit II

Advances in diagnosis and diseases of the eye and adnexia.

Unit III

Ocular neoplasia, advances in neuro ophthalmology, Advances in ophthalmic pharmacology, microbiology and nutrition

Unit IV

Advances in ocular imaging, Advances in ocular anaesthesia and analgesia

Unit V

Advances in ocular emergencies, Opthalmology of exotic species and lab animals, ocular toxicology

Unit VI

Corneal grafting, application of nanotechnology and stem cell therapy in veterinary ophthalmology.

VI. Practical

Exposure to latest ophthalmic instrumentation like phaco, ultrasound, cataract surgery and lens implantation, corneal transplantation.

I. Course Title : Surgical Oncology

II. Course Code : VSR-613

III. Credit Hours : 1+1

IV. Aim of the course

To learn about tumor genesis and treatment in animals.

V. Theory

Unit I

Biology of neoplastic disease: etiology, cellular mechanism, principles of surgical oncology.

Unit II

Diagnosis, classification and clinical staging of tumors and decision making for therapy, metastasis.

Unit III

Surgical management: Surgical excision of tumors, Cytoreductive surgery, Surgery for metastatic disease, Palliative surgery, Evaluation and interpretation of surgical margins.

Unit IV

Clinical signs, Diagnosis and treatment options of tumors of skin, Soft tissues, skeletal system, Head and neck, Gastro-intestinal tract, Respiratory tract, Urinary tract, Genital tract, Mammary gland, Nervous system, Endocrine system, haematopoietic system, the eye and orbit and miscellaneous tumours.

Unit V

Radiation therapy, Chemotherapy, Electrochemotherapy, Cryotherapy and targeted therapy. Side effects of radio and chemotherapy, Nutritional management of cancer patients, Basics of immunotherapy in cancer management.

VI. Practical

General approaches to the diagnosis of neoplasia: Fine needle aspiration biopsy, needle core biopsy, excisional and incisional biopsy, bone marrow biopsy, lymph node biopsy, percutaneous lung biopsy, bone biopsy, ultrasound/ laparoscope guided biopsy.

I. Course Title : Clinical Case Conference
II. Course Code : VSR 687
III. Credit Hours : 0+1

IV. Practical

Present seminar on unusual/ interesting clinical cases done in the semester. Compile them from presentation to follow up and also submit the write up in soft or hard copy.

I. Course Title : Special Problem in Diagnostic Imaging
II. Course Code : VSR 688
III. Credit Hours : 0+2

IV. Practical

Investigative diagnosing imaging problems in clinical models, didactic and interpersonal learning-teaching, problem solving self-learning strategies in problems related to surgery

I. Course Title : Special Problem in Anaesthesia
II. Course Code : VSR 689
III. Credit Hours : 0+2

IV. Practical

Investigative anaesthetic problems in clinical models, didactic and interpersonal learning-teaching, problem solving self-learning strategies in problems related to anaesthesia

I. Course Title : Special Problem in Surgery
II. Course Code : VSR 690
III. Credit Hours : 0+2

IV. Practical

Investigative surgical problems in clinical models, didactic and interpersonal learning-teaching, problem solving self-learning strategies in problems related to surgery

VSR 691 Doctoral Seminar-I (2+0)
VSR 692 Doctoral Seminar-II (2+0)
VSR 699 Doctoral Research (0+75)

Course Outline: Lecture wise

VSR 604: Cardiovascular Surgery (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Surgical anatomy, pathophysiology	1
2.	Systolic and diastolic functions	1
3.	Heart failure	1
	Unit II	
4.	Physical examination	1
5.	Electrocardiography	1
6.	Cardiac catheterization	1
	Unit III	
7.	Special preoperative considerations for patients undergoing cardiovascular surgery, surgical approaches to thorax	1
8.	Different techniques of thoracotomy	1
9.	Special instruments required in cardio-thoracic surgery, defibrillator, heart lung machine	1
	Unit IV	
10.	Surgical management of congenital cardiac disorders: malpositioning, atrial septal defect, endocardial cushion defect	1
11.	Surgical management of congenital cardiac disorders: tricuspid valve disorder, ventricular septal defect	1
12.	Surgical management of congenital cardiac disorders: pulmonic stenosis, teratology of fallot	1
13.	Surgical management of congenital cardiac disorders: eisenmenger's complex, anomalous pulmonary venous return	1
14.	Surgical management of congenital cardiac disorders: mitral valve abnormalities, aortic stenosis, aortic regurgitation	1
15.	Surgical management of congenital cardiac disorders: transposition of the great vessels, aortic pulmonary window, persistent arteriosus	1
16.	Surgical management of congenital cardiac disorders: patent ductus arteriosus, coarctation of aorta, persistent right aortic arch	1
17.	Surgical management of congenital cardiac disorders: pericardial diaphragmatic hernia	1
	Unit V	
18.	Acquired cardiac disorders: mitral regurgitation, tricuspid regurgitation	1
19.	Acquired cardiac disorders: dirofilariasis	1
20.	Acquired cardiac disorders: acquired aortic regurgitation, endocarditis	1
21.	Acquired cardiac disorders: heart block	1
22.	Acquired cardiac disorders: cardiomyopathy, pericarditis, heart tumours	1
23.	Acquired cardiac disorders: hypothermia, extracorporeal circulatory support	1

S. No.	Topics	No. of Lectures/ Practicals
24.	Acquired cardiac disorders: cardiopulmonary bypass	1
25.	Acquired cardiac disorders: artificial heart transplant, post operative management	1
26.	Acquired cardiac disorders: basic peripheral vascular procedures arteriotomy, venotomy, anastomosis	1
27.	Acquired cardiac disorders: portocaval shunts and anomalies	1
Practical		
1.	Instrumentation and suture techniques for cardiovascular surgery	2
2.	Vascular prostheses	1
3.	Anticoagulants	1
4.	Surgical approaches to thorax	1
5.	Different techniques of thoracotomy	1
6.	Hand-on-training of techniques of centesis of thoracic cavity on cadavers	1
7.	Hand-on-training of thoracic drain placement	1
8.	Demonstration of pericardiocentesis	1
9.	Demonstration of pericardiotomy	1
10.	Demonstration of cardiac catheterization	1
11.	Demonstration of pericardiectomy on cadaver and clinical cases of constructive pericarditis	1
12.	Demonstration of cardiac biopsy techniques	1
13.	Demonstration of use of IPPV in thoracic surgery	1

VSR 605: Advances in Anaesthesiology (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Cellular and molecular mechanisms of anaesthesia	1
2.	Effects of anaesthesia on different systems	3
	Unit II	
3.	Drug interactions with anaesthetics	1
4.	Pharmacokinetics and pharmacodynamics of anaesthetics	2
5.	CRI and TCI, computer assisted anaesthesia	1
	Unit III	
6.	Opioids, alpha-2 agonists and ketamine for epidural anaesthesia	2
7.	Acupuncture and electroanaesthesia	
	Unit IV	
8.	Critical acre in ICU	1
9.	Pain transmission and processing, methods for pain assessment in animals	1
10.	Multimodal and preemptive analgesia	1
11.	Techniques and drugs for pain managements	1

S. No.	Topics	No. of Lectures/ Practicals
	Unit V	
12.	Anaesthesia for selected diseases (cardiovascular dysfunction)	1
13.	Anaesthesia for selected diseases (pulmonary dysfunction)	1
14.	Anaesthesia for selected diseases (neurologic diseases)	1
15.	Anaesthesia for selected diseases (renal diseases)	1
16.	Anaesthesia for selected diseases (hepatic diseases)	1
17.	Anaesthesia for selected diseases (gastrointestinal diseases)	1
18.	Anaesthesia for selected diseases (endocrine diseases, airway diseases)	1
	Unit VI	
19.	Anaesthesia for special patients (ocular patients)	1
20.	Anaesthesia for special patients (heart patients)	1
21.	Anaesthesia for special patients (caesarian section patients)	1
22.	Anaesthesia for special patients (trauma patients)	1
23.	Anaesthesia for special patients (neonatal patients)	1
24.	Anaesthesia for special patients (geriatric patients)	1
Practical		
1.	Various procedures for catheterization of heart and great vessels	2
2.	Central venous line	1
3.	Haemodynamic changes during trials of anaesthetics	2
4.	Electrocardiography	1
5.	Encephalographic evaluation of central nervous system activity	1
6.	Cybernetics	1
7.	Data acquisition and retrieval	1
8.	Administration and monitoring of newer anaesthetics combinations	6

VSR 606: Advances in Radiology (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Biological effects of radiations (alpha, beta, X-ray and gamma rays) *in vivo* and *in-vitro* cellular response following radiation as an immunosuppressive agent	4
	Unit II	
2.	Different kind of projections and positioning, contrast material, different contrast techniques, PACS	4
	Unit III	
3.	Radiography of head region	1

S. No.	Topics	No. of Lectures/ Practicals
4.	Radiography of neck region	1
5.	Radiography of thorax	1
6.	Lung patterns	1
7.	Radiography of abdominal region	1
8.	Radiography of pelvic region	1
	Unit IV	
9.	Radiography of limbs for lameness and fracture diagnosis	1
10.	Application of image intensifiers in veterinary practice	1
11.	Different types of screens	1
	Unit V	
12.	Computerized radiography (CR)	1
13.	Digital radiography (DR)	1
14.	Contrast CT	1
15.	Contrast MRI	1
16.	PETCT	1
17.	Advances in scintigraphy	1
18.	Radiation therapy in cancer patients	1
19.	Biological effects of radiation physics	1
20.	Physics of radiation, electromagnetic radiations	1
21.	Hazards of electromagnetic radiations and protection and bio-safety	2
Practical		
1.	Radiographic positioning	3
2.	Radiation safety measures	1
3.	Handling radioactive material	1
4.	Clinical radiological diagnosis at Radiology Unit	8
5.	Demonstration of advanced radiological techniques	2

Suggested Reading

VSR 607: Advances in Diagnostic Imaging Techniques (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Techniques of ultrasonography for diagnosis of different affections of neck	1
2.	Techniques of ultrasonography for diagnosis of different affections of thorax (echocardiography, Doppler techniques)	3

S. No.	Topics	No. of Lectures/ Practicals
3.	Techniques of ultrasonography for diagnosis of different affections of abdomen and pelvis (Urinary bladder and prostrate)	1
4.	Techniques of ultrasonography for diagnosis of different affections of synovial joints	1
5.	Techniques of ultrasonography for diagnosis of different affections of muscle and tendons.	1
6.	Techniques of ultrasonography for diagnosis of different affections of eye.	1
	Unit II	
7.	Interpretation of ultrasonogram of different body organs/ vessels (normal and abnormal)	3
8.	Therapeutic applications of ultrasonography for physiotherapy	1
	Unit III	
9.	Imaging modalities like, MRI, CT scan, nuclear medicine, positron emission tomography technique, single-photon emission computed tomography etc	4
10.	Nuclear Scintigraphy-isotopes (natural and man-made); cyclotron reactor, half-life, decay pattern, storage and handling of radioactive material	4
	Unit IV	
11.	Methods in the detection of isotopes, Geiger-Mullar tubes, photo-multiplier tube, medical use of isotope, dosimetry	2
12.	Nuclear medicine and its use in diagnosis of thyroid	1
13.	Nuclear medicine and its use in diagnosis of kidney	1
14.	Nuclear medicine and its use in diagnosis of bone	1
15.	Nuclear medicine and its use in diagnosis of liver function studies	1
16.	Labelling of isotope and biological uses, detonation and fission products, image storage and transfer, DICOM, PACKS and teleinterpretation	3
Practical		
1.	Hands-on-practice on different visceral organs collected from slaughter house for ultrasonographic scanning in water tub, dry and wet lab training	6
2.	Demonstration and practice on different clinical cases reported for ultrasonography	7
3.	Visit to places with facility of other alternate imaging techniques	2

VSR 608: Advances in Orthopaedics (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Biomechanics of bone, fracture etiology	1
2.	Fracture reduction and different fracture fixation techniques like IM pinning	1
3.	Fracture reduction and different fracture fixation techniques like plating	1
4.	Fracture reduction and different fracture fixation techniques like nailing (inter locking nailing) and external skeletal fixation	1
5.	Fracture reduction and different fracture fixation techniques like external skeletal fixation	1
	Unit II	
6.	Types, properties, biomechanics and use of different orthopaedic implants	1
7.	Bone grafts and their collection, preservation, indications and limitations	1
8.	Bone graft substitutes like ceramics and composites, their usage and limitations	1
	Unit III	
9.	Principles of osteogenesis, osteoinduction and osteoconduction	2
	Unit IV	
10.	Advances in internal fixation techniques in veterinary orthopaedics	2
11.	Advances in internal fixation techniques in veterinary orthopaedics	
12.	Advances in external skeletal fixation techniques in veterinary orthopaedics	2
13.	Metabolic bone diseases like rickets, osteomalacia, osteodystrophy and secondary hyperparathyroidism, etc.	2
14.	Classification, diagnosis and treatment of arthritis.	3
15.	Advances in the management of congenital and acquired disorders of joints like traumatic dislocations, luxations and dysplasia.	2
16.	Etiopathology and management of equine lameness including laminitis, navicular disease, quitter, canker and thrush, sand cracks, ring bone, hygromas, bursitis, spavin and splint.	5
17.	Affections of muscles, tendons and ligaments	1
18.	Joint prosthesis and transplantation	1
	Unit V	
19.	Postoperative management of orthopaedic patients including the role of movement restriction, weight bearing, nutritional therapy, physiotherapy and rehabilitation	2
20.	Introduction to recovery assessment using lameness score, gait analysis using computerized software	2

S. No.	Topics	No. of Lectures/ Practicals
Practical		
1.	Hands on practice for different internal fixation techniques on cadaver	4
2.	Management of different types of long bone fractures in different species of domestic animals, with special reference to practice of bone plating	1
3.	Management of different types of long bone fractures in different species of domestic animals, with special reference to practice of interlocking nailing	1
4.	Management of different types of long bone fractures in different species of domestic animals, with special reference to practice of external skeletal fixation	1
5.	Treatment of metabolic bone diseases in growing animals	1
6.	Correction of antebrachial deformities including osteotomies and limb lengthening procedures	1
7.	Preservation of bone grafts	1
8.	Practice of bone grafting and use of osteoinducers in clinical situation	1
9.	Clinical and radiographic evaluation of various joint affections	1
10.	Reduction and fixation of different joint luxations like coxo-femoral, patellar, femoro-tibial, hock, scapulo-humeral, elbow and temporomandibular	1
11.	Techniques of osteotomy, arthrodesis and joint replacement	1
12.	Repair of tendon and ligament injuries	1
13.	Diagnosis and treatment of various conditions causing lameness in equines	1
14.	Diagnosis and treatment of various conditions causing lameness in bovines	1

VSR 611: Advances in Soft Tissue Surgery (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
	Unit I	
1.	Advances in surgeries of ENT affections of small and large animals-rhinoscopy, rhinotomy, tumors of turbinates	1
2.	Advances in surgeries of ENT affections of small and large animals-cheiloplasty, hare lip correction, salivary duct ligation, parotid gland abalation	1
3.	Advances in surgeries of ENT affections of small and large animals-bullaosteotomy, buccotomy procedures, glossoplagia, self suck correction	1

S. No.	Topics	No. of Lectures/ Practicals
	Unit II	
4.	Upper respiratory tract affection in small and large animals- barchiochephalic air way syndrome, laryngeal paralysis	1
5.	Upper respiratory tract affection in small and large animals- tracheal collapse, tracheostomy (temporary/ permanent)	1
6.	Upper respiratory tract affection in small and large animals- chest trauma, chest tube placement, thoracocentesis	1
7.	Upper respiratory tract affection in small and large animals- pneumectomy, (partial/ unilateral), heart lung transplant, thoracic duct ligation	1
8.	Upper respiratory tract affection in small and large animals- thoracic duct ligation, trans tracheal intubation, thoracoscopic procedure	1
	Unit III	
9.	Esophageal affections in small and large animals- dilatation, diverticulum, PRAA- Mullers surgery	1
10.	Esophageal affections in small and large animals- gastroesophageal intussception, short bowel syndrome	1
11.	Esophageal affections in small and large animals- colostomy, megacolon, rectal tube placement	1
12.	Esophageal affections in small and large animals- rectal diverticulum, gastroscopy techniques	1
	Unit IV	
13.	Pyelolithotomy, lithotripsy	1
14.	Renal transplantation	1
15.	Ectopic ureter, prostatectomy, urinary incontinence	1
16.	Penile urethosotomy, urethroscopic retrival of urolith, endoscopic ureter stunt placement	1
	Unit V	
17.	Thyroidectomy in cats, liver lobectomy	1
18.	Cholelithiasis, cholecystectomy, cholecystoduo denostomy	1
19.	Porto caval shunt, adrenalectomy	1
	Unit VI	
20.	Skin grafting, subdermal, axial skeletal, omocervical axial pattern flap	1
21.	Thoracodorsal axial pattern flap, superficial brachial axial pattern flap, caudal superficial epigastric axial pattern flap	1
22.	Cranial superficial epigastric axial pattern flap, deep circumflex iliac dorsal axial pattern flap	1
23.	Deep circumflex iliac ventral axial pattern flap, genicular axial pattern flap	1
24.	Reverse saphenous conduit flap, caudal auricular axial pattern flap,	1
25.	Split thickness and full thickness grafts	1
26.	Reconstructive surgical procedures	1

Practical

1.	Endoscopic surgical procedures in small and large animals	1
2.	Chest tube placement	1
3.	Rhinoscopy	1
4.	Thoracoscopy	1
5.	Bronchoscopy	1
6.	Gastroscopy	1
7.	Colonoscopy	1

S. No.	Topics	No. of Lectures/ Practicals
8.	Urethrocystoscopy	1
9.	Laparoscopic surgical techniques	2
10.	Skin flap and grafting techniques	3
11.	Tracheaostomy	1
12.	Renal graft cystoplasty	1

Minor Courses for Ph.D. Degree programme

Courses of any one department/ discipline from the list given below:

- Veterinary Physiology
- Veterinary Biochemistry
- Veterinary Biotechnology
- Veterinary Anatomy
- Veterinary Medicine
- Veterinary Pathology
- Animal Reproduction, Gynaecology and Obstetrics
- Animal Biotechnology

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ Guide concerned.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Veterinary Clinical Subjects
– Veterinary Medicine

Preamble
(Veterinary Medicine)

Presently, the veterinary education at undergraduate level is regulated by Veterinary Council of India. Two separate departments of Veterinary Clinical Medicine, Ethics and Jurisprudence and Veterinary Epidemiology and Preventive Medicine were merged in 2008 following implementation of VCI norms as per Minimum Standards of Veterinary Education-2008 (MSVE-2008) and also being followed and strictly implemented as per revised VCI norms (MSVE-2016) issued by The Gazette of India Notification. Single department of Veterinary Medicine is functional in most of the colleges and universities of Veterinary Sciences including Indian Veterinary Research Institute (IVRI), Izatnagar, Bareilly. Therefore, the courses in clinical and preventive medicine have been redesigned under the subject of veterinary medicine. The national eligibility test (NET), being conducted by ICAR, New Delhi, in the subject of veterinary medicine includes syllabus for both clinical and infectious diseases. Course curriculum related to Epidemiology will be covered by the Department of Veterinary Public Health and Epidemiology as per the mandate of the BSMA Committee constituted by ICAR on the recommendation by National Core Group.

The Master's and Doctoral courses and the contents were critically examined for revisions in the light of advances transpired in the discipline of veterinary medicine during the last ten years. Precedence has been given to important species, viz., cattle, buffalo, sheep, goat, pig, canine, feline and equine in the course curriculum for M.V.Sc. programme. The courses have been reorganized with respect to species, viz., ruminant, canine and feline and equine, etc. and attempt has been made to cover all the systemic diseases in a comprehensive manner. Contents of the courses have been revised by including newer trends in diagnosis, treatment, management and prevention of various diseases. Different disease conditions have been listed precisely in ruminant and equine medicine courses so as to remove ambiguity in covering of the various topics.

Small animal practice has grown exponentially in last decade. Accordingly, courses in small animal have been recasted by giving emphasis on diseases of gastro-intestinal, respiratory, cardiovascular system. Endocrine disorders, coagulopathies, immune mediated diseases and neoplastic diseases have been given special emphasis. Problem oriented approach to common disease manifestations for better understanding and applications has been added in canine and feline courses for improving diagnostic skills of the students. In recent times, small animals are also frequently presented for behavior disorders. Therefore, topics on pet psychology, pet behavior, adaptation needs and behavioral medicine have been incorporated.

Two separate courses on clinical diagnostic techniques and emergency medicine have been designed to provide hands on training on diagnostic procedures and practical training. Topics have been included to train the students for special examination of different body systems. Emerging diseases have been added to the course curriculum. Two new courses, viz., Geriatrics and Paediatrics, Oncology and Ethno-Veterinary Medicine have been added. To provide practical approach to the diagnosis and investigation of infectious diseases, a special course on investigation of disease outbreaks has been included in the revised curriculum.

Ph.D. courses have been designed according to body systems. This approach will help students in better comprehension of the diseases as already being followed in all veterinary colleges of countries with very high standards of veterinary education and research (USA, Canada and Europe). The doctorates, following new restructured Ph.D. curricula should, in future, manifest as specialists in the field of their specialization.

Management of emergency cases and critically ill patients is an upcoming challenge for practicing veterinarians. Special training is required for monitoring and resuscitation of critically ill patients as well as diagnosis, management and emergency care procedures for common emergencies. Therefore, a special course on 'Veterinary Emergency and Critical Care Medicine, has been designed for Ph.D. programme. Similarly, a new course on 'Advances in Veterinary Diagnostics' has been added to enhance the diagnosis skills and hands on training on the use of ophthalmoscopy, ultrasonography, endoscopy, pulse-oximetry electrocardiography, echocardiography and their interpretations.

The revision of courses has been given due importance in consonance with the national initiatives and key Central Government policies to improve productivity and livestock health. The course contents have been revised comprehensively to cover syllabi, which will be immensely helpful in introducing and exploring new insights and improving clinical knowledge and skill competency of the students, keeping in view the global trends and developments in veterinary clinical diagnosis, education and research.

Course Title with Credit Load
M.V.Sc. in Veterinary Medicine

Course Code	Course Title	Credit Hours
VMD 501*	Ruminant Medicine-internal	3+0
VMD 502*	Ruminant Medicine-infectious	3+0
VMD 503	Equine Medicine	2+0
VMD 504*	Canine and Feline Medicine-I	2+0
VMD 505*	Canine and Feline Medicine-II	2+0
VMD 506	Metabolic and Endocrine Diseases, Nutritional Deficiencies and Diseases of Mammary Gland	2+0
VMD 507	Paediatrics and Geriatrics	2+0
VMD 508	Avian and Swine Medicine	2+0
VMD 509	Zoo, Wild and Laboratory Animal Medicine	1+0
VMD 510	Toxicology and Forensic Medicine	1+0
VMD 511*	Clinical Diagnostic Techniques	0+2
VMD 512	Emergency Medicine	0+2
VMD 513*	Diagnosis of Veterinary Infectious Diseases	0+1
VMD 514	Oncology and Ethno-veterinary Medicine	1+0
VMD 515	Animal Disease Investigation and Biosecurity	1+1
VMD 516*	Clinical Practice-I	0+3
VMD 517*	Clinical Practice-II	0+3
VMD 591	Master’s Seminar	1+0
VMD 599	Master’s Research	0+30

Course Contents
M.V.Sc. in Veterinary Medicine

I. Course Title : Ruminant Medicine - Internal
II. Course Code : VMD 501
III. Credit Hours : 3+0
IV. Aim of the course

Internal diseases of Digestive, Respiratory, Urinary, Cardiovascular, Blood and blood forming organs, Nervous, Musculoskeletal system, Skin, eye and ear of bovine, Sheep, and goat.

V. Theory

Unit I

Examination of alimentary tract and abdomen; Diseases of the buccal cavity and related organs including pharynx, Oesophagus. Reticulo-ruminal fermentative disorders (simple indigestion, impaction, ruminal lactic acidosis), Primary and secondary bloat, Diaphragmatic hernia, Traumatic reticulo-peritonitis and Omasal impaction.

Unit II

Diseases of abomasum (impaction, displacements, ulcers, bloat), Acute and chronic diarrhoea, Intestinal obstructive disorders (intussusception, volvulus), Peritonitis, caecal dilatation and hemorrhagic bowel syndrome.

Unit III

Manifestations of liver and biliary diseases, Focal and diffuse diseases of liver. Disease of nasal cavity, sinuses, disease of larynx and trachea, pneumonias, pleuritis, manifestations Principles of treatment in uro-genital system; Rupture, Paralysis and infections of urinary bladder, Urolithiasis, Nephritis and renal failure, Nephrosis, renal ischemia, Hemolytic uremic like syndrome, Uremia and neoplasms of urinary tract.

Unit IV

Examination of cardiac system and Special examination of heart (ECG, echocardiography, Markers for diagnosis of cardiac disorders. Principal manifestations of cardiovascular diseases, congenital cardiac diseases, myocarditis), cardiomyopathy, endocarditis, pericarditis, phelebitis, thrombosis, anemia, lymphangitis, lymphadenopathies and thrombocytopenia.

Unit V

Principles of nervous dysfunction, Clinical manifestation and special examination, Localization of lesion in brain and spinal cord, Cortical diseases, Brain abscess, Meningitis, Diseases of brainstem, Cerebellar diseases, Spinal cord compression and peripheral nerve paralysis. Principal manifestations and special examination of musculoskeletal system, Myositis, Myopathies, Foot lameness, Arthritis, Osteodystrophies, Degenerative joint disease and nutritional deficiency diseases affecting musculoskeletal system; conjunctivitis, Keratitis, uveitis, Horner syndrome, neoplasms of eye, otits media, otitis externa; Skin diseases: folliculitis, furunculosis and skin neoplasms.

I. Course Title : Ruminant Medicine-infectious

II. Course Code : VMD 502

III. Credit Hours : 3+0

IV. Aim of the course

Bacterial, fungal, chlamydial, viral, parasitic, mycoplasmal, prions and rickettsial diseases of bovine, sheep, and goat.

V. Theory

Unit I

Clostridial diseases-black quarter, Botulism, Bacillary hemoglobinuria, Braxy, Enterotoxemia, Malignant edema, Pulpy kidney disease, Tetanus, Collibacilosis, Salmonellosis, Compylobacteriosis, Listeriosis, Actinobacillosis, Actinomycosis, Anthrax, Tuberculosis, Johne's disease, Leptospirosis, Pasteurellosis, Ulcerative lymphangitis, Infectious bovine keratoconjuctivitis, Chlamydiosis infections, Dermatophytosis, Cutaneous streptothricosis, Candidiasis and Rhinosporidiosis.

Unit II

Foot and mouth disease, Vesicular stomatitis, Vesicular exanthema, Rinderpest, PPR, Bovine viral diarrhea, Mucosal disease, Ephemeral fever, Bovine herpes viral diseases, Leucosis, Viral pneumonia, Pox diseases, Infectious gastroenteritis of viral etiology. Malignant catarrh fever, Rabies, Bluetongue, Louping ill, Papillomatosis, Contagious ecthyma (orf), Caprine arthritis and Encephalopathy(CAE), Contagious bovine pleuropneumonia and Contagious caprine pleuropneumonia.

Unit III

Bovine spongiform Encephalopathy, Scarpie, Bovine Anaplasmosis, Theileriasis, Babesiosis, Fascioliosis, Amphistomiosis, Gastrointestinal nematodiosis, Schistosomiosis, Lung worm infection, Echinococcosis, Coenurosis and Tapeworm infections, Coccidiosis, Thelaziasis, parasitic dermatitis (scabies, psoroptes).

I. Course Title : Equine Medicine

II. Course Code : VMD 503

III. Credit Hours : 2+0

IV. Aim of the course

Internal and infectious diseases of Equines

V. Theory

Unit I

Diseases of buccal cavity (dental diseases, stomatitis), Oesophagus, Gastric dilatation, gastro-duodenal ulceration, Acute and chronic diarrhea, Colic, Acute and chronic hepatitis.

Unit II

Diseases of cardio-vascular system and blood forming organs; Manifestations and principles of treatment in respiratory disorders, Epistaxis, Ethmoidal hematoma, pharyngitis, sinusitis, Guttural pouch diseases, Tracheal collapse, Adult pneumonia, foal pneumonia, Recurrent air way obstruction, Inflammatory airway disease, Pleura-pneumonia, Pulmonary congestion and edema; Manifestations and principles of treatment of urinary system diseases, Rupture of urinary bladder, Paralysis, urolithiasis, Urinary tract infections, Acute and chronic renal failure and Neoplasms of urinary tract.

Unit III

Principal manifestations of musculoskeletal diseases, Laminitis, Inflammatory Myopathy, Exertional Myopathies, Myotonia, Hyperkalemic periodic paralysis and Nutritional deficiency diseases affecting musculoskeletal system.

Nervous diseases, Viral encephalitis, Intracarotid drug injection, Trauma to brain and cranial nerves, Brain abscess, Peripheral vestibular disease, Temporo-hyoid osteoarthropathy, Ataxia (sorghum toxicity, spinal abscesses), Peripheral facial nerve paralysis, Peripheral nerve disorders; Skin diseases, bacterial, fungal, parasitic and allergic dermatitis (culicoides hypersensitivity), Cutaneous eczema, Cutaneous acne, Cutaneous pustular dermatitis, Candidasis, Histoplasmosis, Coccidiodomycosis and dermatophytosis.

Unit IV

Bacterial, fungal and viral keratitis, Equine recurrent uveitis, Uveitis, Ocular neoplasia. Trypanosomiasis/ dourine, Babesiosis, Parasitic pneumonia, Strangles, equine influenza, Equine herpes virus infection, Potomac horse fever, Equine infectious anaemia and setariasis.

I. Course Title : Canine and Feline Medicine-I

II. Course Code : VMD 504

III. Credit Hours : 2+0

IV. Aim of the course

Internal (digestive, liver, pancreas, cardiovascular, blood and blood forming organs) and infectious (bacterial, parasitic and protozoal) diseases of dogs and cats.

V. Theory

Unit I

Diagnostic approach to common manifestations of disease: Vomiting, acute diarrhea, Chronic diarrhea, Syncope, Anemia, Jaundice, Fever, Weight loss, Edema, Dyspnoea, coughing and nasal discharge.

Unit II

Etiology, pathogenesis, clinical signs, clinical pathology, diagnosis, Differential diagnosis and treatment of diseases of the oral cavity, oesophagus, acute gastritis, chronic gastritis, Gastric dilatation, Volvulus, Tumors of the stomach, Intussusception, Acute enteritis, Chronic enteritis, Inflammatory bowel disease, Colitis, Gastric and Intestinal foreign bodies, Diseases of rectum and anal sac, Peritonitis, Acute hepatitis, Chronic hepatitis, Diseases of gall bladder, Cholangitis, Vascular liver diseases, Extra hepatic biliary system, Acute pancreatitis and Exocrine pancreatic insufficiency.

Unit III

Anemia, Lymphangitis, Lymphadinopathies, Coagulopathies, Immune mediated diseases, Neoplastic diseases of hemo-lymphatic system; Examination of cardiac system and special examination of heart (ECG, Echocardiography, Holter and markers for diagnosis of cardiac disorders), Congenital heart diseases, Dilated cardiomyopathy, Endocardiosis, Cardiac arrhythmias, Pericardial disorders. Pet psychology, Pet behaviour, Adaptation needs and Behavioural medicine

Unit IV

Leptospirosis, Tetanus, Brucellosis, Lyme disease, Rocky mountain spotted fever, Kennel cough, Trypanosomiasis, Ehrlichiosis, Ancylostomiasis, Dirofilariasis, Giardiasis, Coccidiosis/ Isosporosis, Toxoplasmosis, Babesiosis, Neosporosis, Hepatozonoosis and Tape worm infections.

I. Course Title : Canine and Feline Medicine-II

II. Course Code : VMD 505

III. Credit Hours : 2+0

IV. Aim of the course

Internal (respiratory, nervous, urogenital, musculoskeletal, eye, ear and skin) and infectious (viral and fungal) diseases of dogs and cats.

V. Theory

Unit I

Principles of treatment in respiratory disorders, Diseases of nasal cavity, Tracheo-bronchitis, Chronic bronchitis, Pulmonary congestion and edema, Acute pneumonia, Chronic pneumonia, Feline asthma, Pleural effusions and Neoplasms of respiratory tract.

Diagnostic approach to common manifestations of disease: Seizures, Coma, Monoparesis, Pelvic limb paralysis, Pruritis, alopecia, Obesity, Urinary incontinence, Hematuria; Focal, diffuse and multifocal diseases of brain. Diseases of spinal cord and Peripheral nervous system, Vestibular diseases and toxins affecting nervous system.

Unit II

Diseases of muscles- congenital and inherited diseases of muscles, bone and joints, Myasthenia, Myopathy; Nutritional deficiency diseases- Rickets, Primary and Secondary Hyperparathyroidism, Osteodystrophy and Osteomyelitis.

Diseases of eyelids, Epiphora, Keratitis, Conjunctivitis, Uveitis, Glaucoma, Acute blindness and Neoplasms of eye.

Unit III

Skin diseases, Common pyodermas, Atopy, Dermatophytosis and Dermatomycosis, Demodicosis, Scabies, Myiasis, and Nutritional disorders related to skin and its therapeutic management, Flea allergy and its treatment and control measures, Alopecia. Cutaneous manifestations of hormonal imbalances and systemic disorders, Auto immune diseases of skin, Diseases of the pinna, Otitis and principles of treatment in otic infections.

Manifestations and principles of treatment of urinary system diseases, Urinary tract infections, Urolithiasis, Nephritis, Nephrosis, Pyelonephritis, Renal failure and neoplasms of urinary tract.

Unit IV

Viral diseases: Canine parvovirus, Canine distemper, Corona viral gastroenteritis, Infectious hepatitis, Infectious tracheobronchitis, Canine herpes virus, Rabies, Feline Panleukopenia, Infectious peritonitis (FIP), Feline leukemia virus infection, Feline immunodeficiency virus, Vaccination schedule for canine and feline diseases, Dermatophytosis, Blastomycosis, Histoplasmosis, Sporotrichosis, and coccidioidomycosis.

I. Course Title : Metabolic and Endocrine Diseases, Nutritional Deficiencies and Diseases of Mammary Gland

II. Course Code : VMD 506

III. Credit Hours : 2+0

IV. Aim of the course

Study of diagnosis, management and control of metabolic, endocrine, nutritional and mammary gland diseases.

V. Theory

Unit I

Metabolic profile test parturient paresis, Downer cow syndrome, Acute hypokalemia in cattle, Transit recumbency, Lactation tetany of mares, Hypomagnesemia, Tetany of calves, Ketosis, sub-clinical ketosis, Pregnancy toxemia, Fatty liver syndrome, Equine hyperlipidemia, Steatitis, Neonatal hypoglycemia, low milk fat syndrome, Peri-parturient hemoglobinuria and Eclampsia in bitches.

Unit II

Deficiency of energy and protein, Deficiency of fat and water soluble vitamins and deficiency of macro- micro minerals.

Unit III

Mastitis, Diseases of teats and udder in ruminants, “mastitis-metritis-agalactia” in sow and congenital abnormalities of udder and teats.

Unit IV

Diabetes mellitus, Diabetes insipidus, Hypothyroidism, Obesity, Hypo- and hyperadrenocorticism.

I. Course Title : Paediatrics and Geriatrics

II. Course Code : VMD 507

III. Credit Hours : 2+0

IV. Aim of the course

Study of non-infectious and infectious diseases of neonates and geriatric animals.

V. Theory

Unit I

Perinatal management, Perinatal adaptation, Neonatal health, Asphyxia and Resuscitation; Physical examination of the neonate, perinatal and neonatal mortality, Colostrum and its substitutes, Manifestations of disease.

Unit II

Immunization of neonates, Fluid replacement therapy, Nutritional support, Blood and Serum transfusion, Antimicrobial therapy and neonatal diarrhoea.

Unit III

Non-infectious and infectious diseases of viral, bacterial, mycoplasma and parasitic origin of neonates, Young and aged farm and companion animals; Diseases acquired from dam, Congenital disorders, Metabolic disorders, Nutritional deficiencies, Miscellaneous conditions (hypothermia, hyperthermia, starvation, arthritis), Management of shock and other emergencies, Detection and correction of failure of passive transfer of immunity.

Unit IV

Geriatric diseases: Senility, Dental diseases, Glaucoma, Cataract, Keratitis sicca, Urinary incontinence, Renal insufficiency, Cardiac diseases, Pulmonary diseases, Neoplasia, Bone and joint diseases, Neurologic disorders, Otologic disorders, Endocrine diseases (diabetes mellitus, cushing's disease, hypothyroidism), Liver diseases, Psychological and behaviour disorders.

I. Course Title : Avian and Swine Medicine

II. Course Code : VMD 508

III. Credit Hours : 2+0

IV. Aim of the course

Recent concepts in non-infectious and infectious diseases of avian species and pigs.

V. Theory

Unit I

Specific needs of avian species; Diseases due to deficiency of vitamins (vitamins A, B complex, C, D, E, K); minerals (calcium, phosphorus, manganese, zinc, etc.) and sodium chloride.

Unit II

Miscellaneous diseases/ conditions/ vices (cage layer fatigue, beak necrosis, blue comb disease, round heart disease, kerato- conjunctivitis, ascites, urolithiasis, fatty liver, kidney hemorrhagic syndrome, heat stroke, cannabalism, vent picking), egg bound peritonitis, diseases of feather, skin, beak and foot, bumble foot, gout, infectious diseases of poultry (marek's disease, lymphoid leukosis, new castle disease, infectious coryza, fowl typhoid, CRD, pullorum disease, cocciodiosis, chlamydiasis, avian pox, infectious bursal disease, infectious bronchitis, infectious laryngo-tracheitis, etc.)

Unit III

Nutritional deficiency diseases of pigs, swine influenza, hog cholera, african swine fever, swine pox, vesicular exanthema, vesicular stomatitis, rabies. porcine enteroviruses, pseudorabies, listeriosis, leptospirosis, brucellosis, anthrax, salmonellosis, swine erysipelas, pasteurellosis, tuberculosis, mange, etc.

Unit IV

Handling, physical examination, sampling, diagnostic techniques and medication.

I. **Course Title** : **Zoo, Wild and Laboratory Animal Medicine**
II. **Course Code** : **VMD 509**
III. **Credit Hours** : **1+0**

IV. **Aim of the course**

Study of diagnosis, management and control of Zoo, wild and laboratory animals.

V. **Theory**

Unit I

Study of diseases and health management of zoo, Wild and laboratory animals; Etiology, Clinical signs, Diagnosis and management of various diseases of zoo, wild and laboratory animals. Restraint, Feeding, Diseases and health management of exotic animals kept as pets.

Unit II

Specific diseases of laboratory animals caused by bacteria, viruses, fungi and parasites.
Specific diseases of zoo (captive) animals caused by bacteria, viruses, fungi and parasites.

I. **Course Title** : **Toxicology and Forensic Medicine**
II. **Course Code** : **VMD 510**
III. **Credit Hours** : **1+0**

IV. **Aim of the course**

Study of diseases caused by physical, chemical, other toxicants in domestic animals and animal welfare issues.

V. **Theory**

Unit I

Diseases caused by physical agents and poisoning of organic and inorganic compounds. Diseases caused by farm chemicals and phytotoxins. Diseases caused by mycotoxins and zootoxins.

Unit II

Collection, Dispatch and Examination of vetro-legal samples. Examination of wounds, blood, offenses and frauds in animal sales. Animal cruelty and welfare related issues. Study of common laws related to vetro-legal aspects.

I. **Course Title** : **Clinical Diagnostic Techniques**
II. **Course Code** : **VMD 511**
III. **Credit Hours** : **0+2**

IV. **Aim of the course**

To impart training on diagnostic procedures for various diseases of farm and companion animals and their interpretations.

V. **Theory**

Unit I

Peritoneal fluid analysis, Gastrointestinal endoscopy, Colonoscopy, Proctoscopy, Ultrasonography, Liver biopsy, Interventional imaging, Rhinoscopy, Brochoscopy, Transtracheal lavage, Endotracheal lavage, Broncho-alveolar lavage, Thoracocentesis, Pericardiocentesis, Interpretation of hemogram, Renal and Hepatic function tests. Neurological examination.

Unit II

Electrocardiography, Echocardiography, Pulse oximetry, Blood and blood component therapy, Bone marrow biopsy, Arterial blood gas analysis, Cerebrospinal fluid analysis, Cystocentesis, Urinary catheterization, Renal function tests, Specific gravity of urine by refractometer, Skin-biopsy, Cytology- scrapings, Otoscopy, Direct and indirect ophthalmoscopy, Shirmer tear test, Tonometry. Diagnosis tests in mastitis. Assay for $T_{3,}$ $T_{4,}$ lipase, Amylase, Radio immunoassay and indications of CT, MRI, nuclear medicine.

I. Course Title : Emergency Medicine
II. Course Code : VMD 512
III. Credit Hours : 0+2

IV. Aim of the course

Diagnosis and management of common emergencies in animals.

V. Practical

- Diagnosis and therapeutic management of various emergencies of cardiovascular, respiratory, gastrointestinal, urinary and nervous systems.
- Diagnosis and therapeutic management of various emergencies of toxicities, sting bites, snake bite and burns in farm and companion animals.
- Monitoring critical ill patient, application of emergency care procedures for resuscitation of critically ill patients.
- Placement of central venous catheters, introsseous fluid administration, endotracheal intubation, gastric lavage, decompression of guttural pouch, stomach, cecum, ventilation, nebulization, fluid therapy, CPR, oxygen therapy, enteral nutrition, nasogastric intubation, Blood transfusion

I. Course Title : Diagnosis of Veterinary Infectious Diseases
II. Course Code : VMD 513
III. Credit Hours : 0+1

IV. Aim of the course

Concepts and diagnostic tests in veterinary infectious diseases.

V. Practical

- Sampling techniques for collection of samples during research;
- Sensitivity and specificity of diagnostic tests including false positive and false negative tests. Mastitis diagnostic tests;
- Culture and staining techniques;
- Diagnosis of fungal diseases, protozoan and rickettsial diseases, fecal examination for endoparasites, skin scrapping examination for mites, fleas and lice;
- ELISA, PCR, culture sensitivity tests on milk and other body fluids, molecular techniques and types of PCR, Molecular epidemiology tools including RFLP, etc.

I. Course Title : Oncology and Ethno-veterinary Medicine

II. Course Code : VMD 514

III. Credit Hours : 1+0

IV. Aim of the course

Study of diagnosis and management of tumors, natural remedies and alternative systems of medicine.

V. Theory

Unit I

Tumors related to different systems - biology and pathogenesis of cancer, diagnostic procedures, oncology medicine, chemotherapy, radiation therapy, immuno-therapy and miscellaneous therapeutic measures, including advancements of therapeutic approaches, supportive care for the cancer patient.

Unit II

Natural remedies and products for use towards therapy in animal ailments.

Unit III

Acupuncture, physiotherapy, laser therapy, nutraceuticals and dietary supplements.

I. Course Title : Animal Disease Investigation and Biosecurity

II. Course Code : VMD 515

III. Credit Hours : 1+1

IV. Aim of the course

Concepts in investigation of infectious diseases and their prevention.

V. Theory

Unit I

Investigation and diagnosis on dead and live diseased animal (s) and poultry. Point source epidemics and propagating epidemics, Collection, Preservation and transport of material in the face of disease outbreak, and processing of material in the laboratory for diagnosis; Recording and analysis of epidemiological data. Establishing working hypothesis and formulating and advising and/ or implementing treatment, control and prevention measures.

Unit II

Biosecurity definition, Related concepts, Principles and basic components of biosecurity, Physical and operational elements of biosecurity. Routes of entry and transmission dynamics of pathogens. Shedding pattern of pathogens by infected animals and their survival in the environment. Protection of susceptible animals, interruption of pathways of transmission, role of disinfection to break cycle of infection. Sterilization, fumigation and disinfection methods, disinfectants and its classification, Microbial resistance to disinfectants, Risk assessment and its management. Principles of biosecurity in laboratory animal house, Biosecurity measures for collection of specimen from wild animals. Biosecurity in research laboratories. Vaccines-success stories of disease eradication through vaccination.

VI. Practical

- Isolation and identification of field isolates and vaccine strains by conventional,

immunoassays and molecular techniques.
- To perform an outbreak investigation of infectious diseases and toxicological conditions in livestock and poultry in the field/ organised livestock farms.
- Practical use of disinfectants in destruction of microbes in laboratory and under field conditions. Determination of efficacy/ phenol coefficient of commonly used disinfectants.
- Approaches in animal disease control and eradication. Preliminary steps to control animal disease outbreaks.
- Types of vaccines, vaccination schedule in livestock, pets and poultry

I. Course Title : Clinical Practice-I
II. Course Code : VMD 516
III. Credit Hours : 0+3

IV. Aim of the course

Application of the theoretical concepts in practice.

V. Practical

- Diagnostic and therapeutic protocol application, specimen collection, examination and management of sick farm and companion animals, use of diagnostic techniques for diagnosis of medicinal cases, acquaintance with different equipment, client management, public relations, code of conduct, hospital management, database management and maintenance of case records, disaster management
- Note: This course shall be conducted in Veterinary Clinical Complex (VCC), where students shall participate in diagnosis and treatment of diseased animals.

I. Course Title : Clinical Practice-II
II. Course Code : VMD 517
III. Credit Hours : 0+3

IV. Aim of the course

Application of the theoretical concepts in practice.

V. Practical

- Diagnostic and therapeutic protocol application, specimen collection, examination and management of sick farm and companion animals, use of diagnostic techniques for diagnosis of medicinal cases, acquaintance with different equipment, client management, public relations, code of conduct, hospital management, database management and maintenance of case records, disaster management.
- **Note:** This course shall be conducted in Veterinary Clinical Complex (VCC), where students shall participate in diagnosis and treatment of diseased animals.

Course Outline: Lecture wise

VMD 501: Ruminant Medicine-internal 3+0

S. No.	Topics	No. of Lectures
1.	Examination of alimentary tract and abdomen	1
2.	Diseases of the buccal cavity and related organs including pharynx, oesophagus	2
3.	Reticulo-ruminal fermentative disorders (simple indigestion, impaction, ruminal lactic acidosis, alkalosis)	2
4.	Primary and secondary bloat, diaphragmatic hernia	1
5.	Traumatic reticulo-peritonitis, vagal indigestion syndrome, generalised peritonitis vagal indigestion syndrome, generalised peritonitis and omasal impaction	1
6.	Diseases of abomasum (impaction, displacements)	2
7.	(Acute and chronic diarrhoea), hemorrhagic diarrhea	2
8.	Intestinal obstructive disorders (intussusception, volvulus), strangulation	2
9.	Caecal dilatation and volvulus	1
10.	Manifestations of liver and biliary diseases	1
11.	Focal and diffuse diseases of liver, fatty liver syndrome	1
12.	Principle of treatment of respiratory diseases, respiratory insufficiency, anoxias, diseases of nasal cavity, sinuses, diseases of larynx and trachea	2
13.	Epistaxis, hemoptysis, congestion and edema of lungs, hydro and hemothorax	1
14.	Pneumonias and pleuritis	2
15.	Manifestations and principles of treatment in uro-genital system; rupture, paralysis	1
16.	Infections of urinary bladder	1
17.	Urolithiasis, nephritis and renal failure, nephrosis	2
18.	Hemolytic uremic like syndrome, uremia and neoplasms of urinary tract	1
19.	Examination of cardiac system and special examination of heart (ECG, echocardiography disorders)	1
20.	Principal manifestations of cardiovascular diseases	1
21.	Congenital cardiac diseases, Myocarditis	1
22.	Cardiomyopathy, endocarditis, pericarditis	1
23.	Phlebitis, thrombosis, anemia, lymphangitis, lymphadenopathies and thrombocytopenia, lymphosarcoma	2
24.	Principles of nervous dysfunctions, clinical manifestation SOL special examination	1
25.	Localization of lesion in brain and spinal cord	2
26.	Cortical diseases, brain abscess, SOL, meningitis, diseases of brainstem, cerebellar diseases	2
27.	Spinal cord compression, peripheral nerve paralysis, Horner Syndrome, facial nerve paralysis	2
28.	Principle manifestations and special examination of musculoskeletal system	1

S. No.	Topics	No. of Lectures
29.	Foot lameness, arthritis, osteodystrophies, degenerative joint disease and nutritional deficiency diseases affecting musculoskeletal system	3
30.	Diseases of eyes, neoplasms of eyes	1
31.	Conjunctivitis, keratitis, uveitis	1
32.	Diseases of pinna, otits media, otitis externa	2
33.	Skin diseases: folliculitis, furunculosis, and skin neoplasms, skin tumors	1

VMD 502: Ruminant Medicine-infectious 3+0

S. No.	Topics	No. of Lectures
1.	Principles of prevention and control of infectious diseases	1
2.	Anthrax	1
3.	Brucellosis	1
4.	Mastitis	1
5.	Foot rot/ Joint ill	1
6.	Black quarter/ Braxy	1
7.	Tetanus	1
8.	Enterotoxemia	1
9.	Bacillary haemoglobinuria	1
10.	Botulism	1
11.	Colibacillosis	1
12.	Pasteurellosis/ Hemorrhagic septicemia	1
13.	Tuberculosis	1
14.	Paratuberculosis	1
15.	Listeriosis	1
16.	Leptospirosis	1
17.	Acitnomycosis/ Actinobacillosis	1
18.	Ringworm	1
19.	Systemic mycotic infections (Aspergillosis, candidiasis, histoplasmosis, sporotrichosis, coccidiodomycosis, mycotoxicosis)	1
20.	Dermatophilosis	1
21.	Campylobacteriosis	1
22.	Salmonellosis	1
23.	Contagious bovine pleuropneumonia	1
24.	Contagious agalactia	1
25.	Anaplasmosis	1
26.	Chlamydiosis, Q fever, ehrilichiosis	1
27.	Blue tongue	1
28.	Sheep and goat pox	1
29.	Peste des petits ruminants	1
30.	Scrapie, louping ill	1

S. No.	Topics	No. of Lectures
31.	Maedi, visna, jagaskiae disease	1
32.	Rift valley fever	1
33.	Rinderpest	1
34.	Bovine viral diarrhea	1
35.	Malignant catarrhal fever	1
36.	Infectious bovine rhinotracheitis	1
37.	Enzootic bovine leucosis	1
38.	Ephemeral fever	1
39.	Foot and mouth disease	1
40.	Rabies	1
41.	Principles of control of parasitic diseases	1
42.	Amphistomosis	1
43.	Fascioliosis	1
44.	Gastrointestinal nematodiasis, schistosomosis	1
45.	Echinococcosis, tapeworm (cysticercosis)	1
46.	Verminous bronchitis, coeneurosis,	1
47.	Trypanosomosis, babesiosis	1
48.	Theileriosis, hepatozoonosis	1

VMD 503: Equine Medicine (2+0)

S. No.	Topics	No. of Lectures
1.	Manifestations and principles of treatment of gastrointestinal diseases	1
2.	Diseases of the buccal cavity and oesophagus	2
3.	Gastric dilation and rupture, gastro-duodenal ulceration	1
4.	Diseases of the intestine (colic, duodenitis-proximal jejunitis, acute and chronic diarrhea	3
5.	Diseases of liver	1
6.	Diseases of the pericardium, myocardium and endocardium	2
7.	Cardiac arrhythmias, thrombosis	1
8.	Purpura haemorrhagica, immune-mediated thrombocytopenia of the neonates, neonatal isoerythrolysis	1
9.	Sinusitis, ethmoidal hematoma, guttural pouch tympany/ empyema/ mycosis, pharyngitis, recurrent laryngeal neuropathy	2
10.	Pneumonia and pleuropneumonia,	2
11.	Inflammatory airway disease	1
12.	Recurrent airway obstruction	1
13.	Acute renal failure and chronic renal failure	1
14.	Urinary tract infections	1
15.	Exertional myopathy/ Tying up syndrome, myositis	1
16.	Hyperkalemic periodic paralysis, narcolepsy, myotonia	1
17.	Osteodystrophies	1

S. No.	Topics	No. of Lectures
18.	Encephalitis, meningo-encephalitis	2
19.	Facial nerve paralysis, radial nerve paralysis, sciatic nerve paralysis, femoral nerve paralysis, polyneuritis equi (cauda equine neuritis)	1
20.	Bacterial dermatitis (Dermatophilosis, furunculosis, cellulitis, ulcerative lymphangitis, fistulous withers, bacterial psuedomycosis (botryomycosis)	1
21.	Viral skin diseases	1
22.	Allergic dermatitis: Culicoides hypersensitivity, eosinophilic granuloma, anhidrosis, equine sarcoidosis	2
23.	Fungal skin diseases	1
24.	Parasitic skin diseases- habronemiasis, onchocerciasis	1

Suggested Books

- *Equine Internal Medicine*. 2017. Stephen Reed, Warwick Bayly, Debra Sellon, 4th Edition, Elsevier, Saunders.
- *Large Animal Internal Medicine*. 2019. Bradford Smith, David Van Metre, Nicola Pusterla, 6th Edition, Mosby
- Research and Review Papers in Current Journals.

VMD 504: Canine and Feline Medicine-I (2+0)

S. No.	Topics	No. of Lectures
1.	Diagnostic approach to manifestations of gastrointestinal disorders	2
2.	Disorders of oral cavity, pharynx and oesophagus	1
3.	Common disorders of stomach	1
4.	Disorders of small intestine	1
5.	Disorders of large intestine, rectum and anus	1
6.	Diagnostic approach to manifestations of hepato-biliary diseases	2
7.	Hepato-biliary diseases of dogs and cats	1
8.	Exocrine pancreatic disorders of dogs and cats	1
9.	Diagnostic approach to manifestations of hemo-lymphatic disorders	2
10.	Disorders of hematopoietic system	1
11.	Disorders of lymphatic system	1
12.	Diagnostic approach to manifestations of cardiac diseases	1
13.	Congenital heart diseases	1
14.	Acquired valvular diseases, myocardial and pericardial diseases	1
15.	Behaviour disorders of canine and feline	1
16.	Polysystemic protozoal infection of dogs and cats (Hepatozoonosis, babesiosis, trypanosomiasis, neosporosis, toxoplasmosis)	2
17.	Polysystemic rickettsial diseases of dogs and cats (Ehrlichiosis, lyme disease and rocky mountain spotted fever)	2
18.	Important bacterial diseases of canine and feline (Leptospirosis, tetanus, brucellosis and kennel cough)	2
19.	Endoparasitic infestation of dogs and cats	1
20.	Viral diseases of dogs (Canine parvo viral gastroenteritis, canine distemper, corona virus infection, Infectious hepatitis, Infectious trachebronchitis, canine herpes virus and rabies)	3
21.	Viral diseases of cats (Feline panleukopenia, feline infectious peritonitis, feline leukemia virus, feline immunodeficiency virus)	2
22.	Fungal diseases of dogs and cats	1
23.	Vaccination schedule of dogs and cats	1

Suggested Books

- *Small Animal Internal Medicine* 2013. Nelson and Couto, 5th edition, Elesvier Mosby, St. Louis, Missouri
- *Text book of Veterinary Internal Medicine* 2001. Part I and II, Ettinger and Feldman, 7th Edition, *Publisher*: Saunders
- *Small Animal Medical Diagnosis* 2009. MD Lorenz, TM Neer and PL Demars, 3rd Edition, Willey Blackwell, Iowa, USA.
- Research and Review Papers in Current Journals.

VMD 505: Canine and Feline Medicine-II (2+0)

S. No.	Topics	No. of Lectures
1.	Clinical manifestations of upper and lower respiratory tract disorders	1
2.	Canine infectious tracheobronchitis, chronic bronchitis in dogs. feline bronchitis.	1
3.	Pneumonia (viral, bacterial, fungal), pulmonary neoplasia, pulmonary edema	1
4.	Diagnostic approach to pleural effusions	1
5.	Diagnostic approach to diseases of nasal cavity	1
6.	Principles of therapeutic management of respiratory tract disorders	1
7.	Clinical manifestations of urinary tract disorders	1
8.	Acute and chronic renal failure	1
9.	Canine and feline urinary tract infections	1
10.	Disorders of micturition	1
11.	Neoplasms of urinary tract	1
12.	Neurological manifestations of systemic diseases	1
13.	Diagnostic approach to seizures, ataxia, paresis and paralysis	1
14.	Inflammatory brain disorders (bacterial, viral, protozoal, mycotic, parasitic)	2
15.	Diseases of spinal cord (osteomyelitis, intervertibral disc disease)	1
16.	Disorder of peripheral nerves (developmental and congenital disorders, metabolic and toxic disorders, inflammatory and immune mediated neuropathies)	2
17.	Joint diseases of dogs and cats (Non inflammatory and inflammatory)	1
18.	Disorders of muscles (inflammatory myopathies, bacterial, parasitic, immunemediated, degenerative and inherited myopathies	1
19.	Nutritional secondary hyperparathyroidism, rickets	1
20.	Diseases of ears (otitis externa, interna, media), neoplasms, principles of treatment of otitic infections	1
21.	Skin (endocrinopathies, bacterial, parasitic, fungal skin disorders, nutritional disorders related to skin)	2
22.	Alopecia, atopy, flea allergy dermatitis	1
23.	Diagnostic cytology of skin lesions, treatment and control measures.	1
24.	Eyes (diseases of eye lids, keratitis, conjuctivitis, uveitis, glaucoma, acute blindness, neoplasms of eye.	1
25.	Viral diseases of dogs and cats	2
26.	Vaccination for canine and feline diseases	1
27.	Fungal diseases of dogs and cats	2

Suggested books

- *Small Animal Internal Medicine* 2013. by Nelson RW and Couto, CG 5th edition, Elesvier Mosby, St. Louis Missouri

- *Text book of Veterinary Internal Medicine* 2010. by Ettinger and Feldman, 7th Edition, *Publisher*: Saunders
- Research and Review Papers in Current Journals.

VMD 506: Metabolic and Endocrine Diseases, Nutritional Deficiencies and Diseases of Mammary Gland (2+0)

S. No.	Topics	No. of lectures
1.	General aspects of production diseases and metabolic profile test	1
2.	Parturient paresis in dairy animals - etiology, pathogenesis, diagnosis, prevention and therapeutic management	1
3.	Downers cow syndrome and lactation tetany of mares	1
4.	Ketosis, sub clinical ketosis and fatty liver syndrome	1
5.	Nutritional haemoglobinuria in dairy animals	1
6.	Hypomagnesemic tetany in cattle	1
7.	Pregnancy toxaemia in sheep	1
8.	Eclampsia in bitches-etiology, pathogenesis, diagnosis, prevention and therapeutic management	1
9.	Acute hypokalemia and transit recumbency of ruminants	1
10.	Equine hyperlipemia, steatitis and neonatal hypoglycaemia	1
11.	Deficiencies of energy and protein	1
12.	Iodine deficiency disorders of ruminants	1
13.	Copper deficiency diseases of ruminants	1
14.	Diseases associated with deficiency of zinc and manganese	1
15.	Diseases associated with deficiency of iron and cobalt	1
16.	Vitamin E and selenium deficiency	1
17.	Diseases associated with deficiency of vitamin B-complex	1
18.	Diseases associated with deficiencies of vitamin A and K	1
19.	Rickets, osteoporosis and osteodystrophic fibrosa	1
20.	Diabetes mellitus in dogs	1
21.	Diabetes insipidus in dogs	1
22.	Hypo- and hyperthyroidism in dogs	1
23.	Hypo- and hyperadrenocorticism in dogs	1
24.	Anatomy of the mammary glands, physiology of lactation and congenital abnormalities of udder and teats	1
25.	Physical and chemical tests for detection of mastitis	1
26.	Detection and identification of pathogenic bacteria in milk	1
27.	Epidemiology, treatment and control of mastitis caused by contagious, environment and opportunistic pathogens	2
28.	Specific and non-specific viral lesions of teats and udder	1
29.	Teat stenosis; udder oedema; galactorrhagia, galactogogue; agalactia	1
30.	Heifer and goat mastitis, mastitis-metritis-agalactia in sows	1
31.	Public health importance of mastitis	1

Suggested books

- *Veterinary Medicine* 2007. *A Textbook of the Diseases of Cattle, Horses, Sheep, Pigs and Goats by Otto M Radostits*, Clive C Gay, Kenneth W Hinchcliff and Peter D Constable. 10th Edition. Saunders.
- *Clinical Endocrinology of Companion Animals* (2013). Ed. J Rand 1st Edition edt.by Jacquie Rand (Editor), Ellen Behrend (Editor), Danielle Gunn-Moore (Editor), Michelle Campbell-Ward (Editor). Wiley-Blackwell.
- Research and Review Papers in Current Journals.

VMD 507: Paediatrics and Geriatrics (2+0)

S. No.	Topics	No. of Lectures
	Unit I	
1.	Perinatal adaptation, neonatal health, asphyxia and resuscitation	1
2.	Physical examination of the neonate, disease manifestation, supportive care of the abnormal newborn	1
3.	Failure of passive transfer of immunity and its management.	1
	Unit II	
4.	Pediatric pharmacology	1
5.	Fluid replacement therapy	1
6.	Immunization of neonates, nutritional support, blood and serum transfusion	1
	Unit III	
7.	Distended and painful abdomen, bloat	1
8.	Respiratory distress in the neonates	1
9.	Viral diseases of pups, foals and calves	2
10.	Bacterial diseases of pups, foals and calves	2
11.	Neonatal isoerythrolysis in foals, pups and kittens	1
12.	Congenital abnormalities of pups, foals and calves	1
13.	Peri-natal care and diseases of the newborn	1
14.	Non infectious diseases of pups	1
15.	Metabolic disorders, nutritional deficiencies, miscellaneous conditions (hypothermia, hyperthermia, starvation	2
16.	Care, management and treatment of sick puppies	1
	Unit IV	
17.	Guidelines for care of geriatric dogs	1
18.	Neuromuscular dysfunctions in geriatric dogs	1
19.	Common eye and ear affections in older canine and feline patients	1
20.	Hepatic and pancreatic disorders in older dogs and cats	1
21.	Paresis and/ or depressed mentation	1
22.	Urinary system diseases in geriatric dogs and cats	1
23.	Endocrine and metabolic disorders in geriatric patients	1
24.	Respiratory diseases in older dogs and cats	2
25.	Cardiac disorders in geriatric dogs and cats	1
26.	Cancer therapy in geriatric patients	1
27.	Skeletal disorders in geriatric patients	1
28.	Behaviour disorders in geriatric dogs	1

Suggested Readings

- *Equine Pediatric Medicine*. 2018. WV Bernard, BS Barr, 2nd edition, CRC Press.
- *Treatment and Care of the Geriatric Veterinary Patients* 2017. Mary Gardne and Dani McVety, Wiley-Blackwell.
- *Small Animal Pediatrics* 2011. Michael E. Peterson and Michelle Anne Kutzler, Elsevier.
- Research and Review Papers in Current Journals.

VMD 508: Avian and Swine Medicine (2+0)

S. No.	Topics	No. of Lectures
1.	General handling, sample collection and medication in various Avian Spps.	1

S. No.	Topics	No. of Lectures
2.	Etio-pathogenesis, symptomatology, diagnosis and treatment of diseases due to riboflavin deficiency in poultry	1
3.	Encephalomalacia (Crazy chick disease)	1
4.	Rickets and calcium deficiency in poultry	1
5.	Fatty liver and kidney syndrome	1
6.	Manganese and zinc deficiency in poultry	1
7.	Colibacillosis (including peritonitis in layers and salpingitis)	1
8.	Fowl cholera	1
9.	Yolk sac infection and omphalitis	1
10.	Salmonellosis and mycoplasmosis in poultry	1
11.	Infectious bursal disease (Gumboro disease) and Inclusion body hepatitis	1
12.	Infectious laryngotracheitis and infectious bronchitis	1
13.	New castle disease and marek's disease (including transient paralysis)	1
14.	Egg drop syndrome 76 (127 adenovirus/ BC14 infection)	1
15.	Lymphoid leukosis and other leukoses	1
16.	Parasitic diseases (Ascaridiasis and coccidiosis)	1
17.	Miscellaneous poultry diseases (cage layer fatigue, cannibalism, moult and prolapse of oviduct)	1
18.	General handling, physical examination and sample collection in pigs	1
19.	Mineral deficiency diseases in pigs (Calcium, phosphorus, iron, copper and zinc)	1
20.	Vitamin deficiency diseases in pigs (vitamin A, D, E, K, riboflavin and niacin)	1
21.	Swine influenza	1
22.	Swine fever (African and classical)	1
23.	Swine Pox	1
24.	Vesicular exanthema and vesicular stomatitis	1
25.	Swine dysentery (scours) and transmissible gastro-enteritis (TGE)	1
26.	Streptococcal meningitis	1
27.	Porcine reproductive and respiratory syndrome (PRRS)	1
28.	Pneumonia in pigs	1
29.	Glassers disease and greasy pig disease	1
30.	Swine erysipelas and mange	1
31.	FMD and brucellosis	1
32.	New and emerging diseases (Nipah virus)	1

Suggested Poultry Books

- *Diseases of Poultry*. 2013. DE Swayne, JR Glisson, LR McDougald, LK Nolan, DL Suarwz, and VL Nair. *13th Edition,* Wiley-Blackwell.
- *Diseases of poultry and their control*. 2001. R. Chandra, VDP Rao, JC Gomez-Villamandos, SK Shukla and PS Banerjee. 1st edition, International book distributing Co., Lucknow, India. 2001.
- Research and Review Papers in Current Journals.

Suggested Swine Books

- *Diseases of Swine*. 2012. JJ Zimmerman, LA Karriker, A Ramirez, KJ Schwartz and GW. Stevenson. 12th edition, Wiley-Blackwell.
- *Diseases of Swine* 2006. BE Straw, JJ Zimmerman, SD'Allaire and DJ Taylor. 9th edition, Blackwell Publishing.
- Research and Review Papers in Current Journals.

VMD 509: Zoo, Wild and Laboratory Animal Medicine (1+0)

S. No.	Topics	No. of Lectures
1.	Taxonomy of various genera of wild/ zoo animals of India along with their descriptions.	1
2.	Basic principles of habitat and housing of various classes of wild and zoo animals.	1
3.	Nutrient requirements, feeding habits and feeds of zoo, wild and laboratory animals.	2
4.	Diet formulation and feeding of various age groups, sick and geriatric animals.	1
5.	Post mortem examination, handling, processing and interpretation of pathological materials from zoo and wild animals.	1
6.	Breeding for conservation of wild animals.	1
7.	Population dynamics of wild animals, effective population size of wild animals in captivity/ zoo/ natural habitats.	1
8.	Restrain, capture, handling, physical examination and transport of wild and zoo animals.	1
9.	Principles of anesthesia, anesthetics, chemicals of restraining, common surgical Interventions; Capture myopathy.	2
10.	Acts and Rules related to zoo and wild animals.	1
11.	Principles of zoo hygiene, public health problems arising from zoos.	1
12.	Prevention, control and treatment of infectious, parasitic, nutritional and metabolic diseases in zoo and wild animals.	2
13.	Prevention, control and treatment of infectious, parasitic, nutritional and metabolic diseases of laboratory animals.	1

Suggested Books

- *Wild Mammals in Captivity: Principles and Techniques for Zoo Management* (2010). 2nd ed. - Kleiman, DG, University of Chicago Press
- *Zoo and Wild Animal Medicine Current Therapy* (2007). 6th ed. -C Fowler, ME
- *Zoo Animal and Wildlife Immobilization and Anesthesia* (2014). 2nd Ed.-C West, D Heard. N Caulkett, Wiley Blackwell
- Research and Review Papers in Current Journals.

VMD 510: Toxicology and Forensic Medicine (1+0)

S. No.	Topics	No. of Lectures
1.	Lead poisoning	1
2.	Arsenic and selenium poisoning	1
3.	Fluoride and copper toxicity	1
4.	Diseases associated with physical agents	1
5.	Chlorinated hydrocarbons, organophosphorous compounds and carbamates poisoning	1
6.	Nitrate nitrite poisoning, cyanide and urea poisoning	1
7.	Poisoning by mycotoxins and important phytotoxicoses	1
8.	Snakebite poisoning; Bee stings	1
9.	Examination of blood stains	1
10.	The vetero-legal wounds, causes of death from wounds	1
11.	Post-mortem examination of veterolegal case, submission of specimens in suspected cases of poisoning,	1

S. No.	Topics	No. of Lectures
12.	Collection and submission of specimens for histo-pathological examination, and various modern techniques for diagnosis of veterolegal cases	1
13.	Common frauds in the sale of livestock and livestock products	1
14.	Common offenses against animals in India	1
15.	Laws related to animal welfare in India	1
16.	Functioning of Animal welfare board	1

Suggested Books

- *Veterinary Toxicology*. 2014. SK Garg, CBS Publishers.
- *Veterinary Medicine- A textbook of the diseases of cattle, horses, sheep, pigs and goats* by Constable *et al*. 11th Ed., Saunders Ltd.
- *Animal Welfare Ethics and Jurisprudence* 2014. Kirti Dua, 1st Ed., Kalyani Publishers.
- *Veterinary Jurisprudence*. 2015. SN Sharma AK Gahlot and RK Tanwar. 7th Ed., NBS Publisher and Distributor.
- Research and Review Papers in Current Journals.

VMD 511: Clinical Diagnostic Techniques (0+2)

S. No.	Topics	No. of Practicals
1.	Endoscopy in small animals	1
2.	Endoscopic examination of URT in ruminants and equines	1
3.	Tracheo-broncheal lavage in ruminants, horses and dogs	2
4.	Thoracocentesis in dogs, cattle/ buffalo and horses	2
5.	Peritonial fluid collection and examination in dogs, cattle, buffalo and horse	1
6.	Cystocentesis in dogs and urine examination	1
7.	Electrocardiography in dogs and its interpretation	1
8.	Electrocardiography in large animals and its interpretation	1
9.	Techniques in ocular examination	1
10.	Cerebrospinal fluid collection and examination	1
11.	Dermatological examination	1
12.	Collection of biopsy samples (Skin and liver)	2
13.	Diagnosis tests in mastitis	1
14.	Nasogastric/ orogastric intubation in large animals	1
15.	Echocardiography in large and small animals	2
16.	Liver function tests and their interpretation	1
17.	Pericardiocentesis in large and small animals	1
18.	Urinary Catheterization in male and female dogs	1
19.	Urinary Catheterization in a cattle/ buffalo and a mare	1
20.	Renal function tests and their interpretation	1
21.	Arterial blood collection and interpretation of acid base and blood gas analysis	1
22.	Diagnostic tests in ear affections	1
23.	Physical and special examination of musculoskeletal system	1
24.	Neurological examination in small and large animals	2
25.	Bone marrow collection in small and large animals	2
26.	Ultrasonography of chest and abdomen in large animal disease diagnosis	1
27.	CT, MRI, Pulse Oximetry, Radioimmuno assay, Nuclear Medicine	2

Suggested Books

- *Large Animal Internal Medicine*. 2015. Bradford P. Smith, 5th Edition, Mosby Elsevier.
- *Small Animal Clinical Techniques*. 2010. Susan M. Taylor, Saunders Elsevier.
- *Handbook of Veterinary Neurology*. 2010. Michael D. Lorenz, Joan R. Coates and Marc Kent, 5th Edition, Saunders Elsevier.
- *Handbook of Equine Respiratory Endoscopy*. 2007. Safia Barakzai, First Edition, Saunders Elsevier.
- *Manual of Canine and Feline Cardiology*. 2008. Larry P. Tilley, Francis W.K. Smith Jr., M.A. Oyama and M.M. Sleeper, 4th Edition, Saunders Elsevier.
- *Diagnostic Techniques in Equine Medicine: A Textbook for Students and Practitioners Describing Diagnostic Techniques Applicable to the Adult Horse* (2009), Frank GR Taylor, Tim J Brazil and Mark H Hillyer, 2nd Edition, Saunders Elsevier.
- Research and Review Papers in Current Journals.

VMD 512: Emergency Medicine (0+2)

S. No.	Topics	No. of Practicals
1.	Triage and stabilization of critical ill patient	1
2.	Cardiopulmonary resuscitation (CPR) in dogs	1
3.	Oxygen therapy in dogs	1
3.	Gastrointestinal decompression in large and small animals	2
4.	Management of Acute respiratory distress syndrome in small animals	1
5.	Trans-thoracic drainage of pleural effusions in large and small animals	2
6.	Trans-thoracic drainage of pericardial effusions in large and small animals	2
8.	Intra-osseous fluid administration in pups	1
9.	Management of gastrointestinal emergencies; gastric lavage, pain management	1
10.	Endotracheal intubation in dogs	1
11.	Clinical examination and therapeutic management of status epilepticus in small animals	1
12.	Management of the shock patient	1
13.	Blood transfusion in small and large animals	2
14.	Entral nutrition in horse and dog	2
15.	Management of metabolic emergencies (Addison's disease, Diabetic ketoacidosis, Eclampsia, etc.)	2
16.	Management of acute renal failure	1
17.	Diagnosis and management of cardiac arrhythmias	1
18.	Acute obstrcutive colic and its management	1
19.	Poisons and toxins	2
20.	Urinary tract emergencies	2
21.	Ocular emergencies	2
22.	Neurological emergencies	2

Suggested Books

- *Kirk and Bistner's Handbook of Veterinary Procedures and Emergency Treatment*. 2012. Richard B. Ford and Elisa Mazaferro, 9th Edition, Saunders Elsevier.
- *Blackwell's Five Minute Veterinary Consult Clinical Companion, Small Animal Emergency and Critical Care*. 2010. Mazzaferro, M. E. 1st Edition, (Wiley Blackwell)
- *Equine Emergencies Treatment and Procedures*. 2008. Orsini J.A. and Divers T.J., 3rd Edition, Saunders Elsevier.
- Research and Review Papers in Current Journals.

VMD 513: Diagnosis of Veterinary Infectious Diseases (0+1)

S. No.	Topics	No. of Practicals
Practical		
1.	Techniques of random/ probability sampling and using survey tool box software for random selection of villages/ animals from a state population	1
2.	Sources of data and collection of animal health information using passive data and active surveillance	1
3.	Significance of sensitivity and specificity of a diagnostic test and false positive/ negative reactions of a particular test	1
4.	Diagnosis of mastitis by BTB card, SLS paddle test, electrical conductivity meter and somatic cell count.	1
5.	Inoculation of sample on culture media, and isolation/ identification of the organism	1
6.	Culture sensitivity tests on milk and other body fluids	1
7.	Collection and examination of samples for fungal infections	1
8.	Preparation of blood smear for protozoan and ricketssial disease examination	1
9.	Examination of parasitic eggs and along with their identification points including McMaster egg counting technique	1
10.	Collection and/ or examination of skin scrapings for mites, ticks, lice or fleas	1
11.	Screening tests for animal infectious diseases, including TB, JD, glanders and brucellosis	2
12.	Enzyme linked immunosorbant assay (ELISA): direct, indirect and competitive	1
13.	Use of Polymerase chain reaction (PCR) in animal disease diagnosis and its types	2
14.	Molecular epidemiology tools to study strain variation including RFLP, PCR-RFLP, etc.	1

Suggested Books

- *Veterinary Epidemiology* (2018). Michael Thrusfield, Robert Christley. Wiley-Blackwell
- *Veterinary Epidemiologic Research.* (2003). Ian Dohoo, Wayne Martin and Henryk Stryhn, AVC Inc., Charlottetown.
- *Diseases of Animals: Diagnosis and Management* (2013). Singh, Bhoj and Somvanshi, R. Indian Veterinary Research Institute
- *Veterinarian's Guide to the Laboratory Diagnosis of Infectious Diseases* (1986). Gordon R. Carter. Veterinary Medicine Publishing Company
- Research and Review Papers in Current Journals.

VMD 514: Oncology and Ethno-veterinary Medicine (1+0)

S. No.	Topics	No. of Lectures
1.	Introduction to tumors	1
2.	Conventional and advanced diagnostic techniques for diagnosis of tumors	1
3.	Basic and advancements in chemotherapy and radiation therapy for tumors	1
4.	Immune-therapy and other miscellaneous therapy for cancer patients	1
5.	Principles of nutrition and management of chronic pain in cancer patients	1

S. No.	Topics	No. of Lectures
6.	Tumors associated with gastrointestinal tracts	1
7.	Tumors associated with liver and spleen	1
8.	Tumors associated with endocrine system and urinary system	1
9.	Tumors associated with skin, subcutaneous tissues, eye and ear	1
10.	Tumors associated with hemopoietic and respiratory systems	1
11.	Principles of herbal medicines and their use in treating animal diseases	1
12.	Principles of homeopathic medicines and their use in treating animal diseases	1
13.	Application of acupuncture in the management of animal diseases	1
14.	Physiotherapy and laser therapy in animal diseases	1
15.	Common nutraceutical ingredients (prebiotics, probiotics, synbiotics, enzymes and antibacterial alternatives)	1
16.	Use of nutraceuticals in prevention and treatment of various animal diseases	1

Suggested Books

- *BSAVA Manual of Canine and Feline Oncology* by Dobson, Jane M. and Lascelles, B Duncan X. 3rd Ed., BSAVA.
- *Veterinary Herbal Medicine* by SG Wynn and BJ Fougere. 1st Ed., Mosby Elsevier.
- *Textbook of Veterinary Homeopathy*, by J Saxton and P Gregory. Beaconsfield Publishers, Beaconsfield
- *Complementary and Alternative Veterinary Medicine* by Narda G Robinson In: Merck Veterinary Manual. 11th Ed., Wiley.
- *Nutraceuticals in Veterinary Medicine* by, Ramesh C Gupta, Ajay Srivastava and Rajiv Lall. 1st Ed., 2019 Springer.
- Research and Review Papers in Current Journals.

VMD 515: Animal Disease Investigation and Biosecurity (1+1)

S. No.	Topics	No. of lectures/ Practicals
Theory		
1.	Investigation and diagnosis on dead animals and poultry	1
2.	Investigation and diagnosis on live animals and poultry	1
3.	Point source epidemics and propagating epidemics	1
4.	Collection, preservation and transport of material in the face of disease outbreak	1
5.	Processing of material in the laboratory for diagnosis	1
6.	Recording and analysis of epidemiological data	1
7.	Establishing working hypothesis	1
8.	Formulating and advising and/ or implementing treatment, control and prevention strategies	1
9.	Definition and related concepts of biosecurity, principles and basic components of biosecurity, physical operational elements of biosecurity	1
10.	Routes of entry and transmission dynamics of pathogens	1
11.	Shedding pattern of pathogens by infected animals and their survival in the environment	1
12.	Protection of susceptible animals, interruption of pathways of transmission	1
13.	Role of disinfection to break cycle of infection, sterilization, fumigation and disinfection methods	1

S. No.	Topics	No. of Lectures/ Practicals
14.	Disinfectants and its classification; microbial resistance to disinfectants, risk assessment and its management	1
15.	Principles of biosecurity for laboratory animal house, biosecurity in research laboratories, biosecurity measures for collection of specimen from wild animals	1
16.	Vaccines- success stories of disease eradication through vaccination	1
Practical		
1.	Isolation and identification of field isolates and vaccine strains by conventional, immunoassays and molecular techniques	3
2.	Outbreak investigation of infectious diseases in livestock and poultry in the field/ organized livestock farms	2
3.	Outbreak investigation of toxicological conditions in livestock and poultry in the field/ organized livestock farms	1
4.	Practical use of disinfectants in destruction of microbes in the laboratory and under field conditions	1
5.	Determination of efficacy/ phenol coefficient of commonly used disinfectants	1
6.	Approaches in animal disease control and eradication	1
7.	Preliminary steps to control animal disease outbreaks	1
8.	Types of vaccines- conventional and recombinants	1
9.	Vaccination schedule in cattle, sheep and, goats	2
10.	Vaccination schedule in horses and pigs	1
11.	Vaccination schedule of pets including dogs and cats	1
12.	Vaccination schedule of poultry including layers and broilers	1

Suggested Books

- *History of the Surveillance and Control of Transmissible Animal Diseases*. (2003). Jean Blancou. Office International des Epizooties
- *Veterinary Epidemiology* (2018). Michael Thrusfield, Robert Christley. Wiley-Blackwell
- *Biosecurity in Animal Production and Veterinary Medicine* (2018). Jeroen Dewulf, Filip Van Immerseel. *From Principles to Practice*. AMSTERDAM University Press
- Research and Review Papers in Current Journals.

Minor Courses for M.V.Sc. Degree programme

Courses of any one department/ discipline from the list given below:

- Veterinary Physiology
- Veterinary Microbiology
- Veterinary Parasitology
- Veterinary Pharmacology and Toxicology
- Veterinary Surgery and Radiology
- Veterinary Public Health and Epidemiology

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ guide concerned.

Common Courses

The following courses (one credit each) will be offered to all students undergoing Master's degree programme.

- Library and Information Services
- Technical Writing and Communications Skills
- Intellectual Property and its management in Agriculture
- Basic Concepts in Laboratory Techniques
- Agricultural Research, Research Ethics and Rural Development Programmes

Course Contents
Ph.D. in Veterinary Medicine

Course Code	Course Title	Credit Hours
VMD 601	Farm Animal Gastroenterology	2+0
VMD 602	Farm Animal Cardiopulmonary and Urinary System Diseases	2+0
VMD 603	Farm Animal Neurological and Musculo-skeletal System Diseases	1+0
VMD 604	Farm Animal Neonatology	1+0
VMD 605	Herd Health Management	2+1
VMD 606	Canine and Feline Gastroenterology	2+0
VMD 607	Advances in Neurological and Musculoskeletal System Diseases of Canine and Feline	1+0
VMD 608	Canine and Feline Cardiopulmonary and Urinary System Diseases	1+0
VMD 609	Dermatology and Endocrinology	1+0
VMD 610	Canine and Feline Eye and Ear Diseases	1+0
VMD 611	Veterinary Diagnostics	0+2
VMD 612	Metabolic and Nutritional Deficiency Diseases	2+0
VMD 613	Emergency and Critical Care Medicine	1+1
VMD 614	Emerging and Re-emerging Animal Diseases	2+0
VMD 615	Prevention and Control of Infectious Diseases of Ruminants	2+0
VMD 616*	Clinical Practice-I	0+2
VMD 617*	Clinical Practice-II	0+2
VMD 618*	Clinical Practice-III	0+2
VMD 691	Doctoral Seminar-I	1+0
VMD 692	Doctoral Seminar-II	1+0

Course Contents
Ph.D. in Veterinary Medicine

I. Course Title : Farm Animal Gastroenterology

II. Course Code : VMD 601

III. Credit Hours : 2+0

IV. Aim of the course

Study of contemporary advancements in farm animal gastroenterology.

V. Theory

Unit I

Advances in diagnosis, Therapy and control of diseases of gastrointestinal system and associated organs of farm animals.

Unit II

Advances in diagnosis, Therapy, Control and prevention of infectious diseases of gastrointestinal system and associated organs of farm animals.

I. Course Title : Farm Animal Cardiopulmonary and Urinary System Diseases

II. Course Code : VMD 602

III. Credit Hours : 2+0

IV. Aim of the course

Advances in diseases of cardio-pulmonary and urinary systems.

V. Theory

Unit I

Advances in diagnosis and therapeutic management of internal diseases of circulatory system and urinary systems.

Unit II

Advances in diagnosis and therapeutic management of internal diseases of respiratory system.

Unit III

Advances in diagnosis, control, prevention and therapeutic management of infectious diseases of cardiopulmonary and urinary systems.

I. Course Title : Farm Animal Neurological and Musculo-skeletal System Diseases

II. Course Code : VMD 603

III. Credit Hours : 1+0

IV. Aim of the course

Study of recent advances in diseases of neurological and musculoskeletal systems.

V. Theory

Unit I

Advances in diagnosis, Therapy and control of internal diseases of nervous and musculoskeletal system.

Unit II

Advances in diagnosis, Therapy, Control and prevention of infectious diseases of nervous and musculo-skeletal systems.

I. Course Title : Farm Animal Neonatology

II. Course Code : VMD 604

III. Credit Hours : 1+0

IV. Aim of the course

Study of recent advances in care and disease management of equine and ruminant neonates.

V. Theory

Unit I

Advances in diagnosis, Therapy, Prevention and control of internal and infectious diseases of equine neonate.

Unit II

Advances in diagnosis, Therapy, Prevention and control of internal and infectious diseases of ruminant neonate.

I. Course Title : Herd Health Management

II. Course Code : VMD 605

III. Credit Hours : 2+1

IV. Aim of the course

Recent concepts in herd health medicine.

V. Theory

Unit I

General principles, Interactions between health and production, Herd medicine and population health.

Unit II

Herd health management programme for enzootic herds/ flocks.

Unit III

Recent concepts on herd management of chronic Bacterial, parasitic and fungal and rickettsial diseases.

Unit IV

Biosecurity and infection control, Herd and flock immunity, Quality management of herd health, Control of infectious diseases in the herd, Herd health economics.

VI. Practical

Visit to farms, Assessment of their problems, Estimating the presence and prevalence of a disease and new proposals for prevention and control strategies of a specific disease and its impact.

I. Course Title : Canine and Feline Gastroenterology

II. Course Code : VMD 606

III. Credit Hours : 2+0

IV. Aim of the course

Study of advancements in canine and feline gastroenterology.

V. Theory

Unit I

Advances in diagnosis, Therapy and control of internal diseases of gastrointestinal system and associated organs of canine and feline.

Unit II

Advances in diagnosis, Therapy, Control and prevention of infectious diseases of gastrointestinal system and associated organs in canine and feline.

I. Course Title : Advances in Neurological and Musculoskeletal System Diseases of Canine and Feline

II. Course Code : VMD 607

III. Credit Hours : 1+0

IV. Aim of the course

Study of recent advances in the field of neurological and musculoskeletal diseases.

V. Theory

Unit I

Advances in diagnosis, Therapy and control of internal diseases of nervous and musculoskeletal systems.

Unit II

Advances in diagnosis, Therapy and control of infectious diseases of nervous and musculoskeletal systems.

I. Course Title : Canine and Feline Cardiopulmonary and Urinary System Diseases

II. Course Code : VMD 608

III. Credit Hours : 1+0

IV. Aim of the course

Advances in cardiopulmonary and urinary systems.

V. Theory

Unit I

Advances in diagnosis and therapeutic management of internal diseases of circulatory and urinary systems.

Unit II

Advances in diagnosis, therapeutic management of internal diseases of respiratory system.

Unit III

Advances in diagnosis, therapeutic management, prevention and control of infectious diseases of cardiopulmonary and urinary systems.

I. Course Title : Dermatology and Endocrinology

II. Course Code : VMD 609

III. Credit Hours : 1+0

IV. Aim of the course

Recent concepts in diagnosis, management and control of diseases of skin and endocrine organs.

V. Theory

Unit I

Advances in diagnosis, therapy, prevention and control of infectious and non-infectious diseases of skin and integumentary systems.

Unit II

Advances in diagnosis, therapy and control of diseases of endocrine system.

I. Course Title : Canine and Feline Eye and Ear Diseases

II. Course Code : VMD 610

III. Credit Hours : 1+0

IV. Aim of the course

Study of recent advances in eye and ear diseases of canine and feline.

V. Theory

Unit I

Advances in examination, diagnosis and therapy of diseases of eye.

Unit II

Advances in diagnosis and therapy of diseases of ear.

I. Course Title : Veterinary Diagnostics

II. Course Code : VMD 611

III. Credit Hours : 0+2

IV. Aim of the course

Study of recent advances in diagnostics.

V. Practical

Unit I

Analysis and interpretation of hemogram, serum and blood biochemicals.

Unit II

Imaging techniques for the diagnosis of animal diseases (electrocardiography, echocardiography, etc.)

Unit III

Ophthalmoscopy, Ultrasonography, Pulse-oximetry. Assignments on advanced diagnostic techniques for various diseases of domestic animals. Use of above mentioned advanced diagnostic techniques where ever possible. Collection and examination of CSF, gastric/ rumen/ abomasal, peritoneal fluid, absorption and digestion tests, low and high dose dexamethasone test, ACTH stimulation test, hormone profile and enzyme profile.

I. Course Title : Metabolic and Nutritional Deficiency Diseases

II. Course Code : VMD 612

III. Credit Hours : 2+0

IV. Aim of the course

Recent trends in diagnosis, management and control of metabolic and nutritional diseases.

V. Theory

Unit I

Metabolic profile tests, Parturient paresis, Downer's cow syndrome, Acute hypokalemia in cattle, Transit recumbency and lactation tetany of mares, Hypomagnesemic tetany of calves, Ketosis, Subclinical ketosis, Pregnancy toxemia, Fatty liver syndrome, Equine hyperlipidemia, Steatitis, Neonatal hypoglycemia, Low milk fat syndrome, Postparturient hemoglobinuria and eclampsia in bitches.

Unit II

Deficiency of energy and protein, Deficiency of fat. Deficiency of fat and water soluble vitamins, Deficiency of macro and micro minerals.

Unit III

Diabetes mellitus, diabetes insipidus, hypothyroidism, obesity, hypo- and hyperadrenocorticism, hormone deficiency syndromes.

I. Course Title : Emergency and Critical Care Medicine

II. Course Code : VMD 613

III. Credit Hours : 1+1

IV. Aim of the course

Recent advancement in emergency medicine and critical care.

V. Theory

Unit

Diagnosis and therapeutic management of various emergencies of cardiovascular, respiratory, gastrointestinal, urinary and nervous systems.

Unit

Diagnosis and therapeutic management of various emergencies of toxicities, sting bites and burns in farm and companion animals.

Unit

Monitoring critical ill patient, application of emergency care procedures for resuscitation of critically ill patients.

VI. Practical

- Placement of central venous catheters, Intra-osseous fluid administration, Endotracheal intubation, Gastric lavage, Decompression of guttural pouch, Stomach, Cecum, Ventilation, Nebulisation, Fluid therapy, CPR, oxygen therapy, Enteral nutrition, Nasogastric intubation.
- Continuous rate infusion, Defibrillation– Demonstration, Peritoneal dialysis, Peritoneal diagnostic lavage, Management of hypo/ hyper thermia, Trocarization.

I. Course Title : Emerging and Re-emerging Animal Diseases
II. Course Code : VMD 614
III. Credit Hours : 2+0
IV. Aim of the course

Study on emerging and re-emerging diseases of animals.

Unit I

General concepts for emergence of new diseases and re-emergence of old diseases. Factors and determinants of emerging diseases. The role of wildlife in emerging and re-emerging diseases.

Unit II

Microbial adaptation and change; Epidemiological processes involved in the emergence of vector-borne diseases. Epidemiology of globally and nationally important emerging/ re-emerging diseases and designing of strategies for their prevention and control.

I. Course Title : Prevention and Control of Infectious Diseases of Ruminants
II. Course Code : VMD 615
III. Credit Hours : 2+0
IV. Aim of the course

Recent concepts in prevention and control of infectious diseases of ruminants.

V. Theory

Unit I

Bacterial and viral diseases of economic importance in bovines, sheep and goats.

Unit II

Fungal and parasitic diseases of economic importance in bovines, sheep and goats.

Unit III

Blood protozoan and rickettsial diseases of economic importance in bovines, sheep and goats.

I. Course Title : Clinical Practice-I
II. Course Code : VMD 616
III. Credit Hours : 0+2
IV. Aim of the course

Application of the theoretical concepts in practice.

V. Practical

Diagnostic and therapeutic protocol application, Specimen collection, Examination and management of sick farm and companion animals, Use of diagnostic techniques for diagnosis of medicinal cases, Acquaintance with different equipment, Client management, public relations, Code of conduct, hospital management, Database management and maintenance of case records, Disaster management.

Note: This course shall be conducted in Veterinary Clinical Complex (VCC) where students shall participate in diagnosis and treatment of diseased animals.

I. Course Title : Clinical Practice-II

II. Course Code : VMD 617

III. Credit Hours : 0+2

IV. Aim of the course

Application of the theoretical concepts in practice.

V. Practical

Diagnostic and therapeutic protocol application, Specimen collection, Examination and management of sick farm and companion animals, Use of diagnostic techniques for diagnosis of medicinal cases, Acquaintance with different equipment, Client management, Public relations, Code of conduct, Hospital management, Database management and maintenance of case records, Disaster management.

Note: This course shall be conducted in Veterinary Clinical Complex (VCC) where students shall participate in diagnosis and treatment of diseased animals.

I. Course Title : Clinical Practice-III

II. Course Code : VMD 618

III. Credit Hours : 0+2

IV. Aim of the course

Application of the theoretical concepts in practice.

V. Practical

Diagnostic and therapeutic protocol application, Specimen collection, Examination and management of sick farm and companion animals, Use of diagnostic techniques for diagnosis of medicinal cases, Acquaintance with different equipment, Client management, Public relations, Code of conduct, Hospital management, Database management and maintenance of case records, Disaster management.

Course Outline: Lecture wise

VMD 601: Farm Animal Gastroenterology (2+0)

S. No.	Topics	No. of Lectures
1.	Physical examination in gastrointestinal disease diagnostic strategies and initial plan in assessment of gastrointestinal function	1
2.	Imaging techniques for the gastrointestinal system radiography of the gastrointestinal system veterinary nuclear medicine	1
3.	Clinical pharmacology of the gastrointestinal tract	1
4.	Principles of fluid therapy in cattle, horse, pig, sheep and goat	1
5.	Diseases of the buccal cavity and related organs including pharynx, oesophagus	1
6.	Reticulo-ruminal disorders – recent concepts in fermentative disorders-simple indigestion, impaction, ruminal lactic acidosis, alkalosis	2
7.	Primary and secondary bloat- diagnosis	1
8.	Traumatic reticulo-peritonitis, vagal indigestion syndrome, generalised peritonitis, omasal impaction and abdominal distension	2
9.	Diseases of abomasum (impaction, displacements, ulcers)	1
10.	Intestinal disorders (intussusception, volvulus), strangulation, caecal dilatation and volvulus in ruminants.	1
11.	Diseases of bovine liver	1
12.	Diarrhea in cattle and small ruminants	1
13.	Bacterial and viral diseases: Campylobacteriosis, intestinal chlamydial infectionssalmonellosis, tyzzer's diseaseinfectious disease involving gut such as RP, BVD. FMD, actinomycosis, actinobacillosis	3
14.	Protozoal diseases: Coccidiosis, cryptosporidiosis	1
15.	Gastrointestinal parasites of pigsAscaris sp, oesophagostomum, stomach worms, strongyloides sp, trichuris sp	1
16.	Gastrointestinal parasites of horsesGastrophilus, habronema, oxyuris, parascaris, large strongyles, small strongyles, strongyloides, tapeworms, trichostrongylus	2
17.	Gastrointestinal Parasites of cattleCooperia, bunostomum, strongyloidees, nematodirus, toxocara, oesophgostomum, chabertia, trichuris, tapeworms	2
18.	Gastrointestinal parasites of sheep and goatsHaemonchus, ostertagia, and trichostrongylus, intestinal trichostrongylosis, nematodirus, oesophagostomum, chabertia, storngyloides, trichuris, tapeworms	2
19.	Gastrointestinal diseases – Horse and Pigs	1
20.	Dysphagia in horses	1
21.	Diseases of stomach: GIT ulceration, gastric dilation, impaction, gastric parasitism in horses and pigs	1
22.	Diseases causing equine colic such as anterior enteritis, small intestine strangulation, intestine impaction. Protocol and management of equine colic	1
23.	Obstructive intestinal diseases in horse	1
26.	Chronic weight loss without diarrhea, pain or icterus in horse	1
27.	Swine dysentery, hog cholera	1

Suggested Books

- *Equine Internal Medicine*. 2017. Stephen Reed, Warwick Bayly and Debra Sellon, 4th Edition, Elsiever, Saunders.
- *Large Animal Internal Medicine*. 2019. Bradford Smith, David Van Metre and Nicola Pusterla, 6th Edition, Mosby
- *Rebhun's Diseases of Dairy Cattle*. 2018. Simon F Peek and Thomas J Divers, 3rd Edition, Elseviers
- *Veterinary Gastroenterology*. 1992. Neil V. Anderson, 2nd Revised edition, Lea and Febiger, USA.
- Research and Review Papers in Current Journals.

VMD 602: Farm Animal Cardiopulmonary and Urinary System Diseases (2+0)

S. No	Topics	No. of Lectures
1.	Evaluation of patient with respiratory signs	1
2.	Diagnostic aids in evaluation of respiratory line	1
3.	Retropharyngeal lymph node abscessation in horses	1
4.	Pharyngeal affections in horses and Pharyngeal trauma in ruminants	1
5.	Diseases of guttural pouch in horses	1
6.	Laryngeal granuloma, abscess, edema	1
7.	Tracheal collapse and stenosis in farm animals	1
8.	Ethmoid hematoma in horses, diseases of paranasal sinuses in farm animals	1
9.	Disorders of equine soft palate	1
10.	Bacterial pneumonia and pleuropneumonia in adult horses	1
11.	Pneumonia in foals	1
12.	Pulmonary edema and smoke inhalation	1
13.	Recurrent airway obstruction in horses	1
14.	Inflammatory airway disease in horses	1
15.	Epistaxis and Exercise induced pulmonary hemorrhage in horses	1
16.	Bronchopneumonia and interstitial pneumonia in ruminants	1
17.	Hypersensitivity and metastatic pneumonia	1
18.	Progressive viral pneumonia of sheep and goats	1
19.	Pleuritis and pleural effusions, pneumothorax and lung tumors	1
20.	Viral pneumonia of sheep	1
21.	Congenital cardiac diseases	1
22.	Pericardial diseases	1
23.	Myocardial diseases	1
24.	Endocardial diseases	1
25.	Cardiac arrythmias	1
26.	Anaemia	1
27.	Bleeding disorders	1
28.	Renal failure in horses	1
29.	Urinary incontinence and urethral obstruction in equine and bovine	1
30.	Polyuria and polydypsia in horses, urinary system disorders in the foal	1
31.	Ulcerative posthitis and vulvitis in small ruminants	1
32.	Bacterial pyelonephritis and urinary tract infection, leptospirosis	1

Suggested Books

- *Large Animal Internal Medicine*. 2019. Bradford Smith, David Van Metre and Nicola Pusterla, 6th Edition, Mosby
- *Veterinary Medicine: A textbook of the diseases of cattle, horses, sheep, pigs and goats* by Otto M Radostits, Clive C Gay, Kenneth W Hinchcliff and Peter D Constable.10th Edition. Saunders

- *Rebhun's Diseases of Dairy Cattle*. 2018. Simon F Peek, Thomas and J Divers, 3rd Edition, Elseviers
- Research and Review Papers in Current Journals.

VMD 603: Farm Animal Neurological and Musculo-skeletal System Diseases (1+0)

S. No.	Topic	No. of Lectures
1.	Neurological examination in bovine and equine patients; Localization of lesions in nervous system	1
2.	Disease of brain stem in equines and bovines	1
3.	Diseases producing cortical signs in equines and bovines	1
4.	Diseases of spinal cord and Peripheral neuropathies	1
5.	Viral/ Prions encephalopathies: Equine herpes virus, Eastern/ Western equine encephalopathies, Bovine Spongifrom Encepahlopathy, etc.	2
6.	Parasitic thromboembolism and Equine Protozoal encephalomyelitis	1
7.	Encephalomalacia, Narcolepsy and Hyperkalemic periodic paralysis	1
8.	Diagnostic approach to musculoskeletal abnormalities	1
9.	Diseases of Muscle tone; Muscle Cramping	1
10.	Nonexertional Rhabdomyolysis in Horses: Inflammatory myopathies, nutritional, toxic and traumatic rhabdomyolysis	1
11.	Exertional Myopathies in Horses: Congenital, acquired and metabolic disorders	1
12	Osteochondrosis, Septic (Infectious) arthritis osteomyelitis, osteoarthritis, laminitis in horse	1
13	Bovine foot lameness: Characteristics of lameness, metabolic and infectious causes and conformation defects	2
14	Nutrition and Lameness, Claw trimming and foot baths	1

Suggested Books

- *Bovine Laminitis and Lameness*. 2007. Paul R Greenough, First Edition, Saunders Elsevier.
- *Large Animal Internal Medicine*. 2019. Bradford Smith, David Van Metre, Nicola Pusterla, 6th Edition, Mosby
- *Handbook of Veterinary Neurology*. 2010. Michael D Lorenz, Joan R Coates and Marc Kent, 5th Edition, Saunders Elsevier.
- *Equine Internal Medicine*. 2004. Stephen M Reed, Warwick M Bayly and Debra C Sellon, 2nd Edition, Saunders Elsevier.
- Research and Review Papers in Current Journals.

VMD 604: Farm Animal Neonatology (1+0)

S. No.	Topics	No. of Lectures
1.	Advances in management during perinatal adaption period	1
2.	Manifestations of neonatal diseases in calves	2
3.	Manifestations of neonatal diseases in foals	2
4.	Manifestations of neonatal diseases in lambs and kids	2
5.	Neonatal infection and sepsis	1
6.	Advances in diagnostic procedures in neonates	2
7.	Advances in intensive care of management of critically ill neonates	2
8.	Advances in chemotherapeutic management of neonatal diseases	2
9.	Vaccination and maternal antibody interference	1
10.	Advances in management of orphan neonates	1

Suggested Books

- *Equine Pediatric Medicine*. 2018.W V Bernard, BS Barr, 2nd edition, CRC Press
- *Practical Lambing and Lamb Care*. 2018. N Sargison, JP Crilly and A Hopker, 4th edition, Wiley Blackwell
- *Equine Neonatal Medicine*. 2006. MR Paradis, 1st edition, Saunders
- *Bovine Neonatology*. 2009. *Veterinary Clinics of North America: Food Animal Practice*. 1st Edition, Saunders
- Research and Review Papers in Current Journals.

VMD 605: Herd Health Management (2+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
1.	General principles of herd health management	2
2.	Factors to be considered for successful implementation of herd health program	1
3.	Interaction between health and production	2
4.	Monitoring young stock health	1
5.	Targets for young stock rearing and dairy cow culling	1
6.	Disease control in rearing period	1
7.	Herd Medicine and population health	2
8.	Herd nutrition for optimum health	2
9.	Recent concepts on herd management of bacterial diseases	2
10.	Recent concepts on herd management of viral diseases	2
11.	Recent concepts on herd management of parasitic diseases	1
12.	Recent concepts on herd management of fungal diseases	1
13.	Recent concepts on herd management of rickettsial diseases	1
14.	Herd management of metabolic diseases	1
15.	Herd management of deficiency diseases	1
16.	Biosecurity and infection control	1
17.	Herd and flock immunity	1
18.	Quality management of herd health	1
19.	Control of infectious diseases in the herd	1
20.	Herd health economics	1
21.	Importance and steps of record keeping	2
22.	Control of lameness	1
23.	Diagnosis and control of mastitis and enhancement of milk quality	2
Practicals		
1.	Recent advances in calf management and diseases	1
2.	Appropriate animal housing	1
3.	Epidemiological investigations for problem identification at farm	1
4.	Farm biosecurity	1
5.	Recent advances in disinfection of farm sheds and other equipments	1
6.	Stress control of farm animals with respect to environmental and production stress	1
7.	Record keeping	1
8.	Recent advances in disease testing (TB, JD, Brucellosis, Mastitis)	1
9.	Routine farm procedures	2
10.	Herd vaccination	1
11.	Ecto and endo parasitism: principles and latest control trends	1
12.	Recent advances in mastitis control	1

S. No.	Topics	No. of Lectures/ Practicals
13.	Recent advances in lameness control	1
14.	Establishment of farm laboratoty	1
15.	Use of medicines and food safety	1

Suggested Books

- *Dairy Herd Health*. 2012. MJ Green and Andrew J Bradley. CABI *Publishing*
- *Herd Health: Food, Animal, Production, Medicine*. 1994. OM Radostits, KE Leslie, J Fetrow and WB. Saunders,
- *Veterinary Epidemiology*. 2018. Michael Thrusfield, Robert Christley. Wiley-Blackwell
- *The Keys to Herd Health*. 2006. Jerry Brunetti. Acres U.S.A.
- *Herd Health and Production Management in Dairy Practice*. 2003. Arie Brand. International Book Distributing Company
- Research and Review Papers in Current Journals.

VMD 606: Canine and Feline Gastroenterology (2+0)

S. No.	Topics	No. of Lectures
1.	Introduction to gastrointestinal function and microbiota	02
2.	Diagnostic approach to anorexia, abdominal pain and vomiting	02
3.	Approach to clinical signs of diarrhea, constipation and tenesmus	02
4.	Diagnostic and therapeutic approach to hematochezia and melena	02
5.	Diagnostic approach to hepato-biliary diseases and pancreatic diseases, coagulopathy, icterus, ascites and hepatoencephalopathy	02
6.	Approach to clinical signs of weight loss and cachexia	01
7.	Nutritional approach to gastrointestinal disease management	02
8.	Pharmacological approach to gastrointestinal disease: antiemetic, antidiarrhoeal and cytoprotective agents	01
9.	Pharmacological approach to gastrointestinal disease: antimicrobial and anthelmintic agents	01
10.	Pharmacological approach to gastrointestinal disease: prokinetics, probiotics and laxatives	01
11.	Chemotherapy and immunosuppressive drugs in gastrointesinal disease	01
12.	Dentistry and diseases of oropharynx	01
13.	Diagnostic evaluation and diseases of esophagus	01
14.	Gastric diseases: Gastritis, ulceration, neoplasia and dysmotility	02
15.	Advances in treatment and management of Small intestinal diseases	01
16.	Diagnostic approach and management of inflammatory bowel disease (IBD), Ulcerative colitis, bacterial, parasitic and fungal infections of large intestine	02
17.	Diagnostic evaluation and treatment of diseases of anorectum	01
18.	Diagnostic evaluation and common affections of pancreas	01
19.	Liver: Parenchymal, neoplastic, metabolic and biliary disorders	03
20.	Breed related gastrointestinal disorders	01
21.	Behaviour and gastrointestinal disease	01

Suggested books

- *Canine and Feline Gastroenterology*. 2013. RJ Washabau and MJ Day, Elesvier Mosby, St. Louis Missouri
- *Text Book of Veterinary Internal Medicine*. 2001. Part I and II, Ettinger and Feldman, 7th Edition, Saunders

- *Small Animal Medical Diagnosis*. 2009. MD Lorenz, TM. Neer and PL Demars, 3rd Edition, Willey Blackwell, Iowa, USA.
- Research and Review Papers in Current Journals.

VMD-607 Advances in Neurological and Musculoskeletal System Diseases of Canine and Feline (1+0)

S. No	Topics	No. of Lectures
1.	Classification and general diagnostic features of acquired myopathies in dogs and cats	1
2.	Developmental and genetic bone disorders	1
3.	Idiopathic bone disorders	1
4.	Metabolic, nutritional and endocrine bone disorders	1
5.	Neoplasms of bones	1
6.	Focal brain diseases of rapid onset- idiopathic epilepsy, idiopathic vestibular disease, trigeminal neuropathy, idiopathic facial nerve paralysis	1
7.	Brain diseases of intermediate onset- brain abscesses	1
8.	Focal brain diseases of slow onset- Thiamine deficiency, hypoglycemia, poisons	1
9.	Inflammatory brain disorders- viral, bacterial, protozoal and mycotic encephalitis	1
10.	Inflammatory meningitis-granulomatous meningo-encephalitis, Pug encephalitis, rickettsial diseases	1
11.	Metabolic diseases with neurological signs	1
12.	Diseases affecting cervical spinal cord and brachial plexus	1
13.	Diseases affecting thoraco-lumbar and lumbo-sacral segments of spinal cord	2
14.	Inflammatory and immune mediated neuropathies	1
15.	Metabolic and toxic causes affecting peripheral nerves dysfunctions	1

Suggested Books

- *Handbook of Veterinary Neurology*. 2011. MD Lorenz, JR Coates and Marc Kent 5th Edition. Elsevier Saunders
- *Textbook of Veterinary Internal Medicine: Diseases of the Dog and Cat*. 2010. Stephen J. Ettinger and Edward C. Feldman, Elsevier Saunders 7th Edition.
- *Veterinary Clinics of North America: Small Animal Practice*, Elsevier, Monthly
- Research and Review Papers in Current Journals.

VMD 608: Canine and Feline Cardiopulmonary and Urinary System Diseases (1+0)

S. No	Topic	No. of Lectures
1.	Pathophysiology of heart failure, Clinical manifestations of cardiac diseases	1
2.	Diagnostic tests for cardiovascular system (radiography, electrocardiography and echocardiography)	1
3.	Therapeutic management of heart failure	1
4.	Cardiac arrhythmias and anti-arrhythmic therapy	1
5.	Acquired valvular heart diseases (Degenerative atrioventricular valve diseases and infectious endocarditis)	1
6.	Myocardial diseases od dogs and cats(Canine dilated cardiomyopathy, canine hypertrophic cardiomyopathy and feline cardiomyopathies)	1

S. No.	Topics	No. of Lectures
7.	Pericardial diseases and cardiac tumors, systemic arterial hypertension	1
8.	Clinical evaluation of patient with respiratory diseases	1
9.	Feline upper respiratory tract infections	1
10.	Bacterial rhinitis, allergic rhinitis, nasal mycosis, nasal tumors, polypsin dogs and cats	1
11.	Diseases of trachea (infectious tracheobronchitis, lungworms, tracheal hypoplasia and tracheal collapse), Canine and feline bronchitis	1
12.	Pulmonary parenchymal diseases (infectious- viral, bacterial, protozoal, fungal and parasitic)	1
13.	Pulmonary neoplasia, pulmonary edema, pleural effusions, pneumothorax	1
14.	Clinical approach and laboratory evaluation of renal diseases, Glomerulonephritis, Urolithiasis	1
15.	Acute and chronic renal failure	1
16.	Canine and feline lower urinary tract disorders, Disorders of micturition, Neoplasms of urinary tract	1

Suggested Books

- *Small Animal Internal Medicine*. 2013. Nelson RW and Couto, CG 5th edition, Elesvier Mosby, St. Louis Missouri
- *Text book of Veterinary Internal Medicine*. 2010. Ettinger and Feldman, 7th Edition, Saunders
- Research and Review Papers in Current Journals.

VMD 609: Dermatology and Endocrinology (1+0)

S. No.	Topics	No. of Lectures
1.	New trends in management of adrenal gland diseases in dogs and cats	1
2.	Hyperadrenocorticism (Pituitary pars intermedia dysfunction) in horses	1
3.	Primary hyperaldosteronism and pheochromocytoma in dogs and cats	1
4.	Advances in management of diabetes mellitus and diabetic ketoacidosis	1
5.	Equine metabolic syndrome/ Insulin resistance syndrome in horses	1
6.	Hypo and hyperthyroidism in dogs and cats	1
7.	Hypo and hypercalcemia in dogs and cats	1
8.	Hyposomatotropism and acromegaly in dogs	1
9.	Advances in management of diabetes Insipidus and polyuria/ polydipsia in Dogs and cats	1
10.	Advances in management of autoimmune disorders (different forms of pemphigus)	1
11.	Diagnosis, therapy and prevention of hypersensitivity disorders –Atopy, urticaria, milk allergy, vasculitis, contact dermatitis, culicoides hypersensitivity	1
12.	Diagnosis, therapy and prevention of bacterial skin dermatitis-dermatophillus, folliculitis, staphylococcal cellulitis, equine corynebacterial dermatitis	1
13.	Diagnosis, therapy and prevention of fungal skin dermatitis-dermatophytosis, malasezzial dermatitis	1
14.	Diagnosis, therapy and prevention of parasitic skin dermatitis-mange, culicoides hypersensitivity, onchocerciasis, stephanofilaria, cutaneous hebronemiasis	1
15.	Diagnosis, therapy and prevention of viral diseases-warts, pox diseases	1
16.	Advanced diagnosis of skin tumors	1

VMD 610: Canine and Feline Eye and Ear Diseases (1+0)

S. No.	Topics	No. of Lectures
Advances in Examination, Diagnosis and Therapy of diseases of eye		
1.	Diseases of the eyelid and Conjunctiva	2
2.	Diseases of the cornea and sclera	1
3.	Disease of the lens, uvea: Glaucoma	2
4.	Disease of the retina, choroid, and optic nerve	2
5.	Disease of the Lacrimal apparatus	1
6.	Diseases of the the Orbit	1
7.	Neuro-ophthalmology	1
8.	Tumors of eye	1
Advances in Diagnosis and Therapy of diseases of ear		
1.	Otitis Externa	1
2.	Diseases of the external ear canal and pinna	1
3.	Otitis media and Otitis interna	2
4.	Tumors of ear	1

Suggested Books

- *Veterinary Opthalmology*. 2013. Kirk N Gellat, Brian C Gilger and Thomas J Kern, 5th edition.Wiley Blackwell,
- *Saunders Manual of Small Animal Practice*. 2016. SJ Birchard and RG Sherding, WB Saunders Company
- Research and Review Papers in Current Journals.

VMD 611: Veterinary Diagnostics (0+2)

S. No.	Topics	No. of Practicals
Practical		
1.	(i) Endoscopic procedures in small animals (ii) Diagnostic aids and ancillary diagnostic tests in diseases of gastrointestinal system	2
2.	Endoscopic examination of URT in ruminants	1
3.	Endoscopic examination of URT in equines	1
4.	Tracheo-bronchial lavage in ruminants, horses and dogs	2
5.	Thoracocentesis in dogs, cattle/ buffalo and horses	2
6.	Electrocardiography in dogs and its interpretation/ Electrocardiographic diagnosis of arrhythmia in dogs	2
7.	Electrocardiography in diagnosis of arrhythmias in horses and dairy animals	1

S. No.	Topics	No. of Practicals
8.	Cerebrospinal fluid collection, examination and diagnosis and clinical case study (5 animals)	1
9.	Dermatological examination and case workup	1
10.	Biopsy collection techniques and its application on clinical cases	1
11.	Pericardiocentesis and drainage of effusions in large and small animals	1
12.	Neurological examination in small and large animals	2
13.	Techniques in ocular examination-cytology, opthalmoscopy, measurement of intraocular pressure	2
14.	Bone marrow collection and its application in diagnosis in small and large animals	1
15.	Ultrasonography in various thoracic and abdominal affections in large animals	1
16.	Echocardiography in valvular and myocardial diseases in small animals	1
17.	Echocardiography in valvular and myocardial diseases in large animals	1
18.	Liver function tests and their interpretation with case studies	1
19.	Arterial blood collection and interpretation of acid base and blood gas analysis	1
20.	Concepts and diagnostic tests in veterinary infectious diseases Sampling techniques for collection of samples during research	2
21.	ELISA and its types, molecular techniques and types of PCR	1
22.	Molecular epidemiology tools including RFLP, etc.	2
23.	Molecular diagnostic techniques of fungal diseases, protozoan and rickettsial diseases	2

VMD 612: Metabolic and Nutritional Deficiency Diseases (2+0)

S. No.	Topics	No. of Lectures
1.	Strategies for transition cow health management	1
2.	Latest trends in prevention and management of parturient paresis with special reference to calcium cyclers and DCAD	1
3.	Current approach to diagnosis and management of downer's cow syndrome and acute hypokalemia in cow	1
4.	Lactation tetany and transit recumbency in mares	1
5.	Update on diagnosis and management of hypomagnesemic tetany in calves	1

S. No.	Topics	No. of Lectures
6.	Recent trends in diagnosis and management of ketosis in dairy animals with special reference towards blood metabolites and genomic tools	1
7.	Pregnancy toxemia in sheep and goats: current diagnosis and treatment strategies	1
8.	Biomarkers of fatty liver syndrome in dairy cattle: Latest diagnosis and treatment protocols	1
9.	Update on equine hyperlipidemia and steatitis	1
10.	Neonatal hypoglycemia: Recent trends in diagnosis and management	1
11.	Sub-acute ruminal acidosis (SARA) and low milk fat syndrome	1
12.	Nutritional/ parturient/ puerperal hemoglobinuria	1
13.	Recent trends in diagnosis and management of eclampsia in bitches	1
14.	Exertional myopathies in horse	1
15.	Nutritional secondary hyperparathyroidism (bighead; bran disease)	1
16.	Recent trends in mineral supplementation in livestock with special reference to chelated and non-chelated supplements	1
17.	Diseases due to trace elements deficiency in dairy cattle	1
18.	Oxidative stress during transition period: Role of various vitamins and minerals	1
19.	Recent trends in feeding strategies during transition period for prevention of vitamin and mineral deficiencies	1
20.	Update on importance of vitamin E and selenium in transition cows	1
21.	Disorders due to sodium and potassium deficiency	1
22.	Canine diabetes mellitus: Update on diagnosis and management	1
23.	Canine diabetes insipidus: Update on diagnosis and management	1
24.	Hypothyroidism in canine: Recent trends in diagnosis and management	1
25.	Obesity in pet animals: etio-pathogenisis, diagnosis and lifestyle management	1
26.	Diagnostic tools and treatment protocols for hypo and hyper adrenocorticism in dogs	1
27.	Recent trends in diagnosis, treatment and prevention of vitamin A deficiency diseases	1
28.	Diseases due to thiamine deficiency (PEM)	1
29.	Disorders due to vit K deficiency	1
30.	Approaches towards diagnosis, treatment and prevention of riboflavin (vit B2) deficiency in swine and poultry	1
31.	Update on diagnosis, treatment and prevention strategies for niacin deficiency in swine and poultry	1
32.	Diagnosis, management and prevention of Pantothenic acid deficiency in swine and poultry	1

Suggested Books

VMD 613: Emergency and Critical Care Medicine (1+1)

S. No.	Topics	No. of Lectures/ Practicals
Theory		
1.	Triage and stabilization of critical ill patient	1
2.	Newer therapeutic approach in management of a shock patient	2
3.	Advances in management of respiratory emergencies	2
4.	Gastrointestinal emergencies in small and large animals	2
5.	Management of metabolic emergencies (Addison's disease, Diabetic ketoacidosis, Eclampsia, etc.) in small animals	1
6.	Diagnosis and management of Cardiac arrhythmias	1
7.	Acute obstructive colic and its management	1
8.	Poisoning and toxocosis in animals and its management	2
9.	Urinary system emergencies	1
10.	Ocular emergencies	1
11.	Neurological emergencies	1
12.	Pain, assessment and its management	1
Practicals		
1.	Cardiopulmonary resuscitation (CPR) in dogs and monitoring of critical ill patient and oxygen therapy in dogs	1
2.	Gastrointestinal decompression in large and small animals	1
3.	Clinical approach to acute respiratory distress syndrome in small animals	1
4.	Trans-thoracic drainage of pleural effusions in large animals	1
5.	Trans-thoracic drainage of pericardial effusions in large and small animals	1
6.	Intra-osseous fluid administration in pups	1
7.	Procedures for gastrointestinal emergencies in small animals	1
8.	Procedures for gastrointestinal emergencies in large animals	1
9.	Blood component therapy in critical patients	1
10.	Endotracheal intubation in dogs	1
11.	Clinical examination and therapeutic management of status epilepticus in small animals	1
12.	Case Studies on GIT emergencies	1
13.	Case Studies on Respiratory emergencies	1
14.	Case Studies on Cardiac emergencies	1
15.	Case Studies on hematological emergencies	1
16.	Case Studies on metabolic emergencies	1

Suggested Books

VMD 615: Prevention and Control of Infectious Diseases of Ruminants (2+0)

S. No.	Topics	No. of Lectures
1.	Advances in principles of prevention and control of infectious diseases	1
2.	Anthrax as a biological weapon: strategies for its control in animals	1
3.	Screening and control of Brucellosis in organized dairy herds	1
4.	Diagnosis and management of Mastitis	1
5.	Pathogenesis and sympotomatology of Clostridial diseases	2
6.	Pathogenesis and control of Colibacillosis	1
7.	Recent advances in diagnosis and control of Hemorrhagic septicemia	1
8.	Approaches in diagnosis of Tuberculosis	1
9.	Paratuberculosis: differential diagnosis and control	1
10.	Epidemiology, pathogenesis and diagnosis of Listeriosis	1
11.	Pathogenesis and control of Leptospirosis in animals	1

S. No.	Topics	No. of lectures
12.	Clinical presentation, differential diagnosis and treatment of Acitnomycosis and Actinobacillosis	1
13.	Advancement in diagnosis and treatment of dermatophytosis and other fungal infections	1
14.	Differential diagnosis and control of campylobacteriosis	1
15.	Latest advancements in Salmonellosis	1
16.	Advancement in diagnosis and control of Mycoplasma infections	1
17.	Latest trends in diagnosis and treatment of anaplasmosis	1
18.	Latest trends in diagnosis and control of Blue tongue	1
19.	Recent advancement in management of sheep and goat pox	1
20.	Recent literature on diagnosis and control of Peste des petits ruminants	1
21.	Lessons to be learnt from eradication of Rinderpest	1
22.	Recent advances in Bovine viral diarrhea and malignant catarrhal fever	1
23.	Recent literature on Infectious bovine rhinotracheitis	1
24.	Recent studies on clinical symptomatology and diagnosis of ephemeral fever	1
25.	Advancements in diagnosis and control of Foot and mouth disease	1
26.	Recent approaches in diagnosis and control of Rabies	1
27.	Principles of control of parasitic diseases	1
28.	Recent trends in Clinical symptomatology, diagnosis and control of Amphistomosis and fascioliosis	1
29.	Recent approaches in control of major endoparasitic infestations	1
30.	Recent advancements in diagnosis and control of trypanosomosis	1
31.	Recent advancements in diagnosis and control of babesiosis and theileriosis	1

Suggested Books

- *Merck's Veterinary Manual K*. 2016. Susan E Aiello and Michael A Moses, 11th Edition, Merck Sharp and Dohme
- *Veterinary Medicine*. 2016. Peter Constable, Kenneth W Hinchcliff, Stanley Done and Walter Gruenberg, 11th Edition. Saunders Ltd.
- *Dairy Herd Health*. 2012. MJ Green and Andrew J Bradley. CABI Publishing
- Research and Review Papers in Current Journals.

Minor Courses for Ph.D. Degree programme

Courses of any one department/ discipline from the list given below:

- Veterinary Physiology
- Veterinary Microbiology
- Veterinary Parasitology
- Veterinary Pharmacology and Toxicology
- Veterinary Surgery and Radiology
- Veterinary Public Health and Epidemiology

Supporting Courses

It could be any subject considered relevant for student's research work. This will be decided by Advisor/ guide concerned.

ANNEXURE I

List of BSMA Committee Members for Veterinary Clinical Subjects

1. Animal Reproduction Gynaecology and Obstetrics
2. Veterinary Surgery and Radiology
3. Veterinary Medicine

Name	Address	Specialization
Dr Jit Singh Former Dean	Udaipur Veterinary College Flat No.310, Manglam Residency, Rose Block, New Navratan Complex, Bhuwana, Udaipur -313001	Chairman
Dr D.B. Patil Director Research and Dean PGS	Kamdhenu University Gandhinagar-382010, Gujarat	Convener
Dr J. K. Prasad Principal Scientist	Indian Veterinary Research Institute Division of Animal Reproduction, Gynaecology and Obstetrics, Izatnagar, Bareilly, (UP)-243122	Animal Reproduction Gynaecology and Obstetrics
Dr K.N. Aravinda Ghosh Former Professor and Head	College of Vety. and Animal Sciences Animal Reproducation Gynaecology and Obstetrics Department, Mannuthy, Kerala -680651	
Dr Naveen Kumar Principal Scientist	Indian Veterinary Research Institute Division of Veterinary Surgery Izatnagar,Bareilly- 243122 (UP)	Veterinary Surgery and Radiology
Dr Vinod Kumar Gupta Former Principal Scientist	Indian Veterinary Research Institute Division of Veterinary Medicine Izatnagar, Bareilly-243122 (UP)	Veterinary Medicine
Dr S. N. S. Randhawa Professor and Head	Khalsa College of Veterinary and Animal Sciences Ram Tirath Road, Amritsar Punjab-143002	

Restructured and Revised
Syllabi of Post-graduate Programmes
Vol. 3

Veterinary Para-Clinical Subjects

- Veterinary Microbiology
- Veterinary Pathology
- Veterinary Parasitology
- Veterinary Public Health and Epidemiology
- Veterinary Pharmacology and Toxicology

Contents

Acknowledgements

The Chairperson and Convener of BSMA for Veterinary Paraclinical disciplines, express their sincere thanks and gratitude to all the committee members, experts and other stake holders for their direct and indirect contribution in formulation and revision of course curriculum and syllabi. The permission, logistic support and local hospitality provided by the administration of ICAR – Indian Veterinary Research Institute, Izatnagar, CoVAS, CSK HPKV, Palampur, Himachal Pradesh and SKUAST, JAMMU, J&K is duly acknowledged. The BSMA committee also express their deepest sense of gratitude to the Education Division, Indian Council of Agricultural Research (ICAR), New Delhi for giving the opportunity to revise and update the syllabus.

Minimum Credit requirements:

Subject		Master's Programme	Doctoral Programme
i.	**Course work**		
	Major courses	20	12
	Minor courses	08	06
	Supporting courses	06	05
	Common courses	05	–
ii.	**Seminar**	01	02
iii.	**Thesis/ Research**	30	75
	Total	**70**	**100**

Major courses

From the Discipline in which a student takes admission. Among the listed courses, the core courses compulsorily to be taken is given *mark

Minor courses

From the subjects closely related to a student's major subject.

Supporting courses

The subject not related to the major subject. It could be any subject considered relevant for student's research work (such as Statistical Methods, Design of Experiments, etc.) or necessary for building his/ her overall competence.

Common Courses

For Master's degree programme.

Course Code	Course Title	Credits
PGS 501	Library and Information Services	0+1
PGS 502	Technical writing and communication skills	0+1

Course Code	Course Title	Credit Hours
PGS 503	Intellectual Property and its management	1+0
PGS 504	Basic concepts in laboratory techniques	0+1
PGS 505	Agricultural research, research ethics and rural development programmes	1+0

*A student shall be required to register for all the 5 credit hours core courses

*Mandatory Course for Doctoral Degree Programme.

CPE-RPE	Research and Publication Ethics	2+0

Preamble

During the recent years, there has been appreciable advancement in Veterinary Sciences and livestock sector. In order to reduce animal sufferings, ensuring food security and human health, livestock rearing have been gradually changed from subsistence to commercial and organized system. Moreover, the futuristic requirement of the society for better animal health care, public health, food safety, environment, etc. have posed greater challenge for veterinary academicians, scientific community and service providers. Therefore, in tune with the change of development in science and technology, industrial and economic order, etc. needs to be considered for exposing the post graduate students while producing the skilled veterinarians with higher qualification and experiential training. The course curricula and syllabi of all the Veterinary Para-clinical disciplines have been reviewed and revised looking into the contemporary developments in the field of veterinary sciences and other related fields. Several new courses have been introduced as per need of the day along with revision of the contents of earlier courses. The implementations of the new and restructured course curricula is expected to build and improve knowledge, skill and competence of the students so as to enhance their employability and render efficient service to the society, farming community and the Livestock Industry.

Academicians and Researchers are being involved in devising means and methods of developing diagnostics against prevalent and emerging pathogens, prevention and control of animal diseases and zoonosis, monitoring and surveillance of disease of livestock and poultry, combating bio-terrorism, genetic engineering to optimize production and develop disease resistance breeds of animals. Bio-medical research, being heavily dependent upon animal experimentation, demands deeper scientific knowledge of veterinary science. The dominant forces shaping the Veterinary-business and Veterinary-education are global and virtual with a large number of specialists offering tele-veterinary services from off-shore locations like India. The ever changing and demanding public service sector has necessitated re-look into the veterinary higher education. At undergraduate level, veterinary students acquire comprehensive knowledge and skills in basic, para-clinical and clinical subjects required for performing multi-tasking role of a veterinarian. However, at post graduate level, in depth knowledge of theory, practical aspects and research methodology in each subject is of paramount importance. Detailed study of the course curricula and syllabi, being implemented by veterinary colleges in India, revealed that there was enormous heterogeneity in the course structure, nomenclature and contents. In view of the above, the task of formulating need based contemporary post graduate courses and syllabi for implementation of post graduate education uniformly at national level was essential.

Five BSMA committees, constituted by ICAR vide Office order No. F.No.7/ 6/2017-EQR Dated 4th April, 2018 for restructuring of Master's and Doctorate course curricula and syllabi, worked in unison to formulate common basic format. The BSMA committee for Veterinary Para-clinical Subjects (Microbiology, Pathology, Parasitology, Public Health and Epidemiology and Pharmacology and Toxicology) was constituted for developing uniform course curricula, syllabi and academic regulations in line with changing global scenario. The new and restructured Post-Graduate curricula and syllabi in respect of Veterinary

Para-Clinical subjects contain several innovative and practically applicable courses and extensively revamped course contents, viz., ultra-structural studies, molecular techniques in understanding the disease pathogenesis, diagnosis and monitoring surveillance. Veterinary Para-clinical subjects provide essential support by employing disease diagnostic technologies for prevention and control of animal diseases, maintenance of biodiversity, etc. New courses in Veterinary Microbiology, on Cytokines and Chemokines, Immunoregulations and Techniques in Molecular Microbiology, in Veterinary Pathology, courses on Molecular and Ultra structural bases of cell injury, molecular bases of inflammation and pathology of laboratory animal diseases, in Veterinary Parasitology, courses on Biology and Ecology of Parasites, Molecular Veterinary Parasitology and Immunology of Parasitic Diseases, in Veterinary Public Health and Epidemiology, courses on Ecology and Animal/ Human Health, Surveys, Surveillance and Data Management, risk analysis and predictive modeling, Food Safety Standards and Regulations have been included, in Veterinary Pharmacology and Toxicology, courses on Bio-transformation of Xenobiotics, Molecular Pharmacology, Fundamentals of Pharmacokinetics. The contents of most of the courses have been revised and updated to include the latest developments. The learning of research methodology, scientific thinking, planning and experimentation and special problems has been introduced in all the subjects.

The implementations of the new and restructured post graduate course curricula is expected to build knowledge and skill of the students so as to enhance their employability and marketability as multi-service providers with practical skills and comprehensive knowledge of the entire subject area after Masters. The Doctorates should in turn prove as specialists, in their respective disciplines. The valuable inputs received from the stake holders', viz., eminent academicians, scientists, extension workers, leading veterinary practitioners, state animal husbandry department, etc. have immensely helped in preparation of this document.

Major changes made in the revised syllabi including addition of New Courses and updation of contents:

Veterinary Microbiology (VMC)

Masters Degree Programme

- VMC 501 : General Bacteriology (2+1), course name changed (Bacteriology – I) credit hour decreased and course contents updated.
- VMC 502 : Systematic Veterinary Bacteriology (2+1), course name changed (Bacteriology – II) with change in course contents.
- VMC 503 : General Virology (2+1), course number changed
- VMC 504 : Systematic Veterinary Virology (2+1), course number changed, 01 credit hour decreased with changes in course contents.
- VMC 505 : Principles of Veterinary Immunology (2+1), course number and name changed with changes in course contents.
- VMC 506 : Veterinary Mycology (1+1), course number and contents changed.
- VMC 507 : Vaccinology (2+0), course contents revised and updated.
- VMC 508 : Techniques In Microbiology (0+2), New course.
- VMC 509 : Techniques In Molecular Microbiology (1+2), New course.
- VMC 510 : Molecular Immunology (1+1), New course.
- VMC 511 : Mucosal Immunology (1+0), New course.
- VMC 512 : Introduction to Microbial Bioinformatics (1+0), New course

Doctoral Degree Programme

- VMC 601 : Advances in Veterinary Bacteriology (2+1), course contents revised and updated.
- VMC 602 : Advances in Veterinary Mycology (2+1), course contents revised and updated.
- VMC 603 : Bacterial Genetics (2+0), 01 credit hour (P) decreased with change in course contents.
- VMC 604 : Microbial Toxins (2+1), course contents revised and updated.
- VMC 605 : Bacterial Pathogenesis (2+0), course name changed (Molecular determinants of Bacterial Pathogenesis), 01 credit hour (P) decreased.
- VMC 606 : Advances in Veterinary Virology (2+1), course name changed (Advances in Virology), change in course contents.
- VMC 607 : Molecular Viral Pathogenesis (2+1), course name changed (Molecular and Genetic aspects of Viral Pathogenesis), change in course contents.
- VMC 608 : Structure Function Relationship of DNA and RNA Viruses (2+0), 01 credit hour (T) decreased.
- VMC 610 : Slow Viral Infections and Prions (1+0), 01 credit hour (T) decreased.
- VMC 611 : Advances in Veterinary Immunology (2+1), course name changed (Molecular Immunology), changes in course contents.
- VMC 612 : Cytokines and Chemokines (2+ 0), New course
- VMC 613 : Immunoregulation (1+0), New course
- VMC 614 : Advances in Vaccinology (2+0), Course contents revised and updated.
- VMC 615 : Current Topics in Infection and Immunity (2+0), 01 credit hour (T) decreased.

Veterinary Pathology (VPL)

Masters Degree Programme

- VPL 503 : Animal Oncology (1+1), course contents revised and updated.
- VPL 505 : Necropsy Procedures and Interpretations (1+1), 02 courses VPL (VPL – 605, 606) have been merged and course contents revised.
- VPL 506 : Necropsy Conference (0+1), New Course
- VPL 508 : Pathology of Infectious Diseases of Domestic Animals (2+1), course contents updated.
- VPL 509 : Toxicopathology (2+1), course contents revised.
- VPL 510 : Avian Pathology (2+1), course contents updated.
- VPL 511 : Pathology of Wild/ Zoo and Aquatic Animal Diseases (2+1), course reframed, Wild/ Zoo/ Fish diseases included.
- VPL 512 : Pathology of Laboratory Animal Diseases (2+1). New course

Doctoral Degree Programme

- VPL 601 : Molecular and Ultrastructural Basis of Cell Injury (2+1), New course with the merging of contents of molecular pathology of cell injury.
- VPL 602 : Molecular Basis of Inflammation (1+1), New course
- VPL 603 : Molecular Basis of Neoplasia (1+1), New course
- VPL 605 : Advances in Diagnostic Pathology (1+2), course contents revised and updated.
- VPL 607 : Pathology of Important Emerging and Re-emerging Diseases of Pets and Livestock (2+1). Course contents revised and updated.
- VPL 608 : Research Methodology in Pathology (1+0), New course

Veterinary Parasitology (VPA)

Masters Degree Programme

- VPA 501 : Platyhelminthes – I (1+1), Name and contents of old VPA-601 (2+1) changed.
- VPA 502 : Platyhelminthes – II (1+1), Name and contents of old VPA-601 (2+1) changed.
- VPA 503 : Nematyhelminthes and Acanthocephala (2+1), Name of old VPA 602 changed.
- VPA 504 : Arthropod Parasites (2+1), Name and contents of old VPA 603 revised and updated.
- VPA 505 : Parasitic Protozoa (2+1), old VPA 604, course contents revised and updated.
- VPA 506 : Diagnostic Parasitology (0+2), Name and contents of old VPA 605 changed and updated.
- VPA 507 : Clinical Parasitology (1+1), Name and contents of old VPA 606 changed.
- VPA 508 : Management of Parasitic Diseases (1+1), old VPA 607 with revised and updated contents.
- VPA 509 : Immunoparasitology (2+1), old VPA 608 with revised and updated course contents.
- VPA 510 : Parasitic Zoonoses (2+0), old VPA 609.
- VPA 511 : Parasites of Wildlife (1+1), old VPA 610 with change in course title.

Doctoral Degree Programme

- VPA 601 : Advances In Helminthology – I (2+1), old VPA 705 with revised and updated contents.
- VPA 602 : Advances In Helminthology – II (2+1), old VPA 706 with revised and updated contents.
- VPA 603 : Advances in Entomology and Acarology (2+1), old VPA 707 with revised and updated contents.
- VPA 604 : Advances in Protozoology (2+1), course contents revised and updated.
- VPA 605 : Immunology of Parasitic Diseases (1+2), New course.
- VPA 606 : Molecular Diagnostics and Vaccine Development in Parasitology (2+1), old VPA 702 with revised and updated course contents.
- VPA 607 : Host Parasite Interactions (2+0), old VPA 703 with revised and updated course contents.
- VPA 608 : *In-vitro* cultivation of parasites (1+2), New Course.
- VPA 609 : Emerging and Re-emerging Parasitic Diseases (2+0), No change.
- VPA 610 : Biology and Ecology of Parasites (3+0), New course including old VPA 701, 710 and 711 with revised and updated course contents.
- VPA 611 : Molecular Veterinary Parasitology (2+0), New course.
- VPA 612 : Parasite Epidemiology (2+0), New course.

Veterinary Public Health and Epidemiology (VPE)

Masters Degree Programme

- VPE 501 : Concepts in Veterinary Public Health and One Health (2+0), title modified with updated contents.
- VPE 502 : Zoonoses – I (2+1), title modified with updated contents.

- VPE 503 : Zoonoses – II (2+1), title modified with updated contents.
- VPE 504 : Principles of Epidemiology (2+1), New course.
- VPE 505 : Hygiene and Safety of Foods of Animal and Aquatic Origin (2+1), two courses merged (milk and meat hygiene, Fish/ Fish product).
- VPE 506 : Food-borne Infections and Intoxications (2+1), course contents revised and updated.
- VPE 507 : Food Safety Standards, and Regulations (2+1), New course.
- VPE 508 : Environmental Hygiene and Safety (2+1), title modified with updated contents. 01 credit hour reduced.
- VPE 509 : Applied Epidemiology (2+1). New course.
- VPE 510 : Bio-security, Bioterrorism and Disaster Management (2+0), title modified with updated contents.
- VPE 511 : Laboratory Techniques in Veterinary Public Health (0+3), New course.

Doctoral Degree Programme

- VPE 601 : Advances in Veterinary Public Health and Epidemiology (2+1), course contents revised and updated.
- VPE 602 : Emerging, Re-emerging Zoonoses and One Health (2+1), course contents revised and updated.
- VPE 603 : Advances in Food Safety and Quality Control of Foods of Animal Aquatic origin (2+1), course contents revised and updated.
- VPE 604 : Bio-security and Occupational Health Safety (2+1), course contents revised and updated.
- VPE 605 : Recent Concepts in Epidemiology and Disease Forecasting (2+1), New course.
- VPE 606 : Risk Analysis and Predictive Modelling (2+1), New course.
- VPE 607 : Advances in Environmental Hygiene (2+1), course contents revised and updated.
- VPE 608 : Herd Health Management and Disease Economics (2+1), New course.
- VPE 609 : Epidemiology of Trans-boundary, Non-infectious and Chronic diseases (2+1), New course.
- VPE 610 : Ecology and Animal/ Human Health (2+0), New course.
- VPE 611 : Diagnostic Approaches in Epidemiology (2+1), New course.
- VPE 612 : Surveys, Surveillance and Data Management (2+1), New course.

Veterinary Pharmacology and Toxicology (VPT):

Masters Degree Programme

- VPT 501 : Concept of Pharmacology, Drug, Design and Development (2+0), course title changed with revised and updated course contents of General Pharmacology.
- VPT 504 : Digestive and Respiratory Pharmacology (2+1), one practical credit hour added.
- VPT 506 : Endocrine and Reproductive Pharmacology (2+1), one practical credit hour added.
- VPT 509 : Toxinology (2+1), course title changed and 01 practical credit hour added (Toxicology of plant and Toxins).
- VPT 510 : Pharmacological Technique (0+2), one theory credit hour converted to practical.

- VPT 511 : Techniques in Toxicology (0+2), one theory credit hour converted to practical.
- VPT 512 : Ethnopharmacology (1+1), one theory credit hour converted to practical.
- VPT 513 : Fundamental of Pharmacokinetics (1+1), New Course

Doctoral Degree Programme

- VPT 601 : Molecular Pharmacology (3+0), course contents of Advances in Neuropharmacology and Molecular Pharmacology merged.
- VPT 602 : Advances in Autacoid Pharmacology (1+0), course title changed.
- VPT 604 : Biotransformation of Xenobiotics (2+0), course title changed (Drug metabolism).
- VPT 605 : Clinical Pharmacology and Pharmacokinetics (2+1), clinical pharmacology and Pharmacokinetics have been merged.
- VPT 606 : Pharmacogenomics (2+0), course number changed with revised and updated course contents.
- VPT 607 : Immunopharmacology and Immunotoxicology (2+0), course number changed and 01 theory credit hour increased and course title changed to include immunotoxicology.
- VPT 608 : Molecular toxicology (3+0), course number changed and 01 theory credit hour increased.
- VPT 609 : Clinical Toxicology (2+1), course number and course title changed (Clinical Toxicology).
- VPT 610 : Ecotoxicology (3+0), course number changed and 01 theory credit hour increased.
- VPT 611 : Regulatory Toxicology (2+1), course number changed.

Suggested list of specified minor and supporting subjects

Veterinary Microbiology (VMC): Animal/ Veterinary Biotechnology, Veterinary Biochemistry, Veterinary Pathology, Veterinary Public Health and Epidemiology, Animal Genetics or any other discipline as per the requirement of the research problem of the student.

Veterinary Pathology (VPL): Veterinary Microbiology, Animal/ Veterinary Biotechnology, Veterinary Biochemistry, Veterinary Medicine, Veterinary Parasitology, Veterinary Public Health and Epidemiology, Veterinary Pharmacology and Toxicology or any other discipline as per the requirement of the research problem of the student.

Veterinary Parasitology (VPA): Veterinary Microbiology, Animal/ Veterinary Biotechnology, Veterinary Biochemistry, Veterinary Medicine, Veterinary Pathology, Veterinary Public Health and Epidemiology, Veterinary Pharmacology and Toxicology or any other discipline as per the requirement of the research problem of the student.

Veterinary Public Health and Epidemiology (VPE): Veterinary Microbiology, Animal/ Veterinary Biotechnology, Veterinary Medicine, Veterinary Parasitology, Veterinary Pathology, Veterinary Pharmacology and Toxicology, Statistics or any other discipline as per the requirement of the research problem of the student.

Veterinary Pharmacology and Toxicology (VPT): Veterinary Biochemistry; Animal/ Veterinary Biotechnology; Veterinary Physiology; Veterinary Microbiology; Veterinary Pathology; Veterinary Medicine; Veterinary Public Health and Epidemiology or any other discipline as per the requirement of the research problem of the student.

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Veterinary Para-Clinical Subjects
– Veterinary Microbiology

Course Title with Credit Load
M.V.Sc. in Veterinary Microbiology

Course Code	Course Title	Credit Hours
VMC 501	General Bacteriology*	2+1
VMC 502	Systematic Veterinary Bacteriology	2+1
VMC 503	General Virology*	2+1
VMC 504	Systematic Veterinary Virology	2+1
VMC 505	Principles of Veterinary Immunology*	2+1
VMC 506	Veterinary Mycology*	1+1
VMC 507	Vaccinology	2+0
VMC 508	Techniques in Microbiology	0+2
VMC 509	Techniques in Molecular Microbiology	1+2
VMC 510	Molecular Immunology	1+1
VMC 511	Mucosal Immunology	1+0
VMC 512	Introduction to Microbial Bio-informatics	1+0
VMC 591	Master's Seminar*	1+0
VMC 599	Master's Research	0+30

*Core Courses

Course Contents
M.V.Sc. in Veterinary Microbiology

I. Course Title : General Bacteriology
II. Course Code : VMC 501
III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge of general bacteriology.

V. Theory

Unit I

Historical events of microbiology, Taxonomy and nomenclature of bacteria. Basic principles of microscopy and micrometry, Classical, Confocal, Nomaraski and electron microscopy. Staining of bacteria, Structure and function of bacterial cell. Growth, Nutrition, Metabolism, Secretion and excretion systems of bacteria. General principles of bacterial disease diagnosis.

Unit II

Bacterial genetics, Bacterial variation, Horizontal genetic transfer mechanisms (transformation, transduction and conjugation), Plasmids, Transposons and drug resistance.

Unit III

Determinants of pathogenicity and its molecular basis, Markers and PAMPs, exotoxin and endotoxin.
Bacteriophages: temperate and virulent phages; lysogeny and lysogenic conversion.
Antimicrobial agents and disinfectants: Mechanism of action, Resistance and susceptibility testing. Bacterial immunity.

VI. Practical

Orientation to a bacteriology laboratory, Sterilization and disinfection techniques, Laboratory biosafety and biosecurity. Cultivation of aerobic, Microaerophilic and anaerobic bacteria, Isolation of bacteria in pure culture, Microscopy, Morphological characterization of bacteria, Different staining methods and biochemical tests for identification of bacteria, Determination of bacterial number and biomass and standard protocols for antibiotic sensitivity test and detection of MIC.

I. Course Title : Systematic Veterinary Bacteriology
II. Course Code : VMC 502
III. Credit Hours : 2+1

IV. Aim of the course

To learn different aspects with regards to the virulence factors, Antigenic and structural components, Epidemiology, Pathogenesis, Diagnosis and control of important aerobic, Microaerophilic and anaerobic pathogenic bacteria causing diseases in animals and disease status in India.

V. Theory

Unit I

Systematic study of following groups of bacteria:
Spirochetes: *Leptospira, Brachyspira* and *Borrelia.*
Gram-negative

- Aerobic/ Microaerophillic, motile helical/ vibrioid: *Campylobacter;*
- Aerobic/ Microaerophillic rods/ cocci: *Bordetella, Brucella, Morexella, Pseudomonas* and *Burkholderia;*
- Facultative anaerobic Gram-negative rods: members of *Enterobacteriaceae, Pasteurella, Mannheimia* and *Haemophilus;*
- Anaerobic, straight, curved and helical rods: *Dichelobacter* and*Fusobacterium*

Unit II

Rickettsia and Chlamydia: *Rickettsia, Chlamydia* (*Chlamydophila*) and *Coxiella.*
Gram-positive

- Gram-positive cocci: *Staphylococcus* and *Streptococcus* including *Enterococcus*.
- Endospore-forming rods: *Bacillus*and *Clostridium*.
- Regular non-spore forming rods: *Erysipelothrixa* and *Listeria*
- Irregular non-spore forming rods: *Actinomyces*, *Corynebacterium* and *Truepurella.*

Unit III

- Mycobacteria: Mycobacterium; *Actinomycetes*: *Nocardia* and *Rhodococcus, Dermatophilus.*
- Mollicutes: *Mycoplasma.*

Unit IV

- Emerging and transboundary bacterial pathogens.

VI. Practical

Collection, transport and dispatch of clinical samples from various disease conditions. Isolation of bacteria in pure cultures from different clinical samples. Identification of the bacteria using staining, biochemical tests and other molecular techniques. Preservation and storage of bacterial cultures.

I. Course Title : General Virology
II. Course Code : VMC 503
III. Credit Hours : 2+1

IV. Aim of the course

To study general aspects of viral structure, classification, replication, interactions and immunity against viruses.

V. Theory

Unit I

History of virology, Origin and nature of viruses, Morphological structure and chemical composition of viruses, Nomenclature and classification of viruses, Cultivation and purification of viruses, Laboratory diagnosis of viral infections, Viroid and Prions.

Unit II

Replication of DNA and RNA viruses, genetic and non-genetic interactions between viruses.

Unit III

Virus-cell interactions, viral pathogenesis, viral persistence, oncogenic, oncolytic viruses and epidemiology of viral infections.

Unit IV

Immune response to viruses, viral vaccines, viral chemotherapy.

VI. Practical

Orientation to a virology laboratory, Preparation of glassware, Plasticware, Media and reagents for cell culture and other items required for virus cultivation. Protocols for primary and secondary cell cultures, Maintenance of cell lines, Cryopreservation of cells and their revival. Staining of virus infected cultured cells and demonstration of inclusion bodies. Viable cell counting. Cultivation of viruses in embryonated chicken eggs and cell cultures.

I. Course Title : Systematic Veterinary Virology

II. Course Code : VMC 504

III. Credit Hours : 2+1

IV. Aim of the course

To study viral properties, epidemiology, pathogenesis and disease status in India, diagnosis, immunity and control of diseases caused by viruses belonging to different families of animal viruses.

V. Theory

Unit I: Double and Single stranded DNA virus families

Poxviridae, *Asfarviridae*, *Herpesviridae*, *Adenoviridae*, *Papilomaviridae*, *Polyomaviridae*, *Parvoviride*, *Circoviridae* and *Hepdnaviridae.*

Unit II: Single stranded Negative sense and Double stranded RNA viruses

Orthomyxoviridae, *Paramyxoviridae, Rhabdoviridae, Bornaviridae, Reoviridae* and *Birnaviridae.*

Unit III: Single stranded Positive sense RNA viruses

Picornaviridae, *Caliciviridae*, *Togaviridae*, *Flaviviridae*, *Coronaviridae*, *Arteriviridae*, *Astroviridae* and *Retroviridae.*

Unit IV: Prions

BSE, Scrapie and introduction to viriods.

Unit V

Emerging, re-emerging and transboundary viral pathogens

VI. Practical

Collection, Preservation, Transportation of clinical samples and their processing for virus isolation and identification. Isolation and cultivation of viruses from clinical samples, using different methods and its plaque purification. Titration of viruses for 50% end points using different methods, Serum neutralization test.

Electropherotyping. Concentration and purification of viruses by chemical agents, differential centrifugation, density gradient centrifugation and ultra-filtration. Methods for preservation of animal viruses.

I. Course Title : Principles of Veterinary Immunology
II. Course Code : VMC 505
III. Credit Hours : 2+1

IV. Aim of the course

To understand the fundamental principles of veterinary immunology and its applications.

V. Theory

Unit I

Introduction to livestock and poultry immune system: ontogeny and phylogeny of vertebrate immune system, cells and organs of immune system. Types of immunity: Innate and adaptive immune system.

Unit II: Antigen and its characteristics

Characteristic of ideal antigen; Classification of antigens, Factors affecting immunogenicity, Concept of hapten and carrier. Antigenic determinant/ epitope and cross reactivity. B-cell epitope and T cell epitope. Immunoglobulins: Basic structure and function of immunoglobulins, Immunoglobulin diversity and immunoglobulin classes.

Antigen recognition by B cell and T cell: B cell receptor, T cell receptor, receptor diversity, B cell and T cell activation.

Unit III: Major Histocompatibility Complex

General feature, structure, function, gene organization, MHC and immune response. Immune-response development: Phases of humoral and cell mediated immune response. Immunoregulation with B and T cells: Antigen recognition, antigen presentation and processing, antigen recognition by TCR, MHC restriction, Cytokines and chemokines. Cell mediated immune response: General properties of effector T cells, cytotoxic T cells, NK-cells and ADCC. Role of integrin and selectin.

Unit IV: Complement System

Basic concept of complement, mechanism of complement activation, complement pathways and Complement deficiencies. Autoimmunity and autoimmune diseases, immunological tolerance and hypersensitivity: classification, mechanism of induction with examples.

Immunodeficiency: Types with examples. Immune response in foetus and new born.

Unit V: Antigen antibody interaction

Antibody affinity, avidity, cross reactivity, precipitation and agglutination test, radio-immunoprecipitation assay (RIPA), ELISA, Western blotting, Immunodiagnostics and Immunotherapy. Monoclonal antibodies and methods for production and characterization of monoclonal antibodies.

VI. Practical

Preparation of antigens, raising of antisera against soluble and insoluble antigens.

Detection of antibody by gel diffusion, radial immunodiffusion, immune-electrophoresis techniques. Haemagglutination and haemagglutination inhibition test, ELISA and its modifications. Immunoblotting. Agglutination tests. Separation and purification of Immunoglobulin from serum. Separation of mononuclear cells from blood by density gradient centrifugation, viable count of lymphocyte by dye exclusion method. Measurement of T cell response (DTH, lymphoproliferative assay).

I. Course Title : Veterinary Mycology

II. Course Code : VMC 506

III. Credit Hours : 1+1

IV. Aim of the course

To learn detailed morphological, cultural features, virulence factors, antigenic and structural components, epidemiology, pathogenesis, diagnosis and control of fungal infections.

V. Theory

Unit I

History of mycology, Glossary of mycological terms; Morphology of fungi: structure and ultra-structure, differentiation, nutrition, physiology, reproduction, spores, cultural characters and classification of fungi of veterinary importance. Fungal immunity. Antifungal agents and important techniques in diagnosis of fungal infections.

Unit II: Systematic study of animal mycoses:

Aspergillosis, Candidiasis, Cryptococcosis, Epizootic lymphangitis, Rhinosporodiosis, Zygomycosis, Blastomycosis, Sporotrichosis, Histoplasmosis, Coccidioidomycosis, Mycetomas, Dermatophytoses, Dermatomycosis, Mycotoxicosis, Malassezia infections, Mycotic abortion, Mycotic mastitis, and Emerging mycoses.

VI. Practical

Collection and processing of clinical material for isolation of fungi. Microscopy of fungi: Lactophenol cotton blue and India ink preparations. Preparation of basal and special fungal media of veterinary importance. Slide culture and cellophane tape technique for fungi. Diagnosis of dermatophytes. Biosafety precautions in handling yeast and dimorphic fungi. Study of gross and microscopic characters of pathogenic fungi, antifungal sensitivity testing, detection of mycotoxin. Serological and molecular diagnosis in fungi.

I. Course Title : Vaccinology

II. Course Code : VMC 507

III. Credit Hours : 2+0

IV. Aim of the course

To understand different aspects of vaccines, their production, standardization and quality control of various vaccine used in animals.

Unit I

Types of vaccines andvaccine components, factors influencing choice of vaccines. **New generation vaccines:** subunit vaccines, peptide vaccines, recombinant vaccines, reverse genetics vaccines, Marker and DIVA enabled vaccines and transmission blocking vaccines.

Unit II: Preparation of vaccines

Identification of candidate strain, identification of epitopes, seed and challenge strain maintenance. Classical methods of exaltation and attenuation of pathogens and their molecular basis. Technology of production of different types of vaccines.Multicomponent vaccines. Recent advances in vaccine delivery systems. Advances in vaccinesadjuvants with their classification and mode of action.

Unit III

Standardization of veterinary vaccines as per National and Global standards. Laws and regulatory requirements about veterinary biological and Indian pharmacopoeia.

Unit IV

Vaccine failure and post vaccinal reactions. Factors affecting response to vaccines: maintenance of vaccines and cold chain. Quality control. Principles of development of vaccination schedule, methods of conducting vaccine trials (lab to field use) and pharmaco-vigilance. Scaling up methods of vaccine production.

I. Course Title : Techniques in Microbiology

II. Course Code : VMC 508

III. Credit Hours : 0+2

(Course to be offered to the students not majoring in Veterinary Microbiology)

IV. Aim of the course

To give overview of the techniques used in microbiology.

V. Practical

Unit I

Orientation to a microbiology laboratory. Different sterilization and disinfection techniques. Laboratory biosafety and biosecurity. Microscopy, media preparation, isolation, cultivation and purification of bacteria and fungi and their morphological and biochemical characterization. Antibacterial sensitivity test by Disc diffusion, broth dilution and MIC determination technique.

Unit II

Cultivation of viruses in embryonated eggs and cell culture. Virus Neutralization test.

Unit III

Different immunological techniques: Agglutination, precipitation, ELISA, Haemagglutination and HaemagglutinationInhibition and other immunological assays.

I. Course Title : Techniques in Molecular Microbiology

II. Course Code : VMC 509

III. Credit Hours : 1+2

IV. Aim of the course

To provide training in molecular biology and other diagnostic techniques used in microbiology.

V. Theory

Unit I

Basic requirements for establishing molecular diagnostics Laboratory. Principles of molecular diagnostic tests. Methods of nucleic acid extraction from pathogenic microorganisms.

Unit II

PCR, and variants of PCR. Principles of primer designing. Gel electrophoresis methods andblotting techniques: Southern blotting, northern blotting, western blotting, dot-blot. Microarrays, nucleic acid sequencing methods. Sequence analysis-sequence editing, sequence alignment, sequence comparison and phylogentic analysis. Gene cloning and expression. Molecular diagnosis as epidemiological tool.Development and validation of diagnostic tests.

VI. Practical

Unit I

Orientation of molecular diagnosis laboratory: especially RNA and diagnostic PCR laboratory (handling RNA and DNA). Extraction of nucleic acid from different microbes: Gram positive bacteria, Gram negative bacteria, DNA viruses, RNA Viruses and fungi, DNA and RNA isolation from cell culture and blood and isolation of plasmids. Quality and quantity check of nucleic acids.

Unit II

Principles for Primer designing. Procedure for molecular diagnostic tests like PCR, RT-PCR and LAMP. Absolute and relative quantitation of DNA/ RNA using Q-PCR. SDS PAGE of proteins and RNA, study of nucleic acid and proteins by blotting techniques. Restriction Enzyme digestion Techniques and RFLP; PCR product concentration and purification for sequencing. Nucleic acid sequence analysis. Gene Cloning, expression and purification of expression products. An introduction to high throughput sequencing and MALDI-TOF.

I. Course Title : Molecular Immunology

II. Course Code : VMC 510

III. Credit Hours : 1+1

IV. Aim of the course

To learn about molecular aspects of immunology.

V. Theory

Unit I

Molecular Structure and function of PRRs. Ligands of PRRs, signal transduction through PRRs andinflammosome. Cytokines, Lymphocyte markers and CD nomenclature.

Unit II

Molecular structure of Immunoglobulin and class, Isotypes, Synthesis and expression of immunoglobulin, Rearrangement and its organization, Immunoglobulin gene diversity and mechanism of recombination of B cell gene. Theory of antibody generation. Signature molecules of T cell and T regulatory cell. T cell receptor and T cell gene diversity.

Unit III

MHC structure, Genomic organization of the MHC gene haplotype. Concept of congenic and syngeneic, concept of polymorphism of MHC gene, pathway of signal transduction, role of co-stimulators in B cell and T cell activation and recruitment of adaptor proteins. Molecular mechanisms (events) of cell cytotoxicity.

VI. Practical

Isolation and purification of mammalian and avian immunoglobulin by precipitation technique: Caprylic acid, PEG, Ammonium Sulphate, Sodium Sulphate. Separation of immunoglobulins by size, charge and ligand affinity: size exclusion chromatography (gel filteration on Sephadex G200), ion exchange chromatography, affinity chromatography (Protein-A-Sepharose). Immuno-electrophoresis Technique: polyacrylamide gel electrophoresis innative and reducing conditions, fixed andgradient gel, Western blot, Crossed immune-electrophoresis. Chemiluminscence assay and Cell cytotoxicity assays; Non-radioactive methods like LDH realease assay. Antigen detection by Immuno PCR. Haplotype matching between individuals, Flow cytometry for CD4 and CD8 ratio determination and other applications. ELISpot test for cytokine assay.

I. Course Title : Mucosal Immunology

II. Course Code : VMC 511

III. Credit Hours : 1+0

IV. Aim of the course

To learn about mucosal immunity.

V. Theory

Unit I: Innate Mechanisms

Mucosal barrier: Development and physiology of mucosal defense. Cells and lymphoid tissues of mucosal immune system: MALT, GALT, NALT and BALT. Innate immune response at mucosal surfaces: mucus, antimicrobial peptides, role of PPRs, intestinal Dendritic cell, intestinal macrophage, mucosal inductive and effector sites. Antigen uptake and presentation at mucosal sites, transepithelial transport of antigen.

Unit II: Acquired response

Mucosal Immunoglobulin, IgA synthesis and transport to intestinal lumen.Description and role of Paneth cell and crypto patches.M-cells and their functions.Mucosal immune effector mechanisms including secretory IgA response. Extrathymic T cell development in mucosal tissues and their phenotypes and functions.

Unit III: Applications

Importance and limitations of mucosal immunization. Mucosal adjuvants and delivery systems. Oral tolerance mechanistic approach. Immunopathology at mucosal surfaces: Celiac disease, Inflammatory bowel disease, Jhone's disease; Assessment of mucosal immune response and potency testing.

I. Course Title : Introduction to Microbial Bioinformatics

II. Course Code : VMC 512

III. Credit Hours : 1+0

(Relevant practical demonstrations be given along with theory topic)

IV. Aim of the courses

To learn about key bioinformatics techniques, tools and databases.

V. Theory

Unit I

Introduction to Bioinformatics; History, Scope and Application, Internet and world wide web. Bioinformatics resources and information retrieval system. Nucleic acid sequence databases, Genome databases, Protein sequence databases, Metabolic pathways databases, NCBI, ExPASy and Ensembl Genome browser.

Unit II

Sequence comparison and alignment methods; Introduction to sequence alignment, principal methods of pairwise sequence alignment and Dot plot analysis. Significance of BLAST and FASTA programs in DNA and protein sequence analysis, variants of BLAST and FASTA programs. Introduction to multiple sequence alignment and Phylogenetic analysis to retrieve evolutionary information, Global multiple sequence alignment tool- CLUSTAL-W.

Unit III

Overview of protein structure and databases, Structure based protein classification, Protein structure database (CASP), Protein structure alignment tools (VAST, DALI), Protein 3-D structure visualization and modeling using SWISS PROT.

Course Outline-cum-Lecture Schedule for Master degree Programme

VMC 501: General Bacteriology (2+1)

S.No.	Topic of Syllabus	Lecture/ Practical
Theory		
1.	Historical events of Microbiology	2
2.	Taxonomy and nomenclature of bacteria	1
3.	Basic principle of microscopy and micrometry	1
4.	Classical, Confocal, Nomaraski and Electron Microscopy	2
5.	Staining of bacteria	1
6.	Structure and function of bacterial cell	3
7.	Bacterial growth, nutrition and metabolism	3
8.	Secretion and excretion systems of bacteria	2
9.	General Principles of bacterial disease diagnosis	2
10.	Bacterial genetics and Bacterial variation	1
11.	Horizontal genetic transfer mechanisms- transformation, transduction and conjugation	1
12.	Plasmids, transposons and drug resistance	1
13.	Determinants of pathogenicity and its molecular basis	2
14.	Markers and PAMPs, exotoxin and endotoxin	1
15.	Bacteriophages- temperate and virulent phages, lysogeny and lysogenic conversion	2
16.	Antimicrobial agents	2
17.	Disinfectants -Mechanism of action	2
18.	Disinfectants -resistance and susceptibility testing	1
19.	Bacterial immunity	2
	Total	**32**
Practical		
1.	Orientation to a bacteriology laboratory	1
2.	Different sterilization and disinfection techniques	2
3.	Laboratory biosafety and biosecurity	1
4.	Cultivation of aerobic, microaerophilic and anaerobic Bacteria using bacteriological media	2
5.	Isolation of bacteria in pure culture	2
6.	Microscopy	1
7.	Morphological characterization of bacteria by different staining methods	2
8.	Important biochemical tests for identification of bacteria	2
9.	Determination of bacterial number and biomass by different methods	1
10.	Standard protocols for antibiotic sensitivity test	2
11.	Detection of MIC	1
	Total	**16**

VMC 502: Systematic Veterinary Bacteriology (2+1)

S.No.	Topic of Syllabus	Lecture/ Practical
Theory		
1.	Spirochetes: *Leptospira, Brachyspira* and *Borrelia*	2
2.	*Campylobacter*	1
3.	*Bordetella* and *Morexella*	1
4.	*Brucella*	2
5.	*Pseudomonas* and *Burkholderia*	1
6.	*Enterobacteriaceae*	3
7.	*Pasteurella* and *Mannheimia*	2
8.	*Haemophilus*	1
9.	*Dichelobacter* and *Fusobacterium*	1
10.	Rickettsia and Chlamydia-*Rickettsia*	1
11.	Rickettsia and Chlamydia- *Chlamydia* (*Chlamydophila*) and *Coxiella*	1
12.	*Staphylococcus*	1
13.	*Streptococcus* and *Enterococcus*	2
14.	*Bacillus*	1
15.	*Clostridium*	3
16.	*Erysipelothrix*and*Listeria*	2
17.	*Actinomyces*, *Corynebacterium* and *Truepurella.*	1
18.	*Mycobacterium*	2
19.	Actinomycetes: *Nocardia* and *Rhodococcus* and *Dermatophilus*	2
20.	Mollicutes (*Mycoplasma)*	1
21.	Emerging and transboundary bacterial pathogens	2
	Total	**32**
Practical		
1.	Collection, transport and dispatch of clinical samples from various disease conditions	2
2.	Isolation of bacteria in pure cultures from different clinical samples	12
3.	Identification of the bacteria using staining, biochemical tests and other molecular techniques	
4.	Preservation and storage of bacterial cultures	2
	Total	**16**

VMC 503: General Virology (2+1)

S.No.	Topic of Syllabus	Lecture/ Practical
Theory		
1.	History of virology	1
2.	Origin and nature of viruses	1
3.	Morphological structure and chemical composition of viruses	2
4.	Nomenclature and classification of viruses	2
5.	Cultivation and purifications of viruses	2
6.	Laboratory diagnosis of viral infections	2
7.	Viroid and Prions	1
8.	Replication of DNA viruses	2
9.	Replication of RNA viruses	3
10.	Genetic and non-genetic interactions between viruses	2
11.	Virus-cell interactions	1
12.	Viral pathogenesis	2

S.No.	Topic of Syllabus	Lectures/ Practicals
13.	Viral persistence	1
14.	Oncogenic and oncolytic viruses	2
15.	Epidemiology of viral infections	2
16.	Immune response to viruses	2
17.	Viral vaccines	2
18.	Viral chemotherapy	2
	Total	**32**
Practical		
1.	Orientation to a virology laboratory	1
2.	Preparation of glassware, plasticware, media and reagents for cell culture	2
3.	Other items required for virus cultivation	1
4.	Protocols for primary and secondary cell cultures	2
5.	Maintenance of cell lines	1
6.	Cryopreservation of cells and their revival	2
7.	Staining of virus infected cultured cells	1
8.	Demonstration of inclusion bodies	1
9.	Viable cell counting	1
10.	Cultivation of viruses in embryonated chicken eggs	2
11.	Virus cultivation in primary cell cultures and cell lines	2
	Total	**16**

VMC 504: Systematic Veterinary Virology (2+1)

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	*Poxviridae*	2
2.	*Asfarviridae*	1
3.	*Herpesviridae*	3
4.	*Adenoviridae*	2
5.	*Papilomaviridae* and *Polyomaviridae*	1
6.	*Parvoviride*	1
7.	*Circoviridae* and *Hepdnaviridae*	1
8.	*Orthomyxoviridae*	2
9.	*Paramyxoviridae*	2
10.	*Rhabdoviridae*	2
11.	*Bornaviridae*	1
12.	*Reoviridae*	2
13.	*Birnaviridae*	1
14.	*Picorna* and *Caliciviridae*	2
15.	*Togaviridae* and *Flaviviridae*	2
16.	*Coronaviridae*	1
17.	*Arteriviridae* and *Astrovirida*	1
18.	*Retroviridae*	2
19.	Prions: BSE, Scrapie and introduction to viriods	2
20.	Emerging, re-emerging and transboundary viral pathogens	1
	Total	**32**
Practical		
1.	Collection, preservation, transportation of clinical samples	1

S.No.	Topic of Syllabus	Lectures/ Practicals
2.	Processing clinical samples for virus isolation and identification	6
3.	Isolation and cultivation of viruses from clinical samples, using different methods and its plaque purification	
4.	Titration of viruses for 50% end points using different methods	2
5.	Detection of viral antibodies by serum neutralization test	2
6.	Electropherotyping	2
7.	Concentration and purification of animal viruses by chemical agents, differential centrifugation, density gradient centrifugation and ultra-filtration	2
8.	Methods for preservation of animal viruses	1
	Total	**16**

VMC 505: Principles of Veterinary Immunology (2+1)

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Introduction to livestock and poultry immune system	1
2.	Ontogeny and phylogeny of vertebrate immune system	1
3.	Cells and organs of immune system	1
4.	Types of immunity- Innate and adaptive immune system	1
5.	Antigen and its characteristics- Characteristic of ideal antigen, classification of antigens, Factors affecting immunogenicity, Concept of hapten and carrier, Antigenic determinant/ epitope and cross reactivity, B-cell epitope and T cell epitope	2
6.	Immunoglobulins- Basic structure and function of immunoglobulins	1
7.	Immunoglobulin diversity and Immunoglobulin classes	1
8.	Antigen recognition by B cell and T cell	1
9.	B cell receptor/ immunoglobulins and T cell receptor	1
10.	Receptor diversity- B cell and T cell activation	1
11.	Major Histocompatibility Complex(General feature, structure, function, gene organization, MHC and immune response and Cytokines and chemokines)	2
12.	Immune response development- Phases of humoral and cell mediated immune response	2
13.	Immunoregulation with B and T cells(Antigen recognition, Antigen presentation and processing, Antigen recognition by TCR and MHC restriction)	1
14.	Cell mediated immune response- General properties of effector T cells, cytotoxic T cells, NK-cells and ADCC, Role of integrin and selectin	2
15.	Complement System- Basic concept of complement, Mechanism of complement activation, complement pathways and Complement deficiencies	2
16.	Autoimmunity, autoimmune diseases and Immunological tolerance	1
17.	Hypersensitivity- Classification and mechanism of induction with examples	2
18.	Immunodeficiency- Types with examples	1
19.	Immune response in foetus and new born	1
20.	Antigen antibody interaction- Antibody affinity, avidity, cross reactivity, precipitation and agglutination test	2
21.	ELISA and Western blotting	1

S.No.	Topic of Syllabus	Lectures/ Practicals
22.	Immunodiagnostics and Immunotherapy	1
23.	Monoclonal antibodies and methods for production of monoclonal antibodies	1
	Total	**32**
Practical		
1.	Preparation of antigens	1
2.	Raising of antisera against soluble and insoluble antigens	1
3.	Detection of antibody by gel diffusion, radial immune-diffusion and immune-electrophoresis techniques	2
4.	Haemagglutination and haemagglutination inhibition test	2
5.	ELISA and its modifications	2
6.	Immunoblotting	1
7.	Different agglutination tests	2
8.	Separation and purification of Immunoglobulin from serum	1
9.	Separation of mononuclear cells from blood by density gradient centrifugation	1
10.	Viable count of lymphocyte by dye exclusion method	1
11.	Measurement of T cell response- DTH and lymphoproliferative assay	2
	Total	**16**

VMC 506: Veterinary Mycology (1+1)

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Historyof mycology and Morphology of fungi	1
2.	Structure and Ultra structure	1
3.	Differentiation, nutrition, physiology, reproduction, spores and cultural characters	2
4.	Classification of fungi of veterinary importance	1
5.	Glossary of mycological terms and antifungal agents	1
6.	Important techniques in diagnosis of fungal infections	1
7.	Aspergillosis	1
8.	Candidiasis, Cryptococcosis and Pachydermatitis	1
9.	Epizootic lymphangitis and Rhinosporodiosis	1
10.	Zygomycosis and Blastomycosis	1
11.	Sporotrichosis and Histoplasmosis	1
12.	Coccidioidomycosis and Mycetomas	1
13.	Mycotic abortion and mycotic mastitis	1
14.	Dermatophytoses and dermatomycosis	2
15.	Mycotoxicosis and Emerging mycoses	1
	Total	**16**
Practical		
1.	Collection and processing of clinical material for isolation of fungi	1
2.	Microscopy of fungi-Lactophenol cotton blue and india ink preparations	2
3.	Preparation of basal and special fungal media of veterinary importance	1
4.	Slide culture and cellophane tape technique for fungi	2
5.	Biosafety precautions in handling yeast and dimorphic fungi	1
6.	Study of gross and microscopic characters of pathogenic fungi	5
7.	Diagnosis of dermatophytes	1

S.No.	Topic of Syllabus	Lectures/ Practicals
8.	Antifungal sensitivity testing	1
9.	Detection of mycotoxin	1
10.	Serological and molecular diagnosis in fungi	1
	Total	**16**

VMC 507: Vaccinology (2+0)

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Types of vaccines	1
2.	Vaccine components, Immunogens and factors influencing choice of vaccines	1
3.	New generation vaccines- subunit vaccines, peptide vaccines and recombinant vaccines	2
4.	Reverse genetics vaccines, Marker and DIVA vaccines and transmission blocking vaccines	2
5.	Preparation of vaccines- Identification of candidate strain, identification of epitopes	2
6.	Seed and challenge strain maintenance	1
7.	Classical methods of exaltation and attenuation of pathogens and their molecular basis	2
8.	Technology of production of different types of vaccines	1
9.	Recent advances in vaccine delivery systems and multicomponent vaccines	2
10.	Advances in vaccines, adjuvants with their classification and mode of action	2
11.	Standardization of veterinary vaccines as per National and Global standards	2
12.	Laws and regulatory requirements concerning veterinary biologicals	2
13.	Indian pharmacopoeia	2
14.	Vaccine failure and Post vaccinal reactions	1
15.	Factors affecting response to vaccines and Quality control	2
16.	Principles of development of vaccination schedule	1
17.	Principles of development of vaccination schedule	1
18.	Methods of conducting vaccine trials (lab to field use)	1
19.	Pharmaco-vigilance	1
20.	Scaling up methods of vaccine production	1
	Total	**32**

VMC 508: Techniques in Microbiology (0+2)

S.No.	Topic of Syllabus	Practicals
Practical		
1.	Orientation to a microbiology laboratory	1
2.	Different sterilization and disinfection techniques	2
3.	Laboratory biosafety and biosecurity	1
4.	Microscopy	2

S.No.	Topic of Syllabus	Practicals
5.	Media preparation	2
6.	Isolation, cultivation and purification of bacteria and fungi	2
7.	Morphological and biochemical characterization	3
8.	Antibacterial sensitivity test by Disc diffusion, broth dilution and MIC determination technique	3
9.	Cultivation of viruses in embryonated eggs	2
10.	Cultivation of viruses in cell culture	3
11.	VNT	1
12.	Different immunological techniques- Agglutination	2
13.	Precipitation	2
14.	HA and HI	2
15.	ELISA	2
16.	Other immunological assays	2
	Total	**32**

VMC 509: Techniques in Molecular Microbiology (1+2)

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Basic requirements for establishing molecular diagnostics Laboratory	1
2.	Principles of molecular diagnostic tests	2
3.	Methods of nucleic acid extraction from pathogenic microorganisms	2
4.	PCR and variants of PCR	3
5.	Principles of primer designing	1
6.	Gel electrophoresis methods	1
7.	Blotting Techniques- Southern blotting, northern blotting, western blotting and dot-blot	1
8.	Nucleic acid sequencing methods	1
9.	Sequence analysis-sequence editing, sequence alignment, sequence comparison and phylogentic analysis	1
10.	Gene cloning and expression	1
11.	Molecular diagnosis as epidemiological tool	1
12.	Development and validation of diagnostic tests	1
	Total	**16**
Practical		
1.	Orientation of molecular diagnosis laboratory	1
2.	RNA and Diagnostic PCR lab (Handling RNA and DNA)	2
3.	Extraction of nucleic acid from different microbes(Gram Positive bacteria, Gram Negative bacteria, DNA viruses and RNA Viruses and fungi)	4
4.	DNA and RNA isolation from cell culture and blood	2
5.	Quality and quantity check of nucleic acid-Microlitre spectrophotometery and gel electrophoresis	2
6.	Principles for Primer designing	1
7.	Procedure for molecular diagnostic tests like PCR, RT-PCR and LAMP	3
8.	Absolute and relative quantitation of DNA/ RNA using Real time PCR.	2
9.	SDS PAGE of proteins and RNA	2
10.	Study of nucleic acid and proteins by blotting techniques	2
11.	Restriction Enzyme Techniques (REA and RFLP)	2
12.	PCR product concentration and purification for sequencing	2

S.No.	Topic of Syllabus	Lectures/ Practicals
13.	Nucleic acid sequence analysis	2
14.	Gene Cloning, expression and purification of expression products	3
15.	Idea of high throughput sequencing and MALDI-TOF	2
	Total	**32**

VMC 510: Molecular Immunology (1+1)

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Molecular Structure and function of PRRs	1
2.	Ligands of PRRs and signal transduction through TLR,	1
3.	Inflammosome	1
4.	Cytokines	1
5.	Lymphocyte markers and CD nomenclature	1
6.	Molecular structure of Immunoglobulin and class, isotypes, synthesis and expression of immunoglobulin,	1
7.	Rearrangement and its organization, immunoglobulin gene diversity and mechanism of recombination of B cell gene	2
8.	Theory of antibody generation	1
9.	Signature molecules of T cell and T reg cell, T cell receptor and T cell gene diversity	2
10.	MHC structure, Genomic organization of the MHC gene haplotype and pathway of signal transduction	1
11.	Concept of congenic and syngeneic and Concept of polymorphism of MHC gene	1
12.	Role co-stimulators in B cell and T cell activation and recruitment of adaptor proteins	1
13.	Molecular mechanisms (events) of cell cytotoxicity	2
	Total	**16**
Practical		
1.	Isolation and purification of mammalian and avian immunoglobulin by precipitation technique: - Caprylic acid, PEG, Ammonium Sulphate and Sodium Sulphate	2
2.	Separation of immunoglobulins by size, charge and ligand affinity size exclusion chromatography (Sephadex 200), Ion exchange chromatography (DEAE), affinity chromatography (Protein-A, Sepharose) Immuno-electrophoresis Technique	2
3.	Polyacrylamide gel electrophoresis innative and reducing conditions; fixed and gradient gel	2
4.	Western blot and Crossed immune-electrophoresis	2
5.	Solid Phase ELISA and Chemiluminscence assay	1
6.	Cell cytotoxicity assaya - Non radioactive methods like LDH realease assay	2
7.	Antigen detection by Immuno PCR	1
8.	Haplotype matching between individuals	2
9.	Flow cytometry for CD4 and CD8 ratio determination and other applications	1
10.	ELISPOT test for cytokine assay	1
	Total	**16**

VMC 511: Mucosal Immunology (1+0)

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Mucosal barrier- Development and physiology of mucosal defence. Mucosal inductive and effector sites	1
2.	Cells and lymphoid tissues of mucosal immune system	1
3.	MALT, GALT, NALT and BALT	1
4.	Innate immune response at mucosal surfaces: Mucus, Antimicrobial peptides and Role of PPRs	1
5.	Intestinal Dendritic cell and intestinal macrophage	1
6.	Antigen uptake and presentation at mucosal sites and transepithelial transport of antigen	1
7.	Mucosal Immunoglobulin, IgA synthesis and transport to intestinal lumen	1
8.	Extrathymic Description and role ofPaneth cell and crypto patches	1
9.	M-cells and their functions	1
10.	Mucosal immune effector mechanisms including secretory IgA response	1
11.	T cell development in mucosal tissues and their phenotypes and functions	1
12.	Importance and limitations of mucosal immunization.	1
13.	Mucosal adjuvants and delivery systems	1
14.	Oral tolerance mechanistic approach.	1
15.	Immunopathology at mucosal surfaces: Celiac disease, Inflammatory bowel disease, Jhone's disease	1
16.	Assessment of mucosal immune response and potency testing	1
	Total	**16**

VMC 512: Introduction to Microbial Bio-informatics (1+0)

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Introduction to Bioinformatics; History, Scope and Application	1
2.	Bioinformatics Resources and databases	1
3.	Introduction to NCBI, ExPASy and Ensembl Genome browser	1
4.	Sequence comparison and alignment methods	1
5.	Principal and methods of Pairwise sequence alignment	1
6.	Dotplot analysis	1
7.	BLAST and FASTA programs and their variants	1
8.	DNA and protein sequence analysis	1
9.	Introduction to Multiple sequence alignment	1
10.	Introduction to Phylogenetic analysis	1
11.	Global multiple sequence alignment (CLUSTAL-W)	1
12.	Introduction to protein structure and databases	1
13.	Structure based protein classification	1
14.	Protein structure database -CASP	1
15.	Protein structure alignment tools (VAST, DALI)	1
16.	Protein 3-D structure visualization and modeling	1
	Total	**16**

Course Title with Credit Load
Ph.D. in Veterinary Microbiology

Course Code	Course Title	Credit Hours
VMC 601	Advances in Veterinary Bacteriology*	2+1
VMC 602	Advances in Veterinary Mycology	2+1
VMC 603	Bacterial Genetics	2+0
VMC 604	Microbial Toxins	2+1
VMC 605	Bacterial Pathogenesis	2+0
VMC 606	Advances in Veterinary Virology*	2+1
VMC 607	Molecular Viral Pathogenesis	2+1
VMC 608	Structure Function Relationship of DNA and RNA Viruses	2+0
VMC 609	Oncogenic Viruses	2+0
VMC 610	Slow Viral Infections and Prions	1+0
VMC 611	Advances in Veterinary Immunology*	2+1
VMC 612	Cytokines and Chemokines	2+ 0
VMC 613	Immunoregulation	1+0
VMC 614	Advances in Vaccinology	2+0
VMC 615	Current topics in Infection and Immunity	2+0
VMC 616	Veterinary Microbial Biotechnology	2+1
VMC 690	Special Problem	0+1
VMC 691	Doctoral Seminar-I*	1+0
VMC 692	Doctoral Seminar-II*	1+0
VMC 699	Doctoral Research	0+75

* Core courses

Course Contents
Ph.D. in Veterinary Microbiology

I. Course Title : Advances in Veterinary Bacteriology
II. Course Code : VMC 601
III. Credit Hours : 2+1

IV. Aim of the course

To learn about the latest development in field of bacteriology.

V. Theory

Unit I

Recent advances in bacterial taxonomy and phylogeny, advanced studies on cytology, molecular structure and function of bacterial cell surface, peptidoglycans, walls of Gram-positive and Gram-negative bacteria, Cell surface appendages: Flagella and Fimbriae. Role of bacteria cell envelope in pathogenicity and immunogenicity, Biochemical activities, Antigenic structure. Bacterial secretory and excretory system.

Unit II

Bacterial whole genome sequence analysis and its application.

VI. Practical

Isolation of bacterial LPS, OMP, Peptidoglycans, Capsule, Flagellar antigen, genotyping, phage typing, serotyping of bacteria, studies on host pathogen interactions.

I. Course Title : Advances in Veterinary Mycology
II. Course Code : VMC 602
III. Credit Hours : 2+1

IV. Aim of the course

To learn about the latest development in the field of mycology.

V. Theory

Unit I

Advanced studies on taxonomy, Genetics, Physiology and Antigenic characterization of pathogenic fungi.

Unit II

Advanced studies on molecular approaches for identification of fungi; immunology and serology of mycoses, antifungal therapy, fungal vaccines, fungal viruses.

VI. Practical

Morphological, Biochemical and Physiological studies of various fungi. *In vivo* pathogenicity study. Molecular detection and characterization of fungi.

I. Course Title : Bacterial Genetic
II. Course Code : VMC 603
III. Credit Hours : 2+0

IV. Aim of the course

To learn the various aspects of bacterial genetics.

V. Theory

Unit I

Comparative studies of prokaryotic and eukaryotic genome and their replication; structure, classification and replication of plasmids.

Unit II

Bacterial variations: Phenotypic and genotypic variations, Mutations and mutagenesis, Types of bacterial mutants, Detection of mutants and genemapping. Mechanism of gene transfer: Transduction, Transformation and conjugation. Types and mechanism of recombination: Reciprocal, Non-reciprocal and illegitimate recombination's.

Unit III

Mobile genetic elements, molecular mechanism of antibiotic resistance, regulation of gene expression.

I. Course Title : Microbial Toxins
II. Course Code : VMC 604
III. Credit Hours : 2+1

IV. Aim of the course

To learn about the structure, Mechanism of action, Methods of detection of various bacterial and fungal toxins.

V. Theory

Unit I

Classification of bacterial and fungal toxin on the basis of their structure and functions. The role of microbial toxins in the pathogenesis of diseases; biochemical and biological characteristics of toxins. Toxin producing Grams-positive and Grams-negative bacteria. Properties and clinical conditions produced by different bacterial and fungal toxins. Analytical methods for detection of bacterial and fungal toxins: Biological assays, Immunological assays, Nucleic acid-based methods.

Unit II

Application of microbial toxins andimmunobiological studies of toxins.

VI. Practical

Detection and identification of Mycotoxigenic fungi and mycotoxins. Method of detection of bacterial endotoxin, Production of toxins in suitable media, Purification and characterization of toxins, Biological characterization in animal and in tissue culture. Toxin neutralization test.

I. Course Title : Bacterial Pathogenesis
II. Course Code : VMC 605
III. Credit Hours : 2+0
IV. Aim of the course

To learn the molecular mechanisms of bacterial pathogenesis.

V. Theory

Unit I

Molecular structure, Production and mode of action of bacterial virulence factors, Bacterial biofilms and advance studies on pathogenesis of bacterial diseases of various systems.

Unit II

Host-pathogen interaction, Animal models for bacterial pathogens.

I. Course Title : Advances in Veterinary Virology
II. Course Code : VMC 606
III. Credit Hours : 2+1
IV. Aim of the course

Advanced study of virus structure, Their nucleic acids and proteins; Latest trends in animal virus research.

V. Theory

Unit I

Biology of RNA and DNA virus replication. An introduction to bacteriophages and phage replication.

Unit II

Current concepts in animal virus research with respect to viral structure and architecture, viral virulence, viral pathogenesis, persistence and oncogenesis. Viruses as bio-terror agents and viruses for pest management (Bio-control).

Unit III

Antiviral drugs: Scope, Use and limitations, Existing antiviral drugs and their mechanism of action, Latest trends in antiviral drug development.

Unit IV

Preparation of plasmid backbone, Preparation of viral genes for cloning and cloning in viral genome backbone, Confirmation of cloned genes, Development of positive marker and negative markers, DIVA vaccine, Different types of viral vectors (vaccinia, adenoviral, retroviral vectors).

VI. Practical

Characterization of viral proteins and genome. Problem oriented practical assignments aimed at development of bioreagents and relevant diagnostic tests.

I. Course Title : Molecular Viral Pathogenesis
II. Course Code : VMC 607
III. Credit Hours : 2+1
IV. Aim of the course

To study molecular and genetic determinants of viral virulence and pathogenesis;

animal models for studying viral pathogenesis.

V. Theory

Unit I

Study of virus host interactions: Host specificity, Tissue tropism, Mechanism of virus spread in the body.

Unit II

Host immune responses to viral infections; Viral strategies to evade host immune responses. Viral interference and interferons.

Unit III

Pathogenesis of viral diseases of various systems, animal models for studying viral pathogenesis, molecular and genetic determinants of viral virulence, mechanisms of viral virulence.

Unit IV

Molecular and genetic determinants of viral persistence, viral oncogenesis, viral immunosuppression, and immunopathology.

VI. Practical

Pathotyping of animal viruses using Newcastle disease virus as model, Determination of immunosuppressive potential of animal viruses using infectious bursal disease virus/ Marek's disease virus/ chicken anaemia virus, Characterization of molecular determinants of viral virulence using variants, Recombinants and reassortants.

I. Course Title : Structure Function Relationship of DNA and RNA Viruses

II. Course Code : VMC 608

III. Credit Hours : 2+0

IV. Aim of the course

To understand the relationship between structure and function of DNA and RNA viruses of animals for the development of next generation viral vaccine and antivirals.

V. Theory

Unit I

Methods of studying virus structure and architecture, Methods of amplification of viral nucleicacids, Molecular characterization of viral protein and nucleic acids, Nucleotide sequencing and its analysis by software programmes.

Unit II

Detailed study of virus replication in various groups of animal viruses.

Unit III

Understanding the relationship between structure and function of animal DNA and RNA viruses, Development of modern vaccines and antivirals using the relationship between structure and function of animal DNA and RNA viruses.

I. Course Title : Oncogenic Viruses
II. Course Code : VMC 609
III. Credit Hours : 2+0

IV. Aim of the course

To study mechanisms of viral oncogenesis.

V. Theory

Unit I

General features of cell transformation and characterization of transformed cells. Oncogenic RNA and DNA viruses. Oncolytic viruses, viral and cellular oncogenes.

Unit II

Mechanisms of viral oncogenesis and diagnosis of viral oncogenesis.

I. Course Title : Slow Viral Infections and Prions
II. Course Code : VMC 610
III. Credit Hours : 1+0

IV. Aim of the course

To study slow viral infections, properties and replication of prions and diseases caused by them.

V. Theory

Unit I

Epidemiology, Pathogenesis, Diagnosis and control of slow viral infections.

Unit II

Properties, Replication and epidemiology of prions. Pathogenesis, immunity, Diagnosis and control of Scrapies, Bovine spongiform encephalopathy, Chronic wasting disease of dear, Transmissible mink encephalopathy. Recent trends in prion research.

I. Course Title : Advances in Veterinary Immunology
II. Course Code : VMC 611
III. Credit Hours : 2+1

IV. Aim of the course

To study recent advances in immunology.

V. Theory

Unit I

Cells and tissues of immune system: Significance of HSC l, Origin of myeloid cells; Lymphoid cells (T and B cells), NK cells, NKT cell, Apoptosis and its role in homeostatic mechanism. Ontogeny of the lymphoid tissue in mammals and birds. Cell adhesion molecules, Recirculation and trafficking, Cell homing receptor. Antigen presenting cells and their functions at cellular level.

Unit II

Cytokines, chemokines and cytokine receptors.

Unit III

Developmental biology of Immune cells**:** Early development of T and B cells and its differentiation, Maturation in primary lymphoid organ. B cell development and T cell development. Lineage commitment, Memory generation. Organization of expression of lymphocyte receptors gene, Multigenic organization of immunoglobulin gene andthymic selection of T cell repertoire. Concept of extrathymic origin of T cells. Effector and memory T and B cells.

Unit IV

Recombination events in T and B cell: Mechanism of recombination of immunoglobulin genes and T cell receptor genes.

Unit V

Activation of T and B cells: Clonal expansion. Role of T cell help in B cell response, affinity maturation of B cells and class switching and T cell activation.

Unit VI

MHC**:** MHC class-I and II structure and gene arrangement, polymorphism, antigen processing and presentation mechanism.

Unit VII

Antibody mediated and cell mediated effector functions. Cellular immune response: Effector mechanisms of CTL, NK cells and NK T cell activation. Regulation of immune response. Role of T reg-cells, immunological tolerance and graft rejection.

VI. Practical

Purification of immunoglobulin classes, Subclasses, Fragmentation of antibody by enzyme digestion to F (ab)2 and Fc fragments, Affinity chromatography techniques. Separation of protein by SDS PAGE under reducing condition.Western blot experiment to detect the immunogenic protein, ELISPOT, cytotoxic T cell assay, morphological and functional assays of blood monocytes. FACS and MACS.

I. Course Title : Cytokines and Chemokines

II. Course Code : VMC 612

III. Credit Hours : 2+0

IV. Aim of the course

To study recent advances in cytokines and chemokines**.**

V. Theory

Unit I

Properties of cytokines. General structure and function of classification of cytokines family's, Cytokine secretion by Th1 and Th2 subsets. Cytokines cross regulation. Cytokine receptors:general structure of cytokine receptors, Immunoglobulin superfamily receptors, class 1 and class 2 cytokine receptor families. TNF receptor families and cytokine antagonists.

Unit II

Cytokine related diseases. Therapeutic uses of cytokines and their receptors. Chemokines: subgroups of chemokines and their structures and functions, chemokine receptor families.

Unit III

Immunomodulators: Types of immunomodulators and their mechanism of action. Adjuvants: classification, Mode of action, Adjuvants combination and safety. Cytokine as adjuvant, PLG and microparticle as adjuvant, TLR agonist as adjuvant. Antigen delivery system and mode of action. Immunostimulants: Bacterial product and synthetic Compound, Complex carbohydrates, Immune enhancing drugs, Vitamins and cytokines.

Unit IV

Immunosuppression, Neuroendocrine control of immunoregulation, Immunosuppressive agents and drugs, Corticosteroids, Cyclosporin's, Cyclophosphamide and other agents, Like irradiation and the mode of action.

I. Course Title : Immunoregulation
II. Course Code : VMC 613
III. Credit Hours : 1+0

IV. Aim of the course

To study recent advances in immunoregulation mechanisms.

V. Theory

Unit I

Molecular mediators of immune response: Lymphokines and monokines. Idiotypic networks. Epitope specific regulation. Th, Tc and Treg cells. MHC in immunoregulation, Immune response genes. Antigen specific suppressor molecules produced by T cells. Immunosuppressive agents and immune-stimulation. Immunoregulatory pathways.

I. Course Title : Advances in Vaccinology
II. Course Code : VMC 614
III. Credit Hours : 2+0

IV. Aim of the course

To learn about advances in vaccine research and modern approaches for the vaccine development.

V. Theory

Unit I

Different phases in vaccine development. Direct and indirect correlates of protection. Antigen identification and characterization employing emerging technologies such as microarrays, *in vivo* expression technology, Signature-tagged mutagenesis and phage display technology.

Unit II

Immuno-informatics applied to epitope mapping, T cell epitopes and identification of pathogenic epitopes. Novel vaccines: nucleic acids, Marker vaccines, Mucosal vaccines, Bacterial ghosts as vaccines and virus-like particles. Futuristic vaccines: anti-allergic, Anti-autoimmune diseases, De-addiction vaccines and transplant survival/ prolonging vaccines.

I. Course Title : Current Topics in Infection and Immunity

II. Course Code : VMC 615

III. Credit Hours : 2+0

IV. Aim of the course

Discussions on recent developments in the immunobiology of major viral, bacterial and fungal diseases of animals.

V. Theory

Unit I

Introduction and historical developments. Host-pathogen relationship.

Unit II

Effector mechanisms of specific and non-specific immunity to different groups of microbes.

Unit III

Immunobiology of major viral, Bacterial and fungal diseases of animals. Types of vaccines for infectious diseases; Current trends in vaccine development.

I. Course Title : Veterinary Microbial Biotechnology

II. Course Code : VMC 616

III. Credit Hours : 2+1

IV. Aim of the course

To understand as to how microbial processes and activities can be used for development of medically and industrially important products and processes.

V. Theory

Unit I

History of microbial biotechnology. Microbes in nature.Microbes as infectious agents of human and animals. Host-microbe relationships. Microbial metabolism and growth characteristics. Microbial genetics.

Unit II

Introduction to molecular biology of microorganisms: DNA, RNA and proteins structure and functions. DNA replication, RNA transcription, reverse transcription, protein translation and regulatory mechanisms. Bacterial extrachromosomal DNA elements.

Unit III

Genetic engineering: Restriction enzymes, DNA ligases, DNA polymerases, RNases and DNases and other enzymes. DNA sequencing. Plasmids and phage-derived vectors, Bacterial hosts for cloning and expression of transgenes. Genomic libraries and sequencing. Blotting of DNA, RNA and proteins. Polymerase chain reaction. An introduction to Microarrays and Metagenomics.

Unit IV

Expression of antigens and antibody fragments useful as diagnostic reagents and vaccines. PCR and blotting techniques in infectious disease diagnosis. Nucleic acid vaccines. Vectored viral and bacterial vaccines. Construction of defined mutants and marker vaccines using genetic manipulation techniques.Manipulation of microbial processes for production of industrially useful substances.

VI. Practical

Extraction of nucleic acids from viruses and bacteria. Restriction endonuclease digestion of DNA and resolution in agarose gel electrophoresis. PCR amplification of DNA. RT-PCR of RNA. Insertion of DNA fragments into plasmid/ phagemid/ phage vectors. Construction of competent *E. coli* host cells. Transformation and transfection of competent *E. coli* cells. Screening of transformants and isolation of clones. Sequence analysis of clones/ PCR amplicons. Expression of genes of bacterial/ viral antigens. Use of PCR for infectious disease diagnosis.

I. Course Title : Special Problem

II. Course Code : VMC 690

III. Credit Hours : 1+0

IV. Aim of the course

To provide expertise in handling practical research problem(s).

V. Practical

Short research problem(s) involving contemporary issues and research techniques.

Course Outline-cum-Lecture Schedule for Doctoral Degree Programme

VMC 601: Advances in Veterinary Bacteriology 2+1

S.No.	Topic of Syllabus	Lecture/ Practical
Theory		
1.	Recent advances in bacterial taxonomy and phylogeny	3
2.	Advanced studies on bacterial cytology	2
3.	Molecular structure and function of bacterial cell surface Peptidoglycans	2
4.	Walls of Gram-positive and Gram-negative bacteria	2
5.	Cell surface appendages: Flagella and Fimbriae	3
6.	Role of bacteria cell envelope in pathogenicity and immunogenicity	4
7.	Biochemical activities	4
8.	Antigenic structure	4
9.	Bacterial secretory and excretory system	4
10.	Bacterial whole genome sequence analysis and its application	4
	Total	**32**
Practical		
1.	Isolation of bacterial LPS	1
2.	Isolation of bacterial OMP	1
3.	Isolation of bacterial Peptidoglycans	1
4.	Isolation of bacterial Capsule	1
5.	Isolation of bacterial Flagellar antigen	1
6.	Genotyping of bacteria	2
7.	Phage typing of bacteria	2
8.	Serotyping of bacteria	3
9.	Studies on host pathogen interactions	4
	Total	**16**

VMC 602: Advances in Veterinary Mycology 2+1

S.No.	Topic of Syllabus	Lecture/ Practical
Theory		
1.	Advanced studies on taxonomy of pathogenic fungi	2
2.	Advanced studies on genetics of pathogenic fungi	4
3.	Advanced studies on physiology of pathogenic fungi	4
4.	Advanced studies on antigenic characterization of pathogenic fungi	6
5.	Advanced studies on molecular approaches for identification of fungi	4
6.	Immunology and serology of mycoses	4
7.	Antifungal therapy	4
8.	Fungal vaccines	2
9.	Fungal viruses	2
	Total	**32**

S.No.	Topic of Syllabus	Lecture/ Practical
Practical		
1.	Morphological, biochemical and physiological studies of various fungi	6
2.	*In vivo* pathogenicity study	5
3.	Molecular detection and characterization of fungi	5
	Total	**16**

VMC 603: Bacterial Genetics 2+0

S.No.	Topic of Syllabus	Lecture
Theory		
1.	Comparative studies of prokaryotic and eukaryotic genome and their replication	3
2.	Structure, classification and replication of plasmids	3
3.	Bacterial variations: Phenotypic and genotypic variations	3
4.	Mutations and mutagenesis, types of bacterial mutants and detection of mutants	4
5.	Gene mapping	3
6.	Mechanism of gene transfer: transduction, transformation and conjugation	4
7.	Types and mechanism of recombination: Reciprocal, non-reciprocal and illegitimate recombination's	4
8.	Mobile genetic elements	3
9.	Molecular mechanism of antibiotic resistance	3
10.	Regulation of gene expression	2
	Total	**32**

VMC 604: Microbial Toxins 2+1

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Classification of bacterial and fungal toxin on the basis of their structure and functions	4
2.	The role of microbial toxins in the pathogenesis of diseases	3
3.	Biochemical and biological characteristics of toxins	5
4.	Toxin producing Grams-positive and Grams-negative bacteria	2
5.	Properties and clinical conditions produced by different bacterial and fungal toxins	4
6.	Analytical methods for detection of bacterial and fungal toxins: Biological assays, immunological assays, Nucleic acid-based methods	8
7.	Application of microbial toxins	3
8.	Immuno-biological studies of toxins	3
	Total	**32**
Practical		
1.	Detection and identification of Mycotoxigenic fungi and mycotoxins	2
2.	Method of detection of bacterial endotoxin	3
3.	Production of toxins in suitable media	3
4.	Purification and characterization of toxins	3

S.No.	Topic of Syllabus	Lectures/ Practicals
5.	Biological characterization in animal and in tissue culture	3
6.	Toxin neutralization test	2
	Total	**16**

VMC 605: Bacterial Pathogenesis 2+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Molecular structure, production and mode of action of bacterial virulence factors	8
2.	Bacterial biofilms	4
3.	Advancee studies on pathogenesis of bacterial diseases of various systems	8
4.	Host-pathogen interaction	8
5.	Animal models for bacterial pathogens	4
	Total	32

VMC 606: Advances in Veterinary Virology 2+1

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Biology of RNA and DNA virus replication	2
2.	An introduction to bacteriophages and phage replication	2
3.	Current concepts in animal virus research with respect to viral structure and architecture	3
4.	viral virulence, viral pathogenesis, persistence and oncogenesis	4
5.	Viruses as bio-terror agents and viruses for pest management (Bio-control)	2
6.	Antiviral drugs: Scope, use and limitations	3
7.	Existing antiviral drugs and their mechanism of action	2
8.	Latest trends in antiviral drug development	2
9.	Preparation of plasmid backbone, preparation of viral genes for cloning and cloning in viral genome backbone	3
10.	Confirmation of cloned genes	2
11.	Development of positive marker and negative markers	2
12.	DIVA vaccine	2
13.	Different types of viral vectors (vaccinia, adenoviral, retroviral vectors)	3
	Total	**32**
Practical		
1.	Characterization of viral proteins and genome	8
2.	Problem oriented practical assignments aimed at development of bioreagents and relevant diagnostic tests	8
	Total	**16**

VMC 607: Molecular Viral Pathogenesis 2+1

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Study of virus host interactions: host specificity, tissue tropism and mechanism of virus spread in the body	3
2.	Host immune responses to viral infections	2
3.	Viral strategies to evade host immune responses	2
4.	Viral interference and interferons	2
5.	Pathogenesis of viral diseases of various systems	3
6.	Animal models for studying viral pathogenesis	3
7.	Molecular and genetic determinants of viral virulence	3
8.	Mechanisms of viral virulence	3
9.	Molecular and genetic determinants of viral persistence	3
10.	Viral oncogenesis	4
11.	Viral immunosuppression and immunopathology	4
	Total	**32**
Practical		
1.	Pathotyping of animal viruses using Newcastle disease virus as model	4
2.	Determination of immunosuppressive potential of animal viruses using infectious bursal disease virus/ Marek's disease virus/ chicken anaemia virus	8
3.	Characterization of molecular determinants of viral virulence using variants, recombinants and reassortants	4
	Total	**16**

VMC 608: Structure Function Relationship of DNA and RNA Viruses 2+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Methods of studying virus structure and architecture	3
2.	Methods of amplification of viral nucleicacids	2
3.	Molecular characterization of viral protein and nucleic acids	3
4.	Nucleotide sequencing and its analysis by software programmes	6
5.	Detailed study of virus replication in various groups of animal viruses	6
6.	Understanding the relationship between structure and function of animal DNA and RNA viruses	6
7.	Development of modern vaccines and antivirals using the relationship between structure and function of animal DNA and RNA viruses	6
	Total	**32**

VMC 609: Oncogenic Viruses 2+0

S.No.	Topic of Syllabus	Practical
Theory		
1.	General features of cell transformation and characterization of transformed cells	4
2.	Oncogenic RNA and DNA viruses	4

S.No.	Topic of Syllabus	Practical
3.	Oncolytic viruses	5
4.	Viral and cellular oncogenes	5
5.	Mechanisms of viral oncogenesis	8
6.	Diagnosis of viral oncogenesis	6
	Total	**32**

VMC 610: Slow Viral Infections and Prions 1+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Epidemiology of slow viral infections	1
2.	Pathogenesis of slow viral infections	1
3.	Diagnosis and control of slow viral infections	2
4.	Properties, replication and epidemiology of prions	2
5.	Scrapies	2
6.	Bovine spongiform encephalopathy	2
7.	Chronic wasting disease of dear	2
8.	Transmissible mink encephalopathy	2
9.	Recent trends in prion research	2
	Total	**16**

VMC 611: Advances in Veterinary Immunology 2+1

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	Significance of HSC l and Origin of myeloid cells	1
2.	Lymphoid cells (T and B cells), NK cells and NKT cell	1
3.	Apoptosis and its role in homeostatic mechanism	1
4.	Ontogeny of the lymphoid tissue in mammals and birds	1
5.	Cell adhesion molecules, recirculation and trafficking, cell homing receptor	2
6.	Antigen presenting cells and their functions at cellular level	1
7.	Cytokines, chemokines and cytokine receptors	2
8.	Early development of T and B cells and its differentiation and maturation in primary lymphoid organ	1
9.	B cell development and T cell development	2
10.	Lineage commitment and memory generation	2
11.	Organization of expression of lymphocyte receptors gene	2
12.	Multiagenic organization of immunoglobulin gene	1
13.	Thymic selection of T cell repertoire.	1
14.	Concept of extrathymic origin of T cells	1
15.	Effector and memory T and B cells	1
16.	Mechanism of recombination of immunoglobulin genes and T cell receptor genes	2
17.	Clonal expansion	1
18.	Role of T cell help in B cell response	1
19.	Affinity maturation of B cells and class switching and T cell activation	1

S.No.	Topic of Syllabus	Lectures/ Practicals
20.	MHC class-I and II structure and gene arrangement, polymorphism, antigen processing and presentation mechanism	2
21.	Effector mechanisms of CTL, NK cells and NK T cell activation	2
22.	Regulation of immune response	2
23.	Role of T reg-cells, immunological tolerance and graft rejection	1
	Total	**32**
Practical		
1.	Purification of immunoglobulin classes, subclasses, fragmentation of antibody by enzyme digestion to F (ab)2 and Fc fragments, affinity chromatography techniques	2
2.	Separation of protein by SDS PAGE under reducing condition	2
3.	Western blot experiment to detect the immunogenic protein	2
4.	ELISPOT	2
5.	Cytotoxic T cell assay	2
6.	Morphological and functional assays of blood monocytes	2
7.	FACS	2
8.	MACS	2
	Total	**16**

VMC 612: Cytokines and Chemokines 2+ 0

S.No.	Topic of Syllabus	Lectures
Theory		
1	Properties of cytokines	2
2	General structure and function of classification of cytokines family's, cytokine secretion by Th1 and Th2 subsets	3
3	Cytokines cross regulation	2
4	Cytokine receptors:general structure of cytokine receptors, immunoglobulin superfamily receptors, class 1 and class 2 cytokine receptor families	3
5	TNF receptor families and cytokine antagonists	2
6	Cytokine related diseases	2
7	Therapeutic uses of cytokines and their receptors	2
8	Chemokines: subgroups of chemokines and their structures and functions, chemokine receptor families	3
9	Types of immunomodulators and their mechanism of action	2
10	Adjuvants: classification, mode of action, adjuvants combination and safety	2
11	Cytokine as adjuvant, PLG and microparticle as adjuvant, TLR agonist as adjuvant	2
12	Antigen delivery system and mode of action	3
	Immunostimulants: bacterial product and synthetic compound, complex carbohydrates, immune enhancing drugs, vitamins and cytokines	3
13	Immunosuppression, Neuroendocrine control of immunoregulation, Immunosuppressive agents and drugs, corticosteroids, cyclosporin's, cyclophosphamide and other agents, like irradiation and the mode of action	3
	Total	**32**

VMC 613: Immunoregulation 1+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Molecular mediators of immune response:lymphokines and monokines	2
2.	Idiotypic networks	2
3.	Epitope specific regulation	2
4.	Th, Tc and Treg cells	2
5.	MHC in immunoregulation, immune response genes	2
6.	Antigen specific suppressor molecules produced by T cells	2
7.	Immunosuppressive agents and immune-stimulation	2
8.	Immunoregulatory pathways	2
	Total	**16**

VMC 614: Advances in Vaccinology 2+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Different phases in vaccine development	4
2.	Direct and indirect correlates of protection	2
3.	Antigen identification and characterization employing emerging technologies such as microarrays, in vivo expression technology, signature-tagged mutagenesis and phage display technology	6
4.	Immuno-informatics applied to epitope mapping, T cell epitopes and identification of pathogenic epitopes	8
5.	Nucleic acids, marker vaccines, mucosal vaccines, bacterial ghosts as vaccines and virus-like particles	6
6.	Futuristic vaccines: anti-allergic, anti-autoimmune diseases, de-addiction vaccines and transplant survival/ prolonging vaccines	6
	Total	**32**

VMC 615: Current topics in Infection and Immunity 2+0

S.No.	Topic of Syllabus	Lectures
Theory		
1.	Introduction and historical developments	5
2.	Host-pathogen relationship	6
3.	Effector mechanisms of specific and non-specific immunity to different groups of microbes	6
4.	Immunobiology of major viral, bacterial and fungal diseases of animals	6
5.	Types of vaccines for infectious diseases	5
6.	Current trends in vaccine development	6
	Total	**32**

VMC 616: Veterinary Microbial Biotechnology 2+1

S.No.	Topic of Syllabus	Lectures/ Practicals
Theory		
1.	History of microbial biotechnology	1
2.	Microbes in nature	1
3.	Microbes as infectious agents of human and animals	1
4.	Host-microbe relationships	1
5.	Microbial metabolism and growth characteristics	1
6.	Microbial genetics	1
7.	Introduction to molecular biology of microorganisms: DNA, RNA and proteins structure and functions	2
8.	DNA replication, RNA transcription, reverse transcription, protein translation and regulatory mechanisms	2
9.	Bacterial extrachromosomal DNA elements	1
10.	Genetic engineering: restriction enzymes, DNA ligases, DNA polymerases, RNases and DNases and other enzymes	2
11.	DNA sequencing	2
12.	Plasmids and phage-derived vectors, bacterial hosts for cloning and expression of transgenes	2
13.	Genomic libraries and sequencing	1
14.	Blotting of DNA, RNA and proteins	2
15.	Polymerase chain reaction	1
16.	An introduction to Microarrays and Metagenomics	1
17.	Expression of antigens and antibody fragments useful as diagnostic reagents and vaccines	2
18.	PCR and blotting techniques in infectious disease diagnosis	2
19.	Nucleic acid vaccines	1
20.	Vectored viral and bacterial vaccines	1
21.	Construction of defined mutants and marker vaccines using genetic manipulation techniques	2
22.	Manipulation of microbial processes for production of industrially useful substances	2
	Total	**32**
Practical		
1.	Extraction of nucleic acids from viruses and bacteria	2
2.	Restriction endonuclease digestion of DNA and resolution in agarose gel electrophoresis	1
3.	PCR amplification of DNA	1
4.	RT-PCR of RNA	1
5.	Insertion of DNA fragments into plasmid/ phagemid/ phage vectors	2
6.	Construction of competent E. coli host cells	2
7.	Transformation and transfection of competent E. colicells	1
8.	Screening of transformants and isolation of clones	1
9.	Sequence analysis of clones/ PCR amplicons	2
10.	Expression of genes of bacterial/ viral antigens	2
11.	Use of PCR for infectious disease diagnosis	1
	Total	**16**

VMC 690: Special Problem 0+1

Practical

Short research problem(s) involving contemporary issues and research techniques. Planning a short research problem or working on a published research paper or new developments.

Veterinary Para-Clinical Subjects
– Veterinary Pathology

Course Title with Credit Load
M.V.Sc. in Veterinary Pathology

Course Code	Course Title	Credit Hours
VPL 501	General Pathology*	2+1
VPL 502	Techniques in Pathology*	0+2
VPL 503	Animal Oncology	1+1
VPL 504	Clinical Pathology*	1+1
VPL 505	Necropsy Procedures and Interpretations*	1+1
VPL 506	Necropsy Conference*	0+1
VPL 507	Systemic Pathology*	2+1
VPL 508	Pathology of Infectious Diseases of Domestic Animals*	2+1
VPL 509	Toxicopathology	2+1
VPL 510	Avian Pathology*	2+1
VPL 511	Pathology of Wild/ Zoo and Aquatic Animal Diseases	2+1
VPL 512	Pathology of Laboratory Animal Diseases	2+1
VPL 591	Master's Seminar*	1+0
VPL 599	Master's Research	30

*Core Courses

Course Contents
M.V.Sc. in Veterinary Pathology

I. Course Title : General Pathology
II. Course Code : VPL 501
III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with different types of degenerations, cell injuries caused by different types of irritants and inflammation.

V. Theory

Unit I

Introduction and principles of Pathology including genetic basis of disease; Cellular responses to injury: Causes and mechanisms of reversible and irreversible cell injury; Morphologic characteristics, Significance and fate of various intracellular (lipids, glycogen, proteins) and extracellular (hyaline material, amyloid, fibrinoid change, gout) accumulations/ degenerations, Endogenous and exogenous pigmentations, Cell death (necrosis, apoptosis and gangrene), Pathologic calcifications and cellular adaptive changes.

Unit II

Inflammation and repair: Introduction to inflammation, Acute inflammation-cellular and molecular events including mediators and heat shock proteins of acute inflammation; Cellular components, Morphologic classification and outcomes of acute inflammation, Chronic inflammation-causes, Morphologic features and cellular components of chronic inflammation, Healing and repair, Systemic effects of inflammation.

Unit III

Disturbances in circulation: Causes, mechanisms, Morphologic features, Significance and fate of hyperemia, Oedema, Haemorrhage, Thrombosis, Embolism, Ischaemia, infarction and shock.

Unit IV

Immune mediated reactions: Introduction to autoimmunity and immune mediated diseases, mechanisms of hypersensitivity reactions.

VI. Practical

- To study the morphologic descriptions of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions of variety of conditions (degenerations, infiltrations, pigmentations, necrosis, circulatory and growth disturbances and different types of inflammation) in the preserved specimens/ slides. Demonstration of post-mortem changes.
- Continuous assessment of students for their skills in the diagnosis of gross lesions during post-mortem examination of different tissues of domestic animals.

Preparation of histopathology slides on the selected cases followed by interaction in the student seminars/ group discussions.

VII. Suggested Reading

- McGavin MD and Zachary JF. 2017. *Pathologic Basis of Veterinary Diseases*. 6th Ed. Elsevier.
- Vegad JL. 2007. *Text Book of Veterinary General Pathology*. 2nd Ed. International Book Distr.

I. Course Title : Techniques in Pathology

II. Course Code : VPL 502

III. Credit Hours : 0+2

IV. Aim of the course

To acquaint the students with different techniques used frequently in Veterinary Pathology.

V. Practical

- Basic histopathological techniques-Collection of tissues, fixation, processing, section cutting and H and E staining of tissue sections. Collection and fixation of tissues for scanning electron microscopy, transmission electron microscopy, histochemical, toxicological, bacteriological and virological examinations. Application of micrometry and special staining techniques. Demonstration of different inclusions, bacteria and fungi in tissues.
- Principles of dark field, phase contrast and fluorescent microscopy; introduction to scanning electron microscopy and transmission electron microscopy.
- Histochemical techniques for demonstration of fat, glycogen, connective tissue, mucopolysaccharides and common enzymes, pigments and minerals Cryosectioning and application of immunohistochemical techniques–immunoperoxidase and immunofluorescence.
- Principles and applications of PCR and its variants.
- Museum specimen preparation and maintenance.

VI. Suggested Reading

- Culling CFA. 1969. *Handbook of Histological Techniques*. Butterworths.
- Lillie RD. 1965. *Histopathologic Techniques and Practical Histo-chemistry*. 3rd Ed. McGraw-Hill.
- Culling CFA. 2013. *Handbook of Histopathological and Histochemical Techniques: Including Museum Techniques* PDF, eBook (http://mbooknom.men/go/best.php?id=B01DRY52U8)

I. Course Title : Animal Oncology

II. Course Code : VPL-503

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint the students with different types of neoplasms of domestic animals, their nature, cause, pathology and diagnosis.

V. Theory

Unit I

Tumour-Etiology, Carcinogens and oncogenesis, Nomenclature and classification, characteristics of benign and malignant tumours, Molecular mechanisms, Pathways of spread of tumors and tumor immunology

Unit II

Effects of tumour, Grading, Staging and laboratory diagnosis of tumours. Animal tumour models–experimental induction of neoplasms

Unit III

Pathology of different types of epithelial and connective tissue tumours with their characteristic identification features and epidemiology. Commonly encountered tumours of respiratory, haemopoietic, integumentary, musculoskeletal, gastrointestinal, hepatobiliary, uro-genital, nervous, ocular, ear and endocrine system.

VI. Practical

- Cytological diagnosis of tumours via impression smears and Fine Needle Aspiration Cytology.
- To study the gross and microscopic changes in different types of neoplasms.

VII. Suggested Reading

- Meuten DJ. 2016. *Tumors in Domestic Animals*. 5th Ed. Wiley-Blackwell

I. Course Title : Clinical Pathology
II. Course Code : VPL 504
III. Credit Hours : 1+1

IV. Aim of the course

To acquaint the students with clinical alterations in blood, urine, CSF and other body fluids due to different diseases.

V. Theory

Unit I

Study of changes in blood/ plasma/ serum including biochemical profile for organ function tests, Cytological examination and examination of urine, Faeces, Cerebrospinal fluid and biopsy specimens and their interpretation.

VI. Practical

Analysis of clinical samples (blood/ serum/ plasma, urine, faeces, Biopsy samples (exfoliative/ FNAC) including biochemical profile for organ function tests in different disease conditions in animals/ poultry and their interpretations.

VII. Suggested Reading

- Amy C. Valenciano, Rick L. Cowell. 2013. *Cowell and Tyler's Diagnostic Cytology and Hematology of the Dog and Cat*, 4^{th} Ed, Elsevier
- Benzamin MM. 1985. *Outline of Veterinary Clinical Pathology*. 3rd Ed. Ludhiana, Kalyani Publishers.
- Coles EH. 1986. *Veterinary Clinical Pathology*. 4^{th} Ed, WB Saunders.
- Douglas J., Weiss, K and Jane Wardrop. 2010. *Schalm's Veterinary Haematology*, Wiley.

I. Course Title : Necropsy Procedures and Interpretations
II. Course Code : VPL 505
III. Credit Hours : 1+1

IV. Aim of the course

To acquaint the students with necropsy procedures in large and small animals and study of PM lesions in different diseases and to educate the students about common veterolegal problems and technically simple and legal writing of PM reports.

V. Theory

Unit I

General knowledge about the laws relating to veterinary practice, professional discipline and professional etiquettes.

Unit II

Regulations dealing with diseases of animals in India regarding epidemiology, quarantine certificate, issue of soundness certificate, etc.

Unit III

Different manners/ modes of death such as criminal assault, Cruelty to animals, malicious poisoning, Snake bite, Death due to drowning, Lightning strokes during thunderstorms; Veterolegal wounds like electrocution, Gunshot wounds, Automobile accidents, and violent death; Legal implications in animals in above conditions, doping in horses, etc.

VI. Practical

- Detailed necropsy examination of various species of large and small animals including poultry, laboratory animals and wildlife**.** Systematic examination of brain, lungs, heart, endocrine glands, lymph nodes, liver, gastro-intestinal tract, urinary and genital systems for gross pathological and histopathological studies and correlation of the observations to diagnose the disease conditions.
- Necropsy case presentation and report writing/ protocol preparation. Collection, preservation and dispatch of morbid materials for diagnosis of viral, bacterial, protozoan, parasitic diseases, toxic/ poisoning and for histochemistry/ histopathology.

VII. Suggested Reading

- Albert C Strafuss.1988. *Necropsy: Procedures and Basic Diagnostic Methods for Practicing Veterinarians*, Charles C. Thomas Publisher Springfield
- Benjamin Lucio-Martinez and Jodi A Korich. 2010. *Illustrated guide to Poultry Necropsy and diagnosis*, Cornell University (https://www.slideshare.net/heshamkotb/illustrated-guide-to-poultry-necropsy-and-diagnosis)
- D Gopala Krishna Rao. 2005. *Textbook on necropsy and histopathological techniques*, 1st Ed. Academa
- Donald B Feldman and John Curtis Seely. 1988. *Necropsy Guide: Rodents and the Rabbit*, 1st Ed. CRC Press
- Gahlot AK, Sharma SN and Tanwar RA. 2003. *Veterinary Jurisprudence*. 5th Ed. NBS Publishers, Bikaner.
- John M King, David C Dodd and Lois Roth. 2006. *The Necropsy Book,* Fifth Edition, C L Davis Foundation
- Jones TC and Gleiser CA. 1954. *Veterinary Necropsy Procedures*. JB Lippincott
- Lincoln PJ and Thomson J. 1998. *Forensic DNA Profiling Protocols*. Humana Press.
- Majó Masferrer, Natàlia, Dolz Pascual, Roser and Shivaprasad HL. 2011. *Atlas of Avian Necropsy: Macroscopic Diagnosis Sampling,* SERVET Publishers
- Rudin N and Inman K. 2002. *An Introduction to Forensic DNA Analysis*. CRC Press

I. Course Title : Necropsy Conference

II. Course Code : VPL 506

III. Credit Hours : 0+1

IV. Aim of the course

To promote self learning of the students in different necropsy procedures of animals including poultry and description of post-mortem lesions in different diseases/ disease conditions.

V. Practical

- Continuous assessment of students on detailed necropsy examination of various species of large and small animals including poultry; Necropsy associated cytological examinations; Systematic examination of different organs for morphologic description of gross lesions; gross photography; Collection of tissues for histopathology and based on nature of gross lesions, if possible further collection for investigation of viral/ bacterial/ protozoan/ fungal/ parasitic diseases/ toxic or poisoning, etc.
- Morphologic description of microscopic lesions; microscopic photography; correlation of gross and microscopic observations with the results of other parallel investigations to diagnose the disease conditions; presentation of select case(s) in the monthly seminars followed by report writing and final morphologic/ etiologic diagnosis, classification and preservation of microscopic slides.

VI. Suggested Reading

I. Course Title : Systemic Pathology

II. Course Code : VPL 507

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about different disease conditions of haemopoietic, circulatory, respiratory, digestive, urinary and genital systems, nervous, musculoskeletal, endocrine glands and special senses.

V. Theory

Unit I

Advanced study of pathological conditions in relation to their etiology, Pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting cardiovascular (heart, blood vessels and lymph vessels), Respiratory (nasal cavity, Larynx, Trachea, Bronchi, Lungs and pleura) and haemopoietic (bone marrow, blood, spleen, lymph node) systems.

Unit II

Advanced study of pathological conditions in relation to their etiology, Pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting different organs of digestive (buccal cavity, pharynx, oesophagus, stomach and intestines), Urinary (kidneys, ureter, urinary bladder and urethra) and genital (male and female organs including mammary gland) systems.

Unit III

Advanced study of pathological conditions in relation to their etiology, Pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting different organs of nervous (brain and spinal cord), endocrine (pituitary, thyroid, parathyroid, pancreas) musculo-skeletal systems (muscles and bones) and organs of special senses (eye, ear), skin and its appendages (hoof, tail).

VI. Practical

- To study the morphologic description of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions in variety of organs in the preserved specimens/ slides.
- Continuous assessment of students for their skills in the morphologic description of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions in variety of organs during post-mortem examination of domestic animals followed by interaction in the student seminars/ group discussions.

VII. Suggested Reading

- Grant Maxie. 2015. Jubb, Kennedy & Palmer's *Pathology of Domestic Animals*, 6th Ed. Saunders Ltd.
- Vegad JL and Madhu Swamy. 2010. *A text book of Veterinary Systemic Pathology*, 2nd Ed. Publisher IDBC, Lukhnow

I. Course Title : Pathology of Infectious Diseases of Domestic Animals

II. Course Code : VPL 508

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about important infectious disease conditions of domestic animals.

V. Theory

Unit I

Study of etiology, Pathology and pathogenesis of various viral diseases-Foot and mouth disease, Vesicular stomatitis, Vesicular exanthema, Vesicular disease, Rinderpest, Bovine viral diarrhoea-Mucosal disease, Bovine malignant catarrhal fever, Infectious bovine rhinotracheitis, Parainfluenza-3, Bovine respiratory syncytial virus infection, Pox diseases, Blue tongue, Contagious ecthyma, PPR, Rabies, Canine distemper, Parvovirus infections, Infectious canine hepatitis, Pseudorabies, Classical swine fever, Swine and Equine influenza, Equine infectious anaemia, African horse sickness, Equine viral arteritis, Equine viral encephalomyelitis, Equine herpesvirus infections, Papillomatosis, Rift Valley fever, Japanese encephalitis, Ovine encephalomyelitis (Louping ill) and Prion diseases.

Unit II

Study of etiology, pathology and pathogenesis of various bacterial diseases-Tuberculosis, Johne's disease, Actinobacillosis, Actinomycosis, Brucellosis, Listeriosis, Pasteurellosis, Leptospirosis, Anthrax, Clostridial group of diseases, Streptococcal and Staphylococcal infections, Campylobacter infections, Swine erysipelas, Glasser's disease, Foot rot, Colibacillosis and Salmonellosis, Glanders, Melioidosis, Nocardiosis, Cutaneous strepthricosis, Corynebactrium infections, Chlamydial and Mycoplasma infections.

Unit III

Study of etiology, Pathology and pathogenesis of various fungal, Rickettsial and parasitic diseases-Aspergillosis, Blastomycosis, Coccidioidomycosis, Histoplasmosis, Epizootic lymphangitis, Rhinosporidiosis, Sporotrichosis, Candidiasis, Crytococcosis, Dermatomycoses;Diseases due to commonly occurring mycotoxins; Important rickettsial diseases-Q-fever, Heart water disease, Ehrlichiosis, Anaplasmosis, Haemobartonellosis; Important protozoan diseases-Coccidiosis, Toxoplasmosis, Babesiosis, Theilariosis, Cryptosporidiosis, Trypanosomiasis and Pathology of important diseases caused by helminths.

VI. Practical

Morphologic description of lesions based on gross and/ or microscopic lesions and the study of their correlation with a specific disease in the preserved specimens/ slides.

VII. Suggested Reading

- Jones TC, Hunt RD & King NW. 1997. *Veterinary Pathology*. Blackwell Publishing.
- Grant Maxie. 2015. Jubb, Kennedy & Palmer's *Pathology of Domestic Animals*, 6th Ed. Saunders Ltd.
- Gary Procop and Bobbi Pritt. 2014. *Pathology of Infectious Diseases*, 1st Ed. Saunders

I. Course Title : Toxicopathology

II. Course Code : VPL 509

III. Credit Hours : 2+1

IV. Aim of the course

To teach student about toxicity in livestock due to plants and extraneous poisons.

V. Theory

Unit I

Introduction, classification and mode of action of different poisons.

Unit II

Study of pathogenesis, symptoms, gross and microscopic pathology of diseases caused by toxic plants, Organic and inorganic poisons commonly taken or administered maliciously to different species of domestic animals.

Unit III

Various regulatory bodies and regulatory processes, Protocols in conducting toxicopathological trials; Chronology for conducting preclinical toxicology. OECD-

Good Laboratory Practices, Toxicopathological profile including battery of tests for pharmaceutical/ toxic agents.

Unit IV

In-vitro and *In vivo* models for toxicity studies and evaluation parameters.

VI. Practical

- To study gross and histopathological alterations as a result of ingestion of toxic plants and extraneous poisons in domestic animals.
- Assignments on commonly occurring toxic plants of the region; Diagnosis of commonly taken or maliciously administered poisonous substances.

VII. Suggested Reading

- Jones TC, Hunt RD and King NW. 1997. *Veterinary Pathology*. Blackwell Publishing.

I. Course Title : Avian Pathology

II. Course Code : VPL 510

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about the different disease conditions of poultry.

V. Theory

Unit I

Avian inflammation and immunology, Study of etio-pathology, symptoms, transmission, and diagnosis of infectious diseases of chickens, turkeys, ducks and other birds caused by Bacteria: Salmonella, *Escherichia coli* and Clostridial infections, Infectious coryza, Fowl cholera, Tuberculosis and Spirochaetosis; Chlamydial and Mycoplasmal infections; Viruses: Ranikhet disease, Infectious bursal disease, Infectious bronchitis, Infectious laryngotracheitis, Marek's disease, Leukorsarcoma group of diseases, Reticuloendotheliosis, Fowl pox, Avian influenza, Avian encephalomyelitis, Inclusion body hepatitis, Hydropericardium syndrome, Egg drop syndrome-76, Chicken infectious anaemia, Avian nephritis, Reovirus infections- Viral arthritis and Infectious stunting syndrome, Duck plague, Duck viral hepatitis, Coronaviral enteritis and Haemorrhagic enteritis of turkeys: Fungi and mycotoxins; Parasites-Coccidiosis, Histomoniasis, Round worm and Tape worm infections; Ecto-parasites of birds.

Unit II

Study of etio-pathology, clinical symptoms, and diagnosis of nutritional deficiencies - Vitamin and Mineral deficiencies; Metabolic diseases-Ascites, Gout, Fatty liver and kidney syndrome, Fatty liver haemorrhagic syndrome, Cage layer fatigue, etc.; Miscellaneous conditions of poultry-Heat stress, Blue comb, Breast blister, Bumble foot, Cannibalism, False layer, Internal layer, Pendulous crop, Round heart disease etc.

Unit III

Emerging and re-emerging diseases of poultry: Introduction to an emerging and a re-emerging pathogen, mechanisms of poultry pathogen's emergence, co-evolution of poultry pathogens with their vaccines and medications, common diseases of poultry susceptible to point mutations and their pathology.

VI. Practical

- Necropsy examination of the different species of poultry; morphologic description of gross and/ or microscopic lesions in the preserved specimens/ slides.
- Continuous assessment of students for their skills in the diagnosis of gross lesions in different organs of various systems during post-mortem examination of poultry. Preparation of histopathology slides on the select cases followed by interaction in the student seminars/ group discussions.

VII. Suggested Reading

- Saif YM, Barnes FJ, Glisson JR, Fadly AM, Mc Dougald LR & Swayne D. 2008. *Diseases of Poultry*. 12th Ed. Blackwell Publishing.
- Randall CJ. 1984. *A Colour Atlas of Diseases of the Domestic Fowl and Turkey,* Mosby International.
- Majó Masferrer, Natàlia, Dolz Pascual, Roser and Shivaprasad HL. 2011. *Atlas of Avian Necropsy: Macroscopic Diagnosis Sampling*, SERVET Publishers.
- Benjamin Lucio-Martinez and Jodi A Korich. 2010. *Illustrated guide to Poultry Necropsy and diagnosis*, Cornell University (https://www.slideshare.net/heshamkotb/illustrated-guide-to-poultry-necropsy-and-diagnosis)

I. Course Title : Pathology of Wild/ Zoo and Aquatic Animal Diseases

II. Course Code : VPL 511

III. Credit Hours : 2+1

IV. Aim of the course

To teach the pathology and diagnosis of different disease conditions of wild and aquatic animals particularly fish.

V. Theory

Unit I: Wild/ Zoo Animal diseases

Etiology, transmission, gross and microscopic pathology of some commonly occurring infectious diseases of wild animals: West Nile fever, Rabies, Foot and mouth disease, Pox, Kyasanaur forest disease, Infectious hepatitis virus, Infectious feline peritonitis, Anthrax, Tuberculosis, Colibacillosis, Clostridial infections Trypanosomosis, Babesiosis, Theileriosis; Etiology, gross and microscopic pathology of commonly occurring non-infectious diseases of Wild/ Zoo animals.

Unit II: Infectious diseases of fish

Study of etiology, gross and microscopic pathology of Bacterial diseases- Bacterial cold water disease, Bacterial fin disease, Fill rot, Furunculosis, Aeromonas septicemia, Epizootic ulcerative syndrome, Yersiniosis, Pseudomoniasis, Alteromoniasis, Pasteurellosis, Enteric septicemia of catfish, Edwardsiellosis, Vibriosis, Streptococcosis, Bacterial kidney disease, Mycobacteriosis, Nocardiosis, Epitheliocystis: Salmonid rickettsialsepticaemia, Columnaris disease; Viral diseases-Spring viremia of carp, Infectious pancreatic necrosis, Viral hemorrhagic septicaemia, Koi herpes virus disease, Infectious spleen and kidney necrosis, Carp pox, Virus nervous necrosis, Lymphocystis disease, Infectious salmon anemia, Salmon alpha virus infections, Infectious hematopoietic necrosis, Herpes viral hematopoeitic necrosis, Chinese grass carp reovirusdisease, Viral hemorrhagic necrosis, Epizootic hemorrhagic necrosis; Fungal diseases- Saprolegniasis, Branchiomycosis (Gill rot), Ichthyosporidiosis, Exophiala infection, Aphanomyces and Fusarium infection; Parasitic and Protozoal diseases-Ich or White spot disease, Costiasis, Trichodiniasis, Velvet disease, Coral fish disease, Epistylis, Red sore disease, Glossatella, Myxosporidiosis, Whirling disease, Microsporidiosis (Glugea, Pleistophora, Loma), Coccidiosis, Proliferative kidney disease, Cryptosporidiosis.

Unit III: Other diseases of Fish

Nutritional diseases-Nutritional deficiency of protein, lipid, carbohydrate, vitamins and minerals; Neoplastic conditions- Melanoma in Platyfish/ Swordtail hybrids, Hepatoma and hepatocellular carcinoma in rainbow trout, Stomatopapilloma of eels (Cauliflower disease), Papilloma of the brown bullhead, Lip Fibroma (Fibropapilloma) of Angel fish, Dermal fibrosarcomas of walleye pike, Lymphosarcoma of pike, Schwannoma/ Neurofibromas of the bicoloured damselfish; Environmental stress-Gas bubble disease, Acidosis/ Alkalosis, Thermal shock, Sun burn disease, Anoxia, Increased in dissolved CO_2 or H_2S or Ammonia concentration in water, Increased in turbidity of pond water, Algal toxicosis disease.

VI. Practical

Post-mortem examination of wild animals including wild birds. Study of gross and microscopic lesions of important infectious and non-infectious diseases of fish and wild animals

VII. Suggested Reading

- Arora BM. 1984. *Wildlife Diseases in India*. Periodical Expert Book Agency.
- Fowler ME. 1978. *Zoo and Wild Animal Medicine.* WB Saunders. Roberts RJ. 1979. *Fish Pathology*. Bailliere Tindall, London

I. Course Title : Pathology of Laboratory Animal Diseases

II. Course Code : VPL 512

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about pathology and diagnosis of different disease conditions of laboratory animals.

V. Theory

Unit I

Etiology, transmission, gross and microscopic pathology of some commonly occurring diseases of Rabbits: Pasteurellosis, Bordetellosis, Colibacillosis, Tyzzer’s disease, Staphyloccal infections, Venereal spirochetosis, (rabbit syphilis, cuniculosis), Proliferative ileotyphilitis, Salmonellosis, Tularemia, Clostridium infections, Myxomatosis, Rabbit fibroma/ shope fibroma, Rabbit papillomatosis, Viral hemorrhagic disease, Coccidiosis, Enephalotozoonoses, Baylisascarisprocyonis, Cestode, Mites, Fleas and lice, miscellaneous and neoplastic diseases of rabbits.

Unit II

Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Rats: Bacterial diseases-Staphylococcal dermatitis, Pasteurellosis, Streptococcal diseases, Helicobacter infection, CAR bacillus, Mycoplasma pulmonis, Pseudotuberculosis (corynobacteriosis), Tyzzers disease, Salmonellosis, Rat bite fever; Viral diseases- Rat theilo virus (RTV-1), Parvovirus, coronavirus, pneumonia virus of mice, Hantaan virus, Sendai virus, Reovirus-3, Protozoan diseases

(Trichomonads, Chilomastixbettencorti, Spironucleusmuris, Giardia muris, Rat sarcodines, Rat enteric coccidian), Arthropods (Mesostigmated mites, lice of rats), Helminths (rat pinworms, Hymenolepid tapeworm, Cestodes with a rat intermediate host, rat threadworms); fungal disease (*Pneumocystis carinii*), other miscellaneous and neoplastic diseases

Unit III

Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Mice: Bacterial diseases- Helicobacter infection, Pasteurellosis, Staphylococcal furunculosis, *Mycoplasma pulmonis*, Cilia associated respiratory bacillus, *Corynebacterium bovis*, *Pseudomonas aeruginosa*, *Citrobacter rodentium*, Tyzzer's disease, Salmonellosis; Viral diseases- Mouse norovirus, Mouse hepatitis virus, Mouse encephalomyelitis virus, Epizootic diarrhoea of infant mice, Parvovirus, Murine cytomegalovirus, Mouse adenovirus, Ectromelia virus, Lymphocytic choriomengitis virus, Pneumonia virus of mice, Lactate dehydrogenase elevating virus, Sendai virus, Mouse thymic virus, Mouse polyoma viruses, Reo-3 virus; Parasitic diseases-Pin worms, Fur mites of mice, Mange mites, Mesostigmatid mites, Lice of mice, Trichomonads, *Chilomastixbettencorti*, *Spironucleusmuris*, *Giardia muris,* Mouse sarcodines, Mouse enteric coccidian, Mouse parentral coccidian, Mouse sporozoans, Hymenolepid tapeworms, Encysted tape worm; Fungal disease (*Pneumocystis* pneumonia) and other miscellaneous and neoplastic diseases

Unit IV

Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Guinea pigs: Bacterial diseases- Antibiotic-induced enterotoxemia/ haemorrhagic typhlitis, *Bordetella* pneumonia, Streptococcal pneumonia, Cervical lymphadenitis, Pododermatitis, Mastitis, Tyzzer's disease, Salmonellosis; Viral diseases- Guinea pig cytomegalovirus, Adenovirus, Parainfluenza virus, Corona-like virus, Lymphocytic choriomeningitis virus; Parasitic diseases- Coccidia, Fur mites, Helminthes, Lice of guinea pigs, Mange mites, Cryptosporidiosis, Microsporidium parasites and other miscellaneous conditions

Unit V

Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Hamsters, Gerbills and primates

VI. Practical

Post-mortem examination of laboratory animals. Study of gross and microscopic lesions of important infectious and non-infectious diseases of laboratory animals

VII. Suggested Reading

- Beninchka K, Garner FM and Jones TC. 1978. *Pathology of Laboratory Animals.* Vols. I, II. Springer Verlag.

Course Outline-cum-Lecture Schedule for Master Degree Programme

I. Course Title : General Pathology
II. Course Code : VPL 501
III. Credit hours : 2+1

IV. Aim of the course

To acquaint the students with different types of degenerations, cell injuries caused by different types of irritants and inflammation

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction and principles of Pathology including genetic basis of disease	3
2.	Cellular responses to injury: Causes and mechanisms of reversible and irreversible cell injury; morphologic characteristics, significance and fate of various intracellular (lipids, glycogen, proteins) and extracellular (hyaline material, amyloid, fibrinoid change, gout) accumulations/ degenerations, endogenous and exogenous pigmentations, cell death (necrosis and apoptosis), pathologic calcifications and cellular adaptive changes	9
3.	Inflammation and repair: Introduction to inflammation, acute inflammation-cellular and molecular events including mediators and heat shock proteins of acute inflammation; cellular components, morphologic classification and outcomes of acute inflammation	5
4.	Chronic inflammation-causes, morphologic features and cellular components of chronic inflammation, healing and repair, systemic effects of inflammation	5
5.	Disturbances in circulation: Causes, mechanisms, morphologic features, significance and fate of hyperemia, oedema, haemorrhage, thrombosis, embolism, ischaemia, infarction and shock	6
6.	Immune mediated reactions: Introduction to autoimmunity and immune mediated diseases, mechanisms of hypersensitivity reactions.	4
Practical		
1.	To study the morphologic descriptions of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions of variety of conditions (degenerations, infiltrations, pigmentations, necrosis, circulatory and growth disturbances and different types of inflammation) in the preserved specimens/ slides.	6
2.	Demonstration of post-mortem changes.	2
3.	Continuous assessment of students for their skills in the diagnosis of gross lesions during post-mortem examination of different tissues of domestic animals.	4

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
4.	Preparation of histopathology slides on the select cases followed by interaction in the student seminars/ group discussions.	4

I. Course Title : Techniques in Pathology

II. Course Code : VPL 502

III. Credit hours : 0+2

IV. Aim of the course

To acquaint the students with different techniques used frequently in Veterinary Pathology

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practical		
1.	Basic histopathological techniques-Collection of tissues, fixation, processing, section cutting and H and E staining of tissue sections. Collection and fixation of tissues for scanning electron microscopy, transmission electron microscopy, histochemical, toxicological, bacteriological and virological examinations. Application of micrometryand special staining techniques. Demonstration of different inclusions, bacteria and fungi in tissues	10
2.	Principles of dark field, phase contrast and fluorescent microscopy; introduction to scanning electron microscopy and transmission electron microscopy	5
3.	Histochemical techniques for demonstration of fat, glycogen, connective tissue, mucopolysaccharides and common enzymes, pigments and minerals	7
4.	Cryosectioning and application of immunohistochemical techniques–immunoperoxidase and immunofluorescence	3
5.	Principles and applications of PCR and its variants	2
6.	Museum specimen preparation and maintenance	5

I. Course Title : Animal Oncology

II. Course Code : VPL 503

III. Credit hours : 1+1

IV. Aim of the course

To acquaint the students with different types of neoplasms of domestic animals, their nature, cause, pathology and diagnosis.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Tumour-Etiology, carcinogens and oncogenesis, nomenclature and classification, characteristics of benign and malignant tumours, molecular mechanisms, pathways of spread of tumors and tumor immunology	4
2.	Effects of tumour, grading and staging and laboratory diagnosis of tumours. Animal tumour models–experimental induction of neoplasms	4
3.	Pathology of different types of epithelial and connective tissue tumours with their characteristic identification features and epidemiology	2
4.	Tumours of respiratory, haemopoietic, integumentary, musculoskeletal, gastrointestinal, hepatobiliary, uro-genital, nervous, ocular, ear and endocrine system	6
Practical		
1.	Cytological diagnosis of tumours via impression smears and Fine Needle Aspiration Cytology.	8
2.	To study the gross and microscopic changes in different types of neoplasms.	8

I. Course Title : Clinical Pathology

II. Course Code : VPL 504

III. Credit hours : 1 + 1

IV. Aim of the course

To acquaint the students with clinical alterations in blood, urine, CSF and other body fluids due to different diseases.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Study of changes in blood/ plasma/ serum including biochemical profile for organ function tests	8
2.	Cytological examination and examination of urine, faeces, cerebrospinal fluid and biopsy specimens and their interpretation	8
Practical		
1.	Analysis of clinical samples (blood/ serum/ plasma) and their interpretations	4
2.	Analysis of clinical samples (urine) and their interpretations	2
3.	Analysis of clinical samples (faeces) and their interpretations	2
4.	Analysis of biopsy samples (exfoliative/ FNAC) and their interpretations	4
5.	Analysis of biochemical profile for organ function tests in different disease conditions in animals	4

I. Course Title : Necropsy Procedures and Interpretations

II. Course Code : VPL 505

III. Credit hours : 0+1

IV. Aim of the course

To acquaint the students with necropsy procedures in large and small animals and study of PM lesions in different diseases.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practical		
1.	Detailed necropsy examination of various species of large and small animals including poultry, laboratory animals and wildlife.	4
2.	Systematic examination of brain, lungs, heart, endocrine glands, lymph nodes, liver, gastro-intestinal tract, urinary and genital systems for gross pathological and histopathological studies and correlation of the observations to diagnose the disease conditions.	8
3.	Necropsy case presentation and report writing/ protocol preparation. Collection, preservation and dispatch of morbid materials for diagnosis of viral, bacterial, protozoan, parasitic diseases, toxic/ poisoning and for histochemistry/ histopathology.	4

I. Course Title : Necropsy Conference

II. Course Code : VPL 506

III. Credit hours : 0 + 1

IV. Aim of the course

To promote self-learning of the students in different necropsy procedures of animals including poultry and description of post-mortem lesions in different diseases/ disease conditions.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practical		
1.	Continuous assessment of students on detailed necropsy examination of various species of large and small animals including poultry; necropsy associated cytological examinations; systematic examination of different organs for morphologic description of gross lesions; gross photography; collection of tissues for histopathology and based on nature of gross lesions, if possible further collection for investigation of viral/ bacterial/ protozoan/ fungal/ parasitic diseases/ toxic or poisoning, etc.	8
2.	Morphologic description of microscopic lesions; microscopic photography; correlation of gross and microscopic observations with the results of other parallel investigations to diagnose the disease conditions; presentation of select case(s) in the monthly	

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
	seminars followed by report writing and final morphologic/ etiologic diagnosis, classification and preservation of microscopic slides.	8

I. Course Title : Systemic Pathology

II. Course Code : VPL 507

III. Credit hours : 2 + 1

IV. Aim of the course

To teach the students about different disease conditions of haemopoitic, circulatory, respiratory, digestive, urinary and genital systems, nervous, musculoskeletal, endocrine glands and special senses.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Advanced study of pathological conditions in relation to their etiology, pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting cardiovascular (heart, blood vessels and lymph vessels) and respiratory (nasal cavity, larynx, trachea, bronchi, lungs and pleura).	8
2.	Advanced study of pathological conditions in relation to their etiology, pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting digestive (buccal cavity, pharynx, oesophagus, stomach and intestines) and haemopoietic (bone marrow, blood, spleen, lymph node) systems.	8
3.	Advanced study of pathological conditions in relation to their etiology, pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting urinary (kidneys, ureter, urinary bladder and urethra) and genital (male and female organs including mammary gland) systems.	8
4.	Advanced study of pathological conditions in relation to their etiology, pathology and pathogenesis including examples of specific infectious or non-infectious diseases affecting nervous (brain and spinal cord), endocrine (pituitary, thyroid, parathyroid, pancreas) musculo-skeletal systems (muscles and bones) and organs of special senses (eye, ear), skin and its appendages (hoof, tail).	8
Practical		
1.	To study the morphologic description of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions in variety of organs in the preserved specimens/ slides.	8
2.	Continuous assessment of students for their skills in the morphologic description of lesions and nomenclature of a morphologic diagnosis based on gross and/ or microscopic lesions in variety of organs during post-mortem examination of domestic animals followed by interaction in the student seminars/ group discussions.	8

I. Course Title : Pathology of infectious diseases of domestic animals

II. Course Code : VPL 508

III. Credit hours : 2 + 1

IV. Aim of the course

To teach the students about important infectious disease conditions of domestic animals.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Study of etiology, pathology and pathogenesis of various viral diseases- Foot and mouth disease, Vesicular stomatitis, Vesicular exanthema, Vesicular disease, Rinderpest, Bovine viral diarrhoea-Mucosal disease, Bovine malignant catarrhal fever, Infectious bovine rhinotracheitis, Parainfluenza-3, Bovine respiratory syncytial virus infection, Pox diseases, Blue tongue, Contagious ecthyma, PPR	7
2.	Study of etiology, pathology and pathogenesis of various viral diseases- Rabies, Canine distemper, Parvovirus infections, Infectious canine hepatitis, Pseudorabies, Classical swine fever, Swine and Equine influenza, Equine infectious anaemia, African horse sickness, Equine viral arteritis, Equine viral encephalomyelitis, Equine herpesvirus infections, Papillomatosis, Rift Valley fever, Japanese encephalitis, Ovine encephalomyelitis (Louping ill) and Prion diseases.	5
3.	Study of etiology, pathology and pathogenesis of various bacterial diseases- Tuberculosis, Johne's disease, Actinobacillosis, Actinomycosis, Brucellosis, Listeriosis, Pasteurellosis, Leptospirosis, Anthrax, Clostridial group of diseases, Streptococcal and Staphylococcal infections.	5
4.	Study of etiology, pathology and pathogenesis of various bacterial diseases- Campylobacter infections, Swine erysipelas, Glasser's disease, Foot rot, Colibacillosis and Salmonellosis, Glanders, Melioidosis, Nocardiosis, Cutaneous strepthricosis, Corynebactrium infections, Chlamydial and Mycoplasma infections.	5
5.	Study of etiology, pathology and pathogenesis of various fungal diseases-Aspergillosis, Blastomycosis, Coccidioidomycosis, Histoplasmosis, Epizootic lymphangitis, Rhinosporidiosis, Sporotrichosis, Candidiasis, Crytococcosis, Dermatomycoses; Diseases due to commonly occurring mycotoxins	5
6.	Important rickettsial diseases- Q-fever, Heart water disease, Ehrlichiosis, Anaplasmosis, Haemobartonellosis; Important protozoan diseases-Coccidiosis, Toxoplasmosis, Babesiosis, Theilariosis, Cryptosporidiosis, Trypanosomiasis and Pathology of important diseases caused by helminthes	5
Practical		
1.	Morphologic description of lesions based on gross and/ or microscopic lesions and the study of their correlation with a specific disease in the preserved specimens/ slides.	16

I. Course Title : Toxicopathology
II. Course Code : VPL 509
III. Credit Hours : 2 + 1

IV. Aim of the course

To teach student about toxicity in livestock due to plants and extraneouspoisons.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction, classification and mode of action of different poisons.	4
2.	Study of pathogenesis, symptoms, gross and microscopic pathology of diseases caused by toxic plants, organic and inorganic poisons commonly taken or administered maliciously to different species of domestic animals	12
3.	Various regulatory bodies and regulatory processes, porticos in conducting toxicopathological trials. Chronology for conducting preclinical toxicology. OECD-Good Laboratory Practices, toxicopathological profile including battery of tests for pharmaceutical/ toxic agents	8
4.	*In-vitro* and *in-vivo* models for toxicity studies and evaluation parameters	8
Practical		
1.	To study gross and histopathological alterations as a result of ingestion of toxic plants and extraneous poisons in domestic animals.	8
2.	Assignments on commonly occurring toxic plants of the region; Diagnosis of commonly taken or maliciously administered poisonous substances.	8

I. Course Title : Avian Pathology
II. Course Code : VPL 510
III. Credit hours : 2 + 1

IV. Aim of the course

To teach the students about the different disease conditions of poultry.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Avian inflammation and immunology, Study of etio-pathology, symptoms, transmission, and diagnosis of infectious diseases of chickens, turkeys, ducks and other birds caused by Viruses: Ranikhet disease, Infectious bursal disease, Infectious bronchitis, Infectious laryngotracheitis, Marek's disease, Leukorsarcoma group of diseases, Reticuloendotheliosis, Fowl pox, Avian influenza, Avian encephalomyelitis, Inclusion body hepatitis, Hydropericardium syndrome, Egg drop syndrome-76, Chicken infectious anaemia, Avian nephritis,	

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
	Reovirus infections- Viral arthritis and Infectious stunting syndrome, Duck plague, Duck viral hepatitis, Coronaviral enteritis and Haemorrhagic enteritis of turkeys	12
2.	Study of etio-pathology, symptoms, transmission, and diagnosis of infectious diseases of chickens, turkeys, ducks and other birds caused by Bacteria: *Salmonella*, *Escherichia coli* and Clostridial infections, Infectious coryza, Fowl cholera, Tuberculosis and Spirochaetosis; Chlamydial and Mycoplasmal infections; Fungi and mycotoxins; Parasites-Coccidiosis, Histomoniasis, Round worm and Tape worm infections; Ecto-parasites of birds	10

I Course Title : Pathology of Wild/ Zoo and Aquatic Animal Diseases

II. Course Code : VPL 511

III. Credit hours : 2 + 1

IV. Aim of the course

To teach the pathology and diagnosis of different disease conditions of wild and aquatic animals particularly fish

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Wild/ Zoo Animal diseases: Etiology, transmission, gross and microscopic pathology of commonly occurring infectious diseases of wild animals: West Nile fever, Rabies, Foot and mouth disease, Pox,	

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
	Kyasanaur forest disease, Infectious hepatitis virus, Infectious feline peritonitis, Anthrax, Tuberculosis, Colibacillosis, Clostridial infections Trypanosomosis, Babesiosis, Theileriosis; Etiology, gross and microscopic pathology of commonly occurring non-infectious diseases of Wild/ Zoo animals.	7
2.	Infectious diseases of Fish: Study of etiology, gross and microscopic pathology of Viral diseases-Spring viremia of carp, Infectious pancreatic necrosis, Viral hemorrhagic septicaemia, Koi herpes virus disease, Infectious spleen and kidney necrosis, Carp pox, Virus nervous necrosis, Lymphocystis disease, Infectious salmon anemia, Salmon alpha virus infections, Infectious hematopoietic necrosis, Herpes viral hematopoeitic necrosis, Chinese grass carp reovirus disease, Viral hemorrhagic necrosis, Epizootic hemorrhagic necrosis; Fungal diseases- Saprolegniasis, Branchiomycosis (Gill rot), Ichthyosporidiosis, Exophiala infection, Aphanomyces and Fusarium infection.	7
3.	Infectious diseases of Fish: Study of etiology, gross and microscopic pathology of Bacterial diseases- Bacterial cold water disease, Bacterial fin disease, Fill rot, Furunculosis, Aeromonas septicemia, Epizootic ulcerative syndrome, Yersiniosis, Pseudomoniasis, Alteromoniasis, Pasteurellosis, Enteric septicemia of catfish, Edwardsiellosis, Vibriosis, Streptococcosis, Bacterial kidney disease, Mycobacteriosis, Nocardiosis, Epitheliocystis: Salmonidrickettsialsepticaemia, Columnaris disease; Parasitic and Protozoal diseases-Ich or White spot disease, Costiasis, Trichodiniasis, Velvet disease, Coral fish disease, Epistylis, Red sore disease, Glossatella, Myxosporidiosis, Whirling disease, Microsporidiosis (Glugea, Pleistophora, Loma), Coccidiosis, Proliferative kidney disease, Cryptosporidiosis.	6
4.	Other diseases of Fish: Nutritional diseases- Neoplastic conditions- Melanoma in Platyfish/ Swordtail hybrids, Hepatoma and hepatocellular carcinoma in rainbow trout, Stomatopapilloma of eels (Cauliflower disease), Papilloma of the brown bullhead, Lip Fibroma (Fibropapilloma) of Angel fish, Dermal fibrosarcomas of walleye pike, Lymphosarcoma of pike, Schwannoma/ Neurofibromas of the bicoloured damselfish.	6
5.	Other diseases of Fish: Nutritional diseases- Nutritional deficiency of protein, lipid, carbohydrate, vitamins and minerals; Environmental stress- Gas bubble disease, Acidosis/ Alkalosis, Thermal shock, Sun burn disease, Anoxia, Increased in dissolved CO_2 or H_2S or Ammonia concentration in water, Increased in turbidity of pond water, Algal toxicosis disease.	6
Practical		
1.	Post-mortem examination of wild animals including wild birds. Study of gross and microscopic lesions of important infectious and non-infectious diseases of fish and wild animals.	16

I. Course Title : Pathology of Laboratory Animal Diseases

II. Course Code : VPL 512

III. Credit hours : 2 + 1

IV. Aim of the course

To teach the students about pathology and diagnosis of different disease conditions of laboratory animals.

Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Etiology, transmission, gross and microscopic pathology of some commonly occurring diseases of Rabbits: Pasteurellosis, Bordetellosis, Colibacillosis, Tyzzer's disease, Staphyloccal infections, Venereal spirochetosis, (rabbit syphilis, cuniculosis), Proliferative ileotyphilitis, Salmonellosis, Tularemia, Clostridium infections, Myxomatosis, Rabbit fibroma/ shope fibroma, Rabbit papillomatosis, Viral hemorrhagic disease, Coccidiosis, Enephalotozoonoses, Baylisascarisprocyonis, Cestode, Mites, Fleas and lice, miscellaneous and neoplastic diseases of rabbits	5
2.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Rats: Bacterial diseases-Staphylococcal dermatitis, Pasteurellosis, Streptococcal diseases, Helicobacter infection, CAR bacillus, Mycoplasma pulmonis, Pseudotuberculosis (corynobacteriosis), Tyzzers disease, Salmonellosis, Rat bite fever; Protozoan diseases (Trichomonads, *Chilomastix bettencorti*, Spironucleusmuris, Giardia muris, Rat sarcodines, Rat enteric coccidian), Arthropods (Mesostigmated mites, lice of rats), Helminths (rat pinworms, Hymenolepid tapeworm, Cestodes with a rat intermediate host, rat threadworms).	5
3.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Rats: Viral diseases- Rat theilo virus (RTV-1), Parvovirus, coronavirus, pneumonia virus of mice, Hantaan virus, Sendai virus, Reovirus-3 fungal disease (*Pneumocystis carinii*), other miscellaneous and neoplastic diseases	5
4.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Mice: Bacterial diseases- Helicobacter infection, Pasteurellosis, Staphylococcal furunculosis, *Mycoplasma pulmonis*, Cilia associated respiratory bacillus, *Corynebacterium bovis*, *Pseudomonas aeruginosa*, Citrobacter rodentium, Tyzzer's disease, Salmonellosis; Parasitic diseases-Pin worms, Fur mites of mice, Mange mites, Mesostigmatid mites, Lice of mice, Trichomonads, *Chilomastix bettencorti*, *Spironucleus muris*, *Giardia muris,* Mouse sarcodines, Mouse enteric coccidian, Mouse parentral coccidian, Mouse sporozoans, Hymenolepid tapeworms, Encysted tape worm	5
5.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Mice: Viral diseases- Mouse norovirus, Mouse hepatitis virus, Mouse encephalomyelitis virus, Epizootic diarrhoea of infant mice, Parvovirus, Murine cytomegalovirus, Mouse adenovirus, Ectromelia virus, Lymphocytic choriomengitis virus, Pneumonia virus of mice, Lactate dehydrogenase elevating virus,	

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
	Sendai virus, Mouse thymic virus, Mouse polyoma viruses, Reo-3 virus; Fungal disease (*Pneumocystis* pneumonia) and other miscellaneous and neoplastic diseases	5
6.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Guinea pigs: Bacterial diseases- Antibiotic-induced enterotoxemia/ haemorrhagic typhlitis, *Bordetella* pneumonia, Streptococcal pneumonia, Cervical lymphadenitis, Pododermatitis, Mastitis, Tyzzer's disease, Salmonellosis; Viral diseases- Guinea pig cytomegalovirus, Adenovirus, Parainfluenza virus, Corona-like virus, Lymphocytic choriomeningitis virus; Parasitic diseases- Coccidia, Fur mites, Helminthes, Lice of guinea pigs, Mange mites, Cryptosporidiosis, Microsporidium parasites and other miscellaneous conditions	5
7.	Etiology, transmission, gross and microscopic pathology of commonly occurring diseases of Hamsters, Gerbills and primates	2
Practical		
1.	Post-mortem examination of laboratory animals. Study of gross and microscopic lesions of important infectious and non-infectious diseases of laboratory animals.	16

Course Title with Credit Load
Ph.D. in Veterinary Pathology (VPL)

Course Code	Course Title	Credit Hours
VPL 601	Molecular and Ultrastructural Basis of Cell Injury*	2+1
VPL 602	Molecular Basis of Inflammation	1+1
VPL 603	Molecular Basis of Neoplasia	1+1
VPL 604	Immunopathology*	2+1
VPL 605	Advances in Diagnostic Pathology	1+2
VPL 606	Pathology of Nutritional and Metabolic Disturbances	2+1
VPL 607	Pathology of Important Emerging and Re-Emerging Diseases of Pets and Livestock	2+1
VPL 608	Research Methodology in Pathology*	1+0
VPL 609	Necropsy Conference I*	0+1
VPL 690	Special Problem	0+1
VPL 691	Doctoral Seminar-I*	1+0
VPL 692	Doctoral Seminar-II*	1+0
VPL 699	Doctoral Research	75

*Core courses

Course Contents
Ph.D. in Veterinary Pathology (VPL)

I. Course Title : Molecular and Ultrastructural Basis of Cell Injury
II. Course Code : VPL 601
III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about different molecular including ultrastructural changes in diseases conditions.

V. Theory

Unit I

Study of cells- cell morphology, interpretation of normal and abnormal cells.

Unit II

Overview of Cell injury, Targets of cell injury-Cell membranes, Aerobic respiration, structural proteins and enzymes and genetic apparatus of the cell; Mechanisms of cell injury-hypoxia, Injury by free radicals, Chemical injury, Infectious agents, other forms of cell injury-immune mediated reactions, Genetic derangements; Mechanisms of cell membrane damage; Mechanisms of DNA damage-base loss, Base modification, chemical modification, Replication errors, Inter-strand cross-links, DNA-protein cross-links, Strand breaks. Molecular and immunopathological changes associated with different types of cell injuries.

Unit III

Morphology of Reversible and irreversible cell injury with particular emphasis on ultra structural changes in the cells and organelles: Morphology of cell death-necrosis, Apoptosis and autolysis, Mechanism of apoptosis, Intracellular and extracellular accumulations, Pigment and tissue deposits, Consequences of cell injury Cellular adaptations-hyperplasia, Hypertrophy, Atrophy, Metaplasia and dysplasia.

Unit IV

Mechanism of other types of cell death, viz., Pyroptosis, Ferroptosis, Autophagy, ETOSIS, etc.

VI. Practical

Collection and preparation of specimens for electron microscopic studies. Interpretation of ultra-structural changes and their correlation with gross and histopathological findings

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Molecular Basis of Inflammation

II. Course Code : VPL 602

III. Credit Hours : 1+1

IV. Aim of the course

To teach the students about molecular mechanisms of inflammations.

V. Theory

Unit I

Cellular, molecular and immunopathological changes associated with different types of inflammation. Acute inflammation, Vascular events of acute inflammation, Cellular events in acute inflammation, Leucocyte-endothelial interactions, Leucocyte adhesion molecules, Endothelial adhesion molecule receptors, Leucocyte chemotactic factors, Microbicidal activity of leucocytes, Leucocyte activation.

Unit II

Plasma derived mediators of inflammation-Complement system, Kinin system, Coagulation system and Fibrinolytic system; Cell derived mediators of inflammation-vasoactive amines, lipid mediators, cytokines, chemokines, oxygen radicals and nitric oxide, Cellular components of inflammation, types of exudative inflammation.

Unit III

Chronic inflammation and its types, Elements of chronic inflammation, Healing and repair, Wound healing mediators and their functions, Repair of bone, Repair of nervous tissue and myocardium.

VI. Practical

Molecular alterations and their correlation with gross and microscopic inflammatory changes

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Molecular Basis of Neoplasia

II. Course Code : VPL 603

III. Credit Hours : 1+1

IV. Aim of the course

To teach the students about molecular mechanisms of neoplasia and diagnostic techniques.

V. Theory

Unit I

Tumour characteristics, differentiation and proliferation, molecular basis of cancer, tumour stromal interaction, molecular mechanisms of invasion and metastasis of tumours, molecular changes underlying tumour progression and heterogeneity, tumour biology and growth.

Unit II

Tumour genetics, immunohistochemical/ including markers associated tumour diagnosis.

Unit III

Application of cytological, histopathological, immunohistochemical and molecular techniques in diagnosis and prognosis of various tumour conditions.

VI. Suggested Reading

- Selected articles from journals.

I. Course Title : Immunopathology
II. Course Code : VPL 604
III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about immune mediated and autoimmune diseases of animals.

V. Theory

Unit I

Principles of immunopathology, Etiopathology of hypersensitivity reactions and immune complex diseases; Autoimmunity, mechanisms of autoimmunity, Genetic, microbial and environmental factors in autoimmunity.

Unit II

Study of etiology, pathology and pathogenesis of commonly encountered Immunoproliferative disorders (Multiple myeloma, lymphoma, leukemia), Hypersensitivity diseases, Autoimmune diseases and immune deficiencies in domestic animals.

VI. Practical

Immune complexes-quantification and determination by various techniques, Enumeration of various populations of lymphocytes by different techniques, Determination of C3 levels, Autoimmune reaction by demonstrating auto-antibodies, Gross and microscopic pathology of hypersensitivity reactions (class IV and others).

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Advances in Diagnostic Pathology
II. Course Code : VPL 605
III. Credit Hours : 1+2

IV. Aim of the course

To teach the students about current diagnostic techniques for diagnosis of different diseases.

V. Theory

Unit I

Principles and applications of Scanning electron microscopy, Transmission electron microscopy, Laser scanning confocal microscopy, Telemicroscopy-Virtual slide microscopy.

Unit II

Current techniques for diagnosis of animal diseases namely ELISA, PCR and its variants, Flow cytometry (FCM), *In-situ* hybridization, Bio chip techniques (DNA chip, Protein microarray, Tissue microarray), Chromatography, Spectrophotometry and Immunodiffusion technique, Biopsy techniques, Use of laboratory animals, etc.

Unit III

In-vitro cell culture techniques (commonly used cell lines, chicken embryo), cytopathic effect of different viruses and their interpretations.

VI. Practical

Principles and practice of advance techniques for the diagnosis of animal diseases.

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Pathology of Nutritional and Metabolic Disorders

II. Course Code : VPL 606

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about nutritional and metabolic disorder of animals.

V. Theory

Unit I

Pathogenesis, gross and microscopic pathology of nutritional imbalances, viz., carbohydrate, protein, fats, vitamins and macro and microelements.

Unit II

Pathogenesis, gross and microscopic pathology of different metabolic diseases namely Milk fever, Ketosis, Pregnancy toxaemia, Tetany, Azoturia, Equine hyperlipidemia, downer's cow and rheumatism like syndrome and post parturient hemoglobinuria in domestic animals and diabetes mellitus in dogs.

VI. Practical

Estimation of certain minerals in sera of natural and experimentally induced deficiencies in domestic animals. To study the haematological, gross and microscopic pathological alterations caused by nutritional and metabolic disorders.

VII. Suggested Reading

- Selected articles from journals.

I. Course Title : Pathology of Important Emerging and Re-Emerging Diseases

II. Course Code : VPL-607

III. Credit Hours : 2+1

IV. Aim of the course

To teach the students about important emerging, re-emerging, exotic and transboundary diseases of pets and livestock.

V. Theory

Unit I

Advances in pathogenesis and pathology including molecular basis of important viral infections namely Foot and mouth disease, Vesicular stomatitis, Vesicular exanthema, Rinderpest, Bovine malignant catarrhal fever, Infectious bovine rhinotracheitis, Parainfluenza-3, Bovine respiratory syncytial virus infection, Blue tongue, Contagious ecthyma, Pox diseases, Peste des petits ruminants, Rabies, Canine distemper, parvovirus infections, Infectious canine hepatitis, Pseudorabies, Hog cholera/ swine fever, swine influenza, Rift valley fever, Scrapie, Bovine spongiform encephalopathy, Japanese encephalitis, Diseases caused by Nipah virus, Kyasanaur forest disease, West Nile fever, Hendravirus, Ebola virus, Crimean-Congo haemorrhagic fever, Chikungunya virus, Ganjam virus, Marburg virus, etc.

Unit II

Advances in pathogenesis and pathology including molecular basis of important bacterial infections namely Tuberculosis, Johne's disease, Actinobacillosis, Actinomycosis, Brucellosis, Listeriosis, Pasteurellosis, Leptospirosis, Anthrax, Clostridial group of diseases, Swine erysipelas, Glasser's disease, Colibacillosis and Salmonellosis, *Corynebactrium* infections, Chlamydial and Mycoplasmal infections.

Unit III

Advances in pathogenesis and pathology including molecular basis of important fungal infections namely Aspergillosis, Blastomycosis, Coccidioidomycosis, Histoplasmosis, Rhinosporidiosis, Sporotrichosis, Candidiasis, Crytococcosis, Dermatomycoses, diseases due to commonly occurring mycotoxins-Aflatoxins, Ochratoxin, Zearalenone, T-2 toxins, Rubratoxin, Fumonisin, Moniliformin, etc.

VI. Practical

Study of clinical and gross alterations and histopathology of some important emerging and enzootic diseases.

VII. Suggested Reading

- Selected articles from Journals.

I. Course Title : Research Methodology in Pathology

II. Course Code : VPL 608

III. Credit Hours : 1+0

IV. Aim of the course

To provide exposure to the students on different methodologies indispensable in Pathology research through available scientific literature in world class journals.

V. Theory

Unit I

Literature based study: Use of various experimentation techniques in pathology research, Animal experimentation techniques, Planning and design of various types of experiments through study of literature for selection of appropriate methodology and evaluation parameters including scoring system, Data evaluation methods, etc.

Unit II

Introduction to OECD-GLP guidelines, Reference studies through literature for safety evaluation of drug/ plant/ plant molecules using *In-vitro* and *In vivo* techniques, Determination and calculation of LD_{50}, ID_{50}, MIC, MTD, etc., use of modern molecular techniques in experimental pathology research.

VI. Suggested Reading

- Selected articles from journals.

I. Course Title : Necropsy Conference-I

II. Course Code : VPL-609

III. Credit Hours : 0+1

IV. Aim of the course

To promote self learning of the students in different necropsy procedures of animals including poultry and description of post-mortem lesions in different diseases/ disease conditions.

V. Practical

- Continuous assessment of students on detailed necropsy examination of various species of large and small animals including poultry; necropsy associated cytological examinations; systematic examination of different organs for morphologic description of gross lesions; gross photography; collection of tissues for histopathology and based on nature of gross lesions, if possible further collection for investigation of viral/ bacterial/ protozoan/ fungal/ parasitic diseases/ toxic or poisoning, etc.
- Morphologic description of microscopic lesions; microscopic photography; correlation of gross and microscopic observations with the results of other parallel investigations to diagnose the disease conditions; presentation of select case(s) in the monthly seminars followed by report writing and final morphologic/ etiologic diagnosis, classification and preservation of microscopic slides.

VI. Suggested Reading

I. Course Title : Special Problem

II. Course Code : VPL 690

III. Credit Hours : 0+1

IV. Aim of the course

To provide expertise in handling practical research problems.

V. Practical

Short research problem(s) involving contemporary issues and research techniques.

Course Outline-cum-Lecture Schedule for Doctoral Degree Programme

I. Course Title : Molecular and Ultra structural Basis of Cell Injury
II. Course Code : VPL 601
III. Credit Hours : 2 + 1

IV. Aim of the course

To teach the students about different molecular including ultrastructural changes in diseases conditions.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Study of cells- cell morphology, interpretation of normal and abnormal cells	6
2.	Overview of Cell injury, Targets of cell injury-Cell membranes, aerobic respiration, structural proteins and enzymes and genetic apparatus of the cell; mechanisms of cell injury-hypoxia, injury by free radicals, chemical injury, infectious agents, other forms of cell injury-immune mediated reactions, genetic derangements; mechanisms of cell membrane damage; mechanisms of DNA damage-base loss, base modification, chemical modification, replication errors, inter-strand cross-links, DNA-protein cross-links, strand breaks. Molecular and immunopathological changes associated with different types of cell injuries	10
3.	Morphology of Reversible and irreversible cell injury with particular emphasis on ultra structural changes in the cells and organelles: Morphology of cell death-necrosis, apoptosis and autolysis, mechanism of apoptosis, intracellular and extracellular accumulations, pigment and tissue deposits, consequences of cell injury	10
4.	Cellular adaptations-hyperplasia, hypertrophy, atrophy, metaplasia and dysplasia	4
5.	Mechanism of other types of cell death, viz., pyroptosis, ferroptosis, autophagy, ETOSIS, etc.	2
Practical		
1.	Collection and preparation of specimens for electron microscopic studies. Interpretation of ultra-structural changes and their correlation with gross and histopathological findings	16

I. Course Title : Molecular Basis of Inflammation
II. Course Code : VPL 602
III. Credit Hours : 1 + 1
IV. Aim of the course

To teach the students about molecular mechanisms of inflammations.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Cellular, molecular and immunopathological changes associated with different types of inflammation. Acute inflammation, Vascular events of acute inflammation, Cellular events in acute inflammation, Leucocyte-endothelial interactions, Leucocyte adhesion molecules, Endothelial adhesion molecule receptors, Leucocyte chemotactic factors, Microbicidal activity of leucocytes, Leucocyte activation.	6
2.	Plasma derived mediators of inflammation-Complement system, Kinin system, Coagulation system and Fibrinolytic system; Cell derived mediators of inflammation-vasoactive amines, lipid mediators, cytokines, chemokines, oxygen radicals and nitric oxide, Cellular components of inflammation, types of exudative inflammation.	6
3.	Chronic inflammation and its types, Elements of chronic inflammation, Healing and repair, Wound healing mediators and their functions, Repair of bone, Repair of nervous tissue and myocardium.	4
Practical		
1.	Molecular alterations and their correlation with gross and microscopic inflammatory changes.	16

I. Course Title : Molecular Basis of Neoplasia
II. Course Code : VPL 603
III. Credit Hours : 1 + 1
IV. Aim of the course

To teach the students about molecular mechanisms of neoplasia and diagnostic technique.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Tumour characteristics, differentiation and proliferation, molecular basis of cancer, tumour stromal interaction, molecular mechanisms of invasion and metastasis of tumours, molecular changes underlying tumour progression and heterogeneity, tumour biology and growth.	8

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
2.	Tumour genetics, immunohistochemical/ including markers associated tumour diagnosis.	8
Practical		
1.	Application of cytological, histopathological, immunohistochemical and molecular techniques in diagnosis and prognosis of various tumour conditions.	16

I. Course Title : Immunopathology

II. Course Code : VPL 604

III. Credit Hours : 2 + 1

IV. Aim of the course

To teach the students about immune mediated and autoimmune diseases of animals.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Principles of immunopathology, Etiopathology of hypersensitivity reactions and immune complex diseases; Autoimmunity, mechanisms of autoimmunity, Genetic, microbial and environmental factors in autoimmunity.	16
2.	Study of etiology, pathology and pathogenesis of commonly encountered Immunoproliferative disorders (Multiple myeloma, lymphoma, leukemia), hypersensitivity diseases, autoimmune diseases and immune deficiencies in domestic animals.	16
Practical		
1.	Immune complexes-quantification and determination by various techniques, enumeration of various populations of lymphocytes by different techniques, determination of C3 levels.	8
2.	Autoimmune reaction by demonstrating auto-antibodies, gross and microscopic pathology of hypersensitivity reactions (class IV and others).	8

I. Course Title : Advances in Diagnostic Pathology

II. Course Code : VPL 605

III. Credit Hours : 1 + 2

IV. Aim of the course

To teach the students about current diagnostic techniques for diagnosis of different diseases.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Principles and applications of Scanning electron microscopy, Transmission electron microscopy, Laser scanning confocal microscopy, Telemicroscopy-Virtual slide microscopy	4
2.	Current techniques for diagnosis of animal diseases namely ELISA, PCR and its variants, Flow cytometry (FCM), *In-situ* hybridization, Bio-chip techniques (DNA chip, Protein microarray, Tissue microarray), Chromatography, Spectrophotometry and Immunodiffusion technique, Biopsy techniques, Use of laboratory animals, etc.	8
3.	*In-vitro* cell culture techniques (commonly used cell lines, chicken embryo), cytopathic effect of different viruses and their interpretations	4
Practical		
1.	Principles and practice of advance techniques for the diagnosis of animal diseases	32

I. Course Title : Pathology of Nutritional and Metabolic Disorders

II. Course Code : VPL 606

III. Credit Hours : 2 + 1

IV. Aim of the course

To teach the students about nutritional and metabolic disorder of animals.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Pathogenesis, gross and microscopic pathology of nutritional imbalances, viz., carbohydrate, protein, fats, vitamins and macro and microelements	16
2.	Pathogenesis, gross and microscopic pathology of different metabolic diseases namely milk fever, ketosis, pregnancy toxaemia, tetany, azoturia, equine hyperlipidemia, downer's cow and rheumatism like syndrome and post parturient hemoglobinuria in domestic animals and diabetes mellitus in dogs	16
Practical		
1.	Estimation of certain minerals in sera of natural and experimentally induced deficiencies in domestic animals	8
2.	To study the haematological, gross and microscopic pathological alterations caused by nutritional and metabolic disorders	8

I. Course Title : Pathology of Important Emerging and Re-Emerging diseases

II. Course Code : VPL 607

III. Credit Hours : 2 + 1

IV. Aim of the course

To teach the students about important emerging, re-emerging, exotic and transboundary diseases of pets and livestock.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Advances in pathogenesis and pathology including molecular basis of important viral infections namely Foot and mouth disease, Vesicular stomatitis, Vesicular exanthema, Rinderpest, Bovine malignant catarrhal fever, Infectious bovine rhinotracheitis, Parainfluenza-3, Bovine respiratory syncytial virus infection, Blue tongue, Contagious ecthyma, Pox diseases, Peste des petits ruminants, Rabies, Canine distemper, parvovirus infections, Infectious canine hepatitis, Pseudorabies	8
2.	Advances in pathogenesis and pathology including molecular basis of important viral infections namely Hog cholera/ swine fever, swine influenza, Rift valley fever, Scrapie, Bovine spongiform encephalopathy, Japanese encephalitis, Diseases caused by Nipah virus, Kyasanaur forest disease, West Nile fever, Hendravirus, Ebola virus, Crimean-Congo haemorrhagic fever, Chikungunya virus, Ganjam virus, Marburg virus, etc.	8
3.	Advances in pathogenesis and pathology including molecular basis of important bacterial infections namely Tuberculosis, Johne's disease, Actinobacillosis, Actinomycosis, Brucellosis, Listeriosis, Pasteurellosis, Leptospirosis, Anthrax, Clostridial group of diseases, Swine erysipelas, Glasser's disease, Colibacillosis and Salmonellosis, Corynebactrium infections, Chlamydial and Mycoplasmal infections	8
4.	Advances in pathogenesis and pathology including molecular basis of important fungal infections namely Aspergillosis, Blastomycosis, Coccidioidomycosis, Histoplasmosis, Rhinosporidiosis, Sporotrichosis, Candidiasis, Crytococcosis, Dermatomycoses, diseases due to commonly occurring mycotoxins-Aflatoxins, Ochratoxin, Zearalenone, T-2 toxins, Rubratoxin, Fumonisin, Moniliformin, etc.	8
Practical		
1.	Study of clinical and gross alterations and histopathology of some important emerging and enzootic diseases.	16

I. Course Title : Research Methodology in Pathology

II. Course Code : VPL 608

III. Credit Hours : 1+0

IV. Aim of the course

To provide exposure to the students on different methodologies indispensable in Pathology research through available scientific literature in world class journals

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Literature based study: Use of various experimentation techniques in pathology research, animal experimentation techniques, Planning and design of various types of experiments through study of literature for selection of appropriate methodology and evaluation parameters including scoring system, data evaluation methods, etc.	8
2.	Introduction to OECD-GLP guidelines, Reference studies through literature for safety evaluation of drug/ plant/ plant molecules using *In-vitro* and *In vivo* techniques, Determination and calculation of LD_{50}, ID_{50}, MIC, MTD, etc., use of modern molecular techniques in experimental pathology research	8

I. Course Title : Necropsy Conference I

II. Course Code : VPL 609

III. Credit Hours : 0 + 1

IV. Aim of the course

To promote self-learning of the students in different necropsy procedures of animals including poultry and description of post-mortem lesions in different diseases/ disease conditions.

Lecture/ Practical schedule

Sr. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practical		
1.	Continuous assessment of students on detailed necropsy examination of various species of large and small animals including poultry; necropsy associated cytological examinations; systematic examination of different organs for morphologic description of gross lesions; gross photography; collection of tissues for histopathology and based on nature of gross lesions, if possible further collection for investigation of viral/ bacterial/ protozoan/ fungal/ parasitic diseases/ toxic or poisoning, etc.	8
2.	Morphologic description of microscopic lesions; microscopic photography; correlation of gross and microscopic observations with the results of other parallel investigations to diagnose the disease conditions; presentation of select case(s) in the monthly seminars followed by report writing and final morphologic/ etiologic diagnosis, classification and preservation of microscopic slides	8

VPA 508	Management of Parasitic Diseases	1+1
VPA 509	Immunoparasitology	2+1
VPA 510	Parasitic Zoonoses	2+0
VPA 511	Parasites of Wildlife	1+1
VPA 591	Master's Seminar*	1+0
VPA 599	Master Research	30

*Core Courses

Course Contents
M.V.Sc. in Veterinary Parasitology

I. Course Title : Platyhelminthes-I
II. Course Code : VPA 501
III. Credit Hours : 1+1
IV. Aim of the course

To study the morphology, biology, pathogenesis and control measures for trematode parasites of veterinary importance.

V. Theory

Unit I

Introduction, classification, general account and economic importance of trematodes.

Unit II

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, Treatment and control measures of trematodes belonging to families: Dicrocoeliidae, Opisthorchiidae and Fasciolidae.

Unit III

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of trematodes belonging to families: Echinostomatidae, Heterophyidae, Plagiorchiidae, Troglotrematidae, Prosthogonimidae, Nanophyetidae and Paragonimidae.

Unit IV

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of trematodes belonging to families: Notocotylidae, Brachylemidae, Cyclocoelidae, Paramphistomatidae and Schistosomatidae.

Unit V

Classification, characters of snails and control strategies of molluscs of veterinary importance.

VI. Practical

- Collection, preservation/ processing and identification of trematode parasites; their eggs and intermediate hosts.
- Observation on parasitic stages in host tissues and associated pathological lesions.
- Identification of molluscs of veterinary importance and examination of molluscs for various developmental stages of trematode parasites.

I. Course Title : Platyhelminthes-II
II. Course Code : VPA 502
III. Credit Hours : 1+1
IV. Aim of the course

To study the morphology, biology, pathogenesis and control measures for cestode parasites of veterinary importance.

Unit I

Introduction, classification, general account and economic importance of cestodes

Unit II

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of cestodes belonging to families: Diphyllobothriidae, Mesocestoididae and Taeniidae.

Unit III

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of cestodes belonging to families: Davaineidae, Hymenolepididae, Dipylidiidae and Dilepididae.

Unit IV

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, Treatment and control measures of cestodes belonging to families: Anoplocephalidae and Thysanosomidae.

V. Practical

Collection, preservation/ processing and identification of cestode parasites; their eggs, larval stages and intermediate hosts. Parasitic stages in host tissues and associated pathological lesions.

I. Course Title : Nemathelminthes and Acanthocephala

II. Course Code : VPA 503

III. Credit Hours : 2+1

IV. Aim of the course

To study the morphology, biology, pathogenesis, diagnosis and control of nematodes and thorny-headed worms of veterinary importance.

V. Theory

Unit I

Introduction, classification, general account and economic importance of nematodes and thorny-headed worms.

Unit II

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of nematodes belonging to families: Ascarididae, Anisakidae, Oxyuridae, Heterakidae and Subuluridae.

Unit III

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment, and control measures of nematodes belonging to families: Rhabditidae, Strongyloididae and Strongylidae.

Unit IV

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment, and control measures of nematodes belonging to families: Trichonematidae, Amidostomidae, Stephanuridae, Syngamidae and Ancylostomatidae.

Unit V

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of nematodes belonging to families: Filaroididae, Trichostrongylidae, Ollulanidae, Dictyocaulidae and Metastrongylidae.

Unit VI

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of nematodes belonging to families: Spiruridae, Thelaziidae, Acuariidae, Tetrameridae, Physalopteridae, Gnathostomatidae, Filariidae, Setariidae, Onchocercidae and Dracunculidae.

Unit VII

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of nematodes belonging to families: Trichinellidae, Trichuridae, Capillariidae and Dioctophymatidae.

Unit VIII

Morphology, Epidemiology, Life cycle, Pathogenesis, Clinical signs, Diagnosis, treatment and control measures of thorny headed worms belonging to families: Polymorphidae, Oligacanthorhynchidae and Gnathobdellidae.

V. Practical

Collection, preservation/ processing and identification of nematode parasites and thorny headed worms; their eggs and larvae and associated pathological lesions.

I. Course Title : Arthropod Parasites

II. Course Code : VPA 504

III. Credit Hours : 2+1

IV. Aim of the course

To study the morphology, biology, vector potential of the arthropods of veterinary importance and their control measures

V. Theory

Unit I

Introduction, Classification, Harmful effects and Economic importance of arthropod parasites.

Unit II

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Vector potentiality, Economic significance and control of arthropods belonging to the families: Culicidae, Ceratopogonidae, Simuliidae and Psychodidae.

Unit III

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Vector potentiality, Economic significance and control of arthropods belonging to the families: Tabanidae, Gasterophilidae, Muscidae, Cuterebridae and Glossinidae.

Unit IV

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Vector potentiality, Economic significance and control of arthropods belonging to the families: Oestridae, Sarcophagidae, Calliphoridae and Hippoboscidae. Importance of blow flies in forensic entomology and treatment of wounds.

Unit V

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Economic significance and control of arthropods belonging to the families: Pediculidae, Haematopinidae, Linognathidae, Menoponidae, Philopteridae and Trichodectidae.

Unit VI

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Economic significance and control of arthropods belonging to the Orders- Siphonaptera and Hemiptera, Cimicidae and Reduviidae.

Unit VII

Distribution, Life cycle, Seasonal pattern, Vector potentiality, Pathogenesis economic significance and control of acarines belonging to the families: Argasidae and Ixodidae.

Unit VIII

Distribution, Morphology, Life cycle, Seasonal pattern, Pathogenesis, Economic significance and control of acarines belonging to the families: Sarcoptidae, Psoroptidae, Demodicidae, Trombiculidae, Dermanyssidae. Cytoditidae and Linguatulidae.

Unit IX

Chemical, Biological, Immunological control measures and integrated pest management. Detection and mechanisms of acaricidal resistance.

V. Practical

Collection, preservation/ processing, identification, differentiation of arthropod parasites and their developmental stages; associated lesions and skin scraping examination.

I. Course Title : Parasitic Protozoa

II. Course Code : VPA 505

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the morphology, Life cycle, Pathogenesis, Diagnosis and control of protozoan parasites of veterinary importance.

V. Theory

Unit I

Introduction, classification, general account and economic importance of protozoan parasites.

Unit II

Morphology, Epidemiology, Pathogenesis, Clinical signs, Diagnosis, and control measures of protozoan parasites belonging to the families: Trypanosomatidae, Monocercomonadidae, Trichomonadidae, Hexamitidae and Endamoebidae.

Unit III

Morphology, Epidemiology, Pathogenesis, Clinical signs, Diagnosis and control measures of protozoan parasites belonging to the families: Eimeriidae, Cryptosporidiidae and Sarcocystidae.

Unit IV

Morphology, Epidemiology, Pathogenesis, Clinical signs, Diagnosis, Treatment and control measures of protozoan parasites belonging to the families: Plasmodiidae, Babesiidae, Theileriidae, Haemogregarinidae and Balantidiidae.

Unit V

Morphology, Epidemiology, Pathogenesis, Clinical signs, Diagnosis and control measures of Rickettsiales in relation to haemoprotozoans.

VI. Practical

Collection, Preservation/ Processing, Identification of parasitic protozoa in clinical material and host tissues. Special techniques for certain protozoans such as coccidia and Cryptosporidia.

I. Course Title : Diagnostic Parasitology
II. Course Code : VPA 506
III. Credit Hours : 0+2

IV. Aim of the course

To learn the techniques associated with isolation, Identification and preservation of the endo and ectoparasites of veterinary importance and their vectors.

V. Practical

Microscopy and micrometry, Preparation of Romanowsky stains. Collection, preservation, Processing and examination of faecal and blood samples; Lymph node biopsy, Skin scrapings, Nasal washings, Sputum, genital discharges/ washings and urine samples from animals for parasitological examinations. Quantitative faecal examination, Maintenance of fly and tick colonies in laboratory for experimental purposes and testing of drugs; tick dissection for vector potential. Collection of aquatic snails from field and their examination for the presence of different parasitic stages. Collection, fixation, staining, whole mounts and identification of parasites. Culturing techniques for important parasites, pasture larval count, worm count and assessment of worm burden.

Remote Sensing (RS) and Geographic Information System (GIS) as tools for mapping parasitic diseases.

I. Course Title : Clinical Parasitology
II. Course Code : VPA 507
III. Credit Hours : 1+1

IV. Aim of the course

Collection, preservation and examination of clinical material for parasitological investigations and interpretations.

V. Theory

Unit I

Collection, preservation and dispatch of clinical material to laboratory for diagnosis

Unit II

History, clinical signs, gross and microscopic examination of diagnostic material.

Unit III

Animal sub-inoculation technique; blood and lymph node biopsy smear examination; histopathology of affected organs.

VI. Practical

Identification, observation of parasitic stages in host tissues, excretions, secretions and associated pathological lesions. Special techniques for haemoparasites and coccidians.

I. Course Title : Management of Parasitic Diseases

II. Course Code : VPA 508

III. Credit Hours : 1+1

IV. Aim of the course

To study the integrated approach for the control of helminths, arthropods and protozoan parasites of veterinary importance.

V. Theory

Unit I

Conventional and novel methods for control of helminth infections in livestock – anthelmintics, their mode of action, characteristic of an ideal anthelmintic drug, Anthelmintic resistance, Spectrum of activity, Delivery devices and integrated control method. Immunological control, Deworming schedule, Snail and other intermediate host control. Ethno veterinary practices.

Unit II

Conventional and novel methods of control of protozoan parasites–antiprotozoal drugs, Their mode of action, Integrated control method including immunological control.

Unit III

Conventional and novel methods of control with insecticides/ acaricides. Methods of application, their mode of action, insecticide resistance, biological control, integrated control method, genetic control and immunological control.

VI. Practical

In vivo and *in-vitro* detection of efficacy of control agents and resistance to anthelmintics, anticoccidials, insecticides and acaricides.

I. Course Title : Immunoparasitology

II. Course Code : VPA 509

III. Credit Hours : 2+1

IV. Aim of the course

To study the host immune response against endo and ectoparasites of veterinary importance with special reference to immunoprophylaxis and immunodiagnosis.

V. Theory

Unit I

Introduction, types of parasite-specific antigens and their characterization.

Unit II

Types of immunity in parasitic infections.

Unit III

Invasive and evasive mechanisms, immunomodulators and their uses.

Unit IV

Immune responses in helminths, arthropods and protozoa of veterinary importance.

Unit V

Immunological control against parasitic diseases.

VI. Practical

Preparation of various antigens (somatic, excretory-secretory) and their fractionation and characterization and demonstration of various immunodiagnostic methods for the diagnosis of parasitic infections.

I. Course Title : Parasitic Zoonoses

II. Course Code : VPA 510

III. Credit Hours : 2+0

IV. Aim of the course

To study important parasites of zoonotic significance.

Unit I

Introduction to the concept of Zoonotic infections, Definitions, Various classifications of zoonoses, Host-parasite relationships, Modes of infections and factors influencing prevalence of zoonoses.

Unit II

A detailed study of Transmission, Epidemiology, Diagnosis and Control of common protozoa of zoonotic importance.

Unit III

A detailed study of Transmission, Epidemiology, Diagnosis and Control of common helminths of zoonotic importance.

Unit IV

A detailed study of Transmission, Epidemiology, Diagnosis and Control of common arthropods of zoonotic importance.

I. Course Title : Parasites of Wildlife

II. Course Code : VPA 511

III. Credit Hours : 1+1

IV. Aim of the course

To study the biology and control measures for major parasitic diseases of zoo and wild animals.

V. Theory

Unit I

A detailed study of protozoa of zoo and wild animals with particular emphasis on morphological features, Geographical distribution Epidemiology, Diagnosis and management.

Unit II

A detailed study of arthropod parasites of zoo and wild animals with particular emphasis on morphological features, Geographical distribution, Epidemiology, diagnosis and management.

Unit III

A detailed study of helminth parasites of zoo and wild animals with particular emphasis on morphological features, Geographical distribution, Epidemiology, diagnosis and management.

VI. Practical

Methods for investigating parasitic diseases of captive and wild animals. Collection and identification of parasites. Visits to zoos and biological parks/ sanctuaries for collection of samples.

Course Outline-cum-Lecture Schedule for Master Degree Programme

I. Course Title : Platyhelminthes-I
II. Course Code : VPA 501
III. Credit Hours : 1+1

IV. Aim of the course

To study the morphology, biology, pathogenesis and control measures for trematode parasites of veterinary importance

Lecture	Topic
Theory	
1-2	Introduction, history, classification, general account and economic importance of trematodes
3-4	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Dicrocoeliidae and Opisthorchiidae
5-6	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Strigeidae and Fasciolidae
7-8	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Echinostomatidae, Heterophyidae, Plagiorchiidae and Troglotrematidae
9-10	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Prosthogonimidae, Nanophyetidae and Paragonimidae
11-12	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Notocotylidae, Brachylemidae, and Paramphistomatidae
13-14	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of trematodes belonging to families: Cyclocoelidae and Schistosomatidae
15-16	Classification and characters of snails and Control strategies of molluscs of veterinary importance
Practicals	
1-5	Collection, preservation/ processing and identification of trematode parasites; their eggs and intermediate hosts
6-11	Observation on parasitic stages in host tissues and associated pathological lesions caused by treamtodes
12-16	Identification of molluscs of veterinary importance and examination of molluscs for various developmental stages of trematode parasites.

I. Course Title : Platyhelminthes-II
II. Course Code : VPA 502
III. Credit Hours : 1+1

IV. Aim of the course

To study the morphology, biology, pathogenesis and control measures for cestode parasites of veterinary importance

Lecture	Topic
Theory	
1-2	Introduction, history, classification, general account and economic importance of cestodes
3-4	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to family: Diphyllobothriidae
5	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to family: Mesocestoididae
6-8	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to family: Taeniidae
9-10	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to families: Davaineidae and Hymenolepididae
11-12	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to families: Dipylidiidae and Dilepididae
13-14	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to family: Anoplocephalidae
15-16	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of cestodes belonging to family: Thysanosomidae
Practicals	
1-8	Collection, preservation/ processing and identification of cestode parasites; their eggs, larval stages and intermediate hosts.
9-16	Observation on parasitic stages in host tissues and associated pathological lesions

I. Course Title : Nemathelminthes and Acanthocephala
II. Course Code : VPA 503
III. Credit Hours : 2+1

IV. Aim of the course

To study the morphology, biology, pathogenesis and control measures of nematodes and thorny-headed worms of veterinary importance

Lecture	Topic
1-2	Introduction, history, classification, general account and economic importance of nematodes and thorny-headed worms
2-4	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to family: Ascarididae
5-6	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Anisakidae and Oxyuridae
7-8	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Heterakidae and Subuluridae

Lecture	Topic
9-10	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Rhabditidae and Strongyloididae
11-12	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to family: Strongylidae.
13-14	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Trichonematidae and Amidostomidae
15-16	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Stephanuridae and Syngamidae
17-18	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to family: Ancylostomatidae.
19-20	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Filaroididae and Trichostrongylidae
21-22	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Ollulanidae, Dictyocaulidae and Metastrongylidae
23-24	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Spiruridae, Thelaziidae, Acuariidae, Tetrameridae, Physalopteridae, and Gnathostomatidae
25-26	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Filariidae, Setariidae, Onchocercidae and Dracunculidae.
27-28	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Trichinellidae and Trichuridae
29-30	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Capillariidae and Dioctophymatidae
31-32	Morphology, epidemiology, life cycle, pathogenesis, clinical signs, diagnosis and control measures of nematodes belonging to families: Polymorphidae, Oligacanthorhynchidae and Gnathobdellidae.
Practicals	
1-16	Collection, preservation/ processing and identification of nematode parasites and thorny headed worms; their eggs and larvae and associated pathological lesions.

I. Course Title : Arthropod Parasites

II. Course Code : VPA 504

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the morphology, biology, vector potential of the arthropods of veterinary importance and their control measures.

Lecture	Topic
1-2	Introduction, classification harmful effects and economic importance of arthropod parasites.

Lecture	Topic
3-4	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the family: Culicidae
5-6	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the family: Ceratopogonidae
7-8	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the families: Simuliidae and Psychodidae.
8-9	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the families: Tabanidae and Gasterophilidae
10-11	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the families: Muscidae, and Glossinidae
12-14	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the families: Oestridae, Sarcophagidae, Calliphoridae and Hippoboscidae. Importance of blow flies in forensic entomology and treatment of wounds
15-18	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, economic significance and control of arthropods belonging to the families: Pediculidae, Haematopinidae, Linognathidae, Menoponidae, Philopteridae and Trichodectidae
19-20	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, economic significance and control of arthropods belonging to the order: Siphonaptera and families: Cimicidae and Reduviidae
21-25	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, vector potential, economic significance and control of arthropods belonging to the families: Argasidae and Ixodidae
26-30	Distribution, morphology, life cycle, seasonal pattern, pathogenesis, economic significance and control of acarines belonging to the families: Sarcoptidae, Psoroptidae, Demodicidae, Trombiculidae, Dermanyssidae. Cytoditidae and Linguatulidae.
31-32	Chemical, biological, immunological control measures and integrated pest management. Detection and mechanisms of acaricidal resistance
Practicals	
1-16	Collection, preservation/ processing, identification, differentiation of arthropod parasites and their developmental stages; associated lesions and skin scraping examination

I. Course Title : Parasitic Protozoa

II. Course Code : VPA 505

III. Credit Hours : 2+1

IV. Aim of the course

To study the morphology, life cycle, pathogenesis, diagnosis and control of protozoan parasites of veterinary importance.

Lecture	Theory
1-3	Introduction, History, Classification and General account and economic importance of protozoan parasites.

Lecture	Topic
4-7	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Trypanosomatidae
8-10	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Monocercomonadidae and Trichomonadidae
11-12	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Hexamitidae and Endamoebidae
13-14	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Endamoebidae
15-16	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Eimeriidae.
17-18	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Cryptosporidiidae.
19-22	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Sarcocystidae.
23	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Plasmodiidae.
24-26	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Babesiidae.
27-28	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Theileriidae.
29-30	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of protozoan parasites belonging to the family Haemogregarinidaeand Balantidiidae
31-32	Morphology, epidemiology, pathogenesis, clinical signs, diagnosis and control measures of Rickettsiales like *Anaplasma*, *Ehrlichia*, *Haemobartonella* and others.
Practicals	
1-4	Collection, preservation/ processing, identification of protozoan parasites based on faecal examination.
5-8	Collection, preservation/ processing, identification of protozoan parasites based on blood examination.
9-12	Observations on parasite stages in host tissues and the attendant pathological lesions.
13-16	Diagnosis of protozoan parasites of Veterinary importance.

I. Course Title : Diagnostic Parasitology

II. Course Code : VPA 506

III. Credit Hours : 0+2

Aim of the course

To learn the techniques associated with isolation, identification and preservation of the endo and ectoparasites of veterinary importance and their vectors.

Lecture	Topic
Practical	
1-2	Microscopy and micrometry, Preparation of Romanowsky stain.
3-8	Collection, preservation, processing and examination of faecal and blood samples; lymph node biopsy, skin scrapings, nasal washings sputum, genital discharges/ washings and urine samples from animals for parasitological examinations.

Lecture	Topic
9-12	Quantitative faecal examination.
13-16	Maintenance of fly and tick colonies in laboratory for experimental purposes and testing of drugs; tick dissection for vector potential.
17-20	Collection of aquatic snails from field and their examination for the presence of different parasitic stages.
21-24	Collection, fixation, staining, whole mounts and identification of parasites.
25-28	Culturing techniques for important parasites, pasture larval count, worm count and assessment of worm burden.
29-32	Remote Sensing (RS) and Geographic Information System (GIS) as tools for mapping parasitic diseases.

I. Course Title : Clinical Parasitology

II. Course Code : VPA 507

III. Credit Hours : 1+1

IV. Aim of the course

Collection of clinical material, examination/ investigation and its preservation for interpretations.

Lecture	Topic
Theory	
1-3	Unit I: Collection, preservation and dispatch of clinical material to laboratory for diagnosis.
4-8	Unit II: History, clinical signs, gross and microscopic examination of diagnostic material.
9-10	Unit III: Animal sub-inoculation tests.
11-13	Unit III: Blood and biopsy smear examination.
14-16	Unit III: Histopathology of affected organs.
Practical	
1-12	Identification, observation of parasitic stages in host tissues, excretions, secretions and associated pathological lesions.
7-12	Special techniques for *Cryptosporidium* oocysts in faecal samples. Sporulation of coccidial oocysts.

I. Course Title : Management of Parasitic Diseases

II. Course Code : VPA 508

III. Credit Hours : 1+1

IV. Aim of the course

To study the integrated approach for the control of helminths, arthropods and protozoan parasites of veterinary importance.

Lecture	Topic
Theory	
1-6	Unit I: Conventional and novel methods of control of helminth infection in livestock – anthelmintics, their mode of action, characteristic of an ideal anthelmintic drug, anthelmintic resistance, spectrum of activity, delivery devices, integrated

Lecture	Topic
	control method. Immunological control. Deworming schedule. Snail and other intermediate host control.
7-11	Unit II: Conventional and novel methods of control of protozoan parasites–antiprotozoal drugs, their mode of action, integrated control method including immunological control.
12-16	Unit III Conventional and novel methods of control with insecticides/ acaricides. Methods of application, their mode of action, insecticide resistance, biological control, integrated control method, genetic control and immunological control.
Practical	
1-6	*In vivo* detection of efficacy of and resistance to parasiticidal agents.
7-16	*In-vitro* detection of efficacy of and resistance to parasiticidal agents

I. Course Title : Immunoparasitology

II. Course Code : VPA 509

III. Credit Hours : 2+1

IV. Aim of the course

To study the host immune response against the endo and ectoparasites of veterinary importance with special reference to immunoprophylaxis and immunodiagnosis.

Lecture	Topic
Theory	
1-7	Unit I: Introduction, types of parasite-specific antigens and their characterization.
8-13	Unit II: Types of immunity in parasitic infections.
14-18	Unit III: Invasive and evasive mechanisms, immunomodulators and their uses.
19-27	Unit IV: Immune responses in helminths, arthropods and protozoa of veterinary importance.
28-32	Unit V: Immunological control against parasitic diseases
Practical	
1-9	Preparation of various antigens (somatic, excretory-secretory) and their fractionation and characterization and
10-16	Demonstration of various immunodiagnostic methods for the diagnosis of parasitic infections

I. Course Title : Parasitic Zoonoses

II. Course Code : VPA 510

III. Credit Hours : 2+0

IV. Aim of the course

To study important parasites of zoonotic significance.

Lecture	Topic
Theory	
1-3	Unit I: Introduction to the concept of zoonotic infections
4-6	Unit I:Definition and various classifications of zoonoses.

Lecture	Topic
7-10	Unit I: Host-parasite relationships, modes of infections, factors influencing prevalence of zoonoses.
11-18	Unit II: A detailed study of transmission, epidemiology, diagnosis and control of major protozoa of zoonotic importance.
19-25	Unit III: A detailed study of transmission, epidemiology, diagnosis and control of major helminths of zoonotic importance.
26-32	Unit IV: A detailed study of transmission, epidemiology, diagnosis and control of major arthropods of zoonotic importance.

I. Course Title : Parasites of Wildlife

II. Course Code : VPA 511

III. Credit Hours : 1+1

IV. Aim of the course

To study the biology and control measures for major parasitic diseases of zoo and wild animals.

Lecture	
Theory	
1-6	Unit I: A detailed study of protozoa of zoo and wild animals with particular emphasis on morphological features, geographical distribution epidemiology, diagnosis and management.
7-12	Unit II: A detailed study of arthropod parasites of zoo and wild animals with particular emphasis on morphological features, geographical distribution, epidemiology, diagnosis and management.
13-16	Unit III: A detailed study of helminth parasites of zoo and wild animals with particular emphasis on morphological features, geographical distribution, epidemiology, diagnosis and management
Practical	
1-6	Methods for investigating parasitic diseases of captive and wild animals.
7-16	Collection and identification of parasites. Visits to zoos and biological parks/ sanctuaries for collection of samples.

Course Title with Credit Load
Ph.D. in Veterinary Parasitology

Course Code	Course Title	Credits Hours
VPA 601	Advances in Helminthology-I	2+1
VPA 602	Advances in Helminthology-II	2+1
VPA 603	Entomology and Acarology	2+1
VPA 604	Advances in Protozoology	2+1
VPA 605	Immunology of Parasitic Diseases*	1+2
VPA 606	Molecular Diagnostics and Vaccine Development in Parasitology*	2+1
VPA 607	Host Parasite Interactions	2+0
VPA 608	*In-vitro* Cultivation of Parasites	1+2
VPA 609	Emerging and Re-Emerging Parasitic Diseases	2+0
VPA 610	Biology and Ecology of Parasites	3+0

Course Contents
Ph.D. in Veterinary Parasitology

I. Course Title : Advances in Helminthology-I
II. Course Code : VPA 601
III. Credit Hours : 2+1

IV. Aim of the course

Developments in the area of molecular biology, pathogenesis, diagnosis and control of trematodes and cestodes.

V. Theory

Unit I

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of trematodes and their larval stages.

Unit II

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of cestodes and larval stages.

VI. Practical

Morphological, Pathological and Immunological studies of trematode and cestode parasites.

I. Course Title : Advances in Helminthology-II
II. Course Code : VPA 602
III. Credit Hours : 2+1

IV. Aim of the course

To study the recent developments in the area of molecular biology, pathogenesis, diagnosis of nematode parasites and thorny headed worms with an objective of better control.

V. Theory

Unit I

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of nematode parasites and their larval stages.

Unit II

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of thorny-headed worms.

VI. Practical

Morphological, Pathological and Immunological studies of various nematodes and thorny-headed worms.

I. Course Title : Entomology and Acarology
II. Course Code : VPA 603
III. Credit Hours : 2+1

IV. Aim of the course

To study the recent scientific developments on biology and control measures for arthropods of veterinary importance.

V. Theory

Unit I

Origin, Evolution, Regional/ Seasonal distribution and Forecasting of insect and acarine population.

Unit II

Population dynamics of insects and acarines in relation to biotic and abiotic factors

Unit III

Recent developments pertaining to insects of veterinary importance.

Unit IV

Recent developments pertaining to arachnids of veterinary importance.

Unit V

Chemical, Biological, Herbal and Immunological control measures and integrated pest management. Modulation of vector competence to transmit parasitic infections using molecular genetics by developing transgenic vectors.

VI. Practical

Collection and identification of arthropods; Demonstration of the infective stages in vectors. Immuno pathological changes produced in the host tissues due to the infestation of arthropods.

I. Course Title : Advances in Protozoology
II. Course Code : VPA 604
III. Credit Hours : 2+1

IV. Aim of the course

To study the recent developments in molecular biology, pathogenesis, diagnosis and control of protozoan parasites of veterinary importance

V. Theory

Unit I

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of intestinal protozoa.

Unit II

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of haemoprotozoans.

Unit III

Advanced studies on Taxonomy, Molecular biology, Pathogenesis and Immunology of tissue and other protozoa.

VI. Practical

Morphological, pathological and immunodiagnosis of protozoan diseases

I. Course Title : Immunology of Parasitic Diseases

II. Course Code : VPA 605

III. Credit Hours : 1+2

IV. Aim of the course

To study the immune mechanisms operating in different parasitic infections and to identify the immunodominant/ immunoprotective antigens for diagnosis and control of parasitic diseases.

Unit I

To study the salient features of immune responses in relation to trematode, cestode, nematode and protozoan infections in livestock. Immune responses to arthropod infestations.

Unit II

Principles and applications of immunodiagnostic methods for parasitic diseases.

Unit III

Standardization of immunodiagnostic methods for parasitic diseases.

Unit IV

Identification of candidate antigens for diagnosis and vaccine development.

V. Practical

Methods for purification of antigens, fractionation and characterization of antigens, identification of candidate antigens as drug targets, raising of hyperimmune sera, development and standardization of immunodiagnostic methods for the diagnosis and control of parasitic infections.

I. Course Title : Molecular Diagnostics and Vaccine Development for Parasitic Diseases

II. Course Code : VPA 606

III. Credit Hours : 2+1

IV. Aim of the course

To understand the principles of development of sensitive molecular tools for rapid and field oriented tests. Identification of diagnostic and vaccine targets for detection and control of parasites of livestock and pets.

V. Theory

Unit I

Introduction to molecular taxonomy of parasites.

Unit II

Genome organisation in parasites of veterinary importance. Structure and function of nucleic acids.

Unit III

Basic plan of gene cloning, and expression in heterologous host. Production of recombinant protein and downstream processing for diagnostic/ prophylactic applications.

Unit IV

General concept of protein synthesis. Identification and molecular characterization of proteins of diagnostic/ prophylactic relevance of parasitic origin.

Unit V

Nucleic acid based techniques for genetic characterization and sensitive diagnosis of parasitic infections; PCR, LAMP, Nucleic acid hybridization technique, pyrosequencing, Real Time PCR, DNA Microarray, Microsatellite analysis, RNAi, Reverse Genetic Approaches and their applications.

Unit VI

Hybridoma technology. Principle of production of monoclonal antibody. The diagnostic application of monoclonal antibodies of parasitic infection.

Unit VII

DNA vaccine, Vector vaccine, Recombinant protein based vaccine, Subunit vaccine, Principle and Application.

VI. Practical

Identification, Characterization, and Purification of Recombinant Protein Antigens; SDS-PAGE and Western Blotting, Extraction and quantification of nucleic acid and PCR and related techniques.

I. Course Title : Host Parasite Interactions

II. Course Code : VPA 607

III. Credit Hours : 2+0

IV. Aim of the course

To study different level of host-parasite interactions/ association with an objective of efficient control.

V. Theory

Unit I

Introduction, Distribution of parasites on/ in the host, Morphological adaptation for better survival in/ on the host.

Unit II

Behavioural defences, Host immune responses and Genetic resistance to parasites.

Unit III

Establishment of parasites in immune competent, Susceptible, Intermediate and Abnormal hosts, Chronicity of parasitic infections, Immuno evasive strategies of the parasites and host-parasite equilibrium.

Unit IV

Pathological consequences of host parasite interactions in relation to malnutrition and micronutrient metabolism.

I. Course Title : *In-vitro* Cultivation of Parasites
II. Course Code : VPA 608
III. Credit Hours : 1+2

IV. Aim of the course

Development and standardization of *in-vitro* techniques for parasite cultivation.

V. Theory

Unit I

Introduction, problems and goals of *in-vitro* cultivation of parasites.

Unit II

In-vitro cultivation of genital, Intestinal flagellates and Intestinal ciliates.

Unit III

In-vitro cultivation of intestinal protozoa.

Unit IV

In-vitro cultivation of haemoprotozoa.

Unit V

In-vitro techniques, media and tissue culture for cultivation of helminths and their larval stages.

Unit VI

In-vitro mass rearing and colonization of ticks, flies and other insects.

VI. Practical

Preparation of media, sterilization methods and cultivation of different parasites.

I. Course Title : Emerging and Re-Emerging Parasitic Diseases
II. Course Code : VPA 609
III. Credit Hours : 2+0

IV. Aim of the course

To study the emerging and re- emerging parasitic diseases.

V. Theory

Unit I

Emerging and re-emerging helminthic diseases.

Unit II

Emerging and re-emerging protozoan diseases.

Unit III

Emerging and re-emerging vector- borne diseases.

I. Course Title : Biology and Ecology of Parasites
II. Course Code : VPA 610
III. Credit Hours : 3+0

IV. Aim of the course

Study of the bionomics and ecology of the parasites.

V. Theory

Unit I

Ultrastructure, Physiology, Biochemistry and Bionomics of trematodes and cestodes of veterinary importance.

Unit II

Ultrastructure, Physiology, Biochemistry and Bionomics of nematodes of veterinary importance.

Unit III

Ultrastructure, Physiology, Biochemistry and Bionomics of important arthropod parasites.

Unit IV

Ultrastructure, Physiology, Biochemistry and Bionomics of important protozoan parasites.

Unit V

Ecology related definitions, Environmental changes and ecological disturbances due to natural phenomenon and human interventions (demographic, societal and agricultural changes global warming, floods, hurricanes and pollution.

Unit VI

Principles of Remote Sensing, GIS and their role in Veterinary Parasitology.

I. Course Title : Molecular Veterinary Parasitology

II. Course Code : VPA 611

III. Credit Hours : 2+0

IV. Aim of the course

To give an insight into molecular biology of parasites of veterinary importance, their transmission and control. Molecular, immunological and genetic aspects of common parasites of veterinary importance and vector-host-parasite interaction.

V. Theory

Unit I

Introduction to molecular biology of parasites-Biological molecules (carbohydrate, protein and nucleic acid)- Eukaryotic cell structure, cell membrane and organelles-kinetoplast, apicoplast, cilia, flagella biology-Eukaryotic cell metabolism and cell respiration-Oxidative phosphorylation-anaerobic metabolism in parasites-fatty acid metabolism of parasites-cellular reproduction mendelian genetics in parasites and vectors- Genome of parasites of veterinary importance, genome size- molecular taxonomy-DNA barcoding-phylogenetics.

Unit II

Genetic code- Gene expression-Transcription and Translation-post translational modifications- RNA interference in parasites-CRISPR/ Cas9 inparasites-metagenome-microbiome-transcriptome of parasites-transgenic and para transgenic approach in parasites-drug resistance mechanisms.

Unit III

Molecular biology of helminth parasites such as *Fasciola* spp, *Schistosoma* spp, *Taenia* spp, *Echinococcus* spp, *Toxocara* spp, *Haemonchus* spp., *Dictyocaulus* spp.

I. Course Title : Parasite Epidemiology

II. Course Code : VPA 612

III. Credit Hours : 2+0

IV. Aim of the course

To study the disease and transmission characteristics, descriptive epidemiology of infectious diseases.

V. Theory

Unit I: Introduction to epidemiological concepts

Definitions, aims and uses of epidemiological studies, Approaches of epidemiology (descriptive, analytical and experimental), Types of epidemiological studies along with their advantages and disadvantages, Features of parasitic disease epidemiology. Measures of disease frequency: Morbidity and mortality (Rate, Ratio, Proportional rate), Measures of morbidity (Cumulative incidence, Incidence rate, Attack rate, Prevalence-Point and Period) and mortality (Cumulative Mortality, Mortality rate, Death rate, Age/ Sex/ Breed death rate, Case fatality proportion, Cause specific death rate, etc.). The epidemiological triangle, iceberg concept, endemic stability, herd immunity concept, etc.

Unit II: Methods in epidemiology

Cross-sectional, case control and cohort studies. Techniques of epidemiological surveys.

Types of sampling- Non-probability sampling (target sampling, choice sampling, etc.), Probability sampling (Random samples, systemic sampling, stratified sampling. cluster sampling, etc.). Sample size calculation for different epidemiological and experimental studies.

Unit III: Advances in Epidemiological techniques

Sero-epidemiological methods used in important parasitic disease-Uses and limitations, Properties and Evaluation. Molecular epidemiology- Principles, laboratory methods, Bioinformatics in molecular epidemiology. Serological and molecular epidemiology of important parasites. Remote sensing and geographic information system- Scope and applications in Veterinary Parasitology.

Unit IV: Epidemiology of Important Parasitic Diseases

Epidemiological factors affecting distribution and transmission of important parasitic diseases of animals and birds- Agent Factors/ Disease Patterns, Environment and Disease Patterns, Social Factors and Disease Patterns, etc. Parasitic disease monitoring and evaluation, outbreak investigations and surveillance. Forecasting of parasitic diseases

Course Outline-cum-Lecture Schedule Doctoral Degree Programme

I. Course Title : Advances in Helminthology-I
II. Course Code : VPA 601
III. Credit Hours : 2+1
IV. Aim of the course

Developments in the area of molecular biology, pathogenesis, diagnosis and control of trematodes and cestodes.

Lecture	Topics
Theory	
1-16	Unit I: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of trematodes and their larval stages.
17-32	Unit II: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of cestodes and larval stages.
Practicals	
1-9	Morphological, pathological and immunological studies of trematode parasites.
10-16	Morphological, pathological and immunological studies of cestode parasites.

I. Course Title : Advances in Helminthology-II
II. Course Code : VPA 602
III. Credit Hours : 2+1
IV. Aim of the course

To study the recent developments in the area of molecular biology, pathogenesis, diagnosis of nematode parasites and thorny headed worms with an objective of better control.

Lecture	Topics
Theory	
1-28	Unit I: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of nematode parasites and their larval stages.
30-32	Unit II: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of thorny-headed worms.
Practicals	
1-14	Morphological, pathological and immunological studies of various nematodes
15-16	Morphological, pathological and immunological studies of various thorny-headed worms

I. Course Title : Advances in Entomology and Acarology
II. Course Code : VPA 603
III. Credit Hours : (2+1)

IV. Aim of the course

To study the recent scientific developments on biology and control measures for arthropods of veterinary importance.

Lecture	Topics
Theory	
1-5	Unit I: Origin, evolution, regional/ seasonal distribution and forecasting of insect and acarine population
6-14	Unit II: Population dynamics of insects and acarines in relation to biotic and abiotic factors
15-21	Unit III: Recent developments pertaining to insects of veterinary importance.
22-27	Unit IV: Recent developments pertaining to arachnids of veterinary importance
28-32	Unit V: Chemical, biological, herbal and immunological control measures and integrated pest management. Modulation of vector competence to transmit parasitic infections using molecular genetics by developing transgenic vectors
Practicals	
1-11	Collection and identification of arthropods; demonstration of the infective stages in vectors
12-16	Immunopathological changes produced in the host tissues due to the infestation of arthropods

I. Course Title : Advances in Protozoology
II. Course Code : VPA 604
III. Credit Hours : (2+1)

IV. Aim of the course

To study the recent developments in molecular biology, pathogenesis, diagnosis and control of protozoan parasites of veterinary importance.

Lecture	Topics
Theory	
1-5	Unit I: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of intestinal protozoa
6-14	Unit II: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of haemoprotozoans
15-21	Unit III: Advanced studies on taxonomy, molecular biology, pathogenesis and immunology of tissue and other protozoa
Practicals	
1-16	Morphological, pathological and immunodiagnosis of protozoan diseases.

I. Course Title : Immunology of Parasitic Diseases
II. Course Code : VPA 605
III. Credit Hours : (1+2)

IV. Aim of the course

To study the immune mechanisms operating in different parasitic infections and to identify the immunodominant/ immunoprotective antigens for diagnosis and control of parasitic diseases.

Lecture	Topics
Theory	
1-4	Unit I: To study the salient features of immune responses in relation to trematode, cestode, and nematode infections in livestock
5-7	Unit I: To study the salient features of immune responses to protozoan infections in livestock
8-9	Unit I: To study the salient features of immune responses to arthropod infestations
10-11	Unit II: Principles and applications of immunodiagnostic methods for parasitic diseases
12-13	Unit III: Standardization of immunodiagnostic methods for parasitic diseases
14-16	Unit IV: Identification of candidate antigens for diagnosis and vaccine development
Practicals	
1-16	Methods for purification of antigens, fractionation and characterization of antigens, identification of candidate antigens as drug targets,
17-20	Raising of hyperimmune sera
21-32	Development and standardization of immunodiagnostic methods for the diagnosis and control of parasitic infections

I. Course Title : Molecular Diagnostics and Vaccine Development for Parasitic Diseases

II. Course Code : VPA 606

III. Credit Hours : (2+1)

IV. Aim of the course

To understand the principles of development of sensitive molecular tools for rapid and field oriented tests. Identification of vaccine targets for control of parasites of livestock and pets.

Lecture	Topics
Theory	
1-3	Unit I: Introduction. Molecular taxonomy of parasites
4-8	Unit II: Genome organisation in parasites of veterinary importance. Structure and function of nucleic acids
9-14	Unit III: Basic plan of gene cloning, and expression in heterologous host. Production of recombinant protein and downstream processing for diagnostic/ prophylactic applications
15-17	Unit IV: General concept of protein synthesis. Identification and molecular characterization of proteins of diagnostic/ prophylactic relevance of parasitic origin
18-26	Unit V: Nucleic acid based techniques for genetic characterization and sensitive diagnosis of parasitic infections; PCR, LAMP, nucleic acid hybridization technique, pyrosequencing, real time PCR, DNA microarray, microsatellite analysis, RNAi, reverse genetic approaches and their applications, etc.
27-28	Unit VI: Hybridoma technology. Principle of production of monoclonal antibody. The diagnostic application of monoclonal antibodies of parasitic infection
29-32	Unit VII: DNA vaccine, vector vaccine, recombinant protein based vaccine, subunit vaccine, principle and application

Lecture	Topics
Practicals	
1-11	Identification, characterization, and purification of recombinant protein antigens; SDS-PAGE and western blotting,
12-16	Extraction and quantification of nucleic acid and PCR

I. Course Title : Host Parasite Interactions

II. Course Code : VPA 607

III. Credit Hours : (2+0)

IV. Aim of the course

To study different level of host-parasite interactions/ association with an objective of efficient control.

Lecture	Topics
Theory	
1-6	Unit I: Introduction, distribution of parasites on/ in the host, morphological adaptation for better survival in/ on the host
7-14	Unit II: Behavioural defences, host immune responses and genetic resistance to parasites
15-26	Unit III Establishment of parasites in immune competent, susceptible, intermediate and abnormal hosts, chronicity of parasitic infections, immunoevasive strategies of the parasites and host-parasite equilibrium
27-32	Unit IV: Pathological consequences of host parasite interactions in relation to malnutrition and micronutrient metabolism

I. Course Title : *In-vitro* Cultivation of Parasites

II. Course Code : VPA 608

III. Credit Hours : (1+2)

IV. Aim of the course

Development and standardization of *in-vitro* techniques for parasite cultivation.

Lecture	Topics
Theory	
1-2	Unit I: Introduction, problems and goals of *in-vitro* cultivation of parasites
3-6	Unit II: *In-vitro* cultivation of genital, intestinal flagellates and intestinal ciliates
7-9	Unit III: *In-vitro* cultivation of intestinal protozoa
10-11	Unit IV: *In-vitro* cultivation of haemoprotozoa
12-13	Unit V: *In-vitro* techniques, media and tissue culture for cultivation of helminths and their larval stages
14-16	Unit VI: *In-vitro* mass rearing and colonization of ticks, flies and other insects
Practicals	
1-7	Preparation of media, sterilization methods and cultivation of genital, intestinal flagellates and intestinal ciliates
8-16	Preparation of media, sterilization methods and cultivation cultivation of intestinal and haemoprotozoa protozoa

Lecture	Topics
17-24	Preparation of media, sterilization methods and cultivation cultivation of helminths and their larval stages
25-32	Preparation of media, sterilization methods and cultivation cultivation of ticks, flies and other insects

I. Course Title : Emerging and Re-Emerging Parasitic Diseases

II. Course Code : VPA 609

III. Credit Hours : (2+0)

IV. Aim of the course

To study the emerging and re- emerging parasitic diseases.

Lecture	Topics
Theory	
1-10	Unit I: Emerging and re-emerging helminthic diseases
11-21	Unit II: Emerging and re-emerging protozoan diseases
22-32	Unit III: Emerging and re-emerging vector- borne diseases

I. Course Title : Biology and Ecology of Parasites

II. Course Code : VPA 610

III. Credit Hours : (3+0)

IV. Aim of the course

Study of the bionomics and ecology of the parasites.

Lecture	Topics
Theory	
1-5	Unit I: Ultrastructure, physiology, biochemistry and bionomics of trematodes of veterinary importance
6-10	Unit I: Ultrastructure, physiology, biochemistry and bionomics of cestodes of veterinary importance
11-20	Unit II: Ultrastructure, physiology, biochemistry and bionomics of nematodes of veterinary importance
21-30	Unit III: Ultrastructure, physiology, biochemistry and bionomics of important arthropod parasites
31-40	Unit IV: Ultrastructure, physiology, biochemistry and bionomics of important protozoan parasites
41-45	Unit V: Ecology related definitions, Environmental changes and ecological disturbances due to natural phenomenon and human interventions (demographic, societal and agricultural changes global warming, floods, hurricanes and pollution
46-48	Unit VI: Principles of Remote Sensing, GIS and their role in Veterinary Parasitology

I. Course Title : Molecular Veterinary Parasitology

II. Course Code : VPA 611

III. Credit Hours : (2+0)

IV. Aim of the course

To give a deep insight into molecular biology of parasites of veterinary importance, their transmission and control. Molecular, immunological and genetic aspects of selected parasites of veterinary importance and vector-host-parasite interaction.

Lecture	Topics
Theory	
1-2	Unit I: Introduction to molecular biology of parasites-Biological molecules (carbohydrate, protein and nucleic acid)
3-6	Unit I: Eukaryotic cell structure, cell membrane and organelles- kinetoplast, apicoplast, cilia, flagella biology
7-11	Unit I: Eukaryotic cell metabolism and cell respiration-Oxidative phosphorylation-anaerobic metabolism in parasites-fatty acid metabolism of parasites-cellular reproduction mendelian genetics in parasites and vectors
12-16	Unit I: Genome of parasites of veterinary importance, genome size- molecular taxonomy-DNA barcoding-phylogenetics
17-22	Unit II: Genetic code- Gene expression-Transcription and Translation-post translational modifications- RNA interference in parasites-CRISPR/ Cas9 in parasites
23-27	Unit II: Metagenome-microbiome-transcriptome of parasites-transgenic and para transgenic approach in parasites-drug resistance mechanism and genetics
28-32	Unit III: Molecular biology of selected helminth parasites (*Fasciola* spp, *Schistosoma* spp, *Taenia* spp, *Echinococcus* spp, *Toxocara* spp, *Haemonchus* spp, *Dictyocaulus* spp etc)

I. Course Title : Parasite Epidemiology

II. Course Code : VPA 612

III. Credit Hours : (2+0)

IV. Aim of the course

To study the disease and transmission characteristics, descriptive epidemiology of infectious agents.

Lecture	Topics
Theory	
1-4	Unit I: Introduction to epidemiological concepts-Definitions, aims and uses of epidemiological studies, approaches of epidemiology (descriptive, analytical and experimental), types of epidemiological studies along with their advantages and disadvantages, features of parasitic disease epidemiology
5-8	Unit I: Introduction to epidemiological concepts- Measures of disease frequency: Morbidity and mortality (Rate, Ratio, Proportional rate), Measures of morbidity (Cumulative incidence, Incidence rate, Attack rate, Prevalence-Point and Period) and mortality (Cumulative Mortality, Mortality rate, Death rate, Age/ Sex/ Breed death rate, Case fatality proportion, Cause specific death rate, etc.). The epidemiological triangle, iceberg concept, endemic stability, herd immunity concept, etc.
9-12	Unit II: Methods in epidemiology Cross-sectional, case control and cohort studies. Techniques of epidemiological surveys Types of sampling- Non-probability sampling (target sampling, choice sampling, etc.), Probability sampling (Random samples, systemic sampling, stratified sampling. cluster sampling, etc.). Sample size calculation for different epidemiological and experimental studies

Lecture	Topics
13-16	Unit II: Methods in epidemiology Epidemiological Measures of Association-Strength of association (Relative risk, odds ratio), Effect of association (Attributable rate), effect/ importance of association
17-20	Unit III: Advances in Epidemiological techniques Sero-epidemiological methods used in important parasitic disease-Uses and limitations, properties and evaluation. Molecular epidemiology- Principles, laboratory methods, bioinformatics in molecular epidemiology
21-24	Unit III: Advances in Epidemiological techniques Serological and molecular epidemiology of important parasites. Remote sensing and geographic information system- Scope and applications in Veterinary Parasitology
25-28	Unit IV: Epidemiology of Important Parasitic Diseases Epidemiological factors affecting distribution and transmission of important parasitic diseases of animals and birds- Agent Factors/ Disease Patterns, Environment and Disease Patterns, Social Factors and Disease Patterns, etc.
29-32	Unit IV: Epidemiology of Important Parasitic Diseases Parasitic disease monitoring and evaluation, outbreak investigations and surveillance Forecasting of parasitic diseases

Restructured and Revised

Veterinary Para-Clinical Subjects
– Veterinary Public Health and Epidemiology

Course Title with Credit Load
M.V.Sc. in Veterinary Public Health and Epidemiology

Course Code	Course Title	Credit Hours
VPE 501	Concepts in Veterinary Public Health and One Health*	2+0
VPE 502	Zoonoses-I*	2+1
VPE 503	Zoonoses-II*	2+1
VPE 504	Principles of Epidemiology*	2+1
VPE 505	Hygiene and Safety of Foods of Animal and Aquatic Origin*	2+1
VPE 506	Food-borne Infections and Intoxications	2+1
VPE 507	Food Safety Standards, and Regulations	2+1
VPE 508	EnvironmentalHygiene and Safety	2+1
VPE 509	Applied Epidemiology	2+1
VPE 510	Biosecurity, Bioterrorism and Disaster Management	2+0
VPE 511	Laboratory Techniques in Veterinary Public Health*	0+3
VPE 591	Master’s seminar*	0+1
VPE 599	Master’s research	30

*Core courses

Course Contents
M.V.Sc. in Veterinary Public Health and Epidemiology

I. Course Title : Concepts in Veterinary Public Health and One Health
II. Course Code : VPE 501
III. Credit Hours : 2+0
IV. Aim of the course

To equip students with One Health concepts and advanced skills in public health aspects of infectious disease, intelligence, response, prevention and mitigation.

V. Theory

Unit I

VPH administration; organization, administration and implementation of VPH services/ programs; Structure and function of VPH agencies/ organizations of national and international importance. VPH team, administration and functions; responsibilities of veterinarians in public health team.

Unit II

Definition: One Health. Historical emergence of the concept. Scope, Objective and Area of activities of One Health. Strategic frame-work. Purpose for creation of Veterinary Public Health and Epidemiology –NET.

Unit III

Global burden of disease, Coordinated and systemic disease control response, Ecosystem, Urbanization intensive agriculture and animal husbandry practices, Host-pathogen interaction, Anti-microbial resistance and climate change.

VI. Suggested reading

- Sherikar AT, Bachhil VN and Thapliyal DC. 2013. *Text book of Elements of Veterinary Public Health*, ICAR, Govt. of India.
- Zinsstag J, Schelling E, Waltner-Toews D, Whittaker M and Tanner M. 2015. *One Health: the theory and practice of integrated health approaches*. CABI.

I. Course Title : Zoonoses-I
II. Course Code : VPE 502
III. Credit Hours : 2+1
IV. Aim of the course

To impart knowledge on Epidemiology, Etiology, Transmission pattern, Public health significance, Diagnosis and Management of important bacterial, Mycotic and Chlamydial zoonotic diseases.

V. Theory

Unit I

Definition and classification, Factors affecting the occurrence of zoonoses; Disease management strategies, Disease burden on population and socioeconomic impacts.

Unit II

History, Etiology, Epidemiology, Diagnosis and management of important Bacterial zoonoses, viz., Anthrax, Brucellosis, Tuberculosis, Leptospirosis, Salmonellosis, Borreliosis, Cat scratch disease, Glanders, Lyme disease, Malidiosis, Streptococcosis, Plague, Rat bite fever, Tetanus, Tularemia, Yersiniosis, Staphylococcosis, Vibriosis, Listeriosis, Campylobacteriosis and others.

Unit III

History, Etiology, Epidemiology, Diagnosis and Management of important Mycotic zoonoses, viz., Dermatophytosis, Blastomycosis, Coccidioidomycosis, Cryptococcosis, Histoplasmosis, Aspergillosis, Candidiasis, Rhinosporidiosis, Sporotrichosis and others.

Unit IV

History, Etiology, Epidemiology, Diagnosis and Management of Chlamydiosis (Psittacosis and Ornithosis) and Prions diseases, viz., Creutzfeldt-Jakob Disease (CJD); Variant Creutzfeldt-Jakob Disease (vCJD), Kuru. Bovine Spongiform Encephalopathy (BSE), Chronic Wasting Disease (CWD) and Scrapie.

VI. Practical

Isolation and identification of important Bacterial, Mycotic and Chlamydial agents of public health significance from host, Vehicle and environment.

VII. Suggested reading

- Bauerfeind R, Graevenitz AV, Kimmig P, Schiefer HG, Schwarz T, Slenczka W and Zahner H. 2016. *Zoonoses: infectious diseases transmissible from animals and humans* (No. Ed. 4). American Society for Microbiology (ASM).
- Mahendra Pal.Zoonoses.
- Narayan KG *Epidemiology, Diagnosis and Management of Zoonoses.*
- Pedro N Acha and Boris Szyfres. *Zoonoses and Communicable Diseases Common to Man and Animals.*
- Seyedmousavi S, De Hoog GS, Guillot J and Verweij PE. 2018. *Emerging and Epizootic Fungal Infections in Animals*. Springereds.

- *Zoonoses: Recognition Control and Prevention* (Martin E, Jones EH, Hubbart WT and Hagstard HV)

I. Course Title : Zoonoses-II

II. Course Code : VPE 503

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on Epidemiology, Etiology, Transmission pattern, Public health significance, Diagnosis and Management of important Viral, Rickettsial and Parasitic zoonotic diseases.

V. Theory

Unit I

Disease burden, History, Etiology, Epidemiology, Transmission pattern, Diagnosis and management of important viral zoonoses, viz., Japanese encephalitis, Tick-borne encephalitis, Encephalomyelitis, Rabies, Influenza, KFD, Rift valley fever, Chickungunya, FMD, and Enteroviruses.

Unit II

Disease burden, History, Etiology, Epidemiology, Transmission pattern, Diagnosis and management of important viral zoonoses, viz., Crimean-Congo haemorrhagic fever, Dengue, West-Nile fever, Yellow fever, Rift-valley fever, Equine encephalitis, Louping ill, Ebola, Marburg, Hantavirus, Zika, Hendra, Nipah and Corona viruses.

Unit III

Disease burden, History, Etiology, Epidemiology, Transmission pattern, Diagnosis and Management of important Rickettsial zoonoses, viz., Q fever, Typhus fever group.

Unit IV

Disease burden, Etiology, Host range, Epidemiology, Transmission pattern, Diagnosis and Management of important Parasitic zoonoses, viz., Hydatidosis, Taeniosis, Trichinosis, Fascioliosis, Fasciolopsiosis, Toxoplasmosis, Trypanosomosis, Cryptosporidiosis, Cysticercosis, Leishmaniosis, Sarcocystosis, Dracunculosis, Paragonimosis and Diphylobothriosis.

VI. Practical

Isolation and identification methods for important viral and parasitic agents of public health significance from host, vehicle and environment.

VII. Suggested Reading

- Bauerfeind R, Graevenitz AV, Kimmig P, Schiefer HG, Schwarz T, Slenczka W and Zahner H. 2016. *Zoonoses: infectious diseases transmissible from animals and humans* (No. Ed. 4). American Society for Microbiology (ASM).
- Mackie and Mc. Cartney. *Practical Medical Microbiology*.
- Parija SC. *Text book of Medical Parasitology*.
- Pedro N Acha and Boris Szyfres. *Zoonoses and Communicable Diseases Common to Man and Animals*.
- Soulsby JL *Helminthes, Arthropods and Protozoa of Domesticated Animals*.
- Steele JL. *CRC Handbook series in Zoonoses*.
- Thapliyal DC. 1999. *Diseases of animals transmissible to man*. 1st ed. International Book Distributing Company, Lucknow.

I. Course Title : Principles of Epidemiology

II. Course Code : VPE 504

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on the principles and concepts employed for epidemiological investigation of the diseases.

V. Theory

Unit I

Historical perspective and scope of veterinary epidemiology. Theories of disease causation and advancement in the concepts of disease causation, Iceberg concept. Koch's postulates of disease causation. Epidemiological tringles, Disease causing wheels, webs and pies.

Unit II

Definitions: Epidemic, Endemic, Pandemic and Sporadic diseases. Qualitative and quantitative approaches to epidemiology. Measurement of disease. Endemic stability and herd immunity, Basic reproductive ratio, Trends and spatial distribution of disease, Epidemic curve and their utility.

Unit III

Transmission of disease and role of ecology in maintenance of disease agents. Type of epidemiological methods. Landscape and molecular methods used in the epidemiological investigation.

Unit IV

Epidemiological Studies-Observational (Case-control, cohort and cross-sectional studies) and experimental studies (field and clinical trials). Disease surveys, monitoring and surveillance. Epidemiological data bases.

Unit V

Definition, scope and limitation of serological epidemiology and interpretation of results. Characteristics of ideal serological test, multiple testing and evaluation of tests. Investigation of disease outbreaks. Strategies of disease control and eradication.

VI. Practical

Data collection from various sources, analysis and interpretation. Serum collection method demonstration. Analytical diagnostic and relative sensitivity and specificity calculation. use of software for data analysis.

VII. Suggested Reading

- Elliot P, Wakefield JC, Best NG and Briggs DJ. 2000. *Spatial Epidemiology: methods and applications*; Oxford University Press.
- Martin SW, Meek AH and Willeberg P. 1986. *Veterinary Epidemiology: Principles and methods*. IOWA State University Press/ Ames, Iowa. USA.

- Thrusfield M. 1995. *Veterinary Epidemiology*: Blackwell Science Ltd. Oxford, UK.

I. Course Title : Hygiene and Safety of foods of Animal and Aquatic origin

II. Course Code : VPE 505

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students about principles of food hygiene and quality improvement practices.

V. Theory

Unit I

Principles of food hygiene in relation to foods of animal and aquatic origin. Importance of food hygiene in public health. Impact of environmental sanitation and other factors on food quality. General principles of prevention of food-borne illnesses, risk analysis.

Unit II

Importance and objectives of milk hygiene. Hygienic production, Handling, Transportation, Storage and marketing of milk. Mastitis. Milk spoilage and preservation. Milk-borne diseases of public health significance. Milk allergy-lactose intolerance. Residues of pesticide and antibiotics in milk and its impact on human health. Milk spoilage. Milk adulteration, synthetic milk. Milk plant hygiene and sanitation.

Unit III

Objectives and importance of meat hygiene. Hygienic practices at farm and during transportation of food animals including poultry. Hygienic meat production-an overview. Adulteration. Speciation, spoilage and preservation of meat. Meat-borne diseases of public health significance. Treatment and safe disposal of slaughter-house by-products. Hygienic practices in abattoirs.

Unit IV

Fish, fisheries and ichthyology: an introduction. Environmental factors affecting aquatic food hygiene. Hygienic production, Handling, Preservation, Transportation and marketing of aquatic foods. Microbiology and Spoilage of aquatic foods. Safe disposal of fish byproducts. Fish-borne diseases of public health significance.

VI. Practical

Collection of meat/ milk/ egg/ fish samples for determination of physical as well as microbiological quality. Examination of meat/ milk samples for possible adulteration.

VII. Suggested reading

- FAO (Manual No. 79). *Manual on simple methods of Meat preservation.*
- Marriott NG, Schilling MW and Gravani RB. 2018. *Principles of Food sanitation*; Springer.
- Nollet LM and Toldrá F. 2016. *Safety Analysis of Foods of Animal origin*, CRC Press.ed.
- Norer R. 2016. *Genetic Technology and Food Safety*; Springer International Publishinged.
- Wro and Bruno. *Fish Disease and Disorders – Viral Bacterial and Fungal Infections.*

I. Course Title : Food-borne Infections and Intoxications

II. Course Code : VPE 506

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge about illnesses arising due to consumption of contaminated foods.

V. Theory

Unit I

Definition: Food borne infection, Food intoxication, Bacterial toxins, Toxi-infection, etc. Classification, Epidemiology, Disease burden and Economics of food-borne diseases. Reservoirs of food-borne pathogens and its mode of transmission. Vehicles of pathogens. Measures employed for prevention and control of food-borne diseases. Food- poisoning outbreak investigation and management.

Unit II

Epidemiology, Economic, Diagnosis and Management of bacterial food-borne infections and intoxications due to *Salmonella*, *Campylobacter*, *Clostridium*, *Staphylococcus*, *Listeria monocytogenes*, *Vibrio parahaemolyticus*, *E.coli*, *Bacillus cereus*, *Shigella*, *Yersinia enterocolitica* and others. Types of bacterial toxins and its manifestations.

Unit III

Epidemiology, Economics, Diagnosis and Management of food-borne Viral pathogens: Hepatitis viruses, Entero-viruses, Noroviruses, Rotaviruses and other. Food- borne parasitic and rickettsial infections.

Unit IV

Illness due to food additives, seafood toxins, mycotoxins, biocides, plant origin toxins, heavy metals, veterinary drugs, hormones, etc. in foods. Anti-microbial resistance (AMR) in food-borne pathogens-definition, current status, factors responsible, mechanism of resistance, mode of transmission and control.

VI. Practical

Food-borne disease outbreak investigation. Detection, characterization and quantitation of food-borne pathogens, toxins, antibiotics, pesticides and additives in foods.

VII. Suggested reading

- Cliver DO, Potter M and Riemann HP. 2011. *Food borne Infections and Intoxications*; Elsevier.
- D'Mello JPF. *Food Safety-Contaminants and Toxins*.
- Jay JM, Loessner MJ and Golden DA. 2008. *Modern food microbiology*; Springer Science and Business Media.
- Hubbert WT. *Food Safety and Quality Assurance-Foods of Animal Origin*.
- Vernam AH. 1991. *Food-borne pathogens*; Wolfe Publishing Ltd, London.

I. Course Title : Food Safety Standards and Regulations

II. Course Code : VPE 507

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with various parameters responsible for the production of hygienic and safe foods for human consumption.

V. Theory

Unit I

Indicators of food quality and spoilage (biological and others). Food plant hygiene and sanitation. Hurdle technique and its relevance. Microbiological criteria for food quality.

Unit II

Food standards- National, International, Private standards. GSP, GMP, HACCP and ISO 22000, etc. Genesis of food safety standards, Mechanism of food safety standards formulation, Agencies associated in food standard formulation, Role of WTO, FSSAI, BIS and others in standard formulation. National and international regulations and legislation enacted for quality food production.

Unit III

Food safety regulations in reference to the Pesticides, Veterinary drugs residues, Heavy metals, Hormones and others (MRLs, ADIs, etc.). Traceability system, Organic food production.

VI. Practical

Detection of Pesticides, Veterinary drug residues, Heavy metal in food samples. Visits to the various food processing units for examining the compliance of HACCP/ FSSAI regulations and other standards. Microbiological assessment of cleanliness of surface and equipment in abattoir/ meat/ milk plant

VII. Suggested Reading

- Fortin ND. 2016. *Food Regulation: law, science, policy, and practice*. John Wiley and Sons.
- Joint FAO. 2004. *Codex alimentarius: food hygiene basic texts* (No. Ed. 3). Food and Agriculture Organization of the United Nations.
- Josling TE, Roberts D and Orden D. 2004. *Food Regulation and Trade: toward a safe and open global system*; Peterson Institute Press.
- Van Der Meulen and Bernd. 2011. *Private Food Law: Governing food chains through contract law, self-regulation, private standards, audits and certification Schemes*. The Netherlands: Wageningen Academic Publishers.
- Vos E. 1999. *Institutional frameworks of community health and safety legislation: Committees, agencies, and private bodies*. Hart.

I. Course Title : Environmental Hygiene and Safety

II. Course Code : VPE 508

III. Credit Hours : 2+1

IV. Aim of the course

To impart education about environment, environmental pollutants and its manifestations on animal and human health.

V. Theory

Unit I

Introduction to environment, Environmental hygiene, Pollutants and its impact on animal/ human health. Green-house gasses and its effect. Microbial pollution. Environmental risk assessment and management.

Unit II

Nature and characteristics of various environmental pollutants. Pollutions of soil, air and water and its effects on health. Impact of noise pollution on health.

Unit III

Genetic risk from Environmental agents, Health problems due to nuclear energy, Microwave, Electro-magnetic and other radiation pollution, Environmental estrogens, Pesticides pollution. Industrial pollution as well as pollution due to plastic and petrochemical products.

Unit IV

Role of live-stock in environmental pollution, Dissemination of excreted pathogens, animal-waste and human risk, principles of safe disposal of bio-medical waste and recycling of wastes

Unit V

Contamination of environment with heavy metals, pesticides, veterinary drug residues and its impact on human health. National and international pollution control agencies and its role in management of environmental pollution. Regulations on control of environmental pollution.

VI. Practical

Determination of portability of drinking water, Estimation and detection of pathogenic microbes in water, air, soil, animal products, sewage, and animal waste; Visit of sewage and waste disposal plants/ sites.

VII. Suggested reading

- Fairman R, Mead CD and Williams WP. 1998. *Environmental risk assessment: approaches, experiences and information sources*.
- Frumkin H. 2016. *Environmental health: from global to local*. John Wiley and Sons.ed.
- Levy BS. 2006. *Occupational and environmental health: recognizing and preventing disease and injury*. Lippincott Williams and Wilkins. ed.
- Linkov I and Ramadan AB. 2004. *Comparative risk assessment and environmental decision making* (Vol. 38). Springer Science and Business Media.Ed.
- Ray M. *Environmental Pollution: Impact of technology on quality of life*.
- Richard B Philp. *Environmental Hazards and Human Health*

I. Course Title : Applied Epidemiology
II. Course Code : VPE 509
III. Credit Hours : 2+1

IV. Aim of the courses

To impart education on applied aspects of epidemiology.

V. Theory

Unit I

Introduction to applied epidemiology. Models, modelling and types of models. Epidemiological and economic models. Principles and classification of models. Deterministic and stochastic models. Empirical and explanatory models. Application of models in disease forecasting. Modelling in disease prevention and control.

Unit II

Disease occurrence, Ecology of disease, Monitoring and surveillance. Outbreak investigation protocol. Path, regression and discriminate analyses. Time series analysis and analysis of variance.

Unit III

Animal disease economics (cost-benefit analysis, internal rate of return, payback period, partial budgeting), decision analysis. Bayesian analysis. Monte-Carlo and Markovian processes and system evaluation. Uses of multivariate analysis.

Unit IV

Disease outbreaks, Participatory epidemiology, Disease reporting system, Tracing and notification. Disease control strategies, Risk assessment, Exotic diseases, Trans-boundary diseases, Vaccination.

Unit V

Definition; Disease intelligence. Tele-epidemiology. Remote sensing, Geographic information system, Disease surveillance and Early warning system.

VI. Practical

Survey, Sampling and Data presentation. Measurements of disease occurrence, Outbreak investigation and reporting. Use of epidemiological software.

VII. Suggested Reading

- Brownson RC and Petitti DB. 1998. *Applied Epidemiology: theory to practice*. Oxford University Press.
- Durr PA and Gatrell AC. 2004. *GIS and spatial analysis in veterinary science*. Cabi. Ed.
- Toma B, Dufour B, Sanaa M, Benet JJ, Moutou F, Louza A and Ellis P. 1999. *Applied Veterinary Epidemiology and the control of disease in populations*. 7 Avenue du Général de Gaulle.
- Twisk JW. 2013. *Applied longitudinal data analysis for epidemiology: a practical guide*. Cambridge university press.

I. Course Title : Bioterrorism and Disaster Management

II. Course Code : VPE 510

III. Credit Hours : 2+0

IV. Aim of the course

To equip the students with latest information of various types of disaster and its management, biological weapons used in bioterrorism, biological hazards and remedial measures, biomedical hazards and their prevention.

V. Theory

Unit I

Definition: Bioterrorism. Major agents used as biological weapons, Hazard analysis and combating bioterrorism. Bio-ethics and social ethics, Advisory role of veterinarians during such events.

Unit II

Definitions, Natural and man- made disaster, Impact analysis and classification of disaster scale, Essential preparations to manage disaster, Role of central, State and Local government bodies in disaster management, Role of veterinarians/ veterinary public health personnel during emergency/ Disaster and sequence of emergency medical services.

Unit III

Effect of natural disasters like floods, Prolonged draughts, Forest fires, Earthquakes, Tsunami and Tidal damages, Storms, etc. on human as well as animal population, post-disaster disease susceptibility and remedial measures.

Unit IV

Biosecurity– definition, importance, methods used for pathogen inventory, Food processing/ quarantine units/ animals/ poultry farms, etc. Biomedical hazards and biosafety in the laboratories. Occupational health risk and its management.

VI. Suggested Reading

- Antosia RE and Cahill JD. 2006. *Handbook of bioterrorism and disaster medicine*. Springer.ed.
- Hodgkinson PE and Stewart M. 1991. *Coping with catastrophe: A handbook of disaster management*. Taylor and Frances/ Routledge.
- Van De Walle B, Turoff M and Hiltz SR. 2014. *Information systems for emergency management*. Routledge.
- Van Oosterom P, Zlatanova S and Fendel E. 2006. *Geo-information for disaster management*. Springer Science and Business Media.Ed.

I. Course Title : Laboratory Techniques in Veterinary Public Health

II. Course Code : VPE 511

III. Credit Hours : 0+3

IV. Aim of the course

To impart practical exposure of laboratory techniques in Veterinary Public Health to the students.

V. Practical

Unit I

General practices: Use of PPE (Personal Protective Equipment) and biosafety cabinets, Preparation of glass-wares, cultural media, buffer solution, solutions of different molarity and other laboratory materials. Sampling methods for biological materials. Quality analysis of milk, meat, water and other food materials and others.

Unit II

Microbiological techniques: Plate counts, Enumeration and isolation of psychrophilic, Thermophilic and thermoduric organisms in food samples, Enumeration, isolation and identification of important food-borne pathogens, Detection of bacterial toxin involved in food-poisoning, Detection of viral pathogens in various samples. Isolation, identification and enumeration of yeast/ molds/ spores in food samples.

Unit III

Immunological/ Serological and electrophoretic techniques: AGPT, Precipitation tests, Agglutination test, Haem-agglutination test, Polyacrylamide gel electrophoresis, Counter immuno- gel electrophoresis, ELISA, FAT, Intra-dermal inoculation tests and others.

Unit IV

Detection and quantification of residues of pesticides and drugs using immunological and chromatographic methods.

Unit V

Methods for isolation and quantitation of genomic DNA/ RNA from bacterial and other biological specimens using Latest molecular techniques and others. Laboratory records and log books of equipment.

VI. Suggested Reading

Course Outline-cum-Lecture Schedule for Master Degree Programme

I. Course Title : Concepts in Veterinary Public Health and One Health
II. Course Code : VPE 501
III. Credit Hours : 2+0

Lecture(s)	Topic
Theory	
1-2	VPH administration: organization, administration and implementation of VPH services/ programs
3-4	Structure and function of VPH agencies/ organizations at national and international levels
5-6	VPH team; administration and functions; responsibilities of veterinarians in the public health team
7	One Health: Definition, historical emergence of the concept. Scope, objectives and activities of One Health
8-9	One Health Umbrella, stewardship of VPH for the implementation of one health activities
10	Strategic framework of One Health activities
11-12	One Health approaches for control of zoonoses and ensuring food safety
13	One Health approaches for combating antimicrobial resistance
14	One health policies, legislations and research
15-16	Transdisciplinary approach of eco-health concepts; one health integrating policy, science and practices
17	Genesis ofveterinary public health and epidemiology as a discipline
18-19	Global burden of disease – need for inter-sectoral and inter-disciplinary collaboration
20-21	Coordinated and systemic disease control response
22	Ecosystems, urbanization, intensive agriculture and animal husbandry practices
23	Exploring host-pathogen interactions for better multi-sectoral responses at the human-animal-ecosystem interface addressing food safety, zoonoses, and other public health threats
24	Climate change and need for multi-sectoral and collateral/ multi-lateral collaborations
25	Sharing of epidemiological data and laboratory information on zoonoses and food safety problems across sectors
26	Integration of one health approaches for the promotion of ecosystem and wildlife health
27	Organizations and agencies working to mitigate health challenges based on ‘One Health Approach’
28	One Health Initiative as a union of human and veterinary medicine
29	Local, regional, national and international One Health networks
30	One Health in the paradigm of preventive health care and herd health management
31-32	Case study that integrate veterinary public health with one health

I. Course Title : Zoonoses-I
II. Course Code : VPE 502
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definition and classification of zoonoses
2	Factors affecting occurrence of zoonoses
3	Disease management strategies
4	Zoonotic disease burden on population
5	Socioeconomic impact of zoonoses
6	Public health implications of bacterial zoonoses
7-9	History, etiology, epidemiology, diagnosis and management of anthrax, brucellosis and tuberculosis
10	History, etiology, epidemiology, diagnosis and management of leptospirosis
11-12	History, etiology, epidemiology, diagnosis and management of plague, rat bite fever, borreliosis and lyme disease
13-14	History, etiology, epidemiology, diagnosis and management of glanders, malidiosis, streptococcosis
15	History, etiology, epidemiology, diagnosis and management of salmonellosis
16	History, etiology, epidemiology, diagnosis and management of campylobacteriosis
17	History, etiology, epidemiology, diagnosis and management of yersiniosis and vibriosis
18-19	History, etiology, epidemiology, diagnosis and management of tetanus, listeriosis, staphylococcosis and tularemia, etc.
20	History, etiology, epidemiology, diagnosis and management of cat scratch disease,
21	History, etiology, epidemiology, diagnosis and management of mycotic zoonoses – General considerations
22-23	History, etiology, epidemiology, diagnosis and management of dermatophytosis, blastomycosis and coccidioidomycosis
24	History, etiology, epidemiology, diagnosis and management of cryptococcosis and histoplasmosis
25	History, etiology, epidemiology, diagnosis and management of aspergillosis and candidiasis
26	History, etiology, epidemiology, diagnosis and management of rhinosporidiosis, sporotrichosis and others
27	History, etiology, epidemiology, diagnosis and management of chlamydiosis (psittacosis and ornithosis)
28	History, etiology, epidemiology, diagnosis and management of prion diseases - Creutzfeldt-Jakob Disease (CJD) and variants
29-30	History, etiology, epidemiology, diagnosis and management of prion diseases - bovine spongiform encephalopathy (BSE), kuru, chronic wasting disease (CWD) and scrapie
31-32	Case studies pertaining to important zoonoses of India
Practical	
1.	Sampling and laboratory preparedness for handling zoonotic bacterial and fungal agents
2.	Isolation, identification and characterization of agents of *Bacillus anthracis* and zoonotic *Mycobacterium* species.
3.	Isolation, identification and characterization of zoonotic *Streptococcus* and *Staphylococcus* species.

Lecture(s)	Topic
4.	Isolation, identification and characterization of agents of *Clostridium tetani* and zoonotic *Listeria* species.
5.	Isolation, identification and characterization of zoonotic *Leptospira* and *Borrelia* species.
6.	Isolation, identification and characterization of *Burkholderia mallei* and *Burkholderia pseudomallei*
7.	Isolation, identification and characterization of zoonotic *Brucella* species
8.	Isolation, identification and characterization of food-borne and zoonotic *Salmonella* species including serotyping of isolates
9.	Isolation, identification and characterization of zoonotic *Yersinia* and *Vibrio* species
10.	Isolation, identification and characterization of zoonotic agents responsible for rat bite fever, cat scratch disease, tularemia, etc.
11.	Isolation and identification of zoonotic fungal agents of public health significance from the host, vehicle and environment associated with superficial mycozoonoses
12.	Isolation, identification and characterization of important mycotic agents of public health significance associated with systemic mycozoonoses – blastomycosis and coccidioidomycosis
13.	Isolation, identification and characterization of important mycotic agents of public health significance associated with systemic mycozoonoses – cryptococcosis and histoplasmosis
14.	Isolation, identification and characterization of important mycotic agents of public health significance associated with systemic mycozoonoses - aspergillosis, candidiasis, rhinosporidiosis and sporotrichosis
15.	Isolation, identification and characterization of important chlamydial agents of public health significance from host, vehicle and environment
16.	Laboratory detection of prion diseases

I. Course Title : Zoonoses-II
II. Course Code : VPE 503
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1-3	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Japanese encephalitis, Tick-borne encephalitis and Encephalomyelitis
4-8	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Rabies, Influenza, KFD, Rift valley fever andChikungunya
9	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of FMD and Enteroviruses
10	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Crimean-Congo haemorrhagic fever
11-12	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Dengue, West-Nile fever and Yellow fever
13	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Rift-valley fever, Louping ill
14	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of equine encephalitis
15-16	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis

Lecture(s)	Topic
	and management of Ebola, Marburg and Hantavirus
17-18	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Hendra Nepah and Zika virus
19	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of corona viruses
20	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of important rickettsial zoonoses
21	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of Q fever
22	Disease burden, history, etiology, epidemiology, transmission pattern, diagnosis and management of typhus fever group
23-25	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of hydatidosis, taeniosis/ cysticercosis and Trichinosis
26	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of fasciolosis and fasciolopsiosis
27	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of Toxoplasmosis
28-29	Disease burden, etiology, host range, epidemiology transmission pattern, diagnosis and management of Trypanosomosis and Leishmaniosis
30	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of Cryptosporidiosis
31	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of Sarcocystosis and Dracunculiosis
32	Disease burden, etiology, host range, epidemiology, transmission pattern, diagnosis and management of Paragonimiosis and Diphylobothriosis
Practical	
1.	Detection and characterization of zoonotic viral and parasitic agents from host, vehicle, environment, etc. - Sampling and laboratory preparations
2.	Detection and characterization of Japanese encephalitis, chikungunya and dengue viruses
3.	Detection and characterization of encephalomyelitis, Rift valley fever, West-Nile fever, yellow fever, louping ill and equine encephalitis viruses
4.	Detection and characterization of rabies and influenza viruses
5.	Detection and characterization of FMD and entero-viruses
6.	Detection and characterization of KFD, tick-borne encephalitis and Crimean-Congo haemorrhagic fever viruses
7.	Detection and characterization of zoonotic Ebola, Marburg, Hanta, Zika, corona, Hendra and Nipah viruses
8.	Isolation, identification and characterization of agents responsible for Q fever, typhus fever and other rickettsial zoonoses
9.	Detection and characterization of agents responsible for hydatidosis, taeniosis/ cysticercosis and trichinellosis
10.	Detection and characterization of agents responsible for fascioliosis and fasciolopsiosis
11.	Detection and characterization of *Toxoplasma gondii*
12.	Detection and characterization of zoonotic *Trypanosoma* species
13.	Detection and characterization of zoonotic *Cryptosporidium* species of health significance
14.	Detection and characterization of zoonotic *Leishmania* species
15.	Detection and characterization of zoonotic *Sarcocystis* species
16.	Detection and characterization of zoonotic agents responsible for dracunculiosis, paragonimiosis and diphylobothriosis

I. Course Title : Principles of Epidemiology
II. Course Code : VPE 504
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Historical perspective and scope of veterinary epidemiology
2	Disease causation -theories of disease causation, recent advancements and iceberg concept
3	Koch's postulates and Evan's rules
4	Epidemiological triangle
5	Epidemic, endemic, pandemic and sporadic diseases
6	Qualitative and quantitative approaches to epidemiology
7	Measurement of disease in populations
8	Endemic stability and herd immunity
9	Basic reproductive ratio
10	Trends in spatial and temporal distribution of disease
11	Epidemic curve and its applications
12	Transmission of disease
13	Role of ecology in maintenance of disease agents
14	Epidemiological methods
15	Landscape epidemiology
16	Molecular epidemiology
17	Epidemiological studies
18	Observational studies - case-control studies
19	Observational studies - cohort studies
20	Observational studies - cross-sectional studies
21	Experimental studies - field trials
22	Experimental studies - clinical trials
23	Disease surveys
24	Monitoring and surveillance
25	Epidemiological databases
26	Definition, scope and limitations of serological epidemiology and interpretation of results
27	Characteristics of ideal disease diagnostic tests
28	Multiple diagnostic testing
29	Evaluation of diagnostic tests
30	Investigation of disease outbreaks
31	Strategies of disease control
32	Disease eradication
Practical	
1.	Collection of data from various sources, analysis and interpretation
2.	Demonstration of sample (serum) collection
3.	Evaluation of diagnostic tests
4.	Analytical diagnostic and relative sensitivity and specificity calculation
5.	Use of software for data analysis
6.	Designing and interpretation of a case-control study
7.	Designing and interpretation of a cohort study
8.	Designing and interpretation of a cross-sectional study
9.	Designing and interpretation of a field trials
10.	Designing and interpretation of a clinical trials
11.	Determination of vaccines effectiveness
12.	Designing of a survey

Lecture(s)	Topic
13.	Spatio-temporal distribution of disease
14.	Outbreak investigation
15.	Case study on disease eradication
16.	Case study on disease monitoring and surveillance

I. Course Title : Hygiene and Safety of foods of Animal and Aquatic origin

II. Course Code : VPE 505

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Importance of food hygiene in relation to the public health
2	Principles of food hygiene in relation to foods of animal origin (including aquatic origin foods)
3	Environmental sanitation in food establishments
4	Food quality - perspectives
5	Prevention of foodborne illnesses - principles
6	Risk analysis
7	Milk hygiene - importance and objectives
8	Hygienic production, handling, transportation, storage and marketing of milk and milk products
9	Mastitis in dairy animals and its public health significance
10	Spoilage of milk
11	Preservation of milk
12	Milk-borne diseases of public health significance
13	Epidemiology of milk allergy and lactose intolerance
14	Public health impact pesticide residues in milk supply chain
15	Antimicrobial residues in milk supply chain and their public health impact
16	Adulteration of milk and dairy products
17	Public health implications of synthetic milk
18	Milk plant hygiene and sanitation
19	Meat hygiene - importance and objectives
20	Hygienic meat production including hygienic practices at abattoirs
21	Hygienic practices at farm and during transportation of food animals including poultry
22	Adulteration of meat and meat speciation
23	Spoilage of meat and meat products
24	Preservation of meat
25	Meat-borne diseases of public health significance
26	Safe disposal of slaughter house byproducts
27	Fish, fisheries and ichthyology
28	Environmental factors affecting aquatic food hygiene
29	Hygienic production, handling, preservation, transportation and marketing of aquatic foods
30	Microbial profile and spoilage of aquatic foods
31	Disposal of fishery waste
32	Fish-borne diseases of public health significance

Lecture(s)	Topic
Practical	
1.	Collection of samples of meat, milk, egg and fish for physicochemical and microbial analysis
2.	Analysis of foods of animal origin for physicochemical quality
3.	Analysis of foods of animal origin for microbial quality
4.	Detection of adulteration, debasement, substitution and admixing of animal origin foods and products
5.	Recent methods of speciation of meat
6.	Determination of spoilage in foods of animal origin
7.	Extension of shelf life of perishable foods of animal origin
8.	Detection of mastitis in dairy animals and linking it to consumer's health
9.	Study of supply chains of milk, meat, egg and fish
10.	Evaluation of food plant, equipment and the environment for compliance
11.	Microbial risk analysis
12.	Risk analysis for residues of public health significance in foods of animal origin
13.	Source tracing of foodborne outbreaks using molecular, bioinformatics or epidemiological tools
14.	Evaluation of fish and aquatic harvest for quality and safety
15.	Visit to milk/ meat/ egg/ fish processing unit for the demonstration of food quality and safety checkpoints
16.	Study of databases, information communication tools (ICT) and dedicated websites related to quality and safety of animal origin foods

I. Course Title : Food-borne Infections and Intoxications
II. Course Code : VPE 506
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definitions: Foodborne infections, Food intoxications, Toxi-infections, Bacterial toxins, etc.
2-3	Classification, epidemiology, disease burden and economics offoodborne diseases.
4	Fungal toxins
5	Plant, algal, and other toxins
6	Reservoirs of food-borne pathogens
7	Mode of transmission of food-borne pathogens
8	Vehicles of pathogens
9	Measures employed for prevention and control of food-borne diseases
10-11	Food- poisoning outbreak investigation
12	Management of food- poisoning outbreak
13-15	Epidemiology, economic, diagnosis and management of bacterial food-borne diseases
16-17	Foodborne disease due to *Salmonella* and *Campylobacter* species
18-19	Foodborne disease due to *Clostridium*, *Staphylococcus*, *Listeria* and *Bacillus* species
20-22	Foodborne diseases due to species of *Vibrio*, *Escherichia*, *Shigella*, *Yersinia*, etc.
23	Types of bacterial toxins and their manifestations
24-25	Epidemiology, economics, diagnosis and management of food-borne viral pathogens
26	Foodborne diseases due to hepatitis viruses and entero-viruses
27	Foodborne diseases due to noroviruses, rotaviruses, etc.
28	Food- borne rickettsial infections

Lecture(s)	Topic
29	Food- borne parasitic infections
30	Illness due to additives in foods, seafood toxins, mycotoxins, biocides and plant origin toxins
31	Illness due to food heavy metals, veterinary drugs, hormones, etc. in foods
32	Anti-microbial resistance (AMR) in food-borne pathogens-definition, current status, factors responsible, mechanism of resistance, mode of transmission and control

Practical

1. Food-borne disease outbreak investigation
2. Detection and characterization of food-borne bacterial pathogens in foods of animal origin
3. Detection and characterization of food-borne viral pathogens in foods of animal origin
4. Detection, quantification and characterization of microbial toxins in foods of animal origin
5. Detection of antimicrobial resistance in foodborne pathogens and their molecular and epidemiological characterization
6. Detection and characterization of rickettsial pathogens in foods of animal origin
7. Detection and characterization of parasites of public health in foods of animal origin
8. Detection, quantification and characterization of toxic compounds in the fish and aquatic food supply chain
9. Detection and quantification of antimicrobials in foods of animal origin
10. Detection and quantification of phytotoxins, biocides, etc. in foods of animal origin
11. Detection and quantification of pesticides residues in foods of animal origin
12. Detection and quantification of residues of metals and other environmental contaminants in foods of animal origin
13. Detection and quantification of additives in foods of animal origin
14. Detection and quantification of veterinary drugs in foods of animal origin
15. Case study on food-borne microbial disease relevant to the region
16. Case study on non-microbial hazard relevant to the region

I. Course Title : Food Safety Standards and Regulations
II. Course Code : VPE 507
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Indicators of food quality and safety
2	Food spoilage (biological, chemical, etc.)
3	Food plant hygiene
4	Sanitation program for the food plant
5	Hurdle technique and its relevance
6	Microbiological food quality criteria
7-8	National and international food standards
9	Private food standards
10	Prerequisite programs for food safety - GAP, GMP, etc.
11	Application of ISO 9000 series to food establishments
12-13	HACCP, ISO 22000

Lecture(s)	Topic
14	Genesis of food safety standards
15	Mechanisms of food safety standard formulation
16	Agencies associated in food standard formulation
17	Role of WTO and FSSAI in standard formulation
18	Role of BIS and other agencies in standard formulation
19	Role of EIC/ EIA
20	National regulations and legislations related to quality food production
21	International regulations related to quality food production
22-26	Food safety regulations in reference to pesticides, veterinary drug, heavy metals, hormones and other residues (MRL, ADI, etc.)
27	Traceability system for foods of animal origin
28	Organic food production
29	Packaging of foods of animal origin – specifications and standards
30	Public health implications of *in-vitro* and cultured meats as well as meat obtained from genetically modified and unconventional animals
31	SWOT analysis of emerging and novel technologies related to the quality and safety of foods of animal origin
32	Case study related to food standards
Practical	
1.	Detection of pesticide residues in foods of animal origin
2.	Detection of veterinary drug residues in foods of animal origin
3.	Detection of heavy metal residues in foods of animal origin
4.	Estimation of MRL/ MPL
5.	Estimation of NOEL, ADI, etc.
6.	Microbiological assessment of cleanliness of food plant surface
7.	Microbiological assessment of equipment in abattoir/ meat/ milk plant
8.	Visit to food processing units for examining compliance of HACCP/ FSSAI regulations and other standards
9.	Demonstration of traceability system for foods of animal origin
10.	Demonstration of compliance of organic production of foods of animal origin
11.	Demonstration of registration and licensing of food business operator (FBO) under FSSAI regime
12.	Evaluation of detergents and sanitizers used in the food plant
13.	Inventory management and hygiene audit of food plant
14.	Occupational safety at food plant
15.	Case study on HACCP
16.	Case study on ISO 22000

I. Course Title : Environmental Hygiene and Safety
II. Course Code : VPE 508
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Introduction to the environment and environmental hygiene
2	Impact of environmental pollutants on animal and human health
3	Characteristics of various environmental pollutants
4	Nature and impact of microbial pollution
5	Nature and impact of pollution due to chemical pollutants

Lecture(s)	Topic
6	Environmental risk assessment (microbial and non-microbial hazards)
7	Pollutions of soil, air and water and their effects on human, animal and environmental health
8	Dissemination of pathogens and pollutants in the environment
9	Global warming, enhanced green-house effect and climate change- impact on human, animal and environmental health
10	Impact of noise pollution on human and animal health
11	Management of environmental pollution
12	Industrial pollution including impact of plastic and petrochemical products
13	Genetic risk associated with environmental pollutants
14	Health problems due to nuclear energy, microwave, electro-magnetic and other radiation pollutions
15	Pollution due to agrochemicals and pesticides
16-17	Contamination and impact of heavy metals and veterinary drug residues
18	Role of livestock in environmental pollution
19	Public health impact of animal-waste
20	Recycling of wastes
21	Principles of safe disposal of bio-medical waste
22	Food chain consequences of environmental pollutants, contaminants and toxicants
23	Implications of genetically modified organisms on the animal, human and environmental health - regulations and compliance
24	Management of environmental pollution – conventions, treaties, agreements, etc.
25-26	Role of national and international pollution control agencies in the management of environmental pollution.
27	Regulations pertaining to environmental pollution and its control
28	Hygiene and safety at specialized laboratories
29	Designing and maintenance of laboratories that handle high risk pathogens
30	Environmental risk assessment of hazards of regional/ national importance
31	Case studies involving livestock and the environment
32	Case studies indicating human health impact associated livestock
Practical	
1.	Determination of potability of the drinking water
2.	Detection of pollutants in the water
3.	Detection of pollutants in the air
4.	Detection of pollutants in the soil
5.	Detection of pollutants in the animal products
6.	Detection of pollutants in the sewage
7.	Detection of pollutants in the animal waste
8.	Detection and quantification of environmental pollutants, toxicants and contaminants that affect animal, human and environmental health
9.	Sustainable methods for animal waste disposal/ economic utilization arising from intensive animal husbandry
10.	Cost-benefit analysis of environment friendly animal waste disposal approaches
11.	Detection and quantification of genetically modified organisms
12.	Structure and function of institutional biosafety committee (IBSC)
13.	Environmental monitoring of pollutants – markers and methods
14.	Preparation of feasibility report or projects pertaining to selected environmental pollutant(s) of regional importance
15.	Visit to sewage/ waste recycling/ disposal plant/ processing unit
16.	Case studies on risk mapping, environmental risk assessment, pollution mitigation, etc.

I. Course Title : Applied Epidemiology
II. Course Code : VPE 509
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	An introduction to applied epidemiology
2	Models, modeling and types of model
3	Epidemiological and economic models
4	Principles and classification of models
5	Deterministic and stochastic models
6	Empirical and explanatory models
7	Application of models in disease forecasting
8	Modeling in disease prevention and control
9-10	Disease occurrence and ecology of disease
11	Monitoring and surveillance
12	Outbreak investigation protocol
13	Path, regression and discriminate analyses
14	Time series analysis
15	Statistical analysis of the data - Analysis of variance
16	Animal disease economics - cost-benefit analysis, internal rate of return payback period, etc.
17	Animal disease economics - partial budgeting
18	Animal disease economics - decision analysis
19	Bayesian analysis
20	Monte-Carlo and Markovian processes and system evaluation
21	Multivariate analysis
22	Disease outbreaks and participatory epidemiology
23	Disease reporting system - tracing and notification
24	Disease control strategies
25	Risk assessment
26	Exotic diseases and trans-boundary diseases
27	Vaccination for the prevention of diseases
28	Disease intelligence
29	Tele-epidemiology
30	Application of remote sensing technology
31	Geographic information system
32	Disease surveillance and early warning system
Practical	
1.	Survey of animal diseases
2.	Biostatistics for establishing disease causality, association and measurements
3.	Profanity and non-probability sampling methods
4.	Presentation of disease data
5.	Measurements of disease occurrence in populations
6.	Outbreak investigation
7.	Disease reporting systems
8.	Demonstration of epidemiological software
9.	Estimation of disease burden and economics of animal/ zoonotic diseases
10.	Modeling of animal diseases
11.	Demonstration of cartography and disease mapping using computer software
12.	Demonstration of global positioning system (GPS), remote sensing technology and geographic information system (GIS)

Lecture(s)	Topic
13.	Working modality on disease surveillance and monitoring
14.	Demonstration of disease early warning system
15.	Disease modeling
16.	Case study on disease reporting and notifiable disease

I. Course Title : Biosecurity, Bioterrorism and Disaster Management
II. Course Code : VPE 510
III. Credit Hours : 2+0

Lecture(s)	Topic
Theory	
1.	Introduction and definitions related to the bioterrorism
2.	Potential biological weapons
3.	Categorization agents of bioterrorism
4.	Hazard analysis in bioterrorism
5.	Strategies for combating bioterrorism
6.	Bio-ethics, social ethics and advisory role of veterinarians during the event of bioterrorism
7.	Disaster – Definitions, categorization (natural and man-made disasters)
8.	Impact analysis of disasters
9.	Classification of disaster scale
10.	Essential preparations for the management of disasters
11.	Role of central, state and local government bodies in disaster management
12.	Role of veterinarians/ veterinary public health personnel during emergency/ disasters
13.	Sequence of emergency services
14.	Effect of natural disasters on human and animal populations
15.	Nature and characteristics of disasters - floods, tsunami, tides, etc.
16.	Nature and characteristics of disasters - prolonged draughts, forest fires, etc.
17.	Nature and characteristics of disasters - earthquakes, storms, etc.
18.	Post-disaster disease susceptibility and remedial measures
19.	Biosecurity– definition, importance, methods, pathogen inventory, etc.
20.	Biosecurity at food processing establishments
21.	Biosecurity at livestock/ poultry farms
22.	Biosecurity at specialized animal facilities
23.	Quarantine measures for disease prevention – structure and functions
24.	Biomedical hazards at hospitals, laboratories and special animal handling units
25.	Laboratory biosafety – principles, requirements and applications
26.	Biosafety at the specialized laboratories
27.	Occupational health risk and its management
28.	National and international laboratory safety compliance
29.	Prediction, early warning or forecasting systems for disasters
30.	Case study related to bioterrorism
31.	Case study related to biosafety
32.	Case study related to disaster

I. Course Title : Laboratory Techniques in Veterinary Public Health
II. Course Code : VPE 511
III. Credit Hours : 0+3

Class	Topic
Practical	
1	General laboratory practices – safety precautions, hazardous material disposal, maintenance and compliance with existing norms
2	Personal safety and use of PPE (personal protective equipment) in the laboratory
3	Laminar airflows– uses, types of cabinets, SOPs, applications, etc.
4	Biosafety cabinets – uses, types of cabinets, SOPs, applications, etc.
5	Preparation of glassware and plastic wares
6-8	Preparation of culture media
9-10	Preparation of buffers and solutions of different for laboratory use
11-12	Sampling methods
13-14	Techniques for quality analysis of milk and milk product
15-16	Techniques for quality analysis of meat and meat products (including poultry and egg)
17-18	Techniques for quality analysis of food/ feed and environmental samples
19	Analysis of water for quality and safety
20-21	Microbiological techniques: Plate counts - psychrophilic, mesophilic, thermophilic and thermoduric organisms
22-23	Microbiological techniques: enumeration techniques for psychrophilic, mesophilic, thermophilic and thermoduric organisms from samples of foods of animal origin
24-26	Techniques for isolation and identification of foodborne and zoonotic pathogens
27-28	Techniques for detection of microbial toxins associated with food-poisoning and outbreaks
29-30	Techniques for detection and confirmation of viral pathogens
31-32	Techniques for isolation, identification, enumeration, confirmation and characterization of fungi of public health significance
33-34	Immunological techniques used for the detection of zoonotic agents - hypersensitivity based tests
35-36	Serological techniques: precipitation and agglutination tests, counter immune-electrophoresis, ELISA, etc.
37-38	Electrophoresis (AGE, PAGE, SDS-PAGE, etc.) techniques
39-40	Chromatographic methods
41-42	Techniques for the detection and quantification of pesticides residues
43-44	Techniques for the detection and quantification of drugs using immunological and chromatographic methods
45	Methods for isolation and quantification of nucleic acids from pathogens from diverse biological specimens using latest molecular techniques
46-47	Molecular techniques for the detection and characterization of organisms of veterinary public health significance – PCR and other molecular techniques
48	Maintenance of laboratory records, log books of equipment and laboratory accreditation (NABL)

Course Title with Credit Load Ph.D. in Veterinary Public Health and Epidemiology

Course Code	Course Title	Credit Hours
VPE 601	Advances in Veterinary Public Health and Epidemiology*	2+1
VPE 602	Emerging, Re-emerging Zoonoses and One Health*	2+1
VPE 603	Advances in Food Safetyand Quality Control of Foods of Animal/ Aquatic origin*	2+1
VPE 604	Biosecurity and Occupational Health Safety	2+1
VPE 605	Recent Concepts in Epidemiology and Disease Forecasting	2+1
VPE 606	Risk Analysis and Predictive Modelling	2+1
VPE 607	Advances in Environmental Hygiene	2+1
VPE 608	Herd Health Management and Disease Economics	2+1
VPE 609	Epidemiology of Trans-boundary, Non-infectious and Chronic diseased	2+1
VPE 610	Ecology and Animal/ Human Health	2+0
VPE 611	Diagnostic Approaches in Epidemiology	2+1
VPE 612	Surveys, Surveillance and Data Management	2+1
VPE 613	Research Methodology and Publication Ethics in VPE*	2+0
VPE 690	Special Problem	0+1
VPE 691	Doctoral Seminar-I*	0+1
VPE 692	Doctoral Seminar-II*	0+1
VPE 699	Doctoral Research	75

*Core Courses

Course Contents
Ph.D. in Veterinary Public Health and Epidemiology

I. Course Title : Advances in Veterinary Public Health and Epidemiology

II. Course Code : VPE 601

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint with current/ contemporary issues concerning the veterinary public health, veterinary epidemiology and the one health.

V. Theory

Unit I

Contemporary status of Veterinary Public Health in India and abroad. Public Health in the 21stCentury.Veterinary public health and its role in the society. Role of veterinary public health professionals in prevention and control of zoonoses. Organization and administration of veterinary public health agencies structure and functions. Data analysis framework in healthcare and social sectors. Evidence-based information updates on current VPH topics. Global animal disease surveillance.

Unit II

Recent diagnostic tools used for emerging public health problems including zoonoses. Molecular surveillance of recent pandemics of zoonoses. Modes of evolutionary emergence of disease agents pertinent to VPE.

Unit III

Application of bioinformatics, biotechnological and computational tools in food hygiene, safety, quality assurance and environmental health protection. Global pandemic threat preparedness. Emerging Disease Surveillance and Control. Biomedical models in veterinary public health.

VI. Practical

Estimation of burden of food-borne zoonotic diseases. Special problems related to field investigations of outbreaks of food poisoning and zoonotic diseases in a community. Application of recent analytical methods and *in-silico* techniques for public health research. Visits to hospitals to acquaint the students with public health related problems.

VII. Assignments

Each student will select at least two recent articles from journals related to the course and discuss the same in the class through presentation.

VIII. Suggested reading

- Eldridge BF and Edman JD. eds., 2012. *Medical entomology: A textbook on public health and veterinary problems caused by arthropods*. Springer Science and Business Media

- Noordhuizen, Josephus Pieter Thérèse Maria K Frankena, Michael V Thrusfield and EA M Graat. *Application of quantitative methods in veterinary epidemiology*. Wageningen Pers, 2001.
- Schwabe CW, Riemann HP and Franti CE. 1977. *Epidemiology in veterinary practice*. Lea and Febiger.
- Thrusfield M. 2018. *Veterinary epidemiology*. John Wiley and Sons.

I. Course Title : Emerging, Re-emerging Zoonoses and One Health

II. Course Code : VPE 602

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with emerging and re-emerging zoonotic diseases.

V. Theory

Unit I

Status of emerging and re-emerging zoonotic infections, National and international interests in zoonoses, Measurement and economics of zoonoses, Latest diagnostic and Management planning for zoonoses. Factors responsible for emergence and re-emergence of zoonotic diseases. Health threats at the human- animal-ecosystems/ environment interface (HAEI), a tripartite concept of OIE, WHO and FAO.

Unit II

Current challenges and strategies, euzoonoses, xenozoonoses, nosocomial zoonoses, newer zoonotic agents, viz., cat-scratch disease, rat bite fever, Creutzfeld-Jacob disease, Ebola, Marburg, Lassa, Nipah, Menangle, Herpes B, SARS, AI, ZIKA, MERS, etc.

Unit III

Simian and human immunodeficiency, bovine spongiform encephalopathy, hepatitis A and E, Toro, influenza viruses; re-emerging zoonoses with new pathology, viz., neuro-cysticercosis, campylobacteriosis, rabies, Guillain-Barre Syndrome, tuberculosis.

Unit IV

Safety regulations in laboratories, hospitals and biological plants. Use of bio safety cabinets. Bio security.

VI. Practical

Special problems related to emerging/ re-emerging/ prevalent zoonotic diseases in India. Status of Brucellosis and Tuberculosis in the India, OIE recommended diagnostic tests, vaccines/ strategies for prevention and control. Visits to rural health centres to acquire status of zoonotic diseases.

VII. Assignments

Each student will select at least two recent articles from journals related to course and discuss the same in the class through presentation.

VIII. Suggested reading

- Calvin W Schwabe. 1984. *Veterinary Medicine and Human health*. Williams and Wilkins
- Rezza G and Ippolito G. eds. 2017. *Emerging and Re-emerging Viral Infections*. Springer.
- Singh SK. ed. 2015. *Human Emerging and Re-emerging Infections*. John Wiley and Sons.

I. Course Title : Advances in Food Safety and Quality Control of Foods of Animal/ Aquatic

II. Course Code : VPE 603

III. Credit Hours : 2+1

IV. Aim of the course

To provide expertise to students the advances in the food safety, quality control and quality assurance of animal origin foods.

V. Theory

Unit I

Food supply chain. Food handling practices. New age voluntary and mandatory food standards. Types and evolution of food standards. Characteristics of food safety hazards. Quality control, assurance and food safety specifications for animal origin foods such as meat, milk, egg and fish. Trends in green technologies in food production and processing.Impacts and performance of organic farming *vis-a-vis* conventional farming.

Unit II

Recent innovations in shelf-life extension, preservation and packaging. Requirements for food testing and calibration Laboratory Mechanism of food spoilage (microbial and non-microbial). Nature of major food-borne infections and intoxications. Traceability system. Waste reduction along the food supply chain.

Unit III

Rapid detection of food safety hazards. Food safety risk assessment. Quality assurance schemes applicable to foods of animal origin. Elements of national food control system. National food control systems. Global considerations and role of committees and agencies associated with food safety, quality control and quality assurance.

Unit IV

Genesis of food quality/ safety standard. Food quarantine and export guidelines, specifications and standards. National and international food safety compliances. Traceability of foods of animal origin.

VI. Practical

Special problems on quality and safety of foods of animal origin foods. Detection, enumeration and identification of major food-borne pathogens. Visits to food processing establishments. Environmental impact assessment of production of foods of animal origin.

VII. Assignments

Each student will select at least two recent articles from journals related to course and discuss the same in the class through presentation.

VIII. Suggested reading

- Marriott NG, Schilling MW and Gravani RB. 2018. *Principles of food sanitation*. Springer.
- Nollet LM and Toldrá F. eds., 2016. *Safety analysis of foods of animal origin*. CRC Press
- Paustenbach DJ. ed., 2015. *Human and Ecological Risk Assessment: Theory and Practice* (Wiley Classics Library). John Wiley and Sons.
- Toldrá F and Nollet LM. eds., 2017. *Advances in food diagnostics*. John Wiley and Sons.

I. Course Title : Biosecurity and Occupational Health Safety

II. Course Code : VPE 604

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students with biosafety and occupational health safety.

V. Theory

Unit I

Definitions. Physical, Chemical and Biological hazards. Bio-safety and bio-security. Elements of bio-security and bio-containment. Biosecurity requirements. Containment Barriers. Equipment safety. Risk assessment. Bio-safety levels. Laboratory safety. Bio-safety in microbiological and biomedical laboratories.

Unit II

Risk groups, Classification of organisms by risk groups. Classification of occupational groups. Laboratory designs. Transmission, spread, Maintenance and control of diseases affecting various occupational groups in contact with animals and their public health significance. Diseases associated with various occupations.

Unit III

Occupational safety and health. Occupational Health and Safety (OHS) management system standard ISO 45001. regulations pertaining to the Occupational safety and health. Occupational Safety and Health Administration. International Labour Organization.

VI. Practical

Diagnosis of occupational diseases of public health significance. Handling of Bio-safety cabinets. Relation of risk group to bio-safety levels, practices and equipment. Visit to BSL-3 and BSL-4 laboratories.

VII. Suggested reading

- Fleming DO and Hunt DL. 2006. *Biological safety: principles and practices* (No. Ed. 4). ASM Press.
- Guillén J. ed. 2017. *Laboratory Animals: Regulations and Recommendations for the Care and Use of Animals in Research*. Academic Press.
- Rabinowitz PM, Lefkowitz RY, Conti LA, Redlich CA and Weigler BJ. 2015. *Occupational health of laboratory animal workers. In Laboratory Animal Medicine* (pp. 1381-1402). Academic Press.
- World Health Organization. 2016. *Assessment Tool for Key Processes associated with the Design, Construction, Operation, Maintenance and Regulation of BSL-3 Facilities in the WHO African Region*.

I. Course Title : Recent Concepts in Epidemiology and Disease Forecasting

II. Course Code : VPE 605

III. Credit Hours : 2+1

IV. Aim of the course

To learn about different epidemiological aspects of major diseases and to develop suitable disease forecasting system.

V. Theory

Unit I

Review of epidemiological concepts and applications, recent concepts.

Unit II

Epidemiology of economically important diseases in the region (haemorrhagic septicaemia, foot and mouth disease, surra, brucellosis, PPR, swine fever, IBD, NCD, avian Influenza, sheep pox, contagious ecthyma, etc).

Unit III

Geographical Information System and its applications in epidemiology, various expert systems and their role in epidemiology.

Unit IV

Modelling and application of various models in disease forecasting. Epidemiological software and its applications, global and national early warning system.

VI. Practical

Epidemiological exercises of economically important diseases in the region, use of Geographical Information System in epidemiology, various expert systems, modelling and various models used in disease forecasting, development of suitable epidemiological software for the prevailing problems to attend disease outbreaks including laboratory investigations and reporting of routs.

VII. Suggested reading

1. Beaglehole R, Bonita R and Kjellstrom T. 1993. *Basic Epidemiology*, World Health Organization, Geneva.
2. Lilienfeld DE and Stolley P. 1994. *Fundamentals of Epidemiology*, 3rd ed., Oxford University Press, New York
3. Noordhuizen JPTM, Frankena K, van der Hoofd CM and Graat EAM: *Application of quantitative methods in Veterinary Epidemiology*. Wageningen Pers, Wageningen, The Netherlands. 1997.
4. Raj S Bhopal. 2016. *Concepts of Epidemiology: Integrating the ideas, theories, principles and methods of epidemiology*. 3rd Ed., Oxford University Press. Oxford.

I. Course Title : Risk Analysis and Predictive Modelling

II. Course Code : VPE 606

III. Credit Hours : 2+1

IV. Aim of the courses

To Acquaint the students with the latest knowledge on prediction od infections and the extent of risk in the population

Unit 1

Definitions. History of risk analysis. Relevance of risk analysis (RA) to food sector. Principles of risk analysis. Risk analysis components (risk assessment, management and communication). Microbial Risk Assessment (MRA) involving hazard identification, exposure assessment, hazard characterization, and risk characterization. Methodologies used in RA/ MRA. Qualitative and quantitative risk analysis. Quantitative Microbial Risk Assessment (QMRA) for foods of animal origin including water. Application of mathematical models to study propagation of microbial hazards from farm-to-fork. Risk-based decision-making.

Unit II

Variability and uncertainty inherent to biological data. Measurement and modelling of uncertainty and variability during risk assessment. Risk assessment, risk analysis and HACCP. Linking microbial food safety with risk assessment. Relevance of assumptions and observed data for predictive models. Study of software packages used for risk analysis.

Unit III

Mathematical modelling of microbial growth rate. Predictive modelling tools for food safety management. Microbial modelling for the prediction of product shelf life and safety. Applications of predictive modelling of microbial behaviour in foods.

V. Practical

Modelling of infectious diseases using computational and mathematical methods. Building and analysing models of infectious diseases. Study of population-level processes for infectious diseases of animals and humans. Performing risk analysis for selected food safety hazards using microbial risk analysis tools. Risk assessment using through simulation modelling.

VI. Suggested reading

3. Pastorok RA, Bartell SM, Ferson S and Ginzburg LR. eds., 2016. *Ecological modeling in risk assessment: chemical effects on populations, ecosystems, and landscapes*. CRC Press.
4. Subramaniam P and Wareing P. eds., 2016. *The stability and shelf life of food*. Woodhead Publishing.

I. Course Title : Advances in Environmental Hygiene

II. Course Code : VPE 607

III. Credit Hours : 2+1

IV. Aim of the course

To update knowledge on modern environmental pollution problem and control.

V. Theory

Unit I

Current status of problems pertaining to environmental hygiene, air, soil and water pollution, Disinfection procedures, Impact of global warming and other environmental problems leading to change in ecology of diseases and impact on human/ animal health; Carbon footprint, Eco-philosophy, Environmental ethics and Environmental economics, Environmental conflicts and cooperation.

Unit II

Environmental risks their assessment and management and reporting, modern global information, surveillance and monitoring systems, decision making and public awareness. Role of VPH in National Sanitation Programmes such as Swachh Bharat Abhiyan.

Unit III

International environmental management efforts, participatory international organizations and their selected programmes and selected legislations.

VI. Practical

Detection and monitoring/ estimation of air, soil and water pollution; detection of pathogens from environmental sources. Visits to water/ sewage treatment plants.

Assignments

Each student will select at least two recent articles from journals related to course and discuss the same in the class through presentation.

VII. Suggested reading

1. Curtis SE. 1983. *Environmental management in animal agriculture*. Iowa State University Press.
2. Frumkin H. ed., 2016. *Environmental health: from global to local*. John Wiley and Sons.
3. Paustenbach DJ. ed., 2015. *Human and Ecological Risk Assessment: Theory and Practice* (Wiley Classics Library). John Wiley and Sons.
4. Sparling DW. 2016. *Ecotoxicology essentials: environmental contaminants and their biological effects on animals and plants*. Academic Press.

I. Course Title : Herd Health Management and Disease Economics

II. Course Code : VPE 608

III. Credit Hours : 2+1

IV. Aim of the course

Adoption of holistic approach to address issues of herd health without affecting production.

V. Theory

Unit I

General principles, interactions between health and production and herd immunity.

Unit II

Dairy cattle: mastitis, brucellosis and haemo-protozoan control and health management of dairy cows and calves.

Unit III

Health and production in swine, sheep, goats and poultry, vaccination, biosecurity practices for prevention and control of diseases.

VI. Practical

Visit to various bovine, equine, sheep, goat and poultry farms, assessment of their problems, systematic programmes for prevention and control of specific diseases and its impact, calculation of disease economics. Animal-house hygienic practices.

Assignments

Each student shall select at least two recent articles from journals related to course and discuss the same in the class through presentation.

VII. Suggested Reading

I. Course Title : Epidemiology of Trans-boundary, Non-infectious and Chronic Diseases

II. Course Code : VPE 609

III. Credit Hours : 2+1

IV. Aim of the course

To provide students the expertise in elucidating epidemiology of non-infectious and chronic diseases.

V. Theory

Unit I

Establishment of causality and associations in non-infectious and chronic diseases. Characteristics of Koch's/ Henle-Koch postulates and Evans' rules of disease causation. Unified principles of establishing causality for both infectious and non-infectious diseases. Infectious disease and chronic disease connections. Causal role of infectious agents in cancer (relating criteria). Establishment of trends in disease occurrence. Epidemiology of non-infectious and chronic diseases affecting different systems in various animal species.

Unit II

Emerging infectious determinants of chronic diseases- reasons for emergence, range of pathways and epidemiology of chronic non-infectious disease. Study of characteristics of risk factors (genetic, physiological, environmental, behavioral, etc) associated with non-infectious and chronic diseases. Demographic, epidemiological and nutrition transition. Social determinants of non-communicable diseases. Spatial and temporal epidemiology of non-infectious diseases, viz., nutritional, reproductive, chemical poisoning, toxicity (pesticides, poisonous plants), metabolic diseases, toxicities, neoplastic and other miscellaneous diseases.

Unit III

Global status of non-communicable diseases. Modelling of non-infectious non - communicable diseases or chronic diseases. Economic Impact of chronic diseases. Prevention and control: current status and future perspectives.

VI. Practical

Measurement of burden of non-infectious and chronic diseases (mortality, morbidity, survival, risk factors, etc.). Controlled trials and short research problem(s) involving contemporary issues and research techniques. Animal models for the study of non-infectious and chronic diseases. Survey of non-infectious and chronic diseases using animal disease model systems.

VII. Suggested Reading

I. Course Title : Ecology and Animal/ Human Health

II. Course Code : VPE 610

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint students about ecological basis of disease.

V. Theory

Unit I

Establishment of links between animal/ human health with the ecosystems. Assessment of changing trends in the environments and its on the animal/ human health. Study of emerging public health threats linked to the changes in the environment. Study of landscape epidemiology of diseases. Study of contemporary issues centered on ecological and evolutionary perspectives of infectious diseases.

Unit II

Animal–human-ecosystem interface. Study of ecological/ environmental factors influencing spatio-temporal occurrence of disease such as temperature, rainfall and other environmental factors. Ecological conditions and evolutionary dynamics. Disease ecology based explanatory and predictive models. Elucidation of natural history and host-parasite interactions linked to the ecological factors.

Unit III

Ecology of vector borne diseases. Vector dynamics and ecology. Study extrinsic incubation period. Understanding of critical risk factors of spread such as timing, distribution, abundance of competent vectors.

Unit IV

Study of cyclical patterns of disease. Mapping environmental conditions with disease. Establishing functional links between environmental modifications and disease. Linking climate change with disease occurrence. Study of dynamics of ENSO with climate change and disease. Evolution of disease alert and forecasting systems. Use of global positioning and remote sensing tools for disease management. Early warning and GIS based disease predictions.

I. Course Title : Diagnostic Approaches in Epidemiology

II. Course Code : VPE 611

III. Credit Hours : 2+1

IV. Aim of the course

Learning of recent advanced molecular techniques for establishing disease diagnosis.

V. Theory

Unit I

The concept of molecular basis of a disease, molecular determinants of pathogenicity of infectious agents and their transmissibility to susceptible populations of livestock and poultry.

Unit II

Laboratory biosafety, Antigenic, Genetic and Biological characterization of field isolates of pathogens incriminated in field outbreaks, Differentiation of field and Vaccine strains, the concept of Marker vaccines, and Correlation of pathotypes and genotypes of a pathogen.

Unit III

Immunological tests, immunoblotting techniques and use of monoclonal antibodies in different ELISAs for antigenic analysis. Application of nucleic acid-based assays, viz., polymerase chain reaction (PCR) assays, nucleotide sequencing, restriction endonucleaseanalysis and RFLP analysis for genomic characterization using the field material directly or after extraction of nucleic acid from small scale cultures, use of radio-actively labelled or non-radioactive oligo-nucleotide probes in dot-blot and Southern hybridizations.

VI. Practical

Finger printing of the nucleic acid obtained from field isolates and their comparative analysis. PCR and ELISA for screening of field samples.

VII. Assignment

Each student shall select at least two recent articles from journals related to the course and discuss the same in the class through presentation.

VIII. Suggested reading

- Thrusfield M. 2018. *Veterinary Epidemiology,* John Wiley and Sons.

I. Course Title : Surveys, Surveillance and Data Management

II. Course Code : VPE-612

III. Credit Hours : 2+1

IV. Aim of the course

To demonstrate different methodologies and procedures involved in conducting survey and surveillance and collection of data, analysis and interpretation of data. Systematic data collection, analysis and management

V. Theory

Unit I

Robust survey: Planning, Statistical models for the same and Surveillance, Purpose and method of sampling, Size of sample, Questionnaires. State, National and

International agencies (OIE, CDC, etc.), their data bases and their management systems.

Unit II

Goals and types of surveillance, monitoring, mechanism of surveillance and surveillance network.

Unit III

Disease/ data recording and reporting, vet. recording schemes, vet. information system and data bases.

Unit IV

Emergence of new diseases and re-emergence of old diseases. Epidemiology of globally and nationally important emerging/ re-emerging diseases and designing of strategies for their prevention and control.

VI. Practical

Prepare questionnaires on selective topics, survey for livestock and poultry farmers to find out usefulness/ effectiveness of vaccination/ artificial insemination/ other practices, surveillance of important diseases in different parts of state, data analysis and presentation of data, development of suitable software.

VII. Assignment

Each student will select at least two recent articles from journals related to course and discuss the same in the class through presentation.

VIII. Suggested reading

- Hawker J, Begg N, Reintjes R, Ekdahl K, Edeghere O and Van Steenbergen JE. 2018. *Communicable disease control and health protection handbook*. John Wiley and Sons.
- Salman M. ed., 2008. *Animal disease surveillance and survey systems: methods and applications*. John Wiley and Sons.

I. Course Title : Special Problem

II. Course Code : VPE 690

III. Credit Hours : 0+1

IV. Aim of the course

To provide expertise in handling practical research problem(s).

V. Practical

Short research problem(s) involving contemporary issues and research techniques. Presentation and discussion of novel research papers on the disease or intervention strategies such disease pathogenesis, pathobiology, epidemiology, host-agent-environmental relationships, molecular mechanisms/ diagnostics, spatio-temporal trends, etc. Planning a short research problem or working on a published research paper or new developments.

Course Outline-cum-Lecture Schedule for Doctoral Degree Programme

I. Course Title : Advances in Veterinary Public Health and Epidemiology
II. Course Code : VPE 601
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1-3	Contemporary status of Veterinary Public Health in India and abroad. Public Health in the Twenty first Century
4	Veterinary public health and its role in the society
5-6	Role of veterinary public health professionals in prevention and control of zoonoses.
7	Opportunities for veterinary public health professionals
8-9	Organization and administration of veterinary public health agencies structure and functions
10-11	Data analysis framework in healthcare and social sectors
12-15	Evidence-based information updates on current VPH topics
16-17	Global animal disease surveillance
18-19	Recent diagnostic tools used for emerging public health problems including zoonoses
20-21	Molecular surveillance of recent pandemics of zoonoses
22-23	Modes of evolutionary emergence of disease agents pertinent to VPH
24-27	Application of bioinformatics, biotechnological and computational tools for food hygiene. food safety quality assurance environmental health protection
28-29	Global pandemic threat preparedness
30-31	Emerging Disease Surveillance and Control
32	Biomedical models in veterinary public health
Practical	
1	Assessment of health status of an individual
2-3	Estimation of disease burdens in a population
4-5	Estimation of burden of food-borne and zoonotic diseases
6	Molecular epidemiology and genetic analysis of agents of VPH significance
7	Case study related to field investigations of outbreaks of food poisoning
8	Case study related to zoonotic diseases in a community
9	Application of recent analytical methods (*in-vitro, invivo* and *in silico* techniques) used for public health research
10	Visits to hospitals to acquaint the students about public health related problems.
11	Health hazards across food supply chain
12	Hygiene of production/ processing of foods of animal origin
13	Safety management at the large-scale production or processing units of foods of animal origin
14	Longitudinal and integrated food safety assurance
15-16	Assignment: Each student will select at least two recent articles from journals related to the course and discuss in the class through presentation

I. Course Title : Emerging, Re-emerging Zoonoses and One Health
II. Course Code : VPE 602
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definitions – emerging and re-emerging zoonoses. Public health risks of emerging and re-emerging zoonoses
2	Status of emerging and re-emerging zoonotic infections
3	National and international interests in emerging and re-emerging zoonoses
4	Measurement of emerging and re-emerging zoonoses
5	Economics of emerging and re-emerging zoonoses
6	Factors responsible for emergence and re-emergence of zoonotic diseases
7	Role of wildlife in emerging and re-emerging zoonoses
8	Current concepts in the diagnosis of emerging and re-emerging diseases
9	Epidemiology and combating of emerging and re-emerging zoonotic diseases
10	Latest diagnostics and management planning for emerging and re-emerging zoonoses
11-12	Health threats at the human- animal-ecosystems/ environment interface (HAEI) - tripartite (OIE, WHO and FAO) initiatives
13	Comparative medicine and VPH - horizons and perspectives in emerging and re-emerging zoonotic infections
14	Current challenges and strategies in the area of euzoonoses, xenozoonoses, nosocomial zoonoses and newer zoonotic agents
15-16	Characteristics, host range, epidemiology and management of Cat-scratch disease, Rat bite fever, Ebola and Marburg
17-18	Characteristics, host range, epidemiology and management of Lassa, Nipah, and Menangle viruses
19-20	Characteristics, host range, epidemiology and management of SARS, Toro, ZIKA and MERS virus infections
21	Characteristics, host range, epidemiology and management of zoonotic influenza viruses
22	Characteristics, host range, epidemiology and management of herpes and hepatitis (A and E) viruses
23	Characteristics, host range, epidemiology and management of co-infections, super-infections and syndemics - Simian and human immunodeficiency viruses
24	Characteristics, host range, epidemiology and management of taeniasis/ cysticercosis
25	Characteristics, host range, epidemiology and management of Bovine spongiform encephalopathy
26	Characteristics, host range, epidemiology and management of Creutzfeldt-Jacob disease
27	Characteristics, host range, epidemiology and management of brucellosis, tuberculosis and other emerging bacterial zoonoses
28	Guillain-Barre Syndrome and related sequel due to emerging/ re-emerging zoonoses
29-30	Close collaborations with regional, national and international organizations in the control of emerging/ re-emerging pathogens
31-32	Case study on emerging/ re-emerging zoonotic disease
Practical	
1	Application of safety regulations in laboratories, hospitals and biological units for handling emerging/ re-emerging agents
2	Methods to elucidate epidemiology of emerging/ re-emerging zoonoses

Lecture(s)	Topic
3	Approach to establish role of wildlife in emerging/ re-emerging zoonoses
4	Epidemiology of drug resistant emerging/ re-emerging zoonotic agents
5	Establishing genetic basis of bacterial emerging/ re-emerging zoonoses
6	Establishing genetic basis of viral and prion emerging/ re-emerging zoonoses
7	Establishing genetic basis of fungal, rickettsial and chlamydial emerging/ re-emerging zoonoses
8	Recommended diagnostic testing (OIE) for emerging/ re-emerging zoonoses
9	Vaccination and other strategies for the prevention of emerging/ re-emerging zoonoses
10	Application of Novel molecular methods for the understanding of emerging/ re-emerging zoonoses
11	Study abundance, behaviour, profiling and dynamics of vectors associated with emerging/ re-emerging zoonoses
12	Institutional surveillance of emerging/ re-emerging zoonoses
13	Visits to health centre to study of zoonotic diseases and categorization of agents as emerging/ re-emerging zoonosis
14	Special problem related to emerging/ re-emerging or prevalent zoonotic diseases
15-16	**Assignment:** Each student will select at least two recent articles from journals related to course and discuss in the class through presentation

I. Course Title : Advances in Food Safety and Quality Control of Foods of Animal/ Aquatic Origin

II. Course Code : VPE 603

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Food supply chain dynamics
2	Food production, processing and handling practices
3	Food safety and quality assurance of foods of animal origin
4	New age voluntary and mandatory food standards
5	Types and evolution of food standards
6	Characteristics of food safety hazards
7-8	Quality control, assurance and food safety specifications for animal origin foods such as meat, milk, egg and fish
9-10	Recent innovations in shelf-life extension, preservation and packaging
11	Requirements for food testing and calibration Laboratory Mechanism of food spoilage (microbial and non-microbial)
12	Nature of major food-borne infections and intoxications
13	Elimination of food safety hazards from primary production systems
14	Rapid detection of food safety hazards
15	Impact of animal feed on food safety. Prevention and control of risks arising due to animal feeds
16	Coordination of surveillance policies in animal health and food safety
17	Food safety challenges in animal production systems affecting global markets
18	Quality assurance schemes applicable to foods of animal origin
19	Veterinary services for public health and consumer safety
20	Food safety risk assessment
21	National food control systems and its elements

Lecture(s)	Topic
22	Genesis of food quality/ safety standard
23-24	Food quarantine and export guidelines, specifications and standards
25	National and international food safety compliances
26	Traceability system - Traceability of foods of animal origin
27	Global considerations and role of committees and agencies associated with food safety, quality control and quality assurance
28	Trends in green technologies in food production and processing
29	Waste reduction along the food supply chain
30	Impacts and performance of organic farming *vis-a-vis* conventional farming
31	Consumer perspectives of food quality and safety
32	Environmental impact assessment of production of foods of animal origin
Practical	
1-2	Detection, enumeration and identification of food safety hazards
3	Pre-requisite programs for ensuring food safety
4	Environmental impact assessment
5	Application of generic traceability system for foods of animal origin
6	Detection of allergens associated with foods of animal origin
7	Emerging technologies for microbial control in food processing
8-9	Methods of management of waste arising from production and processing units (foods of animal origin including aquaculture)
10	Rapid alert system for food and feed
11-12	Visit to food processing establishments
13-14	Special problems on quality and safety of foods of animal origin foods
15-16	Assignment: Each student will select at least two recent articles from journals related to course and discuss in the class through presentation

I. Course Title : Biosecurity and Occupational Health Safety

II. Course Code : VPE 604

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definitions: Bio-safety, bio-security and bio-containment; physical, chemical and biological hazards
2	Elements of bio-security and bio-containment
3	Nature of physical, chemical and biological hazards at work places
4-5	Bio-security requirements, Containment Barriers
6-7	Laboratory and equipment safety
8	Risk assessment
9	Bio-safety levels
10-11	Bio-safety in microbiological and bio-medical laboratories
12-13	Risk groups, classification of organisms by risk groups
14	Classification of occupational groups
15	Laboratory designs - Biosafety Level 1/ Animal Biosafety Level 1
16	Laboratory designs - Biosafety Level 2/ Animal Biosafety Level 2
17	Laboratory designs - Biosafety Level 3/ Animal Biosafety Level 3
18	Laboratory designs - Biosafety Level 4/ Animal Biosafety Level 4
19-21	Transmission, spread, maintenance and control of diseases affecting various occupational groups in contact with animals and their public health significance

Lecture(s)	Topic
22-23	Diseases associated with various occupations
24	Occupational safety and health
25	Occupational Health and Safety (OHS) management system standard ISO 45001
26	Regulations pertaining to the Occupational safety and health
27	Occupational Safety and Health Administration
28	Risk group classification, Bio-risk Management
29	Classification of infective microorganisms by risk groups
30	Institutional Biosafety Committees (IBCs)
31	The Bio-medical Waste Management (Amendment) Rules, 2018
32	International Labour Organization and its occupational safety provisions, Research Ethics and Compliance
Practical	
1	Standard laboratory practices
2	Handling of Bio-safety cabinets
3-4	Detection of occupational diseases of public health significance
5	Relation of risk group to biosafety levels, practices and equipment
6-7	Design of BSL-1 to BSL-4 laboratories
8	Survey of biosafety and biosecurity in biomedical laboratories
9-11	Transportation of dangerous pathogens/ samples – modes, guidelines and regulations
13	Activity spectrum of detergents and disinfectants
14	Personal protection, Bio-risk Assessment Sheet and Material Safety Data Sheet (MSDS)
15	Case study on occupational safety in specialized laboratories
16	Case study on biosafety level 3 or 4 laboratory

I. Course Title : Recent Concepts in Epidemiology and Disease Forecasting

II. Course Code : VPE 605

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Epidemiological concepts of disease occurrence in population
2	Variations in disease by time, place, and animal/ person
3	Recent epidemiological approaches for elucidating cause and effect
4	Variations: Role of error, bias, and confounding
5	The concept of risk/ risk factor in relation to the disease
6	Characterization and quantification of risk in epidemiology
7	Concepts in the measures of disease frequency
8	Analysis and integration of data for epidemiological methods/ techniques
9	Concepts in epidemiological study designs
10	Recent concepts in the epidemiology of economically important bacterial animal diseases of the region (haemorrhagic septicaemia, brucellosis, etc)
11-12	Recent concepts in the epidemiology of economically important viral animal diseases, viz., FMD, Swine fever, Avian Influenza, Sheep Pox, IBD, NCD and others of the region
13-14	Recent concepts in the epidemiology of economically important fungal, parasitic

Lecture(s)	Topic
	and other animal diseases of the region
15	Geographical Information System (GIS)
16	Advancements in GIS technology for epidemiological application in Veterinary and Animal Sciences
17	Various expert systems and their role in epidemiology
18	Concepts in animal disease modelling, Animal disease modelling, Disease prediction models
19	Modelling of economically important animal diseases
20	Modelling of emerging zoonotic infections
21	Advances in disease forecasting
22	Application of advanced disease forecasting concepts for animal/ zoonotic diseases
23	Disease early warning systems
24	Global and national disease early warning systems
25	Epidemiological softwares and their applications related to animal/ zoonotic infections
26	Common software packages and databases used in veterinary practice
27	Epidemiological Concepts Regarding Disease Monitoring and Surveillance
28	Advances in the practice of Public Health Surveillance
29	Real-time animal tracking using global positioning systems (GPS)
30	Use of advanced computing and remote sensing/ satellite technology for the study of animal/ zoonotic diseases
31	Case study related to application of recent epidemiological tool
32	Case study related to disease forecasting
Practical	
1	Use of Geographical Information System to study epidemiology of disease
2	Disease expert systems for animal/ zoonotic diseases
3	Disease modelling for animal/ zoonotic diseases
4	Model designing for disease forecasting
5	Study of epidemiology of disease outbreaks using advanced epidemiological techniques
6	Investigation of animal/ zoonotic diseases using recent epidemiological tools
7	Advanced disease reporting system
8	Study of animal/ zoonotic diseases using advanced computing tools
9	Study of animal/ zoonotic diseases using remote sensing/ satellite technology
10	Risk mapping for animal/ zoonotic diseases
11-12	Epidemiological exercises of economically important diseases of the region
13	Use of artificial intelligence and neural networks in veterinary epidemiology
14	Integrated disease surveillance system – prototype development
15	Case study related to advanced epidemiological tool
16	Case study related to advanced disease forecasting/ modelling

I. Course Title : Risk Analysis and Predictive Modelling
II. Course Code : VPE 606
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definitions, History of risk analysis
2	Relevance of risk analysis (RA) to food sector

Lecture(s)	Topic
3	Principles of risk analysis
4	Risk analysis components (risk assessment, management and communication)
5	Risk assessment
6	Risk management
7	Risk communication
8	Microbial Risk Assessment (MRA) involving hazard identification, exposure assessment, hazard characterization, and risk characterization
9	Hazard identification
10	Exposure assessment
11	Hazard characterization
12	Risk characterization
13	Methodologies used in risk analysis (RA)/ Microbial Risk Assessment MRA
14	Qualitative and quantitative risk analysis
15	Qualitative risk analysis
16	Quantitative Microbial Risk Assessment (QMRA) for foods of animal origin including water
17	Application of mathematical models to study propagation of microbial hazards from farm-to-fork
18	Risk-based decision-making
19	Variability and uncertainty inherent to biological data
20	Measurement and modelling of uncertainty and variability during risk assessment.
21	Integration of risk assessment/ risk analysis with HACCP and other quality management or assurance systems
22	Linking microbial food safety with risk assessment
23	Relevance of assumptions and observed data for predictive models
24	Study of software packages used for risk analysis
25	Mathematical modelling of microbial growth rate in food/ feeds
26	Predictive modelling tools for food safety management
27	Microbial modelling for the prediction of product shelf-life and safety
28	Applications of predictive modelling of microbial behaviour in foods
29	Meta-analysis in risk analysis of animal/ zoonotic diseases
30	Risk prediction models
31	Multivariate prediction models
32	Case study related to MRA of foods of animal origin

Practical

1. Microbial Risk Assessment (MRA)
2. Risk assessment
3. Risk management
4. Risk communication
5. Qualitative MRA
6. Quantitative MRA
7. Modelling of infectious diseases using computational and mathematical methods.
8. Building and analyzing models of infectious diseases
9. Study of population-level processes for infectious diseases of animals and humans
10. Performing risk analysis for food safety hazards using microbial risk analysis tools
11. Risk assessment using high throughput simulation modelling
12. Investigation of uncertainty, variability and sensitivity analysis techniques using computer models
13. Risk prediction models – study of prototype
14. Meta-analysis – study of prototype

Lecture(s)	Topic
15.	Multivariate prediction models – study of prototype
16.	Case study on MRA

I. Course Title : Advances in Environmental Hygiene
II. Course Code : VPE 607
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Current status of problems pertaining to environmental hygiene
2	Status, impact and management of air pollution
3	Status, impact and management of global warming
4	Status, impact and management of soil pollution
5	Status, impact and management of water pollution
6	Status, impact and management of environmental problems
7	Impact of pollution on the ecology of diseases
8	Environmental impact of intensive animal husbandry
9	Impact of intensive animal husbandry on the public health
10	Animal sector consequences of carbon footprints
11	Eco-philosophy, policy and advocacy of environmental hygiene with veterinary/ animal husbandry perspectives
12	Environmental economics
13	Environmental conflicts and cooperation
14	Ethics and compliance - sustainable animal husbandry and environmental safety
15	Disinfects and disinfection procedures
16	Environmental risk analysis (assessment and management)
17	Occupational health impact of animal farming
18	Occupational environmental hygiene and safety linked to animals
19	Health risk profiling and risk analysis of animal farming and trade
20	Epidemiology of chronic occupational disease induced by environmental pollution
21	Ecotoxicology of toxicants used in the farming
22	Bio-accumulation, concentration and bio-magnification of pollutants, toxicants and hazardous substances in the environment
23	Reporting of environmental issues and global informatics
24	Environmental hazard surveillance and monitoring systems
25	Decision making and public awareness
26	Role of VPH in National Sanitation Programmes (Swachh Bharat Abhiyan and other governmental programmes)
27	International environmental management efforts
28	International organizations and programmes
29	Legislations on environmental hygiene, safety and policy
30	Case study on ammonia as pollutant from animal sector
31	Case study on hydrogen sulphide as pollutant from animal sector
32	Case study on methane as pollutant from animal sector
Practical	
1	Hygiene and sanitization of animals and animal premises
2	Detection and monitoring of pollutants emanating from animals to the air
3	Detection and monitoring of pollutants emanating from animals to the soil

Lecture(s)	Topic
4	Detection and monitoring of pollutants emanating from animals to the water
5	Detection and monitoring of pollutants emanating from animals to other environmental sources
6	Advanced environmental hazard measurement methods
7	Measurement of health effects of environmental toxicants
8	Environmental risk assessment methods
9	Risk analysis of animal contributed ammonia
10	Risk analysis of animal contributed hydrogen sulphide
11	Risk analysis of animal contributed methane
12	Risk analysis of animal contributed other environmental hazards
13-14	Visits to remediation unit, waste water treatment plant, sewage treatment plants, tannery, etc. to study characteristics, impact and mitigation of hazards and associated risks
15-16	Assignments: Each student will select at least two recent articles from journals related to course and discuss in the class through presentation

I. Course Title : Herd Health Management and Disease Economics

II. Course Code : VPE 608

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	General principles of herd health
2	Interaction between health and production
3	Health effects of animal and zoonotic infections at the farm level
4	Direct and indirect losses due to zoonotic diseases
5	Components of the economic impact of animal diseases
6	Herd health management and disease economics
7	Linking heard health with economics – margin of returns
8	Health effects of animal and zoonotic infections at the regional/ state/ national/ international level
9	Interactions between health, production and disease
10	General principles of enhancing herd immunity
11	Economic methods of disease control for decision support
12	Herd health management – intervention options and their economic assessment
13	Quantification of financial effects of animal disease
14	Methods for optimizing decisions at individual animal, herd and population levels
15	Determination of costs and benefits of disease control measures
16	Estimation of extent of the disease and potential spread
17	Economic aspects and impact of zoonotic diseases
18	Estimation of cost of animal/ zoonotic disease on livelihoods outcomes (income, health, and trade), including environmental impacts
19	Assessment of the cost-effectiveness of control strategies used to reduce the risk of animal/ zoonotic diseases
20	Identification of factors affecting adoption of zoonotic risk reduction strategies
21	Estimation of disability adjusted life years (DALYs) parameters
22	Herd health management and disease economics of diseases in cattle/ buffalo
23	Herd health management and disease economics of diseases in sheep/ goat
24	Herd health management and disease economics of diseases in swine

Lecture(s)	Topic
25	Herd health management and disease economics of diseases in poultry
26	Herd health management and disease economics of diseases in other livestock
27	Preventive healthcare through vaccination
28	Preventive healthcare through bio-security practices
29	Economic benefits of prevention and control of diseases
30	Zoning and creation of disease-free area
31	Disease eradication and surveillance
32	Case study on eradiation of disease–Economic perspectives
Practical	
1	Study of framework of animal health management
2	Steps and methods for assessment of the economic impact of a disease
3	Assessing economic merit of interventions to control disease
4	Decision analysis and decision support systems for promoting animal health
5	Modelling animal health economics
6	Modelling the economics of Veterinary Services at the Farm Level
7	Modelling the economics of National Disease Control Programs
8	Economic modelling techniques (i.e. partial budgeting, cost-benefit analysis, decision analysis, and systems simulation) for veterinary decision making
9	Economic assessment of problems, programmes, prevention/ control measures, impact, etc.
10	Economic evaluation of hygienic practices in the animal house
11	Estimation of burden of animal/ zoonotic diseases
12	Estimation of DALY and other disease parameters
13	Case study on economic impact of zoonotic diseases
14	Visit to various livestock farms, assessment of their problems
15-16	Assignments: Each student shall select at least two recent articles from journals related to course and discuss in the class through presentation

I. Course Title : Epidemiology of Trans-boundary, Non-infectious and Chronic Diseases

II. Course Code : VPE 609

III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Definition and characteristics of trans-boundary diseases
2	Global trends in the occurrence of trans-boundary diseases
3	Role of wildlife in emergence of trans-boundary diseases
4	Prevention/ control of trans-boundary diseases
5	Important trans-boundary diseases categorized according to the aetiology
6	Important trans-boundary diseases categorized according to the animal species
7	New Technologies to fight transboundary animal diseases
8	Role of veterinary public health and veterinary services in the management of non-infectious and chronic diseases
9	Establishment of causality and associations in non-infectious and chronic diseases
10	Characteristics of Koch's/ Henle-Koch postulates and Evans' rules of disease causation
11	Unified principles of establishing causality for both infectious and non-infectious diseases

Lecture(s)	Topic
12	Infectious and chronic disease connections
13	Causal role of infectious agents in cancer (relating criteria)
14	Global status of non-communicable diseases
15	Establishment of trends of non-infectious and chronic disease occurrence
16	Epidemiology of non-infectious and chronic diseases affecting different species (livestock/ poultry) and production systems
17	Determinants of chronic and non-infectious diseases- reasons for emergence range of pathways and epidemiology
18	Study of characteristics of risk factors (genetic, physiological, environmental, behavioural, etc) associated with non-infectious and chronic diseases
19	Demographic, epidemiological and nutritional factors
20	Economic impact of chronic and non-communicable diseases
21	Social determinants of non-communicable diseases
22	Spatial and temporal epidemiology of nutritional and metabolic diseases
23	Spatial and temporal epidemiology of reproductive diseases
24	Spatial and temporal epidemiology of chemical poisonings and toxicities (pesticides, poisonous plants, etc)
25	Spatial and temporal epidemiology of neoplastic and other miscellaneous diseases
26	Modelling of non-infectious non –communicable diseases or chronic diseases
27	Trends in the prevention and control of non-infectious and chronic disease – current status and future perspectives
28	Early detection, notification and surveillance
29	Participatory surveillance
30	Case study on vector-borne trans-boundary diseases
31	Case study on non-infectious chronic livestock disease
32	Case study on emerging/ re-emerging zoonotic trans-boundary diseases
Practical	
1	Detection and characterization of trans-boundary diseases
2	Capacity building and training
3	Study of the role of wildlife in trans-boundary animal diseases
4	Wildlife disease surveillance
5	Study of wildlife–livestock interface and disease ecology
6	Disease investigation - data and information collection, collation and sharing
7	Surveillance for trans-boundary diseases
8	Measurement of burden of non-infectious and chronic diseases (mortality, morbidity, survival, risk factors, etc.)
9	Survey of non-infectious and chronic diseases
10	Animal models for the study of non-infectious and chronic diseases
11	Establishment of evidence/ proof of causation of non-infectious and chronic diseases
12	Study of risk factors associated with non-infectious and chronic diseases
13	Measurement of socioeconomic impacts associated with non-infectious and chronic diseases
14	Controlled trials involving contemporary non-infectious and chronic diseases
15	Undertaking short research problem(s)
16	Case study on trans-boundary/ chronic livestock disease

I. Course Title : Ecology and Animal/ Human Health
II. Course Code : VPE 610
III. Credit Hours : 2+0

Lecture(s)	Topic
Theory	
1	Definitions related to ecology and animal or human health
2	Linkage between human/ animal health and the ecosystem
3	Spill-over of diseases – elucidation of social and ecological basis of disease
4	Assessment of changing trends in the environments and its impact on the animal/ human health
5	Study of emerging public health threats linked to the changes in the environment
6	Study of landscape epidemiology of diseases
7	Study of contemporary issues centred on ecological and evolutionary perspectives of infectious diseases
8	Animal–human-ecosystem interface
9	Study of ecological/ environmental factors influencing spatio-temporal occurrence of disease such as temperature, rainfall and other environmental factors
10	Ecological conditions and evolutionary dynamics
11	Disease ecology based explanatory and predictive models
12	Elucidation of natural history and host-parasite interactions linked to the ecological factors
13	Ecology of vector borne diseases
14	Vector dynamics and ecology
15	Study extrinsic incubation period
16	Understanding of critical risk factors of disease spread – timing, distribution, and abundance of competent vectors
17	Study of cyclical patterns of disease
18	Mapping environmental conditions with disease
19	Establishing functional links between environmental modifications and disease
20	Linking climate change with disease occurrence
21	Impact of climate change on disease occurrence
22	Study of dynamics of ENSO with climate change and disease
23	El Niño/ Southern Oscillation (ENSO), influence on global climate variability and disease occurrence
24	Evolution of disease alert and forecasting systems
25	Use of global positioning and remote sensing tools for disease management
26	Early warning and GIS based disease predictions
27	Role of bio-security measures in curtailing transmissible diseases at the animal-animal, animal-human and human-human interface
28	Biology and ecology of vector-borne diseases – ecology of disease – the intersection of human and animal health
29	Impact of ecological/ environmental factors on the emergence of human/ animal diseases
30	Clusters of disease outbreaks
31	Environmental impact of antimicrobial resistance
32	Preparedness for combating the impacts of climate change

I. Course Title : Diagnostic Approaches in Epidemiology
II. Course Code : VPE 611
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Concepts of molecular basis of a disease
2	Molecular epidemiology of diseases/ infections
3	Molecular determinants of pathogenicity and virulence amongst agents
4	Dynamics of disease transmissibility in populations of livestock and poultry
5-6	Epidemiology of antigenic, genetic and biological diversity amongst pathogens associated with disease/ outbreaks
7	Differentiation of field isolates (wild) from vaccine strains (markers, DIVA, etc).
8	Marker vaccine development
9	Detection and characterization of pathotypes, serotypes, biotypes and genotypes of pathogens
10	Understanding epidemiology of disease using immunological, immunoblotting and monoclonal antibody-based tests
11	Understanding epidemiology of disease using conventional and rapid enzyme immune assays. Use of monoclonal antibodies in different ELISAs for antigenic analysis
12	Understanding epidemiology of disease using pathogen typing methods, viz., polymerase chain reaction, sequencing, RFLP, etc.
13	Understanding epidemiology of disease using radio-actively labelled or non-radioactive oligo-nucleotide probes - dot-blot and Southern hybridizations
14	Evaluation of diagnostic tests/ assays using epidemiological approaches
15	Vaccine efficacy/ effectiveness trails
16	Epidemiology of screening and confirmatory diagnostic assays
17	Estimation of disease burden in populations
18	Estimation of frequency and pattern of health events in a population
19	Designing of epidemiological studies
20	Representation disease data/ information
21	Study of disease databases and online resources
22	Quantification of zoonotic agents using conventional and molecular tools
23	Rapid detection of foodborne and zoonotic agents
24	On-site, on-farm and animal-side detection systems- approaches and applications
25	Phylogenetic analysis of disease agents
26	Use of modern bio-informatics and disease informatics tools for the study of zoonotic and other determinants of public health significance
27	Source tracing of origin of infectious agents
28	Outbreak investigation and disease reporting including notifiable diseases
29	Traceability of livestock and its implications
30	Multi-centric molecular typing and validation of foodborne and zoonotic agents
31	Epidemiology of chronic disease makers
32	Case study on quantitative epidemiological analysis
Practical	
1	Molecular fingerprinting of pathogens
2	Molecular epidemiology of foodborne and zoonotic agents
3-4	Detection and characterization of pathogens using nucleic acid based techniques
5	Sero-epidemiology – methods and applications
6-7	Multi-locus sequence typing (MLST), pulsed-field gel electrophoresis (PFGE), and amplified fragment length polymorphism (AFLP) typing of pathogens

Lecture(s)	Topic
8	Source tracing of outbreaks
9	Construction and characterization of epidemic curve
10	Spatio-temporal clustering of diseases
11	Mapping disease and risk factors
12	Calculation of variables and confounders using logistic regression analysis
13	Epidemiological analysis for the disease prediction, early warning and forecasting
14	Epidemiological analysis involving remote sensing, GIS and satellite technologies
15-16	Assignment: Each student shall select at least two recent articles from journals related to the course and discuss in the class through presentation

I. Course Title : Surveys, Surveillance and Data Management
II. Course Code : VPE 612
III. Credit Hours : 2+1

Lecture(s)	Topic
Theory	
1	Robust survey: planning, statistical models. Survey iceberg (tools and technologies).
2	Structured population-based surveys, types of surveys.
3	Survey design - Sampling, Sampling methods, Sample size, etc.
4	National surveys.
5	Surveillance – definition, goals and types of surveillance system.
6	Principles of surveillance.
7	Critical elements of surveillance.
8	Surveillance methods and approaches.
9	Surveillance for distribution and occurrence of infection.
10	Information architecture for surveillance.
11	Structured non-random surveillance.
12	Surveillance programmes. Designing an active surveillance program.
13	Surveillance to demonstrate freedom from disease or infection.
14	Epidemiological surveillance network.
15	Components of regional or national surveillance system.
16	Statistical models for surveillance.
17	Softwares used for surveillance.
18	State, National and International agencies (OIE, CDC, etc.), databases and management systems.
19-20	Surveillance of emerging and re-emerging diseases
21	Animal health surveillance
22	Data and database
23-24	Data acquisition - Sampling and questionnaires
25	Disease/ data recording and reporting
26	Veterinary data recording schemes and information system (databases)
27	National veterinary epidemiology and disease informatics
28-29	Epidemiology informatics on globally and nationally important emerging/ re-emerging diseases and designing of strategies for their prevention and control.
30	Analysis of disease data using software analysis
31	Study of veterinary epidemiology and disease informatics software (e.g. EpiInfo)
32	Case study on disease surveillance

Lecture(s)	Topic
Practical	
1	Data collection, storage and quality control
2	Sampling methods - confidence level, sample unit, sample size, etc.
3	Statistical methods for analysis of disease data
4	Preparation and analysis of questionnaires
5	Questionnaire survey for disease prevalence
6	Data analysis using computer software
7	Data analysis and representation of data pertaining to animal disease/ productivity
8	Survey for livestock and poultry diseases
9	Study/ development of computer software for animal disease/ productivity
10	Evaluation of veterinary/ animal husbandry interventions
11	Evaluation of animal disease surveillance systems
12	Study of national health surveys related to animal/ human disease
13	Surveillance of economically important disease of the region/ state
14	Usefulness/ efficacy/ effectiveness of vaccines/ vaccination
15-16	Assignment: Each student will select at least two recent articles from journals related to course and discuss in the class through presentation

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Veterinary Para-Clinical Subjects
– Veterinary Pharmacology and Toxicology

Course Title with Credit Load M.V.Sc. in Veterinary Pharmacology and Toxicology

Course Code	Course Title	Credit Hours
VPT 501	Concepts of Pharmacology, Drug Design and Development*	2+0
VPT 502	Autonomic and Autacoid Pharmacology*	2+1
VPT 503	CNS Pharmacology	2+1
VPT 504	Digestive and Respiratory Pharmacology	2+1
VPT 505	Cardiovascular and Urinary System Pharmacology	2+0
VPT 506	Endocrine and Reproductive Pharmacology	2+1
VPT 507	Chemotherapy*	2+1
VPT 508	Toxicology of Xenobiotics*	2+1
VPT 509	Toxinology	2+1
VPT 510	Pharmacological Techniques*	0+2
VPT 511	Techniques in Toxicology*	0+2
VPT 512	Ethnopharmacology	1+1
VPT 513	Fundamentals of Pharmacokinetics	1+1
VPT 591	Master's Seminar*	1+0
VPT 599	Master's Research	30

*Core courses

Course Contents
M.V.Sc. in Veterinary Pharmacology and Toxicology

I. Course Title : Concepts of Pharmacology, Drug Design and Development
II. Course Code : VPT 501
III. Credit Hours : 2+0
IV. Aim of the course

To study the basic concepts of drug actions, and drug design and development.

V. Theory

Unit I

Scope of pharmacology, Drugs and other therapeutic agents, Principles of biopharmaceutics and veterinary dosage forms, Dynamics of ADME; Principles of therapeutics; Rationale and Empirical, Various other types of therapeutics.

Unit II

Pharmacodynamics targets for drug actions (enzymes, ion channels, structural and transporter proteins) evidence of drug action through receptor, Signal transduction mechanisms (GPCR, enzyme linked receptor), Regulation and malfunctioning of diseases.

Unit III

Quantitation of drug-receptor interactions and elicited effects, Drug-drug interactions and adverse drug reactions.

Unit IV

Drug invention: Screening, Assaying, Designing and Development of drugs, Clinical trials, Drug safety, Regulations and standards; Gene based therapy and drug delivery system.

I. Course Title : Autonomic and Autacoid Pharmacology
II. Course Code : VPT 502
III. Credit Hours : 2+1
IV. Aim of the course

To study the pharmacological basis of the rapeutic uses of autonomic and autacoid drugs.

V. Theory

Unit I

Anatomical and physiological considerations of autonomic and somatic motor nervous system and Neurohumoral transmission.

Unit II

Agents modulating peripheral nervous system, Non-adrenergic-non cholinergic (NANC) transmission.

Unit III

Pharmacology of adrenergic agonists, Antagonists and Adrenergic neuron blockers.

Unit IV

Pharmacology of cholinergic agonists, Antagonists and cholinergic neuron blockers.

Unit V

Drugs acting at the Neuromuscular Junction and Autonomic Ganglia.

Unit VI

Autacoids: Introduction to immunity and inflammation, Immunostimulants, Immunosuppressants and Tolerogens, Pharmacological aspects of histamine, serotonin, kinins, eicosanoids and platelet activating factor, Angiotensins and other putative autacoids.

VI. Practicals

Pharmacological experiments on intact and isolated preparations for studying the effects of various prototype autonomic and autacoids drugs on vascular, intestinal, respiratory, urinary and reproductive smooth muscles, autonomic ganglia, skeletal muscles; blood pressure, ECG, heart, etc.

I. Course Title : CNS Pharmacology

II. Course Code : VPT 503

III. Credit Hours : 2+1

IV. Aim of the course

To study the pharmacology of drugs acting on central nervous system (CNS).

V. Theory

Unit I

Anatomical and physiological considerations and neurohumoral transmission in CNS.

Unit II

Historical development, theories, principles and stages of general anaesthesia.

Unit III

Recent advances in pharmacology of general anaesthetics and therapeutic gases, local anaesthetics, sedatives, hypnotics, neuroleptics, antiepileptics.

Unit IV

Pharmacology of CNS stimulants, analeptics, opioid agonists and antagonists; non-steroidal anti-inflammatory agents, central muscle relaxants, Pharmacology and regulations of euthanizing agents.

VI. Practicals

Study of pharmacodynamics of prototype drugs of each class of drugs in experimental animals.

I. Course Title : Digestive and Respiratory Pharmacology
II. Course Code : VPT 504
III. Credit Hours : 2+1

IV. Aim of the course

To study the pharmacological aspects of drugs acting on digestive and respiratory systems.

V. Theory

Unit I

Physiological considerations of GIT functions in ruminants and non-ruminants. Pharmacology of drugs acting on gastrointestinal tract. Appetite stimulants, emetics and anti-emetics.

Unit II

Pharmacology of anti-ulcer drugs, modulators of gastric and intestinal motility and secretions.

Unit III

Agents promoting digestive functions; bile acids and pancreatic enzymes, drugs affecting liver; rumen pharmacology.

Unit IV

Gastrointestinal protectant and adsorbents, laxatives and cathartics.

Unit V

Physiological considerations of respiratory functions in animals. Pharmacology of drugs acting on respiratory system: Bronchodilators, Antitussives, Mucolytics, Expectorants, Decongestants. Drugs used in treatment of asthma.

VI. Practicals

Study of effects of drugs on digestive and respiratory functions using different *in-vitro* and *in vivo* animal models.

I. Course Title : Cardiovascular and Urinary System Pharmacology
II. Course Code : VPT 505
III. Credit Hours : 2+0

IV. Aim of the course

To study the pharmacological aspects of drugs acting on CVS and kidneys.

V. Theory

Unit I

Cardiac electrophysiology consideration, Pharmacology of antiarrhythmic drugs, Cardiac glycosides, Myocardial stimulants.

Unit II

Antihypertensive, Antihypotensive and Antihyperlipidaemic drugs.

Unit III

Coagulants and anticoagulants, Thrombolytic agents, Plasma expanders, Drugs affecting haemopoietic system and antiplatelet drugs.

Unit IV

Pharmacology of drugs affecting renal functions and fluid-electrolyte balance: Diuretics, Antidiuretics, Urinary acidifiers, Urinary alkalizers, Urinary antiseptics and Uricosuric and other anti-gout drugs. Principles of acid-base balance, fluid and electrolyte therapy and blood substitutes.

I. Course Title : Endocrine and Reproductive Pharmacology

II. Course Code : VPT 506

III. Credit Hours : 2+1

IV. Aim of the course

To study the pharmacology of drugs affecting endocrine functions.

V. Theory

Unit I

Drugs affecting endocrine functions of hypothalamus, pituitary, thyroid, adrenals and pancreas.

Unit II

Drugs affecting calcium and phosphorus homeostasis.

Unit III

Drugs affecting male reproductive organs, spermatogenesis and erectile dysfunctions.

Unit IV

Drugs affecting female reproductive organs: ovulation, oestrus, conception, gestation and lactation.

Unit V

Oxytocic and other drugs affecting uterus.

VI. Practicals

To study the effects of various endocrine agonists and antagonists in animal models and isolated tissues.

I. Course Code : VPT 507

II. Course Title : Chemotherapy

III. Credit Hours : 2+1

IV. Aim of the course

To study the recent advances in chemotherapeutic agents with relevance to their molecular mechanisms and therapeutic aspects.

V. Theory

Unit I

General consideration and principles of Chemotherapy, Classification of chemotherapeutic agents; Molecular mechanism of Antimicrobial resistance-development and Prevention strategies; Combination therapy, Therapeutic failure.

Unit II

Systemic and gut acting sulphonamides, diaminopyrimidines, sulfones, quinolones, nitrofurans, nitroimidazoles.

Unit III

Penicillins, Cephalosporins, Carbapenems, Carbacephems, monobactam, beta lactamase inhibitors.

Unit IV

Aminoglycosides, Tetracyclines, Chloramphenicol and its congeners, macrolides, lincosamides.

Unit V

Antitubercular drugs, Glycopeptides, and Polypeptide antibiotics, Methenamine, Carbadox, Novobiocin, Virginiamycin, Spectinomycin, Oxazolidinones and newer agents.

Unit VI

Antiprotozoans, Anthelmintics, Ectoparasiticides

Unit VII

Antifungal agents, Antiviral and Anti-neoplastic drugs.

VI. Practicals

Assay of chemotherapeutic agents, Antibiotic sensitivity tests. Determination of minimum inhibitory concentration (MIC), Mutant Prevention Concentration (MPC), Minimum Bactericidal Concentration (MBC) and time kill kinetics. Molecular techniques for intervention of antimicrobial resistance. Determination of anthelmintic properties of drugs using *in-vitro* models.

I. Course Title : Toxicology of Xenobiotics

II. Course Code : VPT 508

III. Credit Hours : 2+1

IV. Aim of the course

To study the molecular basis of poisoning and antidotal therapy in animals.

V. Theory

Unit I

Principles and scope of toxicology.

Unit II

Molecular mechanism of action of poisons and their detoxification, rational approach for diagnosis and treatment of poisonings.

Unit III

Toxicology of metals, non-metals, agrochemicals, solvents and vapors, common salt, urea and other feed additives. Toxicity of drugs.

Unit IV

Genotoxic and other effects of radiations and radioactive chemicals; toxicogenomics and developmental toxicology; forensic and regulatory aspects of toxicology.

VI. Practicals

Extraction, separation and detection of common poisons in toxicological specimens, study of toxicity and antidotal treatment in animals, designing of animal toxicity experiments and general toxicity spot tests.

I. Course Title : Toxinology
II. Course Code : VPT 509
III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge of molecular basis of toxicity induced by toxins of plants, microbes and animals origin.

V. Theory

Unit I

Classification and identification of different types of toxins.

Unit II

Toxicity induced by abrin, strychnine, dhurin, amygdaline, sanguine, solamine, gossypol, beta-amino propionitryl, beta-oxolyl amino L-alanine, other Phytotoxins

Unit III

Toxin induced Teratogenicity, Thiamine deficiency and Phototoxicity.

Unit IV

Toxicology of mycotoxins: aflatoxins, rubratoxins, ochratoxins, sporidesmin, citrinin, F-2 toxin, trichothecenes, tremorgens and ergot alkaloids.

Unit V

Zootoxins: snake venom, scorpion, spider and insect stings and bufotoxins, Puffer fish and Shell fish toxins. Bacterial toxins (botulinum and tetanus toxins)

VI. Practicals

Detection of alkaloids, glycosides, cyanides, nitrate/ nitrite, tannins, saponins, resins and oxalates. Detection of mycotoxins in the samples of feed/ fodder and animal tissue. Identification of toxic weeds and plants of the state/ local area.

I. Course Title : Pharmacological Techniques
II. Course Code : VPT 510
III. Credit Hours : 0+2

IV. Aim of the course

To impart the knowledge of various pharmacological techniques and screening methods of drugs.

V. Practicals

Unit I

Principles of drug action and bioassay. Construction of dose-response plots and their significance. Determination of EC_{50}, median effective (ED_{50}), toxic (TD_{50}) or lethal doses (LD_{50}) from dose-response plots. Calculation of dissociation rate constants, therapeutic ratio, margin of safety, potency ratio, pAx, pDx and pD'x values.

Unit II

Techniques for setting up isolated and intact preparations, recording of BP in hen/ rat, recording of ECG in rat/ other small animals.

Unit III

Organization of screening programme of drugs; multidimensional screening procedures and gross observational methods. Specific tests for evaluation of tranquillizing, hypnotic, analgesic, anticonvulsant, general and local anaesthetic, muscle relaxant, anti-inflammatory, antipyretic, antiarrhythmic, antihypertensive and antihyperglycemic activities.

Unit IV

Guidelines for safety studies on drugs.

I. Course Title : Techniques in Toxicology

II. Course Code : VPT 511

III. Credit Hours : 0+2

IV. Aim of the course

To understand the animal toxicity tests and assessment of various toxicants using specific tests.

V. Practicals

Unit I

Designing of animal models in toxicological studies. Introduction to different toxicological guidelines for *in-vitro* and *in vivo* studies (OECD, WHO, EPA, etc.). In silico toxicity prediction.

Unit II

Animal toxicity tests for acute, sub-acute and chronic toxicity.

Unit III

Specific toxicity tests for Neurotoxicity, Immunotoxicity, Behavioural, Reproductive and Developmental, Inhalation Toxicity, Mutagenicity, Carcinogenicity.

Unit IV

Toxicological tests for the study of metabolism, synergism and antagonism. Assay for marker enzymes, analysis of toxicant residues in biological materials.

I. Course Title : Ethnopharmacology

II. Course Code : VPT 512

III. Credit Hours : 1+1

IV. Aim of the course

To impart the knowledge and importance of traditional Indian medicine.

V. Theory

Unit I

Historical aspects of traditional Indian remedies. Alternate systems of medicine in animals. Scope of Ethnopharmacology.

Unit II

Classification and identification of medicinal plants. Classification, Metabolism and interactions of Phytoconstituents.

Unit III

Standardization and clinical validation of bioactive molecules from plant sources. Therapeutic and adverse effects of potential herbal drugs. Indigenous drugs used as glactagogues, carminatives, antiseptics, antidiarrhoeals, anthelmintics, Immuno-stimulants, antimicrobials, bioenhancers, analgesics, anti-inflammatory agents, etc.

VI. Practicals

Identification of medicinal plants. Preparation of plant extracts in various solvents using different techniques. Phytochemical screening of plant extracts. Evaluation of pharmacological activities of extracts using *in-vitro* and *in-vivo* methods.

I. Course Title : Fundamentals of Pharmacokinetics

II. Course Code : VPT 513

III. Credit Hours : 1+1

IV. Aim of the course

To study the disposition of drugs and dosage regimen.

V. Theory

Unit I

Routes of drug administration, ADME, plasma protein binding, factors modifying ADME

Unit II

Basic concept of pharmacokinetics, Order of pharmacokinetics processes (zero order, first order and mixed order), Models of pharmacokinetics analysis of drugs (compartmental, non-compartmental model)

Unit III

Compartmental models of drug distribution, determinants of absorption, distribution and elimination, rate constants (Cmax, Tmax)

Unit IV

Calculation of pharmacokinetic parameters, dosage regimen and bioavailability based on compartmental analysis, Non-compartmental pharmacokinetic modelling.

VI. Practicals

Analysis of pharmacokinetic data and determination of different pharmacokinetic parameters and bioavailability of drugs in normal and diseased animal models.

Course Outline-cum-Lecture Schedule for Master Degree Programme

I. Course Title : Concepts of Pharmacology, Drug Design and Development

II. Course Code : VPT 501

III. Credit Hours : 2+0

IV. Aim of the course

To study the basic concepts of drug actions, and drug design and development.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Scope of pharmacology, nature and sources of drugs and other therapeutic agents	2
2.	Principles of biopharmaceutics and dosage forms of drugs	2
3.	Principles of Pharmacokinetics-Absorption, distribution, metabolism and excretion of drugs.	4
4.	Principles of drug action, rational, empirical and various other therapeutics	2
5.	Pharmacodynamics-targets for drug actions (enzymes, ion channels, structural and transporter proteins)	4
6.	Receptor mediated drug action, types of drug receptors, second messengers of drug action and signal transduction	4
7.	Regulation and malfunctioning of diseases.	1
8.	Quantitation of drug-receptor interactions and elicited effects	2
9.	Drug interactions and adverse drug reactions	2
10.	Drugs design and development, Screening and drug assay	3
11.	Clinical drug trials	2
12.	Drug safety, drug standards and regulations	2
13.	Gene therapy and novel drug delivery systems.	2

I. Course Title : Autonomic and Autacoid Pharmacology

II. Course Code : VPT 502

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the pharmacological basis of therapeutic uses of autonomic and autacoid drugs.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction to autonomic nervous system (ANS), Anatomical and physiological considerations of autonomic and somatic motor nervous system	2
2.	Neurohumoral transmission	2
3.	Exceptions to generalization of ANS, Agents modulating peripheral nervous system, non adrenergic-non cholinergic (NANC) transmission	3
4.	Sympathetic nervous system, adrenergic agonists, antagonists and adrenergic neuron blockers	4
5.	Therapeutic uses of sympathetic drugs and blockers	1
6.	Parasympathetic nervous system, cholinergic agonists, antagonists and cholinergic neuron blockers	4
7.	Therapeutic uses of parasympathetic drugs and blockers	1
8.	Ganglion stimulating and blocking drugs	2
9.	Neuromuscular blocking drugs	1
10.	Introduction to immunity and inflammation	2
11.	Immunostimulants, immunosuppressants and tolerogens	1
12.	Histaminergic and antihistaminics	2
13.	Serotonin and antiserotonin agents	1
14.	Kinins as mediators of inflammation	2
15.	Eicosanoids and platelet activating factor	3
16.	Angiotensins and other putative autacoids	2
17.	Angiotensins and inhibitors of renin-angiotensin system	1
Practical		
1.	Effect of sympathetic agonists and antagonists on intact and isolated preparations through experiments/ simulation programmes.	5
2.	Effect of sympathetic agonists and antagonists on intact and isolated preparations through experiments/ simulation programmes.	5
3.	Effects of autonomic drugs on blood pressure, ECG, etc.	2
4.	Effect of autacoids on different systems	4

I. Course Title : CNS Pharmacology

II. Course Code : VPT 503

III. Credit Hours : 2 +1

IV. Aim of the course

To study the pharmacology of drugs acting on central nervous system (CNS)

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction to CNS – Physiological and anatomical considerations	1
2.	Drugs action on CNS	1
3.	Central neurotransmitters	2

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
4.	General anaesthesia – History, theories and stages of general anaesthesia	1
5.	Adjuvants to general anaesthetics	1
6.	Inhalant general anaesthetics	3
7.	Injectable general anaesthetics	3
8.	Local anaesthetics	2
9.	Hypnotics and sedatives	3
10.	Psychotropic drugs and drugs modifying abnormal behaviour of animals	3
11.	Anticonvulsants	2
12.	Opioid agonists (analgesics) and antagonists	3
13.	Non steroidal anti-inflammatory drugs (NSAIDs)	3
14.	CNS stimulants	1
15.	Central muscle relaxants	1
16.	Drugs of abuse	2
17.	Currents topics/ Discussion on library assignments	2
Practicals		
1.	Study on general anaesthetics	1
2.	Study on local anaesthetics	2
3.	Study on sedatives and hypnotics	2
4.	Study on anticonvulsants	1
5.	Study on antipyretics	1
6.	Study on analgesics	2
7.	Study on anti-inflammatory drugs	2
8.	Study on psychotropic drugs	2
9.	Study on CNS stimulants	1
10.	Study on central muscle relaxants.	1

I. Course Title : Digestive and Respiratory Pharmacology

II. Course Code : VPT 504

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the pharmacological aspects of drugs acting on digestive and respiratory systems.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Drugs affecting salivary secretions – Sialics and antisialics	1
2.	Drugs affecting gastric secretion – Stomachics, histamine and gastrin analogues	2
3.	Gastric antisecretory and antiulcer drugs – H_2-receptor antagonists and proton pump inhibitors	2
4.	Antacids	2
5.	Emetics	1
6.	Antiemetics	2
7.	Carminatives and antizymotics	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
8.	Appetizers and digestants	1
9.	Pro-kinetics	2
10.	Cathartics	2
11.	Antidiarrhoeic drugs	2
12.	Physiological basis of renal pharmacology	2
13.	Diuretics	3
14.	Drugs affecting fluid, electrolyte and acid-base balance	2
15.	Drugs affecting urinary pH and tubular transport	1
16.	Antitussives	1
17.	Expectorants	1
18.	Analeptics	1
19.	Bronchodilators and other drugs acting on respiratory system	1
20.	Drugs acting on skin and mucous membrane – Demulcents, emollients, protectants, counterirritants, caustics, keratolytics, and wound cleansing agents	2
21.	Current topics/ Disccusion on library assignments.	2
Practicals		
1.	Effects of drugs on digestive functions using different *in-vitro* models	4
2.	Effects of drugs on digestive functions using *in vivo* animal models	4
3.	Effects of drugs on respiratory functions using different *in-vitro* models	4
4.	Effects of drugs on respiratory functions using different animal models	

I. Course Title : Cardiovascular and Urinary System Pharmacology

II. Course Code : VPT 505

III. Credit Hours : 2 + 0

IV. Aim of the course

To study the pharmacological aspects of drugs acting on CVS and kidneys.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	General considerations to cardiovascular system	2
2.	Myocardial stimulants – Cardiac glycosides and other myocardial stimulants	3
3.	Anti-arrhythmic drugs	3
4.	Vasodilators and antianginal drugs	2
5.	Antihypertensive agents	1
6.	Haemostatics and coagulants	2
7.	Anti-coagulants	2
8.	Fibrinolytic and anti-platelet drugs	1
9.	Heamtaopoietic drugs	2
10.	Blood components and blood substitutes	1
11.	Drugs used in treatment of shock	2
12.	Antihyperlipoproteinemics	1
13.	Physiological basis of renal pharmacology	2
14.	Diuretics	3

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
15.	Drugs affecting fluid, electrolyte and acid-base balance	3
16.	Drugs affecting urinary pH and tubular transport	2
17.	Current topics/ Disccusion on library assignments	2

I. Course Title : Endocrine and Reproductive Pharmacology

II. Course Code : VPT 506

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the pharmacology of drugs affecting endocrine functions.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	General considerations to Endocrine and reproductive systems	2
2.	Pharmacology of drugs affecting endocrine functions of Pituitary gland	3
3.	Pharmacology of drugs affecting endocrine functions of thyroid gland	2
4.	Pharmacology of drugs affecting endocrine functions of adrenals	3
5.	Pharmacology of drugs affecting endocrine functions of the Pancreas	2
6.	Physiological basis of calcium and phosphorus homeostasis	2
7.	Hormonal regulation of calcium and phosphorus homeostasis.	2
8.	Pharmacology of drugs affecting male reproductive organs,	2
9.	Drugs affecting spermatogenesis	2
10.	Pharmacology of drugs affecting female reproductive organs	2
11.	Drugs affecting ovulation	2
12.	Drugs affecting oestrus	1
13.	Drugs affecting conception	2
14.	Drugs affecting gestation	2
15.	Drugs affecting lactation	2
16.	Current topics/ Disccusion on library assignments	3
Practicals		
1.	Effects of various hormones in animal models and isolated tissues.	4
2.	Effects of various hormones in and isolated tissues	4
3.	Effects of different hormone antagonists in animal models	4
4.	Effects of different hormone antagonists in isolated tissues	4

I. Course Title : To study the recent advances in chemotherapeutic agents with relevance to their molecular mechanisms and therapeutic aspects.

II. Course Code : VPT 507

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the recent advances in chemotherapeutic agents with relevance to their molecular mechanisms and therapeutic aspects.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	General principles of antibacterial therapy, classification of antibacterial drugs, clinical use of antibiotics, antibiotic combinations. Bacterial resistance	2
2.	Sulfonamides	2
3.	Penicillins and Beta-lactamase inhibitors	2
4.	Cephalosporins	2
5.	Aminoglycosides and Aminocyclitols	2
6.	Chloramphenicol and Thiamphenicol	2
7.	Tetracyclines	2
8.	Macrolide antibiotics and Membrane antibiotics	2
9.	Quinolones – Spectrum, mechanism, kinetics and uses	2
10.	Antifungal agents	2
11.	Antiviral agents	2
12.	Anticancer agents – General principles, classification, mechanism, toxicity, uses	2
13.	Anthelmintics – Antinematodal drugs, Anticestodal drugs, Antitrematodal drugs	2
14.	Ectoparasiticides	2
15.	Antiprotozoan Drugs	2
16.	Antitubercular drugs	2
17.	Curent discussions and assignments	2
Practical		
1.	General methods for assay of chemotherapeutic agents	2
2.	Estimation of sulfonamides in biological fluids	2
3.	Estimation of penicillins in biological fluids	3
4.	Estimation of oxytetracyclines in biological fluids	2
5.	Estimation of trimethoprim in biological fluids	2
6.	Estimation of nitrofurans in biological fluids	2
7.	Antibiotic sensitivity tests	2

I. Course Title : Toxicology of Xenobiotics

II. Course Code : VPT-508

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the molecular basis of poisoning and antidotal therapy in animals.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction, definitions and fields of toxicology	1
2.	History and scope of toxicology	1
3.	Sources and classification of toxicants	1
4.	General modes of action of poisons	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
5.	Detoxification of poisons	2
6.	Principles and fundamentals of toxicology	3
7.	Factors affecting toxicity	1
8.	Diagnosis of poisoning	2
9.	Treatment and management of poisonings	2
10.	Toxicology of metals – Arsenic, mercury, lead, copper, molybdenum, cadmium and iron	5
11.	Toxicology of agrochemicals – Insecticides, herbicides, fungicides and rodenticides	5
12.	Toxicology of solvents and vapours	2
13.	Feed additives – Growth and performance enhancers, non-protein nitrogen compounds, common salt	2
14.	Radiations and radioactive chemicals	2
15.	Genetic and developmental toxicology	2
16.	Regulatory and forensic toxicology	2
17.	Current topics/ Discussion of library assignments	2
Practical		
1.	Collection of material for toxicological investigations	2
2.	Dispatch and processing of samples for toxicological investigations	2
3.	Extraction and separation of poisons from toxicological specimens	2
4.	Identification and detection of common poisons	3
5.	Designing and experiments for acute, subacute and chronic toxicities	2
6.	Calculation of TD50 and LD50	2
7.	Antidotal treatment in animals	2

I. Course Title : Toxinology

II. Course Code : VPT 509

III. Credit Hours : 2 + 1

IV. Aim of the course

To impart knowledge of molecular basis of toxicity induced by toxins of plants, microbes and animals origin.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Classification, identification and chemical constituents of poisonous plants	2
2.	Nitrate/ nitrite poisoning: sources, mechanism of toxicity, clinical findings, diagnosis, treatment and control	2
3.	Cyanide poisoning – Causes, cyanogenetic plants: jowar, etc., mechanism of toxicity diagnosis and treatment	2
4.	Photosensitization – *Lantana camara*: mechanism of toxicity, clinical signs and treatment	2
5.	Bracken fern poisoning – Clinical signs, diagnosis and treatment	2
6.	Poisoning due to strychnos nux-vomica, Ricinus communis and	

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
	kaner – Mechanism of toxicity, clinical signs, diagnosis and treatment	2
7.	Toxicity due to dhatura, Abrus precatorius, Ipomoea carnea – Mechanism of toxicity, clinical signs and treatment	2
8.	Toxicity due to plants containing oxalate – Mechanism of toxicity, clinical signs and treatment	2
9.	Mycotoxins – Hepatotoxins (sporidesmin, aflatoxins and rubratoxins): mechanism of toxicity, symptoms and treatment	2
10.	Nephrotoxins (ochratoxin, citrinin) neurotoxins (penitren A and Patulin). Ergot alkaloids, estrogenism and Trichothecene toxins: clinical signs and treatment	3
11.	Bacterial toxins – Diphtheria toxins, Botulinum toxin, Cholera toxin, tetanus toxin, E.coli., Enterotoxin, Endotoxin	3
12.	Toxicity due to snake venom – Mechanism of toxicity, clinical signs and treatment	3
13.	Toxicity due to scorpion – Mechanism of toxicity, clinical signs and treatment	2
14.	Toxicity due to spider and insect stings and toad poisoning – Mechanism of toxicity, clinical signs and treatment	2
15.	Current topics/ Discussion of library assignments	3
Practicals		
1.	Detection of alkaloids, glycosides, cyanides, nitrate/ nitrite, tannins, saponins, resins and oxalates in toxic plants	8
2.	Phytochemical analysis of toxic plant extracts	2
3.	Detection of mycotoxins in the samples of feed/ fodder and animal tissue	2
4.	Identification of toxic weeds and plants of the state/ local area	2

I. Course Title : Pharmacological Techniques

II. Course Code : VPT 510

III. Credit Hours : 0 + 2

IV. Aim of the course

To impart the knowledge of various pharmacological techniques and screening methods of drugs.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practicals		
1.	Principles of drug action	1
2.	Bioassay.Typs of bioassay, bioassay techniques	3
3.	Setting up of an isolated tissue preparation and an intact preparation	2
4.	Study of dose response relationship	2
5.	Suprmaximal effect by cumulative dose response study	1
6.	Study on isolated organ assembly	3
7.	Intact frog heart perfusion	1
8.	Recording of blood pressure in animals	2
9.	Recording of ECG in animals	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
10.	Screening Programme of drugs: General and multidimensional	2
11.	Gross observational methods in Screening procedures	2
12.	Calculation of EC50, potency ratio, PDv, PDx PD values	1
13.	Screening of hypnotic activity	1
14.	Study of analgesic, antipyretic and anti-inflammatory activity in laboratory animals	2
15.	Study of general and local anaesthesia in experimental animals	1
16.	Study of anticonvulsant and muscle relaxant effect of drugs	2
17.	Study of antiarrythmic and antihypertensive action of test compound	2
18.	Study of antihyperglycemic and anticholinesteric acivity	1

I. Course Title : Techniques in Toxicology

II. Course Code : VPT 511

III. Credit Hours : 0 + 2

IV. Aim of the course

To understand the animal toxicity tests and assessment of various toxicants using specific tests.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Practicals		
1.	Animal models for toxicological studies	2
2.	Animal toxicity tests for acute, subacute, and chronic toxicity	2
3.	Specific toxicity test for neurotoxicity	1
4.	Specific toxicity test for immunotoxicity	1
5.	Specific toxicity test for developmental toxicity	1
6.	Specific toxicity test for behavioral toxicity	1
7.	Specific toxicity test for mutagenecity	1
8.	Specific toxicity test for reproductive toxicity	1
9.	Specific toxicity test for inhalation toxicity	1
10.	Study specific toxicity test for carcinogenecity	1
11.	Animal toxicological tests to study metabolism	1
12.	Animal toxicological tests for synergism	1
13.	Animal toxicological tests for study of antagonisms	1
14.	Good laboratory practices in toxicology	2
15.	Assays for marker enzymes: AchE, GPx, SOD, Catalase	3
16.	Biochemical analysis of suspected toxicity specimens	2
17.	Haematological evaluation of toxicological samples	2
18.	Determination of pesticide residues using Gas Chromatography	2
19.	Analysis of toxicant residues in biological materials	2
20.	Recent advances	1

I. Course Title : Ethnopharmacology

II. Course Code : VPT 512

III. Credit Hours : 1 + 1

IV. Aim of the course

To impart the knowledge and importance of traditional Indian medicine.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	History, traditional remedies and regional folklore in disease cure.	1
2.	Plant drugs with proven pharmacological and therapeutic efficacy	1
3.	Indigenous drugs used in treatment of various gastrointestinal ailments	1
4.	Indigenous drugs used as antimicrobials	1
5.	Indigenous drugs used as analgesics	1
6.	Indigenous drugs used in cardiovascular disorders	1
7.	Indigenous drugs used in CNS disorders	1
8.	Indigenous drugs used in behavioural disorders	1
9.	Indigenous drugs used in Renal and Urinary tract disorders	1
10.	Indigenous drugs used in eye, ear and skin disorders	1
11.	Therapeutic and adverse effects of potential herbal drugs	2
12.	Alternate systems of medicine in animals – Homeopathy	2
13.	Alternate systems of medicine in animals – Folklore medicine	2
14.	Current topics/ Discussion of library assignments	2
Practicals		
1.	Identification of medicinal plants	1
2.	Various processes used in purification and preparation of active constituents from medicinal plants	4
3.	Classification, identification and chemical constituents of medicinal plants	2
4.	Preparation of plant extracts in various solvents using different techniques	2
5.	Phytochemical screening of plant extracts	2
6.	Pharmacological screening of extracts using *in-vitro* methods	2
7.	Evaluation of pharmacological activities of extracts using in animals	2

I. Course Title : Fundamentals of Pharmacokinetics

II. Course Code : VPT 513

III. Credit Hours : 1 + 1

IV. Aim of the course

To study the disposition of drugs and dosage regimen.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Dosage forms of drugs	1
2.	Routes of drug administration	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
3.	Transfer of drugs across biological membranes	2
4.	Absorption of drugs	1
5.	Distribution of drugs	1
6.	Biotransformation of drugs	2
7.	Excretion of drugs	1
8.	Principles of pharmacokinetics	2
9.	Various Pharmacokinetics models	1
10.	Important pharmacokinetic parameters	2
11.	Dosage regiment	1
12.	*In-vitro* plasma protein binding of drugs	1
Practicals		
1.	Various methods of drug assay	2
2.	Microbiological assay for antimicrobial drugs	2
3.	HPLC techniques	4
4.	Bioavailability of drugs	1
5.	Pharmacokinetics in animal disease models	2
6.	*In-vitro* plasma protein binding of drugs	1
7.	Determination of different pharmacokinetic parameters	2
8.	Analysis of pharmacokinetic data	2
9.	PK-PD modelling and Time kill kinetics	1

Course Title with Credit Load
Ph.D. in Veterinary Pharmacology and Toxicology

Course Code	Course Title	Credit Hours

*Core courses

Course Contents
Ph.D. in Veterinary Pharmacology and Toxicology

I. Course Title : Molecular Pharmacology
II. Course Code : VPT 601
III. Credit Hours : 3+0

IV. Aim of the course

To understand the identification and characterization of receptors and drug receptors interactions and underlying mechanisms of drug receptor interactions and its effects.

V. Theory

Unit I

Physicochemical properties of drugs, Forces involved in binding of drugs to receptors, Classification of receptors, Molecular structure of receptors, Properties and regulation of receptors, Receptors for physiological regulatory molecules.

Unit II

Receptor conformation and configuration. Structure activity relationship. Ligand binding study of receptors. Cellular mechanism of signal transduction and second messenger systems; Structures, Types and Functions of membrane ion channels.

Unit III

Theories of drug receptor interactions; Analysis of dose response Relationship and molecular mechanisms of drug actions, Quantitation of drug-receptor interactions and effects, receptors as pharmaceutical targets.

Unit IV

Calcium homeostasis within the cells, pharmacology of mitogen-activated protein (MAP) kinases/ extracellular signal-regulated kinases (ERK) and small G proteins. Methods of identification, isolation and characterization of receptors.

I. Course Title : Advances in Autacoid Pharmacology
II. Course Code : VPT 602
III. Credit Hours : 1+0

IV. Aim of the course

To study the pharmacodynamics and clinical implications of autacoids.

V. Theory

Unit I

Histamine and antihistamines, serotonin and its antagonists.

Unit II

Kinins (Bradykinin, kallikrein, Neurokinin, Substance P, Atrial natriuretic peptides and others).

Unit III

Angiotensins, agonists and antagonists.

Unit IV

Eicosanoids, platelet-activating factors, slow reacting substances of anaphylaxis, Putative neurotransmitters (purine nucleotides, peptides, amino acids and nitric oxide).

Unit V

Pharmacotherapy of inflammation, fever, pain and gout; clinical manifestation of autacoid imbalance.

I. Course Title : Pharmacology of Herbal Drugs
II. Course Code : VPT 603
III. Credit Hours : 2+1

IV. Aim of the course

To study the Pharmacological, Therapeutic and Toxicological aspects of potential medicinal plants.

V. Theory

Unit I

Historical aspect, Chemical constituents of medicinal plants and their classification.

Unit II

Identification, Collection, Preservation, Purification, Isolation, Standardization and Clinical validation of bioactive molecules from vegetable sources.

Unit III

Characterization of pharmacological, therapeutic and toxic effects of potential herbal drugs.

Unit IV

Strategies for development of herbal drugs.

VI. Practical

Extraction, detection, phytochemical analysis and fractionation of medicinal plant extracts. Screening of plant extracts for potential pharmacological activity; Pharmacological effects of herbal drugs on intact and isolated preparations.

I. Course Title : Biotransformation of Xenobiotics
II. Course Code : VPT 604
III. Credit Hours : 2+0

IV. Aim of the course

To study the molecular mechanisms of biotransformation of xenobiotics.

V. Theory

Unit I

Process of drug biotransformation phase I, phase II, and III, Microsomal and non-microsomal metabolizing enzyme systems.

Unit II

Mechanisms and processes of synthetic biotransformation

Unit III

Chemical, biological, genetic and environmental factors affecting drug biotransformation mechanisms.

Unit IV

Metabolic interactions, Enzyme induction and inhibition. Scope of biotransformation in drug development.

I. Course Title : Clinical Pharmacology and Pharmacokinetics
II. Course Code : VPT 605
III. Credit Hours : 2+1
IV. Aim of the course

To study the efficacy and disposition of drugs in clinical conditions.

V. Theory

Unit I

Scope of clinical pharmacology. Drug discovery and clinical trials. Pharmacovigilance, pharmacoepidemiology and pharmacoeconomics.

Unit II

Various drug delivery systems-ruminal, intravaginal, intramammary, etc. Targeted drug delivery systems-liposomes, microparticles, nanoparticles, etc. Factors modifying drug delivery.

Unit III

Application of pharmacokinetic principles in therapeutics. PK-PD relationship and its applications.

Unit IV

Alterations in pharmacological behaviour of drugs in clinical conditions, neonates and pregnancy. Drug interactions and adverse drug reactions. Therapeutic drug monitoring. Rationale of drug use. Medication control programs in performance animals.

VI. Practicals

Analysis of pharmacokinetic data and determination of different pharmacokinetic parameters and drugs interactions in normal and diseased animal/ models.

I. Course Title : Pharmacogenomics
II. Course Code : VPT 606
III. Credit Hours : 2+0
IV. Aim of the course

To study the concepts of genomicsin drug development.

V. Theory

Unit I

History, concepts and definitions of pharmacogenomics transcriptomics, proteomics and metabolomics. Genomic basis of species variations in drug response.

Unit II

Genetic polymorphism and its impact on pharmacokinetics, drug target receptors and disease-drug response.

Unit III

Pharmacogenomics and drug development, Pharmacogenomics in clinical practice, role of bioinformatics in pharmacogenomics.

Unit IV

Concept of gene therapy, gene therapy of inherited diseases, DNA repair and inactivation strategies. Synthesis of therapeutic proteins.

I. Course Title : Immunopharmacology and Immunotoxicology

II. Course Code : VPT 607

III. Credit Hours : 2+0

IV. Aim of the course

To study the pharmacological intervention of immune functions.

V. Theory

Unit I

General aspect of immune system and its interaction with nervous and endocrine systems. Chemical mediators of immune system.

Unit II

Immunomodulators; Immunostimulants, Immunosuppressant and Tolerogens; Immunological basis of drug allergy and drug tolerance.

Unit III

Immunotoxic effects of xenobiotics and environmental pollutants.

Unit IV

Immune deficiencies and autoimmune reactions. Immunotherapeutic applications in asthma, arthritis, cancer, dermatology, and organ transplant, etc.

I. Course Title : Molecular Toxicology

II. Course Code : VPT 608

III. Credit Hours : 3+0

IV. Aim of the course

To understand the mechanisms and targets of cellular/ molecular toxicity.

V. Theory

Unit I

Cellular, sub-cellular and molecular targets and mechanism of toxicity.

Unit II

Cellular dysfunctions and their consequences, Mechanism of cell death in toxicity, repair and disrepair of toxic damage.

Unit III

Molecular mechanisms of target organ directed toxicity of xenobiotics- brain, hematopoietic system, GIT, liver, lungs, kidneys, reproductive system, skin, etc.

Unit IV

Mechanism of chemical mutagenesis, carcinogenesis, teratogenesis and radiation toxicity.

I. Course Title : Clinical Toxicology

II. Course Code : VPT 609

III. Credit Hours : 2+1

IV. Aim of the course

To study the concepts of clinical toxicology and forensic toxicology.

V. Theory

Unit I

Scope of clinical and forensic toxicology. Toxicological investigation, management and antidotal therapy of poisonings.

Unit II

Clinical aspects of poisoning due metals, non-metals and pesticides.

Unit III

Clinical aspects of poisoning due to mycotoxins, animal and bacterial toxins, solvents and vapours, drugs and other food/ feed contaminants.

Unit IV

Forensic toxicology. GLP in toxicological evaluation.

VI. Practical

General screening of biological material for toxicants, analysis of clinical samples for poisons, use of biomarkers in the assessment of toxicity.

I. Course Title : Ecotoxicology

II. Course Code : VPT 610

III. Credit Hours : 3+0

IV. Aim of the course

To impart knowledge regarding ecotoxicology for conservation of healthy eco-system.

V. Theory

Unit I

Basic principles of ecotoxicology. Sources of contamination and effects of pollutants on eco-health.

Unit II

Chemical contamination of air, water, soil and food by major agricultural and industrial chemicals – pesticides, hydrocarbons and metals. Fate of chemicals in the environment and target species.

Unit III

Toxic effects of radiations. Marine and wildlife as monitors of environmental quality, Bioaccumulation and Biomagnifications of toxicants.

Unit IV

Biomarkers of monitoring the impact of environmental pollutants, Environmental hazard and Risk identification from Mixture of chemicals, Contamination control and approaches to rehabilitating damaged ecosystems, Nanoparticle toxicology, ecological emergencies.

I. Course Title : Regulatory Toxicology
II. Course Code : VPT 611
III. Credit Hours : 2+1

IV. Aim of the course

To study acts and regulations and risk assessment regarding use of drugs, chemicals and cosmetics.

V. Theory

Unit I

Principles of risk assessment. Test protocols for toxicity studies of various national and international regulatory agencies.

Unit II

Regulatory essential dose levels in chemical risk assessment (NOEL, NOAEL, LOEL, LOAEL and AOEL). Recommended acceptable levels of environmental pollutants.

Unit III

Risk assessment in practice. Classification and marking/ branding of chemicals. Monitoring/ surveillance of chemicals. Exposure assessment and modelling.

Unit IV

Quality control in safety research (GLP). Operation of product register.

VI. Practical

Good laboratory practice in toxicological research. Screening procedures in regulatory toxicology. Determination of MRL, ADI, NOEL, NOAEL, LOEL, LOAEL and AOEL. Visit to nearest industrial area.

I. Course Title : Special Problem
II. Course Code : VPT 690
III. Credit Hours : 0+1

IV. Aim of the course

To provide expertise in handling practical research problem(s).

V. Practical

Short research problem(s) involving contemporary issues and research techniques.

Course Outline-cum-Lecture Schedule for Doctoral Degree Programme

I. Course Title : Molecular Pharmacology

II. Course Code : VPT 601

III. Credit Hours : 3 + 0

IV. Aim of the course

To understand the identification and characterization of receptors and drug receptors interactions and underlying mechanisms of drug receptor interactions and its effects.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Concept of receptors and forces involved in binding of drugs to receptors	2
2.	Methods of identification, isolation and characterization of receptors.	2
3.	Quantitative aspects and theories of drug-receptor interactions	2
4.	Signal transduction mechanisms: transducers, effectors and second messengers	2
5.	Classification and structures of receptors – Receptor conformation and configuration – Iono-receptors	2
6.	G-protein coupled receptors	2
7.	Enzymatic receptors	2
8.	Steroid receptors	2
9.	Molecular mechanisms of drug actions	2
10.	Receptors for physiological regulatory molecules	2
11.	Receptors as pharmaceutical targets.	2
12.	Hepatic and extra-hepatic metabolism of drugs	3
13.	Structures, types and functions of membrane ion channels.	3
14.	Role of cytochrome P450 isozymes in drug metabolism	2
15.	Metabolic enzyme induction and inhibition	2
16.	Factors affecting drug metabolism	2
17.	Mechanism of bioactivation and cytotoxicity – Electrophilic metabolites, free radicals and reactive oxygen species	3
18.	Drug induced mechanism of cell death – Necrosis and apoptosis	2
19.	Cytoprotective mechanisms against bioactive substances – Role of glutathione and other protectants	2
20.	Calcium homeostasis within the cells	2
21.	Pharmacology of mitogen-activated protein (MAP) kinases/ extracellular signal-regulated kinases (ERK) and small G proteins	3
22.	Current topics/ Discussion of library assignments	2

I. Course Title : Advances in Autacoid Pharmacology

II. Course Code : VPT 602

III. Credit Hours : 1 + 0

IV. Aim of the course

To study the pharmacodynamics and clinical implications of autacoids.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1	Histamine and antihistamines	2
2	5-Hydroxytryptamine and anti-5-HT drugs	2
3	Serotonin and its antagonists	2
4	Kinins	1
5	Angiotensins and inhibitors of renin-angiotensin system	2
6	Lipid-derived autacoids-prostaglandins and leukotrienes	2
7	Platelet activating factor	1
8	Cytokines and other autacoids	2
9	Neurohumoral transmission – purine nucleotides, peptides, amino acids and nitric oxide	2
10	Current topics/ Discussion on library assignments	1

I. Course Title : Pharmacology of Herbal Drugs

II. Course Code : VPT 603

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the pharmacological, therapeutic and toxicological aspects of potential medicinal plants.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction to indigenous pharmacology – History, definitions and scope	1
2.	Basic requirements and classification of indigenous drugs	2
3.	Collection and preparations of indigenous drugs	1
4.	Extraction of drugs	2
5.	Purification of drugs by heat processes – Distillation, evaporation, sublimations,	2
6.	Filtration and clarification	1
7.	Plant drugs with proven pharmacological and therapeutic efficacy	1
8.	Indigenous drugs used in treatment of various gastrointestinal ailments	2
9.	Indigenous drugs used as antimicrobials	1
10.	Indigenous drugs used as analgesics	1
11.	Indigenous drugs used in cardiovascular and CNS disorders	2
12.	Indigenous drugs used in behavioural disorders	1
13.	Indigenous drugs used in Renal and Urinary tract disorders	2

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
14.	Indigenous drugs used in	1
15.	Indigenous drugs used in eye, ear and skin disorders	3
16.	Indigenous drugs used in reproductive disorders	1
17.	Therapeutic and adverse effects of potential herbal drugs	1
18.	Alternate systems of medicine in animals – Homeopathy	1
19.	Alternate systems of medicine in animals – Ayurvedic concepts	2
20.	Alternate systems of medicine in animals – Folklore medicine	1
21.	Alternate systems of medicine in animals – Unani medicine	1
22.	Discussion on few review articles on herbal drugs from journals	2
Practical		
1.	Fundamental techniques in indigenous pharmacology	2
2.	Extraction and purification of drugs from medicinal plants	4
3.	Bioassay of indigenous drugs	3
4.	Pharmacological screening of indigenous drugs – Effect on isolated smooth muscle of ileum	2
5.	Effect on skeletal muscle	1
6.	Effect on perfused heart	1
7.	Effect on uterus	1
8.	Effect on trachea	1

I. Course Title : Biotransformation of Xenobiotics

II. Course Code : VPT 604

III. Credit Hours : 2 + 0

IV. Aim of the course

To study the molecular mechanisms of biotransformation of xenobiotics.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1	Introduction, importance of drug metabolism. Mechanisms and processes of drug biotransformation	1
2	Synthetic and non-synthetic pathways of drug metabolism. Phase reactions- oxidative, reductive, and hydrolytic reactions	1
3	Phase II reactions- conjugation (glucuronidation, sulfation, methylation, acetylation), conjugation with glutathione, aminoacids and thiosulfates	1
4	Oxidation- molecular details, cytochrome P 450 system. Types of CYP enzymes with special reference to CYP 3A4, 1A2, 2D6, 2E1	1
5	Important drugs metabolized by different CYP isoforms- molecular mechanisms involved	1
6	Nuclear receptor mediated transcriptional regulation of cytochrome P 450 system- Nuclear receptors and their ligands	1
7	7-ethoxy-resorufin O-deethylation (EROD) and 7-methoxyresorufin O-demethylation (MROD) as markers of Cytochrome P450 1 activities in hepatic microsomes	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
8	Activity of liver enzymes during the acute and chronic phases of diseases- role of Total bilirubin, Aspartate transaminase (AST), AST/ ALT ratio, Alkaline phosphatase (ALP), Gamma glutamyl transpeptidase (GGT)	1
9	Use S9 liver fraction from animals for the prediction of *in vivo* drug metabolism, Chemical inhibition assays of S9 fraction	1
10	Xenobiotic response systems- AhR (aryl hydrocarbon receptor), ER (estrogen receptor), PPAR (peroxisome proliferator-activated receptor)	1
11	Response systems - VDR (Vitamin-D-Receptor), FXR (farsenoid-X-receptor), HNF4 (hepatocyte nuclear factor), Nrf2-Keap1.	1
12	Concept of orphan nuclear receptors in different phases of metabolism	1
13	Role of Pregnane-X-Receptor (PXR), Constitutive-Androstane-Receptor (CAR), Liver-X-Receptor (LXR) in metabolism of commonly used drugs. Cross-talk in metabolism pathways	1
14	Role of genetically modified animals in drug metabolism studies	1
15	Specific studies on PXR, CAR, LXR involving gene knockout mice, transgenic mice. Cholesterol and bile acid homeostasis. Search for new response elements	1
16	Reduction reactions- molecular details with specific reaction examples of drugs undergoing reduction: of hydrogenation, decarboxylation, amination	1
17	Hydrolysis- molecular details with specific reaction examples of drugs undergoing hydrolysis with enzymes like esterases, peptidases, and amidases	1
18	Glucuronidation- mechanism, sites, general influencing factors	1
19	Glucuronidation affected drugs – metabolism of morphine, oxazepam carbamazepine, acetaminophen, testosterone, zidovudine), inhibitors and inducers of glucuronidation (barbiturates, ibuprofen, etc.	1
20	Sulfation-Tyrosine sulfation (function, Regulation, Posttranslational modification)	1
21	Acetylation- Ultrastructural Aspects of the Heterogeneous Acetylation	1
22	Phase II Biotransformation Reactions-Glutathione-S-Transferase, Glutathione S-conjugates as prodrugs to target drug-resistant tumors	1
23	Phase III – further modification and excretion- detoxification of endogenous reactive metabolites such as peroxides and reactive aldehydes, sites	1
24	Membrane transport – permeability barriers and detoxification, receptor mediated transcytosis, role of the solute carrier (SLC) and the ATP-binding Cassette (ABC) transporters; implications in drug resistance	1
25	Drug metabolism in organs other than liver- role of kidney, intestine and placenta	1
26	Drug metabolism in fetus and new born. *In-vitro* and *in-vivo* studies in drug metabolism; metabolic schemes of selected drugs	1
27	Factors influencing drug metabolism: Steriochemical, Physicochemical and biological factors	1
28	Strain difference in biotransformation, sex, age, environment factors, Genetic factors (pharmacogenetics) heritable factors recognized by use of drugs	1
29	Pathological states- Effect of liver dysfunction on the metabolism of drugs; effect on dosage regimens	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
30	Effect of renal dysfunction on the metabolism of different drugs	1
31	Chemical, biological, genetic and environmental factors. Species variations affecting drug biotransformation mechanisms	1
32	Biotechnology involved in drug metabolism studies- Electrophoretic Mobility Shift Assay (EMSA), northern, western/ southern blotting, PCR, real-time PCR	1
33	Preparation and Analysis of Total RNA Extracted from Hepatocytes for metabolism studies. Sulfation assay using P^{32}, Site-directed Mutagenesis, etc.	1
34	Methods to determine glutathione in liver and blood. Importance of Gamma-glutaylcysteine (GGC) as the immediate precursor to GSH	1
35	Cell lines as tools for drug metabolism studies. Predicting *in-vivo* drug metabolism fron *in-vitro* studies, Cultured hepatocytes (cryopreserved or fresh) for induction and down-regulation studies	1

I. Course Title : Clinical Pharmacology and Pharmacokinetics

II. Course Code : VPT 605

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the efficacy and disposition of drugs in clinical conditions.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction and general principles of pharmacokinetics including absorption, distribution, metabolism and excretion	3
2.	Graphical plotting and interpretation of kinetic data	2
3.	Calculation of pharmacokinetic constants	2
4.	Pharmacokinetic models and their application	2
5.	Determination of pharmacokinetic parameters and their significance	3
6.	Computation of dosage regimen	2
7.	Plasma protein binding of drugs	2
8.	Erythrocyte penetration of drugs	2
9.	Factors modifying pharmacokinetics of drugs	2
10.	Pharmacokinetics of drugs in diseased models	3
11.	Urinary excretion of drugs	1
12.	Kinetics following single and multiple doses	2
13.	Non-compartmental pharmacokinetic modelling	2
14.	Application of pharmacokinetics in clinical practice	2
15.	Drug therapy in neonate and geriatric animals	2
16.	Current topics/ Discussion on library assignments	2
Practical		
1.	Estimation of drugs by chemical and microbiological assays	3
2.	Graphical representation of plasma levels of drugs	1
3.	Determination of pharmacokinetic models	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
4.	Calculation of kinetic constants and parameters	2
5.	Calculation of dosage regimen	1
6.	Renal clearance studies of drugs	1
7.	*In-vitro* experiments on plasma protein binding	2
8.	Calculation of constants of plasma protein binding	1
9.	*In-vitro* erythrocytic penetration of drugs	1
10.	Pharmacokinetic parameters and adjustment of dosage regimen in diseased conditions	2

I. Course Title : Pharmacogenomics

II. Course Code : VPT 606

III. Credit Hours : 2 + 0

IV. Aim of the course

To study the concepts of genomicsin drug development.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction- basic pharmacogenomic nomenclature and principle	1
2.	Pharmacogenomics and bioinformatics: past, present and future, species variations affecting drug responses	1
3.	Optimized drug development- Pharmacogenomics impacts on pharmacokinetics and pharmacodynamics	1
4.	Increased and decreased responsiveness to drug effects/ toxicities and novel drug effects- prediction through databases	1
5.	Personalized medicine using genotyping technologies- Optimized drug therapy	1
6.	Challenges of Pharmacogenomic Testing- access, feasibility, cost	1
7.	Genetic basis of disease – Impact of genetic variations on drug metabolism	1
8.	Ethical applications, social and economic implications	1
9.	Genetic polymorphism- Relevance to a drug, Relevance to a disease, Types of nomenclature- Star Nomenclature, Genotype Nomenclature, Haplotype Nomenclature	1
10.	Genetic polymorphism types-Single nucleotide polymorphism (SNP), Variable number tandem repeat, Gene deletion, Copy number variant	1
11.	Single Nucleotide Polymorphism (SNP)- Synonymous polymorphism, Non-synonymous polymorphism, Variable Number Tandem Repeat: UGT1A1	2
12.	Gene Deletions and Copy Number Variants- Ultra-rapid metabolizers, Extensive metabolizers, Intermediate metabolizers, Poor metabolizers	1
13.	Potential Roles for Healthcare Professionals- Implications for Clinical Practice	1
14.	Pharmacogenomic Resources- Centers for Disease Control and Prevention (CDC), Food and Drug Administration (FDA),	1
15.	Gene therapy: gene transfer technology, viral vectors, natural delivery strategies.	1

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
16.	Transient and Stable Transfection, Transfection Methods- Lipid-mediated method	1
17.	Calcium-phosphate mediated method of transfection, diethylaminoethyloethyl-dextran mediated method of transfection	1
18.	Electroporation- Steps of the electroporation transfection, Biolistics (Gene gun/ microparticle bombardment), Laser transfection	1
19.	Drugs and gene therapy of inherited diseases- approaches, cell types, vectors	1
20.	Genetic inactivation strategies- key concepts. RNA interference (RNAi), Chemical modification on siRNA	1
21.	Engineered nucleases- zinc finger nucleases (ZFNs), transcription activator like effector nucleases (TALENs), clustered regularly interspaced short palindromic repeat associated (CRISPR associated) system	1
22.	DNA repair- Sources of damage –Nuclear versus mitochondrial, Senescence and apoptosis. Mechanisms- Direct reversal, Single-strand damage, Double-strand breaks, Translesion synthesis, Medicine and DNA repair modulation	2
23.	Cancer gene therapy- Immunotherapy, Oncolytic virotherapy- history, current clinical trials, future directions	1
24.	Boosting the immune response, Gene therapies to make cancer treatments effective	1
25.	Pro drug gene therapy, Blocking processes that protect cancer cells, Using altered viruses	1
26.	Role of bioinformatics in pharmacogenomic- Bioinformatics and drug discovery, Barriers to bioinformatics progress in drug design process	1
27.	Pharmacogenomics in drug discovery and development- Personalized/ effective medication.	1
28.	Reviving orphan drug, Barriers to pharmacogenomics progress in drug designing and development.	1
29.	Clinical applications of bioinformatics, genomics, and pharmacogenomics, Relationships and exchange of information with other resources	1
30.	Time dependent inhibition of genes involved in cytochrome P450 (CYP450) enzymes (single point, IC 50 shift)	1

I. Course Title : Immunopharmacology and Immunotoxicology

II. Course Code : VPT 607

III. Credit Hours : 2 + 0

IV. Aim of the course

To study the pharmacological intervention of immune functions.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction to immunology	1
2.	General aspect of Immune system	3

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
3.	Cellular components of immune system	2
4.	General principles of immunopharmacology	1
5.	Immunomodulators and their use in animals	2
6.	Immunostimulants and their role in animal health and diseases	2
7.	Immunosuppressants, and tolerogens – clinical applications	2
8.	Immunological basis of drug allergy and drug tolerance	2
9.	Neuroendocrine immune interactions	2
10.	Iimmunotoxic effects of environmental and other pollutants	3
11.	Molecular mechanisms of immunotoxicity	2
12.	Immunomodulatory effect of xenobiotics	2
13.	Implications of immune alterations in health and disease	2
14.	Immune defiencies, autoimmune response to xenobiotics,	2
15.	Immunoregulants and their therapeutic applications in asthma, arthritis, cancer, dermatology and organ transplant etc	2
16.	Other immunological drugs	2
17.	Current discussions and assignments	2

I. Course Title : Molecular Toxicology

II. Course Code : VPT 608

III. Credit Hours : 3+0

IV. Aim of the course

To understand the mechanisms and targets of cellular/ molecular toxicity.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Cellular, sub-cellular and molecular targets and mechanism of toxicity	2
2.	Concept of receptors and forces involved in binding of xenobiotics to receptors	3
3.	Quantitative aspects and theories of xenobiotic-receptor interactions	3
4.	Signal transduction mechanisms: transducers, effectors and second messengers	2
5.	Classification and structures of receptors – Receptor conformation and configuration – Iono-receptors	2
6.	G-protein coupled receptors	2
7.	Enzymatic receptors	2
8.	Steroid receptors	2
9.	Biophysics of toxicants	2
10.	Hepatic and extra-hepatic metabolism of xenobiotics	3
11.	Metabolic enzyme induction and inhibition	3
12.	Mechanism of bioactivation and cytotoxicity – Electrophilic metabolites, free radicals and reactive oxygen species	3
13.	Molecular mechanisms of target organ directed toxicity of xenobiotics- brain, hematopoietic system, GIT, liver, lungs, kidneys, reproductive system, skin, etc.	4
14.	Cellular dysfunctions and their consequences	2
15.	Repair and disrepair of toxic damage	2

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
16.	Xenobiotic induced mechanism of cell death – Necrosis and apoptosis	3
17.	Risk Assessment	2
18.	Mechanism involved in carcinogenesis, mutagenesis, teratogenesis	2
19.	Radiation toxicity	2
20.	Current topics/ Discussion of library assignments	2

I. Course Title : Clinical Toxicology

II. Course Code : VPT 609

III. Credit Hours : 2 + 1

IV. Aim of the course

To study the concepts of clinical toxicology.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction, history, definition and scope of clinical toxicology	1
2.	Importance and processes of forensic toxicology	1
3.	Toxicological investigations	1
4.	Management and antidotal therapy of poisonings	1
5.	Toxicity of metals – Arsenic, lead, mercury, selenium, molybdenum, and other metals	3
6.	Toxicity of non-metals – Fluoride, nitrite/ nitrate, sodium chloride, phosphorus	3
7.	Toxicity of insecticides – Chlorinated hydrocarbons, organophosphates, carbamates, pyrethroids, and botanical and newer insecticides	3
8.	Toxicity of fumigants	1
9.	Toxicity of herbicides	2
10.	Toxicity of fungicides	1
11.	Toxicity of rodenticides	2
12.	Toxicity of fertilizers	2
13.	Toxicity of solvents and vapours	2
14.	Toxic plants – Plants causing cyanide poisoning, photosensitization, thiamine deficiency and oxalate poisoning	3
15.	Mycotoxins	2
16.	Venomous stings and bites – Snake, scorpion, spider, bees and wasps	2
17.	Toxicity of therapeutic agent	2
18.	GLP in toxicological evaluation	2
Practicals		
1.	Extraction, separation and detection of various poisons in suspected materials	3
2.	Use of blood and tissue biomarker enzymes in assessment of toxicity, viz., acetylcholinesterase, carboxylesterase, etc.	3
3.	Demonstration of poisoning and their antidotal treatment	3
4.	Evaluation of antioxidant profile of toxicosed animals	2
5.	Analysis of poisons in biological samples	2

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
6.	Use of biomarkers in the assessment of toxicity	1
7.	Good laboratory practices evaluation	1
8.	Identification and collection of poisonous plants	1

I. Course Title : Ecotoxicology

II. Course Code : VPT 610

III. Credit Hours : 3 + 0

IV. Aim of the course

To impart knowledge regarding ecotoxicology for conservation of healthy eco-system.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction and basic principles of ecotoxicology	2
2.	Sources of environmental contamination	2
3.	Effects of pollutants on eco-health	2
4.	Fate of chemicals in the environment and target species	2
5.	General aspects of hazards associated with Air and water pollutants	2
6.	Radiation and its hazards	2
7.	Toxicity of pesticides in relation to environmental contamination	3
8.	Toxicity of metals related to agriculture	3
9.	Nanoparticle toxicology	2
10.	Ecological emergencies	2
11.	Residues of agrochemicals in food and ecosystem	2
12.	Marine and wildlife as monitors of environmental quality	2
13.	Bioaccumulation and biomagnifications of toxicants	1
14.	Forensic and regulatory toxicology as related to agrochemicals	3
15.	Hazards of toxicants in domestic and wild life	3
16.	Biomarkers of monitoring the impact of environmental pollutants	3
17.	Environmental hazard and risk identification from mixture of chemicals	2
18.	Contamination control measures	3
19.	Approaches to rehabilitating damaged ecosystems	3
20.	Ethical, moral, and professional issues in toxicology	2

I. Course Title : Regulatory Toxicology

II. Course Code : VPT 611

III. Credit Hours : 2 + 1

IV. Aim of the course

To study acts and regulations and risk assessment regarding use of drugs, chemicals and cosmetics.

V. Lecture/ Practical schedule

S. No.	Name of Topic	No. of Tentative Lectures/ Practicals
Theory		
1.	Introduction to toxicology; scope and industrial application	1
2.	Drug and development in modern industry	1
3.	Regulatory toxicology and pre-clinical pharmaceutical testing services-linkage	2
4.	Principles of Hazard Identification	1
5.	Different guidelines for safety assessments	1
6.	Methods of toxic dose estimation	2
7.	Risk assessment and post marking surveillance	2
8.	Procedure for acute, sub-acute and chronic toxicity study	3
9.	Toxicity test guidelines and different routes	2
10.	Guidelines for herbal safety risk assessment evaluation	1
11.	Working principle of FDA and Indian legislations	1
12.	Schedules of drugs and classification of industrial chemicals	1
13.	Approaches to hazard identification-carcinogenicity	2
14.	Modern concept tolerance: classification, evaluation	2
15.	Dose-response assessment LOEL, LOAEL and AOEL, NOEL, NOAEL, ADI, etc.	3
16.	Guidelines for registration of medicines	2
17.	Specific aspects of drug registration legislation abroad	1
18.	Central drugs standard control organization – CDSCO- India	2
19.	Concept of GLP India and abroad; Role of GLP in toxicological evaluation	2
Practical		
1.	Introduction to good laboratory practices in toxicology	2
2.	Screening procedures in regulatory toxicology	3
3.	Evaluation of acceptable daily intake	2
4.	Determination of No-observable effect level and NOAEL	2
5.	Determination of Low-observable effect level and LOAEL	2
6.	Determination of AOEL	2
7.	Mandatory toxicity testing protocols	2

ANNEXURE I

List of BSMA Committee Members for Veterinary Para-Clinical Subjects

Name	Address	Specialization
Dr Placid E. D'Souza Former Dean and Retd. Professor-cum-Director CAFT in Veterinary Parasitology CVSc, Bengaluru **Chairman**	Department of Veterinary Parasitology, Veterinary College, KVAFSU, Regional campus Bengaluru -560024	Veterinary Parasitology
Dr K P Singh Principal Scientist-cum-Head **Convener**	Division of Veterinary Pathology Indian Veterinary Research Institute, Izatnagar, Bareilly-243 122 (UP)	Veterinary Pathology
Dr R K Asrani Professor	Department of Veterinary Pathology, Dr G C Negi College of Veterinary and Animal Sciences, CSK HPKV, Palampur-176 062 (HP)	Veterinary Pathology
Dr Veer Singh Professor and Head	Division of Veterinary Parasitology, Dantiwada Agricultural University, Gujarat-385 506	Veterinary Parasitology
Dr Rajesh Katoch Professor and Head	Division of Veterinary Parasitology, Sher-e-Kashmir University of Agricultural Sciences and Technology, Jammu-180 009	Veterinary Parasitology
Dr Sunil Maherchandani Professor	Department of Veterinary Microbiology, Rajasthan University of Veterinary and Animal Sciences, Bikaner-334 001	Veterinary Microbiology

Name	Address	Specialization
Dr A K Tiwari Principal Scientist and Head	Division of Veterinary Microbiology, Indian Veterinary Research Institute, Izatnagar, Bareilly-243 122 (UP)	Veterinary Microbiology
Dr N K Mahajan Dean, PGS	Department of Veterinary Public Health and Epidemiology, Lala Lajpat Rai University of Veterinary and Animal Sciences, Hisar-125 001	Veterinary Public Health
Dr S P Singh Retired Professor	Department of Veterinary Public Health and Epidemiology, G. B. Pant University of Agriculture and Technology, Pantnagar-263 145, Uttarakhand	Veterinary Public Health
Dr Vinod Kumar Professor and Head	Department of Veterinary Pharmacology, Lala Lajpat Rai University of Veterinary and Animal Sciences, Hisar-125 001, Haryana	Veterinary Pharmacology
Dr V K Dhumka Professor and Head	Department of Veterinary Pharmacology, Guru Angad Dev Veterinary and Animal Sciences University, Ludhiana-141 012, Punjab	Veterinary Pharmacology

Animal Production Sciences

- Animal Genetics and Breeding
- Animal Nutrition
- Livestock Production and Management
- Livestock Products Technology
- Poultry Science

Contents

Acknowledgements

At the outset, we, on behalf of all the Members of BSMA on Animal Production Sciences (BSMA-APS), would like to thank the Indian Council of Agricultural Research for nominating us to revise the syllabi.

The BSMA on Animal Production Sciences has been tasked with the revision of the existing ICAR syllabi in respect of five disciplines namely, Animal Genetics and Breeding, Animal Nutrition, Livestock Production and Management, Livestock Products Technology and Poultry Science.

The task of revising the existing syllabi for higher education is always a challenging one. However, this enormous task has been successfully completed thanks to the sincere efforts of all the Members of the BSMA-APS Committee. During this revision process, a total of four workshops were carried out at different parts of the country to facilitate greater participation of the faculty involved in the postgraduate teaching. We would, therefore, like to express my sincere gratitude to the Hon'ble Vice-Chancellors of Chhattisgarh Kamdhenu University (Durg), Assam Agricultural University (Guwahati), PV Narsimha Rao Telangana Veterinary University (Hyderabad) and SK University of Agricultural Sciences and Technology of Kashmir (Srinagar) for their kind consent to host the workshops. We are also thankful to the Deans of the respective colleges (College of Veterinary Sciences, Anjora, Durg; College of Veterinary Sciences, Khanapara, Guwahati; College of Veterinary Science, Rajendranagar, Hyderabad; College of Veterinary Science, Shuhama, Srinagar) alongside the Organizing Secretaries and the respective local faculty from the five disciplines for putting in a lot of efforts to make the workshops successful.

The present syllabus is the outcome of the collective efforts of many senior academicians with longstanding experiences in postgraduate teaching and research. The present syllabi development involved inputs received from more than 25 veterinary colleges/ agricultural universities besides the direct contribution of 64 Subject Matter Experts specially invited to the workshops for their direct contribution to the syllabus development process through collective interactions.

Ashok Kumar Pattanaik
Convener, BSMA-APS

Sita Prasad Tiwari
Chairman, BSMA-APS

Animal Production Sciences
– Animal Genetics and Breeding

Preamble
(Animal Genetics and Breeding)

Livestock plays an important role in Indian economy. About 20.5 million people depend upon livestock for their livelihood. Livestock contribute 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP. The economy of farmer is greatly influenced by livestock keeping. The farmers in India maintain mixed farming system i.e. a combination of crop and livestock where the output of one enterprise becomes the input of another enterprise thereby realize the resource efficiency. The livestock serve the farmers in four different ways: income, employment, food and social security. So the conservation and development of indigenous livestock is the need of the hour. The study of the subject of Animal Genetics and Breeding and its application for conservation and improvement of livestock is very important.

Genetic improvement in domesticated animal populations that are used for agricultural production mainly involves selection of males and females that, when mated, are expected to produce progeny that perform better than the average of the current generation. Performance usually includes a combination of multiple characteristics, or traits, most of which are quantitative in nature. Animal breeding involves the selective breeding of livestock with the intention to improve desirable (and heritable) qualities in the next generation. This course introduces the steps required to design a program for breeding animals and teaches the genetic and statistical concepts that are needed to build a solid breeding program. By following this course the students can learn the key aspects of improving and increasing productivity and learn what it takes to create and maintain a healthy strong population. Students will learn how an animal breeder balances the need for improving the desirable qualities of the animals with the need for genetic diversity and long-term sustainability of the breeding program. Also students will learn about the scientific concepts in genetics that are applied in animal breeding, as well as how to apply the genetic models and computational methods that are used in animal breeding. Professionals working with animals will be able to use the knowledge from this course to understand the impact of breeding on animal populations and use genetic principles to make their decisions. This course will allow an advanced starting point for further studies, such as M.Sc. level courses in breeding.

Although animal breeding was practiced long before the science of genetics and the relevant disciplines of population and quantitative genetics were known, breeding programs have mainly relied on simply selecting and mating the best individuals on their own or relatives' performance. This is based on sound quantitative genetic principles, developed and expounded by Lush, who attributed much of his understanding to Wright, and formalized in Fisher's infinitesimal model. Analysis at the level of individual loci and gene frequency distributions has had relatively little impact. Now with access to genomic data, a revolution in which molecular information is being used to enhance response with "genomic selection" is occurring. The predictions of breeding value still utilize multiple loci throughout the genome and, indeed, are largely compatible with additive and specifically infinitesimal model assumptions.

The main goal in animal breeding is to select individuals that have high breeding values for traits of interest as parents to produce the next generation and, to do so, as quickly as possible. To date, most programs rely on statistical analysis of large data bases with phenotypes on breeding populations by linear mixed model methodology to estimate breeding values on selected candidates. However, there is a long history of research on the use of genetic markers to identify quantitative trait loci and their use in marker-assisted selection but with limited implementation in practical breeding programs. The advent of high-density SNP genotyping, combined with novel statistical methods for the use of this data to estimate breeding values, has resulted in the recent extensive application of genomic or whole-genome selection in dairy cattle and research to implement genomic selection in other livestock species is underway. The high-density SNP data also provides opportunities to detect QTL and to uncover the genetic architecture of quantitative traits, in terms of the distribution of the size of genetic effects that contribute to trait differences in a population. Experimental results show that this genetic architecture differs among traits but that for most traits, over 50% of the genetic variation resides in genomic regions with small effects that are of the order of magnitude expected under a highly polygenic model of inheritance.

In indigenous livestock breed improvement program and conservation of indigenous livestock courses, different schemes like Rastriya Krishi Vikash Yojana (RKVY), Rastriya Gokul Mission (RGM) and National Programme for Bovine Breeding and Dairy Development (NPBBDD) launched by GoI under Ministry of Agriculture, Animal Husbandry, Dairying and Fisheries are included.

Addition of Courses

In M.V.Sc. degree programme, six new courses are proposed namely AGB-611 (Swine Breeding), AGB-612 (Pet Animal Breeding- dogs and cats), AGB-613 (Wild Animal Genetics and Breeding), AGB-614 (Equine Breeding), AGB-615 (Camel Breeding), AGB-616 (Yak and Mithun Breeding) and AGB-617 (Statistical Methods in Animal Breeding).

In Ph.D. degree programme, one new course is proposed namely AGB-707 (Statistical Software in Animal Breeding) based on inputs of stakeholders and contemporary requirement.

The course contents have been decided and modified as per suggestions of all the stakeholders during four workshops held at Durg, Guwahati, Hyderabad and Srinagar. Assuming the priority day-by-day, the areas which need to be strengthened in Animal Genetics and Breeding are: Molecular Techniques in Animal Breeding, Biometrical Techniques in Animal Breeding, Bio-informatics in Animal Genetics and Breeding, Breeding for different species having regional importance, viz., Swine, Camel, Equine, Yak and Mithun Breeding. Pet Animal Breeding is important in the sense that majority of people are fond of keeping pets where pedigreed dog and cats are the choice. Wild Animal Genetics and Breeding is an essential part for conservation of wild life now-a- days.

Deletion of Courses

In Ph.D., one course has been deleted namely AGB-707 (Utilization of non-additive genetic variance in farm animals) which appears to be redundant and/ or contents included elsewhere.

Changes of Name of Courses

Title of five courses in M.V.Sc. and five courses in Ph.D. have been modified as per the following Table:

Course Code	Old Title/ Existing	Modified Title
AGB 601	Animal Cytogenetics and Immunogenetics	Animal Cytogenetics and Immunogenetics I
AGB 602	Molecular Genetics in Animal Breeding	Molecular Genetics I
AGB 605	Biometrical Techniques in Animal Breeding	Biometrical Genetics I
AGB 608	Small Farm Animal Breeding (sheep, goat, swine and rabbit)	Sheep and Goat Breeding
AGB 610	Laboratory Animal Breeding	Laboratory Animal and Rabbit Breeding
AGB 701	Recent Advances in Animal Genetics	Molecular Genetics II
AGB 702	Recent Trends in Animal Breeding	Trends in Animal Breeding
AGB 703	Advances in Biometrical Genetics	Biometrical Genetics II
AGB 705	Bioinformatics in Animal Genetics and Breeding	Bioinformatics in Animal Breeding
AGB 706	Advances in Molecular Cytogenetics	Animal Cytogenetics and Immunogenetics II

Change of Credit Hours

For AGB 604 and AGB 605, credit hours have been reduced from 3+1 to 2+1. For AGB 610, credit hour has been increased from 1+0 to 2+0 to accommodate rabbit breeding components. For AGB 705, credit hour has been modified from 2+0 to 1+1 to accommodate practical classes.

For M.V.Sc. degree programme, out of the total of 20 credit hours from major, 15 credits hours have been decided as core (compulsory) courses and five credit hours from optional major courses. For Ph.D. degree programme, out of the total 12 credit hours 10 credit hours have been decided as core (compulsory) courses and two credits from optional major courses.

Course Title with Credit Load
M.V.Sc. in Animal Genetics and Breeding

Course Code	Course Title	Credit Hours
AGB 601*	Animal Cytogenetics and Immunogenetics I	2+1
AGB 602*	Molecular Genetics I	2+1
AGB 603*	Population and Quantitative Genetics	2+1
AGB 604*	Selection Method and Breeding System	2+1
AGB 605*	Biometrical Genetics I	2+1
AGB 606	Conservation of Animal Genetics Resources	2+0
AGB 607	Cattle and Buffalo Breeding	2+1
AGB 608	Sheep and Goat Breeding	2+0
AGB 609	Poultry Breeding	2+1
AGB 610*	Laboratory Animal and Rabbit Breeding	2+0
AGB 611	Swine Breeding	1+0
AGB 612	Pet Animal Breeding (Dogs and Cats)	1+0
AGB 613	Wild Animal Genetics and Breeding	1+0
AGB 614	Equine Breeding	1+0
AGB 615	Camel Breeding	1+0
AGB 616	Yak and Mithun Breeding	1+0
AGB 617	Statistical Methods in Animal Breeding	2+1
AGB 691	Seminar	1+0
AGB 699	Research	30

Course Contents
M.V.Sc. in Animal Genetics and Breeding

I. Course Title : Animal Cytogenetics and Immunogenetics I

II. Course Code : AGB 601

III. Credit Hours : 2+1

IV. Why this course?

To provide basic and advanced theoretical and practical training in animal cytogenetics and immunogenetics with an ulterior aim of enhancing animal production.

V. Aim of the course

This course is aimed to train students in identifying genetic/ chromosomal abnormalities and reviewing genetic mechanisms responsible for the generation of diversity in genes for immunoglobulin, TLR and MHC, etc., facilitating the better application of both classical and molecular cytogenetics and immunogenetics for animal improvement.

VI. Theory

Unit I (7 Lectures)

Physical and chemical basis of heredity; Development in animal cytogenetics and immunogenetics of farm animals; Inborn errors of metabolism and inherited disorders; immunoglobulin and their types; Antigen-antibody interactions; Immune response; ELISA.

Unit II (10 Lectures)

Chromatin structure of eukaryotes; Chromosome number and morphology in farm animals; Karyotyping and banding; Chromosomal abnormalities and genetic syndromes; DNA packing in chromosomes; Types of DNA; FISH chromosome painting and PRINS; SCH and RH panel mapping.

Unit III (10 Lectures)

Genetic variants in blood group systems of farm animals; Major histocompatibility complex: BoLA, BuLA; Genetics of biochemical variants and their applications; Immune response genes and concepts of disease resistance including major genes; Hybridoma and its significance; Concept of immunofertility; TLRs and interleukins.

Unit IV (3 Lectures)

Mutation and assays of mutagenesis; Sister chromatid exchanges.

VII. Practical (15 Classes)

Identification of Barr bodies; *In-vitro* and *in vivo* preparation of somatic metaphase chromosomes; Screening of chromosomal abnormalities; Microphotography and karyotyping; Banding procedures for comparing the chromosomal complement; FISH and PRINS; ELISA; Immunocompetence tests.

VIII. Teaching methods

Blackboard; PPT-animations; Hands-on practical training; application based practical approach; Visit labs specialising in animal cytogenetics and immunogenetics; Research article discussion in the classroom.

IX. Learning outcome

Upon successful completion, the students will be able to understand the immune response (IR) and its role in disease resistance along with the role of allelic variations in IR genes in animal production in addition to the advances in the field of animal cytogenetics and immunogenetics.

I. Course Title : Molecular Genetics in Animal Breeding

II. Course Code : AGB 602

III. Credit Hours : 2+1

IV. Why this course?

To provide basic and advanced concepts of molecular genetics and their application to different species of animals

V. Aim of the course

This aim of this course is to study genes and their functions to understand their role in animal breeding and selection. Also aimed at the genetics of populations including quantitative genetics and its applications in animal breeding.

VI. Theory

Unit I (8 Lectures)

Basic concepts in molecular genetics; Concepts of proteomics and genomics; Genesis and importance of molecular techniques; Genome organization: physical and genetic map, current status of genome maps of livestock; Gene expression and control.

Unit II (8 Lectures)

Molecular markers and their applications; RFLP, RAPD, Microsatellite/ Minisatellite markers, SNP marker, DNA fingerprinting.

Unit III (7 Lectures)

DNA sequencing; Genome sequencing; Genomic Library; Polymerase Chain Reaction (PCR) and its types (PCR-RFLP, AS-PCR, etc.) and applications; Transgenesis and methods of gene transfer; Recombinant DNA technology and applications.

Unit IV (7 Lectures)

Analysis of molecular genetic data; Quantitative Trait Loci (QTL) mapping and its application in animal breeding: Genome scan, candidate gene approach.

VII. Practical (15 Classes)

Extraction and purification of genomic DNA; Gel electrophoresis; Restriction enzyme digestion of DNA and analysis; PCR-RFLP; PCR-SSCP; Bioinformatics tool for DNA sequence analysis; Isolation of RNA; cDNA synthesis; Statistical methods for analyzing molecular genetic data.

VIII. Teaching methods

Blackboard; PPT-animations; Web-courses (if available); Hands-on practical training; Application based practical skills; Visit labs specialising in molecular genetics critical discussion of articles in the area.

IX. Learning outcome

Upon successful completion, the students will have an understanding of how genes control biological functions from cellular activities to development, techniques used to manipulate gene functions in addition to genomics, proteomics and their applications in livestock improvement.

I. Course Title : Population and Quantitative Genetics

II. Course Code : AGB 603

III. Credit Hours : 2+1

IV. Why this course?

To study the genetic structure of the animal population and the importance of genetic variation and covariation among quantitative traits.

V. Aim of the course

To impart knowledge on the general structure of animal population and factors affecting it and estimation of genetic and phenotypic parameters of different quantitative traits.

VI. Theory

Unit I (15 Lectures)

Genetic structure of population; Hardy Weinberg Law; Idealized population; Factors affecting changes in gene and genotypic frequencies; Systematic processes; Approach to equilibrium under different situations: Single autosomal locus with two alleles, single sex-linked locus, two pairs of autosomal linked and unlinked loci; Linkage equilibrium and disequilibrium; Combined effect of all forces changing gene frequency.

Unit II (10 Lectures)

Dispersive process - small population: random genetic drift; Effective population size; Regular and irregular inbreeding systems; Founder effect and bottleneck; Effective number of founders and ancestors.

Unit III (10 Lectures)

Quantitative genetics: Gene effects, population mean, breeding value; Variance and its partitioning; Genotype-environment interaction and correlation; Resemblance between relatives.

Unit IV (10 Lectures)

Genetic and phenotypic parameters (heritability, repeatability, correlations): Methods of estimation, uses, possible biases, precision, optimal designs; Scale effects and threshold traits.

VII. Practical (15 Classes)

Estimation of gene and genotypic frequencies under different conditions; Estimation of inbreeding in regular and irregular systems; Estimation of effective population size; Computation of quantitative genetic effects; Estimation of variance components; Computation of heritability, repeatability, genetic, phenotypic and environmental correlations and their standard errors.

VIII. Teaching methods

Lectures; PPT-Presentations; MS-Excel for estimation of data.

IX. Learning outcome

Understanding the effect of gene and genotype frequencies on the genetic structure of populations, and estimation of genetic variation and covariation among different quantitative traits.

I. Course Title : Selection Method and Breeding System

II. Course Code : AGB 604

III. Credit Hours : 2+1

IV. Why this course?

To explain the methodology of selection and breeding systems for improvement of livestock and poultry.

V. Aim of the course

To study different methods of selection and factors affecting it, various mating systems and their use in animal genetics and the concepts of recent selection techniques.

VI. Theory

Unit I (6 Lectures)

Types of selection and their genetic consequences; Response to selection: Prediction and improvement.

Unit II (12 Lectures)

Theoretical aspects of accuracy and efficiency of selection bases; Prediction of breeding value using different criteria; Combined selection; Correlated response and efficiency of indirect selection.

Unit III (12 Lectures)

Selection for several traits; Different types of selection indices; Evaluation of short term and long term selection experiments: bidirectional selection, asymmetry of response, selection limit.

Unit IV (15 Lectures)

Different mating systems: assortative mating, inbreeding, out-breeding; Genetic and phenotypic consequences and applications of various mating systems in animal improvement; Heterosis; Selection for general and specific combining abilities; Genetic polymorphism and its application in genetic improvement: Basic concepts of marker-assisted selection (MAS) and genomic selection.

VII. Practical (15 Classes)

Prediction of direct and correlated response; Computation of realized heritability and genetic correlation; Computation of selection index; Estimation of breeding values from different sources of information; Determining the accuracy of selection; Estimation of heterosis for different types of crosses; Estimation of GCA and SCA.

VIII. Teaching methods

Blackboard; PPT-animations; Hands-on practical training; application based practical approach; Visit labs specialising in animal cytogenetics and immunogenetics; Research article discussion in the classroom.

IX. Learning outcome

Good knowledge of the application of selection methods and mating systems in animal improvement, and application of selection for combining abilities.

I. Course Title : Biometrical Genetics I

II. Course Code : AGB 605

III. Credit Hours : 2+1

IV. Why this course?

To educate about the various biometrical techniques for data analysis and their applications

V. Aim of the course

To impart knowledge about common diseases and disorders of poultry, diagnosis, vaccination, prevention, control and treatment.

VI. Theory

Unit I (8 Lectures)

Nature and structure of animal breeding data; Source of variation; Adjustment of data; Outliers and their removal; Basic concepts in statistical inference and experimental designs.

Unit II (7 Lectures)

Introduction to matrix algebra; Types of matrices and their operations; Determinants and their properties; Matrix inversion and its applications.

Unit III (15 Lectures)

Multiple regression and correlations; Fisher's discriminant function and its application; D^2 statistics in divergent analysis; Cluster analysis; Fixation index; Genetic distance estimation and phylogeny construction; Linear models and their types; Least-squares (LS) analysis; Generalized LS and weighted LS; BLUE, BLUP; Methods of estimation of variance components: ANOVA, ML, REML, MINQUE, MIVQUE; Bayesian approach.

Unit IV (15 Lectures)

Animal model; Reduced animal model; Sire model; Maternal grandsire model; Maternal effects model; Repeatability model; Random regression model; Threshold model; Multidimensional scaling (MDS) and principal component analysis (PCA); Database management and use of software in animal breeding.

VII. Practical (15 Classes)

Collection, compilation, coding and transformation of animal breeding data; Matrix applications, determinant and inverse of matrices; Building of models for various types of data; Least-squares analysis of data; Estimation of BLUE and BLUP solutions; Formation of numerator relationship, dominance and identical by descent matrix; Estimation of variance components.

VIII. Teaching methods

Blackboard; PPT-Presentations; Application based practical approach; Research article discussion in the classroom.

IX. Learning outcome

Students will develop skills in analyzing breeding data using different biometrical techniques.

I. Course Title : Conservation of Animal Genetics Resources

II. Course Code : AGB 606

III. Credit Hours : 2+0

IV. Why this course?

To study the concepts of conservation of animal genetic resources (AnGR)

V. Aim of the course

To impart knowledge on AnGR in India and their characterization, concepts and methods of conservation and national and international strategies for conservation of AnGR.

VI. Theory

Unit I (12 Lectures)

Domestic animal diversity in India: Origin, history and utilization; Present status and flow of AnGR and its contribution to livelihood security; Methodology for phenotypic and genotypic characterization of livestock and poultry breeds through systematic surveys; Management of breed; Physical, biochemical and performance traits and uniqueness of animals of a breed; Social, cultural and economic aspects of their owners/ communities rearing the breed.

Unit II (12 Lectures)

Methods for increasing effective population size of endangered breed/ species: Effective number of alleles, inbreeding effective size, variance effective size, minimum viable population size; Methodology for characterization of AnGR; nuDNA and mtDNA based diversity analysis and relationship among the breeds; Concept of conservation: *In-situ* and *ex-situ* (in-*vivo* and *in-vitro*); Models of conservation; Prioritization of breeds for conservation; Strategies for conservation of livestock and poultry genetics resources; Gene bank concept; Preservation of ecosystem.

Unit III (6 Lectures)

Status, opportunities and challenges in the conservation of AnGR; IPR issues on animal genetic resources/ animal products or by-products; Registration of livestock breeds and protection of livestock owner's rights in India; Breed societies and their role in conservation.

VII. Practical -

VIII. Teaching methods

Blackboard; PPT-Presentations; Application based practical approach; Research article discussion in the classroom

IX. Learning outcome

Conservation strategies of AnGR, their characterization and methods of conservation to protect biodiversity

I. Course Title : Cattle and Buffalo Breeding

II. Course Code : AGB 607

III. Credit Hours : 2+1

IV. Why this course?

To educate the concept of cattle and buffalo breeding and improvement in dairy production

V. Aim of the course

To impart knowledge on different breeds of cattle and buffalo and their economic traits, sire evaluation methods and breeding systems and different cattle and buffalo breeding programmes.

VI. Theory

Unit I (15 Lectures)

History of dairy cattle and buffalo breeding; Evolution of cattle and buffalo breeds and their characteristics; Population dynamics and production systems; Inheritance of important economic traits; Recording and handling of breeding data; Standardization of records; Computation of correction factors for the adjustment of the data; International Committee on Animal Recording (ICAR) and INAPH.

Unit II (12 Lectures)

Progeny testing under farm and field conditions; Evaluation of bulls by different models; Estimation of breeding values of the cows; Nucleus breeding system; Marker-assisted selection and genomic selection.

Unit III (12 Lectures)

Crossbreeding in cattle in India and abroad; Development of new breeds; Conservation of threatened breeds of cattle and buffaloes; Role of breed associations in dairy improvement; Breeding policy: national and state.

Unit IV (6 Lectures)

Import of exotic germplasm for breeding cattle in the tropics; Appraisal of buffalo and cattle breeding programme; Role of breed associations in dairy improvement.

VII. Practical (15 Classes)

Performance recording; Standardization of records; Estimation of economic traits; Computation of genetic parameters; Genetic gain; Sire evaluation methods; Estimation of heterosis; Culling and replacement.

VIII. Teaching methods

Blackboard; PPT-Presentations; Application based practical approach; Research article discussion in the classroom

IX. Learning outcome

After completion of the course, the students get good knowledge of different breeds of cattle and buffalo and breeding programmes

X. Suggested Reading

I. Course Title : Sheep and Goat Breeding
II. Course Code : AGB 608
III. Credit Hours : 2+0

IV. Why this course?

To educate about sheep and goat breeding concepts and development in small ruminants

V. Aim of the course

To impart knowledge on different breeds of sheep and goat and their economic traits, breeding systems and selection strategies, and different sheep and goat breeding policies.

VI. Theory

Unit I (8 Lectures)

Breeds; Economic traits; Population dynamics and production systems; Prolificacy; Breeding records and standardization; Computation of correction factors.

Unit II (12 Lectures)

Genetic parameters; Selection of males and female; Selection indices for sheep and goat; Breeding systems; Breeding strategies for improvement of production (meat, milk and wool) and reproduction (fertility and fecundity); Inbreeding and its effects on production traits; Group breeding schemes; Development of new breeds; Strategies for introgression of genes (fecundity and growth).

Unit III (10 Lectures)

Breeding policy; Sheep and goat improvement programme in India; Conservation of breeds; Culling and replacement; Equivalent Animal Death Rate (EADR).

VII. Teaching methods

Blackboard; PPT-presentations

VIII. Learning outcome

After completion of the course, the students get a good knowledge of different breeds of sheep and goat and their breeding policies

IX. Suggested Reading

- Jindal SK. 2013. *Goat Production and Health Management*. New India Publishers.
- Karim SA. 2010. *Climate Change and Stress Management: Sheep and Goat Production*. Satish Serial Publications.

I. Course Title : Poultry Breeding

II. Course Code : AGB 609

III. Credit Hours : 2+1

IV. Why this course?

To educate about advances in poultry breeding practices

V. Aim of the course

To impart knowledge on different species of poultry and their economic traits, selection criteria and selection indices, and conservation of poultry genetic resources.

VI. Theory

Unit I (10 Lectures)

Origin and history of poultry species: Chicken, turkey, duck and quail; Poultry classes and breeds; Important qualitative traits in poultry including lethal; Economic traits of egg and meat-type chicken and their standardization; Different mating systems.

Unit II (10 Lectures)

Selection criteria and selection indices; Response to selection; Genetic controls; Genotype and environment interaction; Inbreeding and its effects on production traits in egg and meat-type chickens; Development of inbred lines and strains; Strain and line crosses; Introduction to diallel cross; Utilisation of heterosis and reciprocal effect; Recurrent selection, reciprocal recurrent selection and modified RRS; Specialized sire and dam lines; Genetic improvement programs in poultry; Selection strategies for the improvement of layers and broilers; Performance testing of commercial strains; Backyard poultry.

Unit III (4 Lectures)

Industrial breeding; Artificial insemination in chicken; Auto-sexing; Random Sample Test.

Unit IV (6 Lectures)

Biochemical variants and immunogenetics of poultry; Use of molecular genetics in poultry breeding; Quantitative trait loci; Marker-assisted selection and genomic selection; Conservation of poultry genetic resources.

VII. Practical (15 Classes)

Inheritance of qualitative traits; Economic traits of egg-type and meat-type chicken; Procedures of standardization; Estimations of heritability, the correlation between various production traits; Inbreeding co-efficient and heterosis; Selection of sires and dams; Osborne index; Restricted selection index; Collection and evaluation of semen and insemination; Estimation of GCA and SCA.

VIII. Teaching methods

Blackboard; PPT-presentations

IX. Learning outcome

Students get acquainted with different poultry species, applications of selection methodology and molecular genetics in poultry for higher productivity.

I. Course Title : Laboratory Animal and Rabbit Breeding

II. Course Code : AGB 610

III. Credit Hours : 2+0

IV. Why this course?

To educate about laboratory animal breeding principles and commercial rabbit breeding.

V. Aim of the course

To impart knowledge on different laboratory animals and their importance, selection and mating methods, and commercial rabbit production and management.

VI. Theory

Unit I (6 Lectures)

Introduction to laboratory animal genetics; Breeding colonies of mice, rats, hamsters, guinea pigs and rabbits and their maintenance; Use of primates in animal research.

Unit II (4 Lectures)

Selection methods and mating systems: Monogamous, polygamous and others.

Unit III (12 Lectures)

Development of genetically controlled laboratory animals; Rules for nomenclature: Inbred strains, outbred stocks, mutant stocks, recombinant inbred strains, transgenic strains; Gene targeting and production of 'gene knock-out' animals; Production and use of specific pathogen-free animals; Guidelines and SOPs for the establishment of lab animal house; Genetic control and monitoring; Record-keeping; Ethics of laboratory animal research: FELASA, CPCSEA and IAEA regulations.

Unit IV (8 Lectures)

Rabbit production and management systems; Rabbit breeds for meat and wool; Economic traits and their inheritance; Breeding records and standardisation; Selection methods and breeding systems.

VII. Teaching methods

Blackboard; PPT-presentations

VIII. Learning outcome

Students get a view on breeding importance of laboratory animals and their applications in animal genetics. Additionally, knowledge of commercial rabbit production will also be developed

I. Course Title : Swine Breeding

II. Course Code : AGB 611

III. Credit Hours : 1+0

IV. Why this course?

To educate about swine breeding principles and swine improvement programme in India

V. Aim of the course

To impart knowledge on different breeds of swine and their economic traits, breeding systems and selection methods, and breeding policies and conservation methods.

VI. Theory

Unit I (7 Lectures)

History and development of swine industry; Different breeds of pigs; Economic traits; Breeding records and standardization; Computation of correction factors; Culling and replacement; Equivalent Animal Death Rate (EADR).

Unit II (6 Lectures)

Genetic parameters; Bases and methods of selection; Selection of boars and sows; Breeding systems; Breeding strategies for improvement of indigenous and pure exotic breeds; Inbreeding and its effects on performance traits; Exploitation of heterosis; Development of synthetic varieties/ breeds.

Unit III (2 Lectures)

Swine breeding policy; National swine improvement programme; Conservation of breeds.

VII. Teaching methods

Blackboard: PPT-presentations: Research article discussion in the classroom

VIII. Learning outcome

Get acquainted with different breeds of swine, breeding methods and swine improvement programmes in India

I. Course Title : Pet Animal Breeding (Dogs and Cats)

II. Course Code : AGB 612

III. Credit Hours : 1+0

IV. Why this course?

To educate about pet animal breeding principles which are contemporary in the defence establishment and affluent civic society

V. Aim of the course

To impart knowledge on different breeds of cats and dogs besides the principles of breeding management.

VI. Theory

Unit I (9 Lectures)

Breeds of dogs: Classification of breeds, important Indian and exotic breeds; Pedigree breeding and maintenance of breeding records; Kennel Club; Breed associations; Breeding management of dog.

Unit II (6 Lectures)

Breeds of cats: Classification of breeds, important Indian and exotic breeds; Pedigree breeding and maintenance of breeding records; Breeding management of cat.

VII. Teaching methods

Blackboard; PPT-animations; research article discussion in the classroom

VIII. Learning outcome

Different breeds of cats and dogs and their breeding management

IX. Suggested Reading

I. Course Title : Wild Animal Genetics and Breeding

II. Course Code : AGB 613

III. Credit Hours : 1+0

IV. Why this course?

To educate about wild animal breeding

V. Aim of the course

To impart knowledge on wildlife biodiversity in India, wild animal breeding in nature and captivity, and conservation of wild animals.

VI. Theory

Unit I (4 Lectures)

Wildlife biodiversity of India; Adaptation and natural selection; Species and speciation; Population dynamics; Variation; Loss of genetic variation; Hardy-Weinberg equilibrium.

Unit II (6 Lectures)

Inbreeding: Inbreeding depression, effective population size, demographic bottleneck; Genetic considerations in the translocation of wild animals; Wild animal breeding in nature and captivity; Captive breeding projects and principles; Concept of landscape genetics.

Unit III (5 Lectures)

Conservation of wild animals; Cryopreservation of semen and embryos of endangered species; Frozen zoo concept; Genetic markers; Application of molecular and cytogenetic techniques in wildlife breeding; Genetic defects in wild animals; Wildlife Protection Act.

VII. Teaching methods

Blackboard; PPT-animations; research article discussion in the classroom

VIII. Learning outcome

Breeding and conservation methods of wild animals

IX. Suggested Reading

I. Course Title : Equine Breeding

II. Course Code : AGB 614

III. Credit Hours : 1+0

IV. Why this course?

To educate about breeding practices in equines

V. Aim of the course

To impart knowledge on classification of light and work-horses, breeding management and selection strategies in equines, and biotechnology in equine breeding programmes requirements of poultry and factors influencing the same.

VI. Theory

Unit I (4 Lectures)

Equine population in India; Domestic diversity, its origin, history and utilization; Breeds of native and exotic horses; Types and classes of light and work-horses.

Unit II (6 Lectures)

Cytogenetics of horses and donkeys; Breeding of horses and donkeys and production of mules; Foaling and care of foal; Important quantitative and qualitative traits and their inheritance; Recording and handling of breeding data; Standardization of records.

Unit III (5 Lectures)

Stallion and mare complementation; Judging criteria for elite animals; Conservation strategies; Selecting the mare and the stallion for breeding; Ongoing breed improvement programmes; Biotechnology in equine breeding programmes.

VII. Teaching methods

Blackboard; PPT-presentations

VIII. Learning outcome

Breeding and conservation methods of equines

IX. Suggested Reading

- McKinnon AO, Squres EL, Vaala WE and Varner DD. 2011. *Equine Reproduction*. Wiley Blackwell.
- Morel MCGD. 2008. *Equine Reproductive Physiology, Breeding and Stud Management*. CABI.
- Samper JC. 2008. *Equine Breeding Management and Artificial Insemination*. Science Direct Publications.

I. Course Title : Camel Breeding

II. Course Code : AGB 615

III. Credit Hours : 1+0

IV. Why this course?

To educate about camel breeding, an emerging economically important species of livestock

V. Aim of the course

To impart knowledge on breeding management of camels, breed improvement programmes, and application of molecular genetic methods in camel breeding.

VI. Theory

Unit I (7 Lectures)

Population dynamics and economic importance; Breeds of the camel; Production systems and herd structure; Inheritance of important economic traits; Recording and handling of breeding data; Standardization of records; Cytogenetics of the camel; Behaviour and breeding management.

Unit II (5 Lectures)

Judging criteria for elite animals; Selection of breeding stock; Breeding seasons; Methods for detection of heat; Natural service and artificial insemination; Breed improvement programmes.

Unit III (3 Lectures)

Conservation strategies; Immune status of camel; Molecular genetics in camel breeding.

VII. Teaching methods

Blackboard; PPT-presentations; Research article discussion in the classroom

VIII. Learning outcome

Breeding and conservation methods of camels

IX. Suggested Reading

- Dmitriez NG and Ernst LK. 1989. *Animal Genetic Resources of the USSR*. FAO.
- Wilson RT. 1984. *The Camel*. Longman.
- Selected Research Articles

I. Course Title : Yak and Mithun Breeding

II. Course Code : AGB 616

III. Credit Hours : 1+0

IV. Why this course?

To educate about Yak and Mithun breeding

V. Aim of the course

To impart knowledge on breeds/ types of Yak and Mithun, production systems in Yaks and Mithun, their behaviour and breeding management including conservation strategies and molecular genetics in Yak and Mithun breeding.

VI. Theory

Unit I (7 Lectures)

Population dynamics and economic importance; Breeds/ types of yak and mithun; Production systems; Inheritance of important economic traits; Recording and handling of breeding data; Standardization of records; Cytogenetics of yak and mithun; Behaviour and breeding management.

Unit II (5 Lectures)

Judging criteria for elite animals; Selection of breeding stock; Breeding seasons; Methods for detection of heat; Natural service and artificial insemination; Breed improvement. programmes

Unit III (3 Lectures)

Conservation strategies; Molecular genetics in yak and mithun breeding.

VII. Teaching methods

Blackboard; PPT-presentations; Research article discussion in classroom

VIII. Learning outcome

Breeding and conservation methods of yak and mithun

IX. Suggested Reading

- *Selected Research Articles*

I. Course Title : Statistical Methods in Animal Breeding

II. Course Code : AGB 617

III. Credit Hours : 2+1

IV. Why this course?

To educate about Statistical Methods in Animal breeding

V. Aim of the course

To impart knowledge on the transformation of data, sampling, standard error and importance, basics of statistical inferences, and analysis of variance.

VI. Theory

Unit I (12 Lectures)

Measures of central tendency; Measures of dispersion; Correlation and regression; Probability; Theory of distributions; Transformation of data; Sampling: Theory, need and properties; Estimators: Concept, standard error and importance.

Unit II (8 Lectures)

Basics of statistical inferences; Parametric tests: Z, t and F distribution; Non-parametric test: c^2 sign test, run test and rank test; Confidence interval.

Unit III (10 Lectures)

Analysis of variance: One and two way; Experimental designs: CRD, RBD and LSD; Missing plot techniques; Analysis of covariance.

VII. Practical (15 Classes)

Measures of central tendency; Measures of dispersion; Correlation and regression; Transformation of data; Probability; Z, t, F and c^2 tests; CRD, RBD and LSD; Analysis of covariance

VIII. Teaching methods

Blackboard; PPT-presentations

IX. Learning outcome

Application of statistical methods in animal breeding

Course Contents
Ph.D. in Animal Genetics and Breeding

I. Course Title : Molecular Genetics II

II. Course Code : AGB 701

III. Credit Hours : 2+0

IV. Why this course?

To educate about the latest tools and techniques of animal genetics and their uses in animal sciences

V. Aim of the course

To impart knowledge on the eukaryotic genome, gene editing, gene knock-out and silencing, transgenic animals their benefits in livestock production, and genomic selection.

VI. Theory

Unit I (10 Lectures)

Eukaryotic genome: Gene families, pseudogenes, SnRNPs; Types of RNA including miRNA; Gene conversion; Tandem repeats; Minisatellites and microsatellites; Sequencing of EST.

Unit II (10 Lectures)

Transposable elements; Transcription and RNA processing; Translation; Regulation of gene expression; Differential expression analysis; Serial analysis of gene expression; Selective gene amplification; The proteasome and longevity of proteins; Gene editing; Gene targeting; Gene knock-out and silencing.

Unit III (10 Lectures)

Transgenic animals: Application, ethical issues; Gene therapy; Bio-pharming; Cloning; Genome imprinting; Epigenetic modification; Creation of SNP chips and microarray technology; Next-generation sequencing; Genomic selection.

VII. Teaching methods

Blackboard; PPT-animations; Research article discussion in classroom

VIII. Learning outcome

Epigenetic Modification and transgenic animal production

IX. Suggested Reading

I. Course Title : Trends in Animal Breeding

II. Course Code : AGB 702

III. Credit Hours : 2+0

IV. Why this course?

To acquaint with recent trends in animal breeding and designing of need-based breeding strategies

V. Aim of the course

To impart knowledge on identification of novel traits and their role in breed improvement programme, development of mixed model equations, formulation of detailed breeding plans and advanced techniques in genetic manipulation for multiplication and improvement of livestock species.

VI. Theory

Unit I (12 Lectures)

Identification of novel traits and their role in breed improvement programme; Development of mixed model equations; Advancement in biometrical methods including artificial neural network and Bayesian approach; Detection of QTL; Ancestry informative markers for admixture analysis.

Unit II (10 Lectures)

Formulation of detailed breeding plans; Breeding for disease resistance and functional traits; Breeding for climate resilience; Inheritance of animal behavior traits; Breeding for animal welfare; Impact analysis of different breed improvement programme in various livestock species.

Unit III (8 Lectures)

Advanced techniques in genetic manipulation for multiplication and improvement of livestock species: Use of sexed semen, gene introgression, and cloning, etc.

VII. Teaching methods

Blackboard; PPTs; Research article discussion in the classroom

VIII. Learning outcome

Breeding for disease resistance and functional traits; Breeding for climate resilience

IX. Suggested Reading

I. Course Title : Biometrical Genetics II

II. Course Code : AGB 703

III. Credit Hours : 2+1

IV. Why this course?

To impart knowledge about recent advances in population genetic theory and application in animal breeding.

V. Aim of the course

To impart knowledge on multivariate analysis, QTL gene mapping, mating designs and other advanced biometrical techniques pertaining to animal breeding.

VI. Theory

Unit I (8 Lectures)

Multivariate analysis; Discriminant function; D^2 analysis; Principal component analysis; Path analysis.

Unit II (8 Lectures)

Mating designs: Basis, diallel, partial diallel, NCD-1, 2, 3 for reciprocal and maternal effects.

Unit III (5 Lectures)

Prediction of recombinant inbred lines using genetic parameters; Advances in genotype-environment interaction and selection indices.

Unit IV (9 Lectures)

QTL mapping; Analysis of SNP data for genomic selection; Advances in the estimation of variance component and prediction of breeding value: Threshold, dominance, random regression and survival models.

VII. Practical (15 Classes)

Discriminant function; D^2 analysis; Principal component analysis; Path analysis; Estimation of GCA and SCA through diallel, partial diallel, NCD-1, 2, 3; Advances in construction of selection indices; QTL mapping; Analysis of SNP data for genomic selection; Advances in estimation of variance components.

VIII. Teaching methods

Blackboard; PPTs; Research article discussion in the classroom

IX. Learning outcome

Students can analyze data on Animal Genetics using different Biometrical Techniques

X. Suggested Reading

I. Course Title : Advances in Selection Methodology

II. Course Code : AGB 704

III. Credit Hours : 2+1

IV. Why this course?

To educate about the latest advances in selection theory and their application in animal breeding

V. Aim of the course

To impart knowledge on design of selection experiments, information on single and multiple trait animal models, construction of various selection indices and their relationship with BLUP including the fundamentals of MAS and gBLUP.

VI. Theory

Unit I (8 Lectures)

Fundamental theorem of natural selection; Selection in finite populations; Effect on genetic structure and variance; Design of selection experiments for testing selection theory.

Unit II (6 Lectures)

Measurement of genetic and environmental trends; Advances in selection indices: Multistage, restricted and retrospective selection indices.

Unit III (6 Lectures)

Empirical evaluation of selection theory: genetic slippage, limits to the selection, asymmetry of response, selection experiments, the effect of selection on variance.

Unit IV (10 Lectures)

Selection for threshold traits; Selection under single and multiple trait animal models; Direct and correlated response through various selection indices; Relationship between BLUP and selection index; Selection using markers and entire genome; Methods for analysing GS data like RR-BLUP, Bayes-1, 2 and 3, etc.

VII. Practical (15 Classes)

Determination of culling levels and selection intensity; Estimation of direct and correlated response; Estimation of relative economic values; Construction of various selection indices; Prediction of breeding value using advance methods; QTL analysis using LDMAS and LEMAS.

VIII. Teaching methods

Blackboard; PPT; Research article discussion in classroom

IX. Learning outcome

They will be acquainted with all the theoretical techniques of the advanced selection methodology

X. Suggested Reading

I. Course Title : Bioinformatics in Animal Breeding

II. Course Code : AGB 705

III. Credit Hours : 1+1

IV. Why this course?

To educate about basic concepts of bioinformatics and their applications in animal breeding

V. Aim of the course

To impart knowledge on the concepts of bioinformatics, information resources for protein and genome databases, genetic characterization and selection using bioinformatic tools, and modern bioinformatic tools like GWAS.

VI. Theory

Unit I (4 Lectures)

Overview of bioinformatics; Database concepts; Algorithms; Information resources for protein and genome databases: GenBank, EMBL, SWISSPROT, PROSITE.

Unit II (5 Lectures)

Nucleotide and protein sequence analysis; Pair-wise and multiple sequence alignments; Phylogeny; Big SNP data analysis methods; Micro-array processing; Clustering; Software for secondary database search and analysis.

Unit III (6 Lectures)

Genetic characterization; Use of bioinformatics tools for identifying QTL and selection of elite germplasm; GWAS; Development of DNA chips; NGS data analysis.

VII. Practical (15 Classes)

Database development; Algorithms; Nucleotide and protein sequence analysis; Pair-wise and multiple sequence alignments; Phylogeny and dendrogram; Micro-array processing; Clustering; Secondary database search and analysis; Genetic characterization; Identification of QTL; GWAS; NGS data analysis.

VIII. Teaching methods

Blackboard; PPT-animations; Research article discussion in the classroom

IX. Learning outcome

Nucleotide and protein sequence analysis and phylogenetic analysis

X. Suggested Reading

I. Course Title : Animal Cytogenetics and Immunogenetics II

II. Course Code : AGB 706

III. Credit Hours : 1+1

IV. Why this course?

To educate about the advances in cytogenetics and their application in animal genetics and breeding

V. Aim of the course

To impart knowledge on somatic cell genetics, stem cell genetics, image analysis of advanced karyotyping techniques, and molecular cytogenetics and gene mapping techniques.

VI. Theory

Unit I (8 Lectures)

Structure of eukaryotic chromosomes; Evolution of karyotype; Various *in- vitro* cell culture techniques; Cell lines and utility; Genotoxicity

Unit II (10 Lectures)

Somatic cell genetics; Stem cell genetics; Molecular cytogenetics and gene mapping; Linkage mapping; ISH; FISH; Radiation hybrid mapping; Fibre-FISH; PRINS; Positional cloning; Spectral karyotyping

Unit III (12 Lectures)

Image analysis; Chromosome painting; Chromosome walking; Micro-dissection of chromosomes; Structure and functions of major histocompatibility complex; T Cell receptor; CD4; Interleukins; Toll-like receptors and their functions

VII. Teaching methods

Blackboard; PPT-animations; Research article discussion in the classroom

VIII. Learning outcome

Students get a good grip on different gene mapping techniques and image analysis

I. **Course Title** : **Statistical Software in Animal Breeding**

II. **Course Code** : **AGB 707**

III. **Credit Hours** : **1+1**

IV. **Why this course?**

To educate about the standard statistical software packages in animal breeding

V. **Aim of the course**

To impart knowledge on the use of software for computation of different statistical data

VI. **Theory**

Unit I (4 Lectures)

Data preparation and job control commands for statistical analysis of data; Introduction to statistical and standard software packages.

Unit II (6 Lectures)

Use of software for t-test, Chi-squares test, F-test, ANOVA (CRD, RBD and LSD), correlation and regression (simple, multiple, curvilinear, stepwise) and discriminant analysis.

Unit III (5 Lectures)

Graphic features of the software packages; Linear programming using appropriate software package; Least-squares analysis; Data mining techniques such as neural networks, genetic algorithms and fuzzy logic for predictive modelling.

VII. **Practical (15 Classes)**

Data preparation and generation; Import and export of data from spreadsheet and database packages; Use of software for t-test, Chi-squares test, F-test, ANOVA (CRD, RBD and LSD), correlation and regression (simple, multiple, curvilinear, stepwise) and discriminant analysis; Graphic features of the software packages; Use of software for linear programming problem; Least-squares analysis; Use of software for neural networks and fuzzy logic models for prediction.

VIII. **Teaching methods**

Blackboard; PPTs; Research article discussion in the classroom

IX. **Learning outcome**

Students get an idea on the availability of different statistical and standard software packages and their application in Animal Breeding.

Animal Production Sciences
– Animal Nutrition

Preamble

(Animal Nutrition)

As is true for all branches of science, the science of nutrition has seen a lot of progress during the last decade or so in understanding underlying metabolic processes and the application. Accordingly, it has become imperative to update the course curricula of Animal Nutrition to make a student of Animal Nutrition conversant with the latest development in the field. Therefore, a consorted effort was made by the Committee to gather inputs from all concerned, including experts from academics and industry and incorporate the same after thorough deliberations. The followings are the aspects that were taken into consideration while revising the Animal Nutrition syllabi to make it up to date with the aim of making it knowledge-based while at the same time making it rewarding from a career point of view:

- Latest developments in the science of nutrition and food bioscience and integrating the newer concepts from human and laboratory animal nutrition into the curriculum of animal nutrition
- A particular focus was given to the use of molecular biology (nutrigenomics), which has become a key to understanding the outcome of various nutritional interventions in health and more so in diseases including the rumen metabolism.
- Because of the changing perspectives of livestock and environment, greater thrust on the role of feeding and nutrition on minimizing and/ or mitigating the (adverse) environmental impacts of rearing various classes of farm animals
- Sound feeding practices and evolving nutritional concepts for ensuring safe food production for consumers
- The potential use of nutrition (involving specific nutrients and emerging nutraceuticals) for promotion of health: both for preventive and prophylactic use of clinical nutrition for farm, companion and captive and zoo animals
- Greater focus on the industrial application of nutritional concepts in order to make the students more industry-ready. It also aimed to inculcate a sense of entrepreneurship among animal nutrition students.
- Continued focus on making better use of local and alternate feed resources strategically to make livestock production economic and rewarding while maintaining the sustainability for various classes of livestock farmers.

Summary of Changes Made

Course	Title	Remarks
M.V.Sc. Courses		
ANN 601	Energy and Protein Nutrition	Contents updated
ANN 602	Minerals and Vitamin Nutrition and Feed Additives	Contents updated
ANN 603	Feed and Fodder Technology	Merging of ANN 603 and ANN 604
ANN 604	Ruminant Nutrition	Contents updated
ANN 605	Non-Ruminant Nutrition	Contents updated
ANN 606	Companion Animal Nutrition	ANN 607 split into two courses (AAN 606 and ANN 607)
ANN 607	Nutrition of Laboratory, Wild and Zoo Animals	
ANN 608	Research Methodology in Animal Nutrition	Contents updated
ANN 609	Non-Conventional Feed Resources	Contents updated
ANN 610	Nutritional Biochemistry	New Course
ANN 611	Clinical Nutrition	New Course
ANN 612	Rumen Biotechnology	New Course
Ph.D. Courses		
ANN 701	Modern Concepts in Feeding of Ruminants	ANN 701 split into two courses (ANN 701 and ANN 702)
ANN 702	Forages in Animal Nutrition	
ANN 703	Modern Concepts in Feeding of Non-Ruminants	Contents updated
ANN 704	Emerging Concepts in Rumen Metabolism	Contents updated
ANN 705	Advances in Mineral and Vitamin Nutrition	Contents updated
ANN 706	Advanced Techniques in Nutritional Research	Contents updated
ANN 707	Recent Trends in Feed Technology	Contents updated
ANN 708	Clinical Nutrition of Farm and Pet Animals	Merging of two courses: ANN 707 and ANN 708
ANN 709	Toxicants and Antimetabolites in Animal Nutrition	Contents updated
ANN 710*	Nutrigenomics in Animal Nutrition	New Course
ANN 711	Equine Nutrition	New Course

Course Contents
M.V.Sc. in Animal Nutrition

I. Course Title : Nutritional Biochemistry

II. Course Code : ANN 601

III. Credit Hours : 1+0

IV. Why this course?

Biochemistry is the mother of all sciences. To understand the mechanism of nutrient metabolism a clear understanding of the various biochemical events is essential for a student specialising in animal nutrition.

V. Aim of the course

To help to develop the concepts of biochemical pathways involving nutrient metabolism.

VI. Theory

Unit I (12 Lectures)

Classification of carbohydrates and their functions. Digestion and metabolism of carbohydrate in ruminants and non-ruminants. Carbohydrate synthesis.

Unit II (8 Lectures)

Classification and properties of fats and their functions. Digestion and metabolism of fat in ruminants and non-ruminants. Fat synthesis

Unit III (12 Lectures)

Classification, structure, properties and function of proteins, amino acids and nucleic acids. Digestion and metabolism of proteins and other nitrogenous compounds in ruminants and non-ruminants. Protein synthesis. Control of metabolism

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Understanding of biochemical basis of nutrient metabolism.

IX. Suggested Reading

I. Course Title : Energy and Protein Nutrition

II. Course Code : ANN 602

III. Credit Hours : 2+0

IV. Why this course?

Energy and protein constitute the major nutrients driving the maintenance and production in farm animals. A clear understanding of underlying concepts is key to the application of the same under practical feeding situation.

V. Aim of the course

To understand the metabolic pathways involved in energy and protein utilization including their requirements for various classes of animals for different physiological functions.

VI. Theory

Unit I (8 Lectures)

Measures of feed energy. Partitioning of feed energy. Energy balance, Fasting catabolism. Direct and indirect calorimetry. Efficiency of energy and protein utilization.

Unit II (12 Lectures)

Rumen degradable protein (RDP), and rumen undegradable protein (UDP) and fermentation kinetics. Protein turnover. Quantification of microbial protein synthesis. Protein quality determination in ruminants and monogastrics. Supplementary value of amino acids. NPN metabolism, urea fermentation potential and metabolizable protein. Amino acids imbalance, antagonism and toxicity.

Unit III (12 Lectures)

Feeding standards: comparative appraisal and limitations. Determination of energy and protein requirements. Nutrients metabolism with special reference to milk, meat and wool production. Energy and protein requirement for maintenance, growth, pregnancy and lactation in farm animals.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Development of comprehensive knowledge of basic nutrition involving energy and protein.

IX. Suggested Reading

I. Course Title : Minerals and Vitamin Nutrition and Feed Additives

II. Course Code : ANN 603

III. Credit Hours : 2+1

IV. Why this course?

Mineral and vitamins are key drivers of intermediary metabolism besides playing an important role in health and production

V. Aim of the course

To impart knowledge on sources, functions, analysis, signs of deficiency and signs of toxicity of various minerals and vitamins

VI. Theory

Unit I (12 Lectures)

General role of minerals, factors affecting mineral requirements. Macro-minerals and micro-minerals, their, distribution, metabolism, physiological functions, deficiencies and excesses, and sources and requirements. Probable essential minerals.

Unit II (6 Lectures)

Mineral interactions. Chelated minerals and concept of nano-minerals. Bioavailability studies in minerals. Impact of minerals on reproduction, fertility, and immunity. Soil-plant-animal-human relationship, development of area-specific minerals. Toxic minerals; their role in health and production of farm animals. Newly recognized trace minerals.

Unit III (10 Lectures)

Definition, history, classification, chemistry, functions, deficiencies and excesses, requirements and sources of water-soluble and fat-soluble vitamins. Role of vitamins in energy metabolism. Vitamin-mineral interrelationship. Vitamin toxicosis. Role of vitamins in reproduction, fertility and immunity.

Unit IV (4 Lectures)

Feed additives and nutraceuticals. Probiotics, prebiotics and synbiotics; eubiotics. Feed enzymes. Phytochemical feed additives; polyphenols and essential oils; organic acids and acidifiers.

VII. Practical (16 Classes)

General principles of mineral estimation. Sampling and processing techniques. Use of atomic absorption spectrometry and ICP in mineral estimation. Estimation of macro- and micro-minerals. Formulation of mineral mixture for various species. Estimation of some important vitamins (vitamin A, E and C). Purified diets for mineral and vitamin studies. Calculation of mineral and vitamin requirements.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions

- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

- Comprehensive knowledge about mineral and vitamin metabolism and their requirements for farm animals
- Capacity for estimation of various minerals and vitamins using advanced analytical techniques

X. Suggested Reading

I. Course Title : Feed and Fodder Technology

II. Course Code : ANN 604

III. Credit Hours : 1+1

IV. Why this course?

Processing of feed and fodder are important means to augment the utilization for efficient animal production.

V. Aim of the course

To understand various technological options available for processing of classes of food, feeds and fodders and their potential application in feeding management of farm animals.

VI. Theory

Unit I (4 Lectures)

Various feed mill equipment and their handling; layout and operations in feed mill (small, medium and large feed plants); automated feed mill: merits and demerits. Procurement of feed ingredients: specification and guidelines. Quality control of feed ingredients and finished feeds. BIS standard.

Unit II (4 Lectures)

Principles and process of material handling, weighing, grinding, mixing, pelleting, packaging and other major processing operations. Crumbling, flaking, popping and extrusion. Premixes. Codex Alimentarius, HACCP.

Unit III (4 Lectures)

Feed and fodder processing and preservation techniques. Densification, chemical and biological treatment of feeds/ fodders. Fodder conservation through hay and silages; Microbiological evaluation of processed and preserved feeds; Effect of preservation on the nutritional value of feed.

Unit IV (4 Lectures)

Feed storage and godown management; goods sanitation and hygiene of go-down. Traditional and modern farm-level storage structures. Factors affecting feedstuffs during storage. Liquid feed ingredients. Storage losses; insect pests and rodents control measures; Mycotoxins in feedstuffs and its control measures.

VII. Practical (16 Classes)

Quality control and inspection of feed materials. Qualitative tests for adulterants urea, urease, thiram. Identification of insect pests and fungi in stored products. Feed microscopy. Formulation and preparation premixes. Quality evaluation of silage and hay, Laboratory preparation of silage. Visit to feed plant: Hands-on training on preparation of feed and mineral mixture. Preparation of project report on plant layout and design, problems related to feasibility, record-keeping in different sections of a feed mill.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Practical understanding and application of feed processing technologies

X. Suggested Reading

I. Course Title : Ruminant Nutrition

II. Course Code : ANN 605

III. Credit Hours : 2+1

IV. Why this course?

Ruminants possess unique digestive capabilities involving rumen microbes that utilize diverse feed resources which are otherwise not fit for monogastric animals.

V. Aim of the course

To develop an understanding of the rumen metabolism and its manipulation for improving nutrient utilization for enhancing ruminant production.

VI. Theory

Unit I (6 Lectures)

Functional anatomy of the digestive system of ruminants. Introduction to rumen microflora and fauna. Development of rumen. Feeds and fodders for ruminant feeding.

Unit II (12 Lectures)

Water requirements. Nutrient requirements and feeding of calves, heifers, dry, pregnant and lactating cows, buffaloes, sheep and goat. Peculiarities of digestive physiology, nutrition and feeding management of camels.

Unit III (6 Lectures)

Voluntary feed intake. Determination of digestibility, factors affecting digestibility. Manipulation of rumen fermentation.

Unit IV (12 Lectures)

Concept of complete feed and total mixed ration. Precision feeding. Phase feeding. Limiting nutrients and strategic feeding of high yielding ruminants. Concept of by-pass nutrients and their impact on production, reproduction and immune status.

Unit V (12 Lectures)

Nutritional approaches for increasing the functional properties of milk: role of CLA, omega fatty acids. Different systems of feeding buffalo for beef production. Feeding during stress and natural calamities. Feeding management of migratory/ nomadic small ruminants.

VII. Practical (16 Classes)

Design and planning of feeding experiments. Identification of feed and fodder based on its composition. Ration formulation for large and small ruminants for different physiological stages. Estimation of digestibility and nutritive value of feeds and fodders by metabolism trial in dairy cattle. Determination of nutritive value of pastures by the use of range techniques. Collection and processing of rumen liquor. Estimation of rumen metabolic profile (pH, ammonia, lactate, and TVFA, etc.). Estimation of purine derivatives.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

In-depth knowledge of feeding ruminants in light of their metabolic peculiaritiesFeed evaluation based on an assessment of various rumen functions

I. Course Title : Non-Ruminant Nutrition

II. Course Code : ANN 606

III. Credit Hours : 2+1

IV. Why this course?

The nutritional attributes of non-ruminants differ among various species as well as their characteristic digestive physiology.

V. Aim of the course

To impart knowledge on the nutrient metabolism of various classes of monogastric animals involving poultry, swine, equines and rabbits under different physiological stages.

VI. Theory

Unit I (20 Lectures)

Feeding of poultry for meat and egg production. Ideal protein concept. Standard ileal digestible amino acids. Nutrient requirements for broilers and layers. Feeding of breeder hens; nutritional factors affecting hatchability. Feeding systems for poultry. Feed additives for poultry. Nutritional approaches for designer egg and meat production. Nutritional disorders in poultry and the role of nutrition in diseases prevention. Water intake and quality in poultry production.

Unit II (16 Lectures)

Nutrition and feeding of swine in different stages of growth and production. Nutritional factors affecting the quality of the products: lean meat production. Water intake and quality in pig production.

Unit III (12 Lectures)

Feeding of equines. Feeding of rabbits. Hindgut fermentation and its importance. Nutrient requirements of equines. Special features of equine feeding management. Nutritional management of colic and other health disorders. Nutrient requirements of rabbits for wool and meat production. Nutrition-related disorders in rabbits.

VII. Practical (16 Classes)

Design and planning for poultry and swine feeding experiments. Calculation of nutrient requirements for broilers and layers. Formulation and compounding of general and least-cost rations, determination of the nutritive value of poultry and swine feeds by balance experiments. Formulation of rations for horses and rabbits. Visit poultry and piggery units, feed and fodder stores. Calculation of different measures of protein quality.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Knowledge of practical feeding management of various classes of non-ruminant species.

I. Course Title : Research Methodology in Animal Nutrition

II. Course Code : ANN 607

III. Credit Hours : 0+2

IV. Why this course?

Nutritional evaluation involving feed analysis and nutrient metabolism is vital in the interpretation of the outcomes of nutritional studies.

V. Aim of the course

Preparedness in part of the students to understand the basics of various analytical techniques and their application in nutritional research.

VI. Practical

Unit I (6 Classes)

Principles of animal experimentation. Common statistical tools for nutritional research.

Unit II (20 Classes)

Preparation of standard solutions. Proximate analysis of feeds and fodders. Cell-wall partitioning using Van Soest methods. Markers in digestibility determination. *In-vitro/ in sacco* determination of digestibility and digestion kinetics. Determination of energy content of feed, faeces and urine using bomb calorimeter. Determination of blood metabolic profile.Unit III (6 *Classes*)Introduction and principles of GC, HPLC, AAS, ICP, tracer technique, flame photometer, NIR, SF_6, rumen-simulation technique, and amino acid analyzer.

VII. Teaching methods/ activities

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on training of laboratory techniques

VIII. Learning outcome

Capacity building of the students to undertake animal nutrition research.

IX. Suggested Reading

I. Course Title : Companion Animal Nutrition

II. Course Code : ANN 608

III. Credit Hours : 1+0

IV. Why this course?

The philosophy of companion animal nutrition is altogether different from that of the farm animals.

V. Aim of the course

To impart knowledge in the fundamental and applied aspects of the nutrient metabolism for ensuring health and wellbeing of companion animals.

VI. Theory

Unit I (4 Lectures)

Philosophy of companion animal nutrition. Digestion and absorption of nutrients in dogs and cats. Nutrient requirements for dogs and cats during different life stages: energy, protein, fat, minerals and vitamins. Critical nutrients for cats.

Unit II (4 Lectures)

Common feed ingredients and supplements for pets. Homemade diets. Commercial pet foods: types and nutritional profile. Processing techniques in pet food manufacturing. Pet food evaluation and quality control.

Unit III (4 Lectures)

Feeding management for dogs and cats of different age groups, viz., pregnancy, lactation, neonatal puppies and kitten, growth, adult maintenance, stress and geriatrics including feeding behaviour. Water requirements.

Unit IV (4 Lectures)

Deficiencies and excesses of nutrients. Nutritionally responsive disorders: inherited disorders of nutrient metabolism, diabetes mellitus, obesity, urinary tract health and kidney diseases. Parenteral nutrition for hospitalized pets.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Understanding of the nutritional concepts for feeding management of companion animals.

IX. Suggested Reading

I. Course Title : Nutrition of Laboratory, Wild and Zoo Animals

II. Course Code : ANN 609

III. Credit Hours : 2+1

IV. Why this course?

The nutrition of laboratory animals is important to ensure their health performance making them ready for use in biomedical research. On the contrary, wild and zoo animals as a part of the ecosystem call for an entirely different approach in terms of their nutritional management.

V. Aim of the course

To understand the mechanism involved in the nutrient metabolism in laboratory and wild animals and their diverse applications for effective health management and wellness.

VI. Theory

Unit I (12 Lectures)

Digestive structure and functions of laboratory animals: rats, mice, and guinea pigs. Nutritional requirements of various species of laboratory animals. Feeding of laboratory animals. Concept of purified diets in laboratory animals. Nutrition of non-human primates.

Unit II (10 Lectures)

Natural dietary habits of zoo animals. Feeding schedules of various classes captive and zoo animals and birds. Feeding orphan and neonates. Role of nutrition in the management of health disorders in zoo animals. Feeding of sick and old animals: parenteral nutrition.

Unit III (10 Lectures)

Feeding habits, and behaviour of wild animals. General aspects of digestive physiology of herbivores and carnivores. Nutrition of semi-wild animals like mithun and yak. Nutritive characteristics of forages for wild animals. Adequacy of forage plants for wild and zoo animals.

VII. Practical (16 Classes)

Formulation and preparation of hygienic, balanced diets and feeding of laboratory animals. Characteristics of ration formulation and feeding schedules wild and zoo animals. Visit zoological parks and wildlife sanctuary, and collection of information on the feeding schedule of different categories of captive animals.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Understanding of nutritional management of the laboratory, wild and zoo animals

I. Course Title : Non-Conventional Feed Resources

II. Course Code : ANN 610

III. Credit Hours : 1+1

IV. Why this course?

Exploration of alternative feed resources for farm animals is a continuous process considering the scarcity of quality feeds and fodders for efficient livestock production.

V. Aim of the course

To build-up concepts involving the availability and potential use of various classes of non-conventional feed resources including ameliorative measures to ensure feed and food safety.

VI. Theory

Unit I (8 Lectures)

Present and future feed requirements and current availability for livestock and poultry. Use of non-conventional feeds; By-products of agricultural, industrial, food processing units and forest by-products. Slaughterhouse by-products, aquatic weeds. Permissible levels of inclusion of various non-conventional feeds in the ration of different kinds of livestock. Formulation of economical rations using the non-conventional feed.

Unit II (5 Lectures)

Classification of toxic principles in animal feedstuffs. Chemico-physical properties of various anti-nutritional factors (ANFs). Rumen microbial adaptation to various ANFs. Effect of anti-nutritional factors on health and production indifferent species of livestock.

Unit III (3 Lectures)

Detoxification of toxin principles by various physical, chemical and biological techniques. Insecticide and pesticide residues, heavy metals residues in feeds and fodders.

VII. Practical (16 Classes)

Qualitative methods for the presence/ detection of ANFs in feedstuffs. Estimation of mycotoxins in various feeds and fodders. Estimation nitrates, HCN, oxalates, protease inhibitors, tannins, saponins, gossypol, mimosine and heavy metals.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Comprehensive knowledge on the integration of alternative feed resources in practical farm animal production.

X. Suggested Reading

I. Course Title : Introductory Clinical Nutrition

II. Course Code : ANN 611

III. Credit Hours : 1+0

IV. Why this course?

Nutrition forms the basis of health and therefore could be strategically used for prevention and/ or therapeutic management of various diseases.

V. Aim of the course

To understand the role of nutrients in the development of various disease processesTo elucidate the potential of various nutrients and nutraceuticals in amelioration and management of disease of diverse nature.

VI. Theory

Unit I (8 Lectures)

Metabolic disorders and peri-parturient diseases: milk fever, ketosis, downer cow syndrome, retained placenta, sub-acute ruminal acidosis, laminitis, abomasal displacement, mastitis. Nutrient parasite interaction. Enterotoxaemia

Unit II (8 Lectures)

Nutritional amelioration of biotic and abiotic stress: heat and cold stress, transportation stress. Potential plant toxicity to grazing animals. Toxicity of grazing animals: signs of poisoning. Nitrite poisoning, toxic effects of goitrogens, glucosinolates. Nutritional management of reproductive disorders.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Understanding of nutritional management of health disorders.

IX. Suggested Reading

I. Course Title : Rumen Biotechnology

II. Course Code : ANN 612

III. Credit Hours : 1+0

IV. Why this course?

Rumen being a distinctive digestive organ typical to ruminants harbouring diverse microbial communities offers opportunities for their manipulation using molecular biological approaches.

V. Aim of the course

To understand the basics of rumen metabolism employing molecular biology tools

VI. Theory

Unit I (8 Lectures)

Rumen ecology. Manipulation of rumen fermentation for better utilization of fibrous feeds and reduction in methane production. Biotechnological applications for lignin degradation. Role of feed additives, chemicals, antibiotics and probiotics and their effect on rumen metabolism. Degradation of anti-nutritional factors in the rumen.

Unit II (8 Lectures)

Genetic manipulation, DNA recombinant technology for improvement in rumen fermentation. Factors influencing the fate of introduced microbes. Metagenomics for microbial diversity: concept and application.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Basic knowledge of molecular biology as applicable to rumen functions.

IX. Suggested Reading

Course Contents
Ph.D. in Animal Nutrition

I. Course Title : Modern Concepts in Feeding of Ruminants
II. Course Code : ANN 701
III. Credit Hours : 2+0
IV. Why this course?

The feeding management of ruminants is undergoing rapid changes because of scientific and technological advances to augment productivity.

V. Aim of the course

To understand the emerging concepts involving feeding management of high producing ruminant animals.

VI. Theory

Unit I (20 Lectures)

Developments in ruminant digestive physiology. Advanced concepts in the determination of energy and protein requirements. Importance of energy and protein quality for milk and meat production. Recent concepts in protein and energy systems like CNCPS, net energy, metabolizable and available protein. Methods of estimation of energy and protein values of feeds for different physiological functions of livestock. Kinetics of nutrient metabolism. Hindgut fermentation. Efficiency of nutrient utilization for different production purposes. Hormonal regulation of nutrient partitioning.

Unit II (12 Lectures)

Concept of limiting amino acids for high yielders. Strategic feeding of high yielding dairy cows and meat-producing ruminants. Concept of phase feeding and precision feeding. Feeding during the transition period. Bypass nutrient technology. Rumen manipulation to optimize productivity and reduce methanogenesis.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Knowledge of the newer concepts for its application in the feeding management of ruminants.

IX. Suggested Reading

- D'Mello JPF. 2003. *Amino Acids in Animal Nutrition*, 2nd ed. CAB International.

I. Course Title : Forages in Animal Nutrition

II. Course Code : ANN 702

III. Credit Hours : 1+0

IV. Why this course?

Forages are the principal component of the animal feeding system and therefore their effective utilization is the key for efficient animal production.

V. Aim of the course

To impart knowledge on the fodder management including different forage production systems and their utilization.

VI. Theory

Unit I (10 Lectures)

Forages in ruminant production. Improvement in productivity of fodders and pasture: feed-food crops, silvi-pasture, horti-pasture, shrubs. Use of conserved forages in ruminant feeding. Factors affecting the nutritive value of cultivated and conserved forages. Hydroponics as an alternate to green fodder production.Top feeds, fodder trees and their effective utilization. Tree leaves as a source of condensed tannins: role in protein protection and GI parasite control.

Unit II (6 Lectures)

Methods in forage evaluation: calculated *in-vitro* DOMD and ME by using *in-vitro* gas production technique. Pasture consumption and evaluation studies.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Understanding of various aspects of forage production, fodder evaluation and their integration into the different animal production system.

IX. Suggested Reading

- Givens D, Axford R and Owen E. (Ed.). 2000. *Forage Evaluation in Ruminant Nutrition*. CAB International.

I. Course Title : Recent Concepts in Feeding of Non-Ruminants

II. Course Code : ANN 703

III. Credit Hours : 1+0

IV. Why this course?

Increased consumer awareness has necessitated a relook into the feeding management of food animals leading to the production of safe and healthy food.

V. Aim of the course

To derive knowledge regarding the nutritional manipulation of food animals for the production of quality food for human consumption.

VI. Theory

Unit I (18 Lectures)

Latest concepts in nutrition and feeding in different phases of broiler, layer and breeder stocks. In-ovo and early chick nutrition. Nutritional disorders in modern poultry production and their amelioration. Nutritional factors affecting egg quality and hatchability in poultry. Feeding strategies for the production of designer eggs and meat. Omega fatty acids. Recent trends in amino acid nutrition. Advances in new generation feed and feed additives.

Unit II (14 Lectures)

Nutrition and feeding of pigs in various stages of production. Modern concepts in amino acids nutrition in swine production. Emerging concepts in feeds and feed additive for pigs. Role of vitamins and minerals in health and disease. Nutritional manipulation for lean meat and designer pork production. Carcass modifiers.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Comprehensive knowledge on the scope of nutritional management of non-ruminant animals for the production of healthy food.

IX. Suggested Reading

I. Course Title : Advances in Rumen Metabolism

II. Course Code : ANN 704

III. Credit Hours : 1+1

IV. Why this course?

An in-depth of the understanding of the rumen function is key to devise strategies for augmenting the efficiency of production besides ensuring environmental sustainability.

V. Aim of the course

To understand the metabolic aspects of rumen function and its application for eco-friendly ruminant production.

VI. Theory

Unit I (8 Lectures)

Rumen development. Rumen microflora: classification and their role in fermentation and digestion, microbial interactions, rumen kinetics, the nutrient requirement of rumen microbes. Dynamics of nitrogen metabolism in the rumen.

Unit II (8 Lectures)

Manipulation of rumen fermentation: physical, chemical and biological approaches. Trans-faunation and defaunation. Concept of metagenomics in rumen manipulation. Green-house gas production from rumen and mitigation strategies

VII. Practical (16 Classes)

Rumen microbial and protozoal count. Estimation of rumen microbial protein. Estimation of nitrogen-fractions in rumen liquor. Volatile fatty acid fractionations. Rumen enzymes assay. Extraction of nucleic acids and quantification of rumen microbes by PCR.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Comprehensive knowledge of various concepts of rumen metabolism for efficient ruminant production.

X. Suggested Reading

- Dehority BA. 2003. *Rumen Microbiology*. Nottingham University Press.

I. Course Title : Advances in Mineral and Vitamin Nutrition

II. Course Code : ANN 705

III. Credit Hours : 2+0

IV. Why this course?

Molecular mechanisms driving the metabolism of minerals and vitamins have opened up a new vista in the nutrition of farm animals.

V. Aim of the course

To understand advances in mineral and vitamin metabolism for its application in ensuring optimized health and efficient production in farm animals.

VI. Theory

Unit I (18 Lectures)

Role of minerals in nutrient metabolism. Mineral absorption, transport, metabolism and its regulation. Bio-availability of macro and micro minerals: factors affecting the bioavailability; bio-markers for mineral status. Mineral interactions. Dietary cation-anion difference (DCAD). Identification and correction of deficiencies and toxicities of minerals. Mineral tolerance in animals. Mineral requirements for growth, reproduction and lactation. Mineral toxicities concerning livestock feeding and their amelioration. Methods of mineral supplementation.

Unit II (14 Lectures)

Chemical nature of fat-soluble and water-soluble vitamins. Role of vitamins in nutrient metabolism. Advances in physiological functions and metabolism of vitamins. Vitamin deficiency: clinical signs and their management. Antimetabolites to vitamins. Hypervitaminosis. Vitamins as antioxidants. Role of vitamins in immunity and stress. Dietary supplementation of vitamins: forms, storage and stability.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Knowledge on the latest understanding of mineral and vitamins and its application in practical feeding conditions.

IX. Suggested Reading

- McDowell RL. 1989. *Vitamins in Animal Nutrition*. Academic Press.
- McDowell LR. 2003. *Minerals in Animal and Human Nutrition*, 2nd ed. Elsevier Science B.V.
- Suttle N. 2010. *The Mineral Nutrition of Livestock*, 4th ed. CAB International.

I. Course Title : Advanced Clinical Nutrition

II. Course Code : ANN 706

III. Credit Hours : 1+1

IV. Why this course?

Approaches involving preventive, therapeutic and convalescent nutrition have been recognized as a sustainable means of ensuring health and wellbeing of animals besides the production of safe and healthy food.

V. Aim of the course

To understand the disease-induced alterations in nutrient metabolism and the potential of select nutrients to prevent and/ or support disease management in prone animals.

VI. Theory

Unit I (12 Lectures)

Metabolic disorders in farm animals. Modern concepts in the metabolic alterations leading to production diseases, viz., milk fever, ketosis, downer cow syndrome, retained placenta, sub-acute ruminal acidosis, laminitis, abomasal displacement and mastitis Optimum nutrition for peri-parturient dairy animals.

Unit II (10 Lectures)

Metabolic effects of infection: metabolism of carbohydrates, fats, protein and amino acids and minerals during various infection and inflammatory diseases. Role of cytokines in nutrient homeorrhesis. Nutrition-immunity interaction: Role of nutrients (fats, amino acids, minerals and vitamins) in the immune response. Metabolic alterations during abiotic stress and feeding management during stress situations.

Unit III (10 Lectures)

Nutritional manipulation and feeding of sick and hospitalized animals. Preventive and therapeutic nutrition. Optimum nutrition for the management of diseases of the hepatic, renal and gastrointestinal system. Convalescence diet. Feeding management of pre- and post-operated animals.

VII. Practical (16 Classes)

Assessment of immunity: humoral immune response, cell-mediated immune response. Assessment of antioxidant status: Superoxide dismutase, Catalase, Glutathione peroxidase, reduced glutathione (GSH), lipid peroxides. Formulation of diet for sick and diseased animals.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

IX. Learning outcome

Understanding the potential of nutrition for prophylaxis and therapeutic purposes.

X. Suggested Reading

- Cheeke PR and Dierenfeld E. 2010. *Comparative Animal Nutrition and Metabolism*. CAB International.

I. Course Title : Advanced Techniques in Nutritional Research

II. Course Code : ANN 707

III. Credit Hours : 1+1

IV. Why this course?

Cutting edge technologies in analytical science have revolutionized food science research.

V. Aim of the course

To become conversant with the use of advanced techniques in nutritional research.

VI. Theory

Unit I (16 Lectures)

Good laboratory practices. Analytical equipment in animal nutrition research. Estimation of minerals using atomic absorption spectrophotometer and ICP. Principles and applications and of GC, HPLC, amino acid analyzer, SF6, and electron microscopy. Remote sensing and geographic information system (GIS) in animal nutrition research. Analysis of feeds and fodders using NIR. Faecal inoculum as an alternative to rumen liquor for *in-vitro* studies.

VII. Practical (16 Classes)

RUSITEC. Estimation of minerals by atomic absorption spectrophotometer. Estimation of mycotoxins, oxalate, nitrates and tannin. Fatty acid analysis. Vitamin estimation.

VIII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments
- Hands-on training of laboratory techniques

VIII. Learning outcome

Skill development in terms of efficient use of modern analytical techniques related to animal nutrition research.

IX. Suggested Reading

- Kaneko J, Harvey J, Bruss M.(Eds.) 2008. *Clinical Biochemistry of Domestic Animals*, 6th ed. Academic Press.
- Krishna 2012. *Livestock Nutrition- Analytical Techniques*. New India Publishing Agency.

I. Course Title : Advances in Feed Technology

II. Course Code : ANN 708

III. Credit Hours : 1+0

IV. Why this course?

The translation of nutritional knowledge for its wider application involves industrial-scale technological adaptations.

V. Aim of the course

To understand the basic as well as applied aspects of various feed processing technologies.

VI. Theory

Unit I (10 Lectures)

Good manufacturer practices (GMP) in feed plants. Planning and designing of feed plants of different capacities. Recent developments in feed processing: particle size reduction, pelleting, extrusion, expanding, conditioning, micronizing. Post pelleting applications. Automation in feed processing. Flow charts for preparation of feeds for various species. Mixer efficiency test, pellet durability test. Densification of bulk feeds. Silos of various capacity, silage preparation and silage additives.Laws and regulations of the feed manufacturing industry. Introduction to labour laws and standards, planning and production programme. Record-keeping.

Unit II (6 Lectures)

Roughage processing. Whole plant processing. Solid-state fermentation technology. Preparation of complete feeds and its processing.Formulation of premixes. Carriers and diluents. Liquid feed handling. Latest concepts in feed microscopy. Qualitative tests for rancidity.

VII. Teaching methods

- Classroom lectures using audio-visual aids

- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Skill development in terms of increased employment and entrepreneurship

IX. Suggested Reading

I. Course Title : Toxicants and Anti-Metabolites in Animal Nutrition

II. Course Code : ANN 709

III. Credit Hours : 1+0

IV. Why this course?

In-feed anti-metabolites in incriminating factor poses a threat not only to the animal health but also for human health and safe food production.

V. Aim of the course

To impart knowledge on the various toxicants and anti-metabolites in the feeding system and their amelioration.

VI. Theory

Unit I (12 Lectures)

Classification of toxicants in animal feeds. Plant origin toxicants, microbial origin toxicants, acquired toxicants (heavy metals, pesticide residues, drug residues), and their effects on animal health and production. Ameliorative measures. Detoxification of plant origin toxicants. Residual effects on animal products and the environment.

Unit II (4 Lectures)

Anti-metabolites in animal feedstuffs. Effects of anti-metabolites on animal health and production. Anti-vitamins

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Safe use of animal feed resources for ensuring food safety.

IX. Suggested Reading

I. Course Title : Nutrigenomics in Animal Nutrition

II. Course Code : ANN 710

III. Credit Hours : 1+0

IV. Why this course?

The establishment of a functional relationship between nutrition and gene expression has become recognized as a tool to unravel the mechanisms involving the role of nutrition in health and disease.

V. Aim of the course

To impart the knowledge on the basics of nutrigenomics and its application in nutrition.

VI. Theory

Unit I (4 Lectures)

Basic concepts of genetics and molecular biology. Nucleic acid structure and replication, transcription and translation.

Unit II (8 Lectures)

Introduction to nutrigenomics and nutrigenetics. Nutritional regulation of gene expression. Introduction to epigenetics, and its influence on early life nutrition and health.

Unit III (4 Lectures)

Concepts of proteomics and metabolomics. Microbiome and diseases of nutritional importance. Dietary influences on the microbiome.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

Development of concepts on nutrigenomics.

IX. Suggested Reading

- Carlberg C, Ulven SM and Molnár F. 2016. *Nutrigenomics*. Springer
- Caterina RDE, Martinez, JA and Kohlmeier M.(Eds.) 2020. *Principles of Nutrigenetics and Nutrigenomics*. Elsevier Inc.

- Select articles from Journals

I. Course Title : Equine Nutrition
II. Course Code : ANN 711
III. Credit Hours : 1+0

IV. Why this course?

Nutrition of equines calls for special attention considering their use for mankind.

V. Aim of the course

To impart a comprehensive knowledge on the nutrition of horses and other equids.

VI. Theory

Unit I (8 Lectures)

Digestive function and metabolism of nutrients. Nutrient requirements of equines in different physiological stages. Feed ingredient for horses. Digestive disorders.

Unit II (8 Lectures)

Feeding foal, yearlings, mares and stallions for production and reproduction. Feeding for performance and nutrient metabolism during exercise. Nutritional management of race-horses. Diet formulation for all classes of horses.

VII. Teaching methods

- Classroom lectures using audio-visual aids
- Instructional conversations and discussions
- Hands-on learning and assignments

VIII. Learning outcome

In-depth knowledge of equine nutrition including its application.

IX. Suggested Reading

Vol. 3

Animal Production Sciences
– Livestock Production and Management

Preamble
(Livestock Production and Management)

Veterinarians with higher qualifications are increasingly being involved in devising means and methods of production. Temporal aspirations of knowledge seekers ought to be addressed through building knowledge and skill portfolio suiting the job market and thus enhancing the marketability of the veterinary post graduates.

At undergraduate level, veterinary students acquire comprehensive knowledge and skills in basic, para-clinical and clinical subjects required for performing multi-tasking role of a veterinarian. However, at post graduate level, in-depth knowledge of theory, practical aspects and research methodology in each subject is of paramount importance.

In this perspective the proposed course curriculum and syllabus in Livestock Production Management have been developed. There have been unprecedented advancements in all the branches of veterinary sciences including Livestock Production Management. The guiding principle of the proposed new approach is to impart comprehensive and practical knowledge by covering all important aspects of the subject area of study at Master's level. The new and restructured Post-Graduate syllabus in respect of LPM contain several innovative and practically applicable courses and extensively revamped course contents, viz., production aspects, business and entrepreneur ship skills, environment and climate change issues, behaviour and welfare aspects of animals, wildlife management and recycling of waste or wealth from waste, etc.

Apart from the existing syllabus 3 new PG course have been incorporated keeping in view of the demand

1. LPM-607 Companion animal production management
2. LPM-613 Livestock farm machinery management
3. LPM-615 Regional animal production management

Salient features of the M.V.Sc. courses

- To acquaint students on basic aspects of dairying in India comparing with developed countries, problems and prospects of dairying, detailed aspects of care and management of different categories of dairy cattle and buffaloes.
- To impart knowledge on various aspects of swine farming in India, principles of housing, breeding, feeding and health care of pigs, management practices at different stages of growth and economic pig production systems.
- To familiarize students on climate, weather, various climatic factors and their role in production and health of animals in both temperate and tropics, micro and macroclimatic conditions of animal house and assessing the heat tolerance of bovines.
- To acquaint students on principles of farm animal behaviour with regard to environmental influence, group formation, social behaviour and and behavioural adaptations under domestication.
- To acquaint with dog and cat breeds their feeding, breeding, health management and socialization.
- To acquaint students with the principles and concepts of wild life sanctuaries and national parks, classification of wild animals, role of authorities in conservation and

management of wild animals in captivity
- To familiarize students on principles of air and water hygiene with reference to impurities and inclusions of water, collection and disposal of waste from the animal house, modern techniques in manure disposal and biosecurity measures to be adapted for hygienic production of livestock products.
- To familiarize students on various aspects, viz., scope and limitations of integrated livestock farming system, recent approach and economic feasibility of different integration models for sustainable production
- To familiarize the students with various aspects of lab animals, problems and prospectus, principles of housing, breeding, feeding and health care of rabbits, rats, mice and guinea pigs, measures to reduce the mortality in young ones at different seasons.
- To acquaint students with knowledge in principles, planning, technical approach and preparing financial statement in Livestock Business Management and preparing projects for financing.
- To familiarize the students with different farm machines and milking machine, different parts and their functions for better utilization

New Ph.D. Courses

1. LPM-704 Livestock and Environment
2. LPM-705 Organic livestock production
3. LPM-706 Recent developments in welfare of farm animals
4. LPM-707 Entrepreneurship in livestock production
5. LPM-708 Precision livestock farming

Salient features of Ph.D. Courses

- To impart knowledge related to application of technologies that improve the efficiency of land use and feed use can mitigate the negative effects of livestock production on biodiversity, ecosystems and global warming. Technologies that increase livestock efficiency include improved breeds, improved grazing-land management, improved herd-health management, etc.
- To impart knowledge on key considerations, organic farming standards, certifying agencies, role of organic livestock farming in environmental protection and biodiversity enhancement and economics of organic livestock products.
- To familiarize students with the concept and practice of ethical livestock production and production from content ended animals - Animal Welfare Management
- To understand livestock entrepreneurship, concept, incubation centre, PPP prospective in animal husbandry sector, business communication, inter-personnel skills for establishing an enterprise.
- To educate the students with a concept of precision in livestock farming, implementation of sensor system, automation, use of software and analysis

Course Contents
M.V.Sc. in Livestock Production and Management

I. Course Title : Cattle and Buffalo Production Management

II. Course Code : LPM 601

III. Credit Hours : 2+1

IV. Why this course?

Important species of livestock are a source of employment and cater to nutritional demands and socio-economic upliftment of people.

V. Aim of the course

To acquaint students with basic aspects of dairying in India comparing with developed countries, problems and prospects of dairying, detailed aspects of care and management of different categories of dairy cattle and buffaloes.

VI. Theory

Unit I (2 Lectures)

Development of dairy industry in India and the world. Present status and future prospects of dairying in India and the world. SWOT analysis of the dairy sector in different agro-climatic zones. Production systems in vogue under Indian conditions. Breeds of cattle and buffalo with more emphasis on breeds of economic importance.

Unit II (6 Lectures)

Housing/ Shelter management. Housing and equipment requirements for different classes of cattle and buffaloes. Layout plans and construction details for different sized farms in different climatic zones of India. Ventilation and lighting systems in dairy farms.

Unit III (8 Lectures)

Feed and fodder resources used for feeding cattle and buffaloes. Scientific technique and regimen of feeding and watering of different categories of cattle and buffaloes. Feed and fodder requirements of different categories of cattle and buffaloes. Supply of green fodder round the year. Enrichment of poor quality roughages. Non-conventional feeding resources. Pasture management.

Unit IV (8 Lectures)

Traits of economic importance and their inter-relationships. Selection and methods of breeding. Reproduction management - Pre-natal and post-natal care and management of dams. Care of neonates and young calves. Management strategies for reducing mortality in calves, optimizing age at first calving and calving interval. Improving breeding efficiency of dairy animals.

Unit V (8 Lectures)

Farm management - Routine management practices and farm labour management. Milking management - Machine milking and hand milking. Clean milk production-Techniques of harvesting clean milk, cooling and transportation. Different laws and practices governing the dairy sector to produce quality products on par with international standards. Health management of dairy animals. Summer and winter management of dairy animals. Draughtability and management of draught animals.

VII. Practical (14 Classes)

Visits to different sized dairy farms and assessment of routine managemental practices. Analysis of various farm records for economic evaluation. Computation of practical and economical rations. Layout plans and housing details. Housing, milking, calf, heifer and adult management. Dairy Cattle and Buffalo judging and body condition scoring (BCS). Project preparation for commercial farms.

VIII. Teaching methods

Blackboard, ICTs, success stories, group discussions and farm visits

IX. Learning outcome

By the end of this course, the student will come out with practical knowledge of cattle and buffalo production management aspects, entrepreneurship skills.

I. Course Title : Sheep and Goat Production Management

II. Course Code : LPM 602

III. Credit Hours : 2+1

IV. Why this course?

To know the production and management of small ruminants. Important species of livestock provide employment and supplementary income besides meeting the nutritional demands and are of commercial importance.

V. Aim of the course

To acquaint students on the status of sheep and goat farming in India, principles of housing and feeding, breeding management to improve the reproductive efficiency and detailed account on care and management of different classes of sheep and goat.

VI. Theory

Unit I (2 Lectures)

Population structure and importance. Sheep farming under different systems of management. Advantages and limitations of sheep and goat farming. Genetic resources of sheep and goats with special emphasis on breeds of economic importance.

Unit II (6 Lectures)

Shelter management. Housing and equipment requirements for different classes of sheep and goats. Designing feeders and waterers. Layout plans and construction details for different size farms in different agro-climatic zones of India.

Unit III (8 Lectures)

Feed and fodder resources for small ruminants. Common property resources (CPR's) and their management. Principles and systems of feeding and watering different categories of sheep and goat. Pasture utilization and improvement.

Unit IV (8 Lectures)

Breeding Management, Traits of economic importance and their inter-relationship. Breeding seasons. Selection of breeding animals. Methods of detection of heat, use of teaser, flushing, tupping. Estrous synchronization, Natural Service, artificial insemination and off-season breeding in small ruminants. Care and management of pregnant animals and breeding stock. Culling.

Unit V (4 Lectures)

Disease Management. Prevention and control measures including vaccination, deworming, dipping and spraying, etc. Transportation of small ruminants.

Unit VI (4 Lectures)

Meat, Methods of slaughter, dressing percentage. Wool: Shearing methods. Importance of wool, wool quality. Goat fibers: mohair, pashmina - Marketing of goat fibers/ wool. Milk, Milking, avoidance of goaty odour in milk, clean milk production and its therapeutic uses.

VII. Practical (14 Classes)

Visits to modern sheep and goat farms and critical analysis of various managerial practices under different conditions. Study of practical housing management. Diseases control management. Shearing management. Record keeping and economics of sheep and goat farming for mutton/ chevon, wool/ fibre and milk. Preparation of project for commercial farming. Daily and periodical farm operations. Dipping and vaccination.

VIII. Teaching methods

Blackboard, ICTs, success stories, group discussions and farm visits

IX. Learning outcome

By the end of this course, the students get practical exposure to different aspects of sheep rearing, production and management.

I. Course Title : Swine Production Management

II. Course Code : LPM 603

III. Credit Hours : 1+1

IV. Why this course?

Majority of people are rearing pigs under traditional and small scale production.

V. Aim of the course

To impart knowledge on various aspects of swine farming in India, principles of housing, breeding, feeding and health care of pigs, management practices at different stages of growth and economic pig production systems.

VI. Theory

Unit I (2 Lectures)

Population dynamic, Economic contribution of pigs, Advantages and limitations of swine rearing, Systems of management. Breeds of economic importance.

Unit II (2 Lectures)

Housing and rearing systems. Housing and equipment requirements for different classes of swine, layout plans and construction for different sized farms.

Unit III (3 Lectures)

Feeding principles and nutritional requirement of different classes of swine. Feeding schedule for different classes of swine. Traditional and scientific methods of swine feeding.

Unit IV (4 Lectures)

Traits of economic importance and their interrelationship. Selection of breeding stock. Reproductive parameters of swine. Methods for detection of heat. Mating systems. Care and management of pregnant sows, piglets, growers and boar. Summer management in swine.

Unit V (3 Lectures)

Health Management, Prevention and control measures including sanitation, vaccination, deworming, etc. Piglet anaemia and its management.

Unit VI (2 Lectures)

Methods of slaughter, dressing percentage, Methods of marketing and transportation. Use of by-products from the swine industry

VII. Practical (14 Classes)

Visit modern piggeries and critical analysis of various types of managemental practices. Practical feeding and breeding management, disease control measures, Judging. Record-keeping. Economics of pig production. Formulation of economic rations for different classes of swine. Project formulation of commercial swine production.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

The students will come up with scientific principles, production and management techniques in swine production.

I. Course Title : Climatology and Livestock Production

II. Course Code : LPM 604

III. Credit Hours : 1+1

IV. Why this course?

This course is important to know the climatic changes that affect the health and production of livestock and vice versa.

V. Aim of the course

To familiarize students on climate, weather, various climatic factors and their role in production and health of animals in both temperate and tropics, micro and macroclimatic conditions of the animal house and assessing the heat tolerance of bovines.

VI. Theory

Unit I (4 Lectures)

Climatology and agro-climatic regions of India. Study of climatic factors and their measurement. Climatic stress in livestock (heat stress/ cold stress): effects, measurement and amelioration. Temperature-humidity index and thermo-neutral zone. Adaptation and acclimatization.

Unit II (4 Lectures)

Light: natural and artificial, photoperiod, mechanism of light action and responses. Application in livestock production.

Unit III (4 Lectures)

Performance of livestock introduced in different climates. Micro-climate modification in animal houses. Livestock and global warming.

Unit IV (4 Lectures)

Climate-resilient livestock production systems. Natural disasters-effects on livestock and mitigation measures.

VII. Practical (14 Classes)

Visit modern weather forecast stations. Assessment of climate: Microclimatic conditions within the animal house, Measurement of Temperature, Relative humidity, wind velocity and intensity of light. Ambient temperature. Construction of climographs and hythergraphs. Heat tolerance test in bovines.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits.

IX. Learning outcome

The student is expected to know the different climatic conditions and adaptations for better production and managing livestock.

X. Suggested Reading

I. Course Title : Behaviour and Welfare of Farm Animals

II. Course Code : LPM 605

III. Credit Hours : 1+1

IV. Why this course?

Improving the behaviour of livestock for better productivity and welfare.

V. Aim of the course

To acquaint students on principles of farm animal behaviour concerning environmental influence, group formation, social behaviour and behavioural adaptations under domestication.

VI. Theory

Unit I (4 Lectures)

Introduction to Animal behaviour. Evolution of animal behaviour: Theories of animal behaviour. Importance of animal behaviour studies. Physiological basis of behaviour. Natural selection, proximate and ultimate causes, fitness, optimality theory, selfish genes, kin selection, and game theory. Influence of genetic, environmental and physiological influence. Daily and seasonal cycles of behaviour. Patterns of behaviour. Favourable and unfavourable behaviours of domestication.

Unit II (4 Lectures)

Ethogram construction for general behaviour management – interpretation - behaviour assisted animal management - flight zone, Animal learning and training-conditioning- operant and classical, animal behaviour based housing designs – Methods of studying animal behaviour- Vices – causes and prevention.

Unit III (2 Lectures)

Group formation. Social relationships like hierarchy and aggression, the process of socialization, locality and behaviour. Behavioural characters for management practices.

Unit IV (6 Lectures)

Animal welfare – concepts – animal rights – animal freedoms – animal welfare organizations Measurement of animal welfare: - indicators of animal welfare-improvement of animal welfare through selection- the welfare of livestock in commercial farms and captivity, environmental enrichment- Welfare of livestock during various management activities such as handling, transportation, etc., Legislation and regulations of animal welfare – welfare and economics.

VII. Practical (14 Classes)

Behavioural characters for managemental practices. Behavioural adaptations under domestication. Analysis of behaviour in relation to climate. Analysis of social behaviour. Preparation of ethogram (time budgeting).

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

The student will apply the understanding of animal behaviour to draw conclusions about animal welfare, Consider how common management practices for livestock influence behaviour and welfare, Interpret and critically evaluate scientific literature in the field of animal behaviour

I. Course Title : Equine Production Management
II. Course Code : LPM 606
III. Credit Hours : 1+1

IV. Why this course?

Equines are important sports and pack animals

V. Aim of the course

To make the students become familiarize with principles of housing, breeding, feeding and health care of different classes of horse, stable routines and measures to reduce the mortality in young ones at different seasons.

VI. Theory

Unit I (2 Lectures)

Scope of equine husbandry in India. Equine population dynamics. Types and classes in equines. Breeds of economic importance.

Unit II (2 Lectures)

Housing and stable management, behaviour, stable vices and their management

Unit III (4 Lectures)

Feeding and breeding of equines. Care and management of stallion, broodmare, pregnant mare and foal.

Unit IV (2 Lectures)

Stud farms, Race clubs, Race-horses and their care, training, exercising, doping and horsemanship.

Unit V (4 Lectures)

Foot care and dental care in equines. General health management and diseases control. Colic, equine azoturia - prevention and management. Regulatory acts in equine disease control and welfare.

Unit VI (2 Lectures)

Transportation, Laws governing the import and export of equines, Horse passport and trading

VII. Practical (14 Classes)

Visit institutional stables. Identification, ageing, soundness and selection. Passing of nasogastric tube, Shoeing and covering. Saddle fitting, Gaits of horses and horse colours.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the student gains knowledge on management practices of equine production

X. Suggested Reading

I. Course Title : Companion Animal Production Management

II. Course Code : LPM 607

III. Credit Hours : 1+1

IV. Why this course?

To know the different practices of dog and cats

V. Aim of the course

To acquaint with dog and cat breeds their feeding, breeding, health management and socialization.

VI. Theory

Unit I (4 Lectures)

Various companion animals, evolutionary history, the process of domestication of dog and cat. Breeds of dogs and cats. Ownership. Selection of dog, cat and other companion animals. Dogs/ cat body: structure, movement and special senses.

Unit II (4 Lectures)

Reproduction and breeding management, care of newborn, weaning, reproductive problems of bitch/ queen, Socialization.

Unit III (4 Lectures)

Principles of the feeding of dog and cat, Feeding during different life stages and disease conditions, feeding behaviour, common nutritional problems and their preventive measures.

Unit IV (4 Lectures)

Basic Kennel and health management. Principles of training of dogs/ cats. Dog shows. Preparation for the shows, kennel clubs, important characters for judgment. Vaccination/ deworming schedules.

VII. Practical (14 Classes)

Recognizing various breeds. Handling and Restraining of dogs/ cats, Routine management practices of dogs/ cats. Detection of oestrus, mating, whelping/ kittening (through demonstration). Kennel/ cattery design and management. Hygiene of kennel/ pens. Licensing and identification of companion animals. Visit dog hostels and dog park/ shows.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and visits to kennels

IX. Learning outcome

By the end of the course, the student will be able to gain knowledge on different aspects of breeds and management of companion animals.

IX. Suggested Reading

I. Course Title : Farm Hygiene and Waste Management

II. Course Code : LPM 608

III. Credit Hours : 1+1

IV. Why this course?

Maintenance of farm hygiene and proper waste management promotes animal health

V. Aim of the course

To familiarize students on principles of air and water hygiene concerning impurities and inclusions of water, collection and disposal of waste from the animal house, modern techniques in manure disposal and biosecurity measures to be adapted for hygienic production of livestock products.

VI. Theory

Unit I (4 Lectures)

Animal air hygiene. Measure air pollutants and their sources. Factors affecting outdoor and indoor pollution. Methods to control these factors.

Unit II (4 Lectures)

Water Hygiene. Sources of drinking water-Impurities and inclusions. Hygienic requirements and standards for drinking water. Purification of water. Water conservation.

Unit III (4 Lectures)

Manure, Quantity of manure voided by domestic animals. Animal excreta a factor in the spread of disease. Hygienic and economic disposal of farm wastes. Drainage in livestock farms. Lagoons, Sewers, septic tanks, drains and traps.

Unit IV (2 Lectures)

Environmental protection act: Air (Prevention and control of pollution) act and water (Prevention and control of pollution) act.

Unit V (2 Lectures)

Factors affecting environmental pollution and their effect on livestock and livestock products for human consumption. Controlling measures thereof.

VII. Practical (14 Classes)

Assessment of air pollutants on animal health and production. Collection of water samples: Physical, chemical, bacteriological and microscopic examination. Bio-security measures. Modern techniques used in the disposal of farm wastes. Value-added products from farm wastes. Visit water filtration plants and study of filtration systems (rapid and slow-sand, etc.). Testing of drains in livestock farms.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the students know the practical knowledge and experiences in hygiene and waste management and control methods.

X. Suggested Reading

- Baba MD. 2007. *Environmental Changes and Natural Disasters*. New India Publ.
- Overcash MR. 1983. *Livestock Waste Management*. CRC Press.

I. Course Title : Integrated Livestock Farming Systems

II. Course Code : LPM 609

III. Credit Hours : 1+1

IV. Why this course?

To know the Integration of livestock farming systems which in turn helps improves the overall profitability of the livestock system.

V. Aim of the course

To familiarize students on various aspects, viz., scope and limitations of integrated livestock farming system, recent approach and economic feasibility of different integration models for sustainable production

VI. Theory

Unit I (4 Lectures)

Classification of livestock-based farming systems. Principles, Scope, drivers and tradeoffs in integrated livestock farming systems. Sustainability and ecological advantages of integrated livestock farming systems and their economic importance.

Unit II (4 Lectures)

Integration of various components of farming systems. Livestock-fish, arable farming, plantation crops and different livestock enterprises (cattle, buffalo, sheep, goat, pig, rabbit, poultry, beekeeping, silkworm, etc.) along with the bio-gas plant, FYM, vermicompost, solar and wind energy utilization

Unit III (4 Lectures)

New approach for changing farming systems in the light of global warming, carbon sequestration and mitigation of GHGs (reducing carbon and water footprints)

Unit IV (4 Lectures)

Project formulation and evaluation of various integrated livestock enterprises in light of reducing poverty, livelihood diversification, environmental sustainability and resource conservation.

VII. Practical (14 Classes)

Visit modern integrated livestock farming units. Critical analysis of different subunits, economic analysis and preparation of feasibility reports

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the students are expected to know with different integrated farming systems and their application in the field of their study.

I. Course Title : Management and Conservation of Wild and Zoo Animals

II. Course Code : LPM 610

III. Credit Hours : 1+1

IV. Why this course?

The course is useful to know about the zoo, wild animals and their biodiversity conservation

V. Aim of the course

To acquaint students with the principles and concepts of wildlife sanctuaries and national parks, classification of wild animals, the role of authorities in conservation and management of wild animals in captivity.

VI. Theory

Unit I (2 Lectures)

Taxonomy and distribution of important Indian wild animals and birds – Ecology of wildlife sanctuaries and National parks - Principles and concepts of Zoo and captive wild animals- Status of forest in India - Biological and ecological basis of management of wildlife

Unit II (2 Lectures)

Rules and regulations of Zoo Authority of India - Wildlife protection act - Conservation of wild animals – feeding of captive animals and birds- Habitat Components-Cover, food, water, space and their development and conservation

Unit III (6 Lectures)

Wildlife health control - Population dynamics- and it’s manipulation Movements – Corridors, – Mortality - Predator and prey relationship - Human-animal conflict - Refuge rehabilitation

Unit IV (6 Lectures)

Principles for the protection of wild and zoo animals - Breeding seasons - Breeding characteristics – puberty - pregnancy - parturition - postnatal survival of the young. Social factors among various species. Miscellaneous management procedures. Wildlife Census methods- captive animal breeding

VII. Practical (14 Classes)

Visit wildlife sanctuary/ national park/ biosphere reserves/ conservation breeding centre and zoo. Restraining methods. Funding agencies for wildlife research and preparation of project proposals, Habitat analysis and design.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the students gain knowledge in zoo animals and wildlife management and conservation methods.

I. Course Title : Laboratory Animal Production Management

II. Course Code : LPM 611

III. Credit Hours : 1+1

IV. Why this course?

Laboratory animals are important components of research for conducting animal experiments.

V. Aim of the course

To familiarize the students with various aspects of lab animals, problems and prospectus, principles of housing, breeding, feeding and health care of rabbits, rats, mice and guinea pigs, measures to reduce the mortality in young ones at different seasons.

VI. Theory

Unit I (2 Lectures)

Importance of rabbit, rats, mice, hamster and guinea pigs as laboratory animals.

Unit II (4 Lectures)

Systems of housing, layout and design for laboratory animals house. Feeding management of laboratory animals. Feeding regimen, Types of diets.

Unit III (6 Lectures)

Production of laboratory animal models for various experiments. Management of specific pathogen-free, gnotobiotic and germ-free animals. Concepts related to the welfare of laboratory animals. Sanitary and hygienic measures. Common diseases and their control measures. Biosecurity measures. Transportation.

Unit IV (4 Lectures)

Breeding, growth, sexual maturity, mating, gestation, parturition, litter size, weaning. Selection of breeding stock for replacement.

VII. Practical (14 Classes)

Visit to laboratory animal house and critical analysis of various types of managerial practices. Handling and restraining of laboratory animals. Practical breeding methods. Disease control and special management. Ageing and identification. Economics of production.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and experimental lab visits

IX. Learning outcome

By the end of the course, the students get practical exposure on different experimental laboratory animals, their production and management.

I. Course Title : Livestock Business Management

II. Course Code : LPM 612

III. Credit Hours : 1+1

IV. Why this course?

Study of livestock business management will improve marketing of livestock and livestock products and enhance the profitability

V. Aim of the course

To acquaint students with knowledge in principles, planning, technical approach and preparing financial statement in Livestock Business Management and preparing projects for financing.

VI. Theory

Unit I (3 Lectures)

Management principles, Planning Techniques, strategic planning, organization structure, co-ordination and controlling techniques, Approaches to management.

Unit II (5 Lectures)

Key economic concepts, factors of production, farm enterprises, cost of production, opportunity cost, value of production, gross margin, farm profit, net farm family income, substitution, and efficiency: return to scarce resources, risk. SWOT analysis for different livestock species and products, Livestock production economics, theory of supply and demand, production relationships, production function, cost input variables, profit maximization.

Unit III (4 Lectures)

Economics and the market, market intelligence, newer concepts in marketing, market research and opinion polling, advertising research, market surveillance, etc.

Unit IV (3 Lectures)

Marketing channels, Marketing of livestock and livestock products and laws governing them, Pricing strategies, supply chain management, marketing agencies.

VII. Practical (14 Classes)

Accounting records, fund flow statement, Cost and benefit analysis. Budgeting and control. Preparation of financial statements, depreciation accounting methods, trend and variance analysis, cost-volume profit analysis. Financial planning and forecasting. Estimation of working capital requirement. Break even analysis. Visit to livestock business firms and banks. Preparing projects for financing.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of course the students gain knowledge in planning and handling business records.

I. Course Title : Livestock Farm Machinery Management

II. Course Code : LPM 613

III. Credit Hours : 0+2

IV. Why this course?

The course will facilitate effective utilization and maintenance of farm machinery with their practical knowledge.

V. Aim of the course

To familiarize the students with different farm machines and milking machine, different parts and their functions for better utilization

VI. Theory

Unit I (2 Lectures)

Visit to Instructional Livestock Farm Complex, Identification of various livestock farm machineries

Unit II (2 Lectures)

Familiarization with different parts and their functions of tractor and power tiller (for tillage implements for fodder land development).

Unit III (2 Lectures)

Irrigation of fodder field. Familiarization with different electric motors and diesel engines, use of sprinkler for irrigation.

Unit IV (2 Lectures)

Non-conventional energy source-Wind energy and its utilization in livestock farm.

Unit V (2 Lectures)

Post-harvest equipment/ machineries. Common terms used in harvesting of fodder crops; hay and forage harvesting equipment, mowers, field choppers, chaff cutters for silage making, different types of silos, forage harvesters, mechanical hay driers, conventional balers, hay stackers, straw combine.

Unit VI (2 Lectures)

Familiarization with different parts of milking/ shearing machines, handling, operation and cleaning after use, instruments used for milk packaging. Automatic feeders and waterers

Unit VII (2 Lectures)

Milk storing equipment, pasteurization equipment and transportation of milk, handling of equipment for preparation traditional milk products.

Unit VIII (2 Lectures)

Forage densifying machine/ Feed block machine and its use- preparation of complete feed block (CFB).

Unit IX (2 Lectures)

Visit to feed mill- use and maintenance of feed grinder and mixture machines in the farms. Visit milk processing unit

VII. Teaching methods

Practical demonstration of prescribed machinery in different farms/ processing plants

VIII. Learning outcome

By the end of course the students get knowledge on different farm machineries including milking machine.

IX. Suggested Reading

- Malhotra K. 2012. *Handbook of Farm, Dairy, and Food Machinery*. Centrum Press.
- Selected articles from journals.

I. Course Title : Poultry Farm and Hatchery Management

II. Course Code : LPM 614

III. Credit Hours : 1+1

IV. Why this course?

Poultry rearing provides employment opportunities and is an important component of food security

V. Aim of the course

To impart knowledge on housing, flooring and management of poultry. They also learn incubation and hatching of eggs.

VI. Theory

Unit I (4 Lectures)

Poultry housing systems - cage vs floor system, litter management and lighting for poultry, rearing turkey, duck and quails, backyard poultry.

Unit II (4 Lectures)

Management of chicks, growing, laying and breeding flocks, broiler production, selection and culling of laying flocks. Health management. Management of birds during disease outbreaks.

Unit III (3 Lectures)

Procuring, care and pre-incubation storage of hatching eggs - Method of incubation, sanitation disinfection and management of hatchery. Biosecurity in poultry farms

Unit IV (2 Lectures)

Embryonic development and factors affecting fertility and hatchability of eggs.

Unit V (3 Lectures)

Chick sexing, packing and hatchery business - Transporting management of farm and hatchery waste.

VII. Practical (14 Classes)

Observation and recording of Poultry Farm management - Brooding of chicks; selection of laying flocks - Disease preventive measures - Selection and care of hatching eggs; incubator operation, fumigation and candling setting and hatching, packaging of chicks - Waste management - Marketing of products.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the students gain knowledge on poultry farm management, brooding and hatching management including health.

LPM 707	Entrepreneurship in Livestock Production	1+1
LPM 708	Precision Livestock Farming	1+1
LPM 709	Recent Developments in Poultry Production Management	2+1
LPM 791	Seminar-I	1+0
LPM 792	Seminar-II	1+0
LPM 799	Research	75

*Core courses

Course Contents
Ph.D. in Livestock Production and Management

I. Course Title : Recent Developments in Large Ruminants Production Management

II. Course Code : LPM 701

III. Credit Hours : 2+1

IV. Why this course?

Large ruminants are a source of employment and cater to nutritional demands and socio-economic upliftment of people.

V. Aim of the course

To know modern trends on housing, feeding, health and milking management in dairy bovines.

VI. Theory

Unit I (2 Lectures)

Present status of dairying in India *vis-à-vis* Global and south Asian scenarios, Production dynamics, Recent policy initiatives in dairy development. Conservation of indigenous germplasm

Unit II (4 Lectures)

Advances in housing management, viz., design, layout, construction materials, cost of construction suits to various agro-climatic zones of India. Low-cost houses for large ruminants. Ideal shelter management practices for better productivity, Advances in manure and waste disposal.

Unit III (6 Lectures)

Recent approaches in breeding and reproductive Management of dairy animals, Optimization of reproductive traits, Estrus synchronization, MOET, Sexed semen, Cloning and IVF.

Unit IV (4 Lectures)

Recent approaches in Feeding, Phased feeding, Transition period, Hydroponic fodder, Eco-feeding, standards for drinking water and water hygiene.

Unit V (4 Lectures)

Advances in health management of dairy animals, preventive measures for production-related diseases, bio-security measures, etc.

Unit VI (4 Lectures)

Milking management, automation, Sanitary and phytosanitary standards for the production of quality milk, post-harvest processing.

Unit VII (4 Lectures)

Establishing a Dairy Enterprise suitable for various economic strata with different sizes, SWOT analysis. Computerization of dairy enterprises, Best management practices.

Unit VIII (4 Lectures)

Advances in herd management and data analysis, Advances in the management aspects of buffaloes, salvaging of buffalo calves, Advances in work animal management.

VII. Practical (14 Classes)

Critical analysis of various types of managerial practices at farms. Preparation of layout and designs for construction of sheds of various sizes in different agro-climatic zones. Cost analysis of dairy bovine housing. Organization of milking machines. Dairy Cattle and Buffalo judging – BCS. Farm record analysis. Project report preparation for commercial dairy farms.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the student gain knowledge and experience in different aspects of advanced methods of large ruminants management in different fields of housing, feeding, breeding and milking of dairy animals.

I. Course Title : Recent Developments in Small Ruminants Production Management

II. Course Code : LPM 702

III. Credit Hours : 2+1

IV. Why this course?

Small ruminants are an important source of livelihood security to rural masses and study/ application of recent advances will improve the profitability of small ruminant rearing.

V. Aim of the course?

To familiarize the students with advanced methods of housing, feeding, breeding, reproduction and health management.

VI. Theory

Unit I (4 Lectures)

Relevance of small ruminants in the Indian economy. Population and production dynamics of small ruminants. Systems of rearing. Needs and possibilities for research in future.

Unit II (8 Lectures)

Recent approaches in breeding and reproductive management. Management during the breeding season, Mating seasons and their control. Recent approaches in reproductive biotechnologies, MOET, Cloning, transgenic, genomics and accelerated lambing.

Unit III (6 Lectures)

Recent approaches in feeding management, Pasture and grazing management, Phase feeding, Feed resources and feeding techniques under different systems.

Unit IV (6 Lectures)

Recent approaches in housing systems with reference to different agro-climatic zones and rearing systems.

Unit V (6 Lectures)

Prospects of management under stall-fed conditions, management of small ruminates during scarcity periods, Migratory pattern and flock management. Recent approaches in exploiting goat's, milk quality, safety and production aspects of dairy goats. Wool/ fibre production and its quality.

Unit VI (2 Lectures)

Recent approaches in health care management, Parasitic control in present ecological and environmental changes.

VII. Practical (14 Classes)

Critical analysis of various farm practices, Preparation of layout and designs for construction of sheds of various sizes in different agro-climatic zones. Cost analysis of housing. Organization of shearing. Sheep and goat judging – BCS. Farm record analysis. Disease control management. Scorecard and grading of wool. Project report preparation for commercial sheep and goat units.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

The students gain knowledge and experience on different advance management aspects of small ruminants.

I. Course Title : Recent Developments in Swine Production Management

II. Course Code : LPM 703

III. Credit Hours : 1+1

IV. Why this course?

Study of recent developments will facilitate their application for better growth of the swine industry

V. Aim of the course

To impart knowledge on recent advances in the improvement of swine housing, feeding, reproduction and health management.

VI. Theory

Unit I (2 Lectures)

Trends in population and production in India and world, Production systems followed in developed countries.

Unit II (6 Lectures)

Recent approaches in improvement of economic traits, Prenatal and postnatal development, care of newborn, Growth, breeding and reproduction, analysis of mating systems, Farrowing and lactation.

Unit III (3 Lectures)

Strategic management measures in feeding, Phase feeding, Split sex feeding and individual feeding. Automatic feeding and watering techniques, Feed resources and feeding systems.

Unit IV (2 Lectures)

Recent approaches in housing, environmental physiology, summer management, approaches in manure management.

Unit V (2 Lectures)

Strategies to reduce mortality in different classes, common diseases, health management, Biosecurity measures.

VII. Practical (14 Classes)

Critical analysis of various types of managerial practices at farms. Preparation of layout and designs for construction of sties for the backyard and commercial piggeries. Judging and BCS, Farm record analysis. Preparation of Project report for commercial and backyard piggeries. Marketing Analysis

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of the course, the students will gain knowledge on modern aspects swine practices and management including health.

X. Suggested Reading

I. Course Title : Livestock and Environment

II. Course Code : LPM 704

III. Credit Hours : 1+0

IV. Why this course?

There is an urgent need for governments and institutions to develop and enact appropriate policies, at the national and international levels, that focus more on and account for livestock–environment interactions.

V. Aim of the course

To impart knowledge related to the application of technologies that improve the efficiency of land use and feed use can mitigate the negative effects of livestock production on biodiversity, ecosystems and global warming. Technologies that increase livestock efficiency include improved breeds, improved grazing-land management, improved herd-health management, etc.,

VI. Theory

Unit I (4 Lectures)

Effect of livestock on the environment- Role of ruminants in global warming, Slaughterhouse waste, Tannery waste, Stray and fallen animal impact. Strategies for mitigation of methane emission from the livestock sector, animal waste management. A life cycle assessment of the environmental impacts of livestock in different production systems.

Unit II (4 Lectures)

Effect of environment on livestock and quality of products: Heat and cold stress, Pollution, Heavy metals, Pesticide residues, etc., Management of micro and macro-environment with respect to animal well-being,

Unit III (4 Lectures)

Concept of Water, Carbon footprints and carbon sequestration of farm animals and products. Thermal load indices, Livestock comfort zones. Carbon trading, mechanisms and opportunities in the livestock sector.

Unit IV (4 Lectures)

Selection of breeds of livestock for hot climate. Recent advances in shelter management practices under the impending climate change scenario. Climate and reproduction. Environment and diseases.

VII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions.

VIII. Learning outcome

By the end of the course, the students gain knowledge about the interaction between livestock and the environment. They also acquire knowledge of the greenhouse effect and mitigation.

I. Course Title : Organic Livestock Production

II. Course Code : LPM 705

III. Credit Hours : 1+0

IV. Why this course?

Organic livestock production offers an effective means of satisfying consumer demand for healthy and safe foods and reducing the environmental pressure of agricultural production. There is a need to know the organic production of livestock products and by-products.

V. Aim of the course

To impart knowledge on key considerations, organic farming standards, certifying agencies, the role of organic livestock farming in environmental protection and biodiversity enhancement and economics of organic livestock products.

VI. Theory

Unit I (2 Lectures)

Historical background and origin, Organic livestock farming vis-a-vis conventional livestock farming, the current status of organic farming in India and world- objectives and importance of organic livestock farming. Opportunities and Problems of organic livestock farming in India.

Unit II (6 Lectures)

Key consideration, selection of animals, housing, feeding, breeding, health care, record keeping, processing and labelling and marketing. Conversion of livestock farm into an organic farm. ITKs used in organic livestock production.

Unit III (4 Lectures)

Organic farming standards in India and the world. IFOAM basic standards, WHO/ FAO Codex Alimentarius, NSOP of India, etc. Role of organic livestock farming in environmental Protection and biodiversity enhancement.

Unit IV (4 Lectures)

Accreditation of inspection and certification agencies. Organic certification mark. Guidelines for organic certification of livestock modalities in the certification of organic products. The economic value of organic livestock products, pricing strategy and marketing of organic products.

VII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions

VIII. Learning outcome

By the end of the course, the student will be acquainted with organic livestock production, economics and marketing of organic products.

IX. Suggested Reading

I. Course Title : Recent Developments in Welfare of Farm Animals

II. Course Code : LPM 706

III. Credit Hours : 1+0

IV. Why this course?

Now there are big movements on ethical animal production all over the World. Hence a doctoral student of LPM has to be prepared on this issue too.

V. Aim of the course

To familiarize students with the concept and practice of ethical livestock production and production from content ended animals - Animal Welfare Management;

VI. Theory

Unit I (2 Lectures)

Ethology: species-specific behaviour, changing with the season, physiological condition of animals, as a guide to animal welfare; not driving animals beyond their natural capacity, for better performance;

Unit II (6 Lectures)

Amelioration of climatic stress and avoidance of unnecessary injury, pain and stress to animals in animal houses, during handling, before and during slaughter, carting bullocks, feeding, milking, shearing, transportation, etc., including deprivance of quality feeds and water; this being a common feature;

Unit III (4 Lectures)

Providing safety, healthcare, feed and water to unproductive animals let off to free roam and injured or orphaned pets, birds and others; monkeys being common – Good management of goshalas and safe shelters for such animals – Conversion of their wastes into VAP to meet part costs of running shelters; Education of the general public, especially children to avoid wanton harm to animals via *Lectures* in schools, TV and radio talks, leaflets, etc.

Unit IV (4 Lectures)

Evaluation of animal welfare measures as an 'instrument' of good animal husbandry, production of quality products and enhanced income to farmers.

VII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

VIII. Learning outcome

By the end of this course, the student will be familiarized with species-specific behaviour, amelioration of climatic stress and evaluation of animal welfare measures.

I. Course Title : Entrepreneurship in Livestock Production

II. Course Code : LPM 707

III. Credit Hours : 1+1

IV. Why this course?

Livestock production has huge scope vis a vis income generation. Study of concepts of entrepreneurship will ensure awareness towards the possibilities of taking livestock production as a business unit.

I. Aim of the course

To understand livestock entrepreneurship, concept, incubation centre, PPP perspective in the animal husbandry sector, business communication, inter-personnel skills for establishing an enterprise.

II. Theory

Unit I (2 Lectures)

Understanding livestock entrepreneurship, Concept and characteristics of Entrepreneurship, Role of entrepreneur in relation to enterprise, Functions of the entrepreneur in the economy,

Unit II (4 Lectures)

Process of entrepreneurship development. Barriers in entrepreneurship. The institutional interface in the development of entrepreneurship, incubation centres, startups, PPP Prospective in the animal husbandry sector.

Unit III (6 Lectures)

Essential criteria for the development of entrepreneurship in livestock sector - basic requirements for entrepreneurship initiatives in livestock and allied sectors (i.e. techno-economic feasibility of the enterprises under different conditions, training and management skills, business acumen, business communication, inter-personnel skills for establishing an enterprise, etc.).

Unit IV (4 Lectures)

Entrepreneurial training/ development programmes at the State and National level, Livestock Insurance, Bank and Government support for entrepreneurship, Financial credit and financial management: general principles and practices, analyzing project appraisals and reports, capital, expenditure decisions, reinvestment and payback.

Unit V (2 Lectures)

Preparing projects for bank appraisal, banking requirements, Assessing project profits, Procurement management quality issues, standardisation, grading and packaging.

III. Practical (14 Classes)

Visit incubation centres, extrapolation of existing financial models in livestock entrepreneurship, Approach to the preparation of Entrepreneurial Project on livestock, Bankable project for a dairy enterprise (small/ large dairy unit), Bankable project for a sheep/ goat/ Ram lamb enterprise, Bankable project for a pig-enterprise, Bankable project for a Broiler enterprise (small/ medium/ large unit), Bankable project for a layer-enterprise

IV. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

V. Learning outcome

The student acquires knowledge in entrepreneurship initiatives in livestock and allied sectors, financial management and assessment of project profit.

VI. Suggested Reading

- *Selected articles from journals.*

I. Course Title : Precision Livestock Farming

II. Course Code : LPM 708

III. Credit Hours : 1+1

IV. Why this course?

Precision Livestock Farming is a combination of developing animal sensing (sensors) tools and decision-making process at the farm level. This information is very much needed for the students in the present technology of the world.

V. Aim of the course

To educate the students with a concept of precision in livestock farming, implementation of the sensor system, automation, use of software and analysis

VI. Theory

Unit I (2 Lectures)

Concepts of Precision Livestock Farming-Scope and limitations. Utilities of Precision tools in Livestock Farming, the present level of usage of precision tools in India

Unit II (6 Lectures)

Implementation of sensor systems and ICTs in animal health, productivity and welfare, Animal identification and tracking- Radio frequency identification (RFID), Livestock identification and traceback system (LITS), etc. Geo-tagging, Virtual fencing, GPS and GIS in the exploration of feeding resources and grasslands.

Unit III (6 Lectures)

Automation in water resource management. Development and evaluation of early warning and disease support systems for animal health and welfare.

Unit IV (2 Lectures)

Use of software's for database creation of the livestock farms, computation and analysis.

VII. Practical (14 Classes)

GPS/ GIS Application in the exploration of breeding tracts of livestock, forage and grassland profiles. Exposure visit to precision livestock farms with automation, use of tools in reproduction and health care, use of different software in farm routines.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of this course, the students will gain knowledge in precision livestock farming.

X. Suggested Reading

- Halachmi I. 2015. *Precision Livestock Farming Applications*. Wageningen Academic Pub.

I. Course Title : Recent Developments in Poultry Production Management

II. Course Code : LPM 709

III. Credit Hours : 2+1

IV. Why this course?

The poultry industry is growing at a very fast rate. Students have to remain aware of the recent developments in the sector

V. Aim of the course

To educate the students on recent developments on the management of farms and hatcheries, egg, meat and policy developments in poultry.

VI. Theory

Unit I (8 Lectures)

Planning, organization, executive and management of poultry farms and hatcheries of various sizes - an alternative in poultry production

Unit II (4 Lectures)

Demand, supply, the present status of poultry production in India.

Unit III (10 Lectures)

Problems and new management techniques in poultry for egg and meat in India vis-à-vis in other countries of the world - Automation in poultry houses, management of specific pathogen-free flocks.

Unit IV (10 Lectures)

Poultry development policies and planning for higher production constraints in development and solutions, Ethology in relation to avian welfare in intensive poultry production.

VII. Practical (14 Classes)

Planning and preparation of research and commercial projects on broiler and layer production management.

VIII. Teaching methods

Blackboard, power point presentations, ICT, Group discussions and farm visits

IX. Learning outcome

By the end of this course, the student acquires knowledge in advances of modern poultry farm and hatchery management

X. Suggested Reading

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Animal Production Sciences
– Livestock Products Technology

Preamble
(Livestock Products Technology)

Salient features of revised courses

- Changed course numbers to bring desired sequence in the courses for better understanding. Revised and updated all courses to ensure practical and latest knowledge covering processing quality control and other aspects of livestock products.
- To give more emphasis on processing, packaging, quality control and marketing of livestock products, separate courses have been developed for processing, packaging and marketing, and quality control (earlier course no. was LPT 602, Now LPT 603, LPT 605, LPT 606). Many latest topics have been included in the revised courses.
- Topics related to poultry meat (earlier course no. LPT 603) are included along with other meat topic in LPT 601, LPT 603, LPT 605 and LPT 606). Separate course has been developed for Fish and Fish Products (LPT 613, optional).
- In abattoir course (LPT 605), contents related to meat plant operations are included as per requirement of industry, so that students get practical knowledge. Course number is changed to LPT 601 to bring desired change in sequence.
- In slaughter house byproducts course (earlier course no. was LPT 606, now LPT 607), all updated/ latest technologies/ processes have been included.
- Courses specifically related to milk, are re-casted. Separate course (LPT 604) is developed on Milk and milk products processing (after deleting processing content from old course - LPT 610). This ensures more emphasis on Market milk and dairy plant operations (LPT 610).
- Updated, revised and changed In-plant training course (LPT 612) to Industrial and Entrepreneurial Training course (LPT 608) and made it as a credit course.
- Advances in Fresh and Processed Meat Products Technology (LPT 702), is divided into two courses (LPT 702 and 703). Topics related to Meat production are also included in LPT 702.
- Contents of these two related courses (LPT 705 and 706, quality control and biotechnological tools) are merged and given in new course LPT 705. Topics are revised, updated and rearranged in other courses.
- Considering the entrepreneurship importance, changing trends of consumer preference for novel animal food products and requirement of the industry, and also to provide practical exposure and training to students, following new courses are proposed:
  1. LPT 706- Ethnic and Organic Meat and Milk Products (1+1)
  2. LPT 707- Industrial and Entrepreneurial Training (0+2)
  3. LPT 708- Current trends in Disposal and Utilization of Waste from Meat and Dairy Industry (1+1)
  4. LPT 709 Advances in Egg and Egg Products Technology (1+1)

Course Title with Credit Load
M.V.Sc. in Livestock Products Technology

Course No.	Course Title	Credits Hours
LPT 601*	Abattoir Practices and Meat Plant Operations	2+1
LPT 602*	Fresh Meat Technology	1+1
LPT 603*	Processing and Preservation of Meat	2+1
LPT 604*	Processing of Milk and Milk Products	1+1
LPT 605*	Packaging and Marketing of Livestock Products	1+1
LPT 606*	Microbiology and Quality Control of Livestock Products	1+1
LPT 607*	Slaughterhouse By-products Technology	1+1
LPT 608	In-Plant Training	0+2
LPT 609	Egg and Egg Products Technology	1+1
LPT 610	Market Milk Processing and Dairy Plant Practices	1+1
LPT 611	Processing and Marketing of Wool	1+1
LPT 612	Biotechnology of Foods of Animal Origin	1+1
LPT 613	Fish and Fish Products Technology	1+1
LPT 691	Seminar	1+0
LPT 699	Research	30

*Core courses

Course Contents
M.V.Sc. in Livestock Products Technology

I. Course Title : Abattoir Practices and Meat Plant Operations

II. Course Code : LPT 601

III. Credit Hours : 2+1

IV. Why this course?

Human Resource Development (Manager, Supervisor, Meat inspector and other Technocrats) for Slaughterhouses and Meat processing plants.

V. Aim of the Course

To impart knowledge about the handling of meat animals, layout and design of abattoir, sanitation and basics of slaughterhouse practices and meat plant operations.

VI. Theory

Unit I (12 Lectures)

Handling and transportation of meat animals including poultry - Pre-slaughter handling and care of food animals – Ante-mortem inspection - Humane slaughter - Principles and methods of stunning - Ritual methods of the slaughter of food animals and poultry - Machinery for slaughter and dressing of food animals - Post-mortem inspection - Handling, disposal and condemnation of unfit materials.

Unit II (11 Lectures)

Abattoir - layout, designing, organization and operation - Maintenance of meat and poultry processing plants - Record keeping - Legislations and regulations for establishment and operation of slaughterhouses and meat processing plants.

Unit III (11 Lectures)

Sanitation of slaughterhouse - Sanitary practices in meat plant and its benefits - Solid and liquid waste management of slaughterhouse - Different methods of effluent treatment and designs of effluent treatment plants - State and Central Pollution Control Board norms.

VII. Practical (17 classes)

Design and outlay of modern abattoir including poultry processing and effluent treatment plants for different capacities - Judging and grading of food animals - Procedure for the slaughter of food animals and poultry - Ante-mortem and post-mortem inspection - Recording of carcass data - carcass yield, meat bone ratio, etc. - Measurement of effluent characteristics - pH, BOD, COD, suspended solids, etc. - Visit slaughterhouse, poultry processing and effluent treatment plants - DPR for the establishment of an abattoir.

VIII. Teaching methods

- Classroom teaching, practical demonstration in Divisional laboratory/ slaughter unit.
- Visit municipal slaughterhouse and meat plants.
- Demonstration of charts, video films and models.

IX. Learning Outcome

Gaining knowledge of abattoir practices and operations to be carried out in meat plants.

X. Suggested Reading

I. Course Title : Fresh Meat Technology

II. Course Code : LPT 602

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for Meat processing Sector

V. Aim of the Course

To impart knowledge about the status of the meat industry, muscle structure and composition, carcass handling, grading and fabrication.

VI. Theory

Unit I (10 Lectures)

History, current development and prospects of meat and poultry industry in India – Skeletal muscle development – pre- and post-natal- Structure and chemistry of muscle including poultry – Muscle Proteins - sarcoplasmic and myofibrillar proteins – Stromal proteins – Types of muscle fibres - Post mortem changes – Rigor mortis - Conversion of Muscle to meat - Pre and post-slaughter factors affecting meat quality – Defects during the conversion of muscle to meat – PSE/ DFD/ Cold Shortening – Off odour development.

Unit II (7 Lectures)

Composition and nutritive value of meat and poultry - Qualities of fresh meat – pH, WHC, colour, odour, juiciness, texture/ tenderness and firmness - Chilling, ageing and conditioning of meat - Electrical stimulation - Carcass evaluation, grading and fabrication- Tenderization of meat.

VII. Practical (17 Classes)

Evaluation/ estimation of physicochemical properties of fresh meat pH, colour, water holding capacity, ERV, shear force value, glycogen, R-value and myoglobin - Proximate analysis of meat - Estimation of drip loss - Determination of sarcomere length, fibre diameter and myofibrillar fragmentation index - Fractionation of sarcoplasmic, myofibrillar and stromal proteins - Carcass evaluation and grading - Meat cutting, retail and wholesale cuts.

VIII. Teaching methods

- Classroom teaching, practical demonstration and analysis in Divisional laboratory/ slaughter unit.
- Visit slaughterhouses, meat plants and retail units
- Use of Audio-visual Capsules.

IX. Learning Outcome

Acquiring knowledge on quality attributes of fresh meat, factors affecting these attributes, composition and nutritive value of meat.

X. Suggested Reading

I. Course Title : Processing and Preservation of Meat

II. Course Code : LPT 603

III. Credit Hours : 2+1

IV. Why this course?

Human Resource Development for Meat and Poultry Processing Industry and Entrepreneurship development

V. Aim of the Course

To impart knowledge about processing and preservation of meat including poultry meat, fundamentals of sensory evaluation and techniques for sensory evaluation of meat products.

VI. Theory

Unit I (8 Lectures)

Basic principles of meat preservation – dehydration, chilling, freezing, freeze-drying, thermal processing, direct microbial inhibition, irradiation, use of chemicals and antimicrobials - Curing and smoking - Hurdle technology concept.

Unit II (17 Lectures)

Principles of Meat Processing - Meat and non-meat ingredients and their roles - Additives - Processing techniques - comminution, chopping, blending, marination, massaging, tumbling, etc. - Cooking methods including microwaving – Development of meat products including ham, bacon, tandoori and barbeque - Emulsion formation – factors affecting emulsion formation - Emulsion based meat products - sausages, nuggets and patties - Enrobed, restructured, fermented and intermediate moisture meat products – Ready-to-cook, ready-to-eat and shelf-stable meat products - Canned and retort meat products – Traditional and ethnic meat products - Functional meat products.

Unit III (9 Lectures)

Sensory evaluation – Sensory physiology, types, methods, quality attributes - Factors influencing sensory measurements - Types of sensory panels - Selection of sensory panellists- Sensory evaluation tests- Layout and designing of sensory evaluation laboratory.

VII. Practicals (17 Classes)

Estimation of tyrosine value, nitrite content, TBARS value, peroxide value - Preparation of Meat Products - Minced meat products - Emulsion based meat products – sausages, nuggets and patties - Ham and Bacon - Meat Pickles – Enrobed, restructured, fermented and shelf-stable meat products - Canned/ retorted Meat Products - Traditional and ethnic Meat Products - Kebabs - Sensory evaluation of meat products - Subjective and objective method of sensory evaluation - differential, descriptive, training tests, etc. – Test practices and training in the sensory lab - Determination of emulsion stability - Cooking yield - Texture Profile Analysis.

VIII. Teaching methods

- Classroom teaching, practical performance in Divisional Pilot Processing Plant.
- Visit of Meat and Poultry Processing Unit.
- Demonstration videos

IX. Learning Outcome

Theoretical and practical understanding of meat preservation, processing and sensory evaluation of the meat products.

X. Suggested Reading

I. Course Title : Processing of Milk and Milk Products

II. Course Code : LPT 604

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Milk Processing Industry, Cooperatives, etc.

V. Aim of the Course

To impart knowledge about the organization of dairy plants, basic milk operations, cleaning and sanitization of milk processing plants, milk products processing and applications of membrane technologies in dairy industries.

VI. Theory

Unit I (6 Lectures)

Basic concepts of dairy plant organization and operation - collection, chilling, transportation - Heat treatments of Milk - Cleaning and sanitization of Dairy plants - Composition, nutritional, physico-chemical and functional properties of milk - Standards for milk and milk products.

Unit II (7 Lectures)

Manufacture of milk products - Flavoured Milk - Drying of milk and milk products - Evaporated and condensed milk - Milk powders – Butter - Ice cream and other frozen desserts - Manufacture of different fermented milk products - Manufacture of cheddar, mozzarella, cottage and processed cheese - Manufacture of indigenous milk products – paneer, channa, khoa, ghee, dahi and shrikhand - Rheology of milk products - Dairy by-products.

Unit III (4 Lectures)

Membrane filtration technology- principles and concepts - Manufacturing and functional properties of casein - Caseinates- Co-precipitates - Whey protein concentrates (WPC) - Lactose- Dairy whiteners.

VII. Practical (17 Classes)

Platform tests - Determination of fat, SNF, TS, protein, lactose and ash contents of milk - Preparation of butter, ice cream, cheese – cheddar, mozzarella and cottage cheese, khoa, paneer, channa, ghee, dahi, yoghurt, casein, caseinate, co-precipitate, flavoured milk - Determination of degree of browning - Measurement of rheological properties of different milk products - Evaluation of sensory quality of milk and milk products - Visit dairy plants.

VIII. Teaching methods

- Classroom teaching and laboratory practical.
- Visit the milk processing plant.
- Use of Audio-visual Capsules

IX. Learning Outcome

Gaining knowledge of handling and processing of milk and milk products.

I. Course Title : Packaging and Marketing of Livestock Products

II. Course Code : LPT 605

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor, Marketing Executives and other Technocrats) for Packaging Industry and Business Planning.

V. Aim of the Course

To impart knowledge about properties of different packaging material, techniques used in packaging of different livestock products, marketing channels and value chain of processed products.

VI. Theory

Unit I (10 Lectures)

Principles of packaging - objectives and functions - Product characteristics affecting packaging requirements - Packaging materials and their characteristics - Different packaging systems for fresh, cured, dehydrated, freeze-dried and shelf-stable products of milk, meat and chicken - Aseptic packaging of milk - UHT milk - Vacuum packaging – MAP and role of different gases - Retort pouch processing - Active and intelligent/ smart (biosensors) packaging - Edible and biodegradable packaging - Nanotechnology for food packaging - Recycling of packaging materials - Labelling requirements – Barcoding and its importance - Packaging standards and regulations – Economics of different packaging systems.

Unit II (7 Lectures)

Marketing of Livestock Products - Types of markets - Marketing channels of live meat animals and Poultry - Existing systems - constraints and possible solutions - Value Chain of meat, poultry and processed products - strategies and interventions for better profitability – Meat retailing and establishment of retail outlets for meat and poultry - FSSAI, APEDA, EIA, GOI/ WTO regulations for the domestic market, import and export of livestock products.

VII. Practical (17 Classes)

Different packaging materials and their properties - Determination of thickness, bursting strength, piercing strength, water vapour transmission rate, gas transmission rate, headspace gas analysis - Vacuum, shrink, MAP and retort packaging of meat and milk products - Visit milk and meat processing plants - Study of the value chain of livestock products including online marketing.

VIII. Teaching methods

- Classroom teaching, Practical demonstration in the laboratory.
- Visit market and packaging units.
- Demonstration using video films and models.

IX. Learning Outcome

Developing an understanding of packaging and marketing of livestock products.

X. Suggested Reading

- Aberle ED, Forrest JC, Gerrard DE and Mills EW. 2013. *Principles of Meat Science*, 5th ed. Kendall Hunt Publishing Company, Iowa.

- *Selected Articles from Journals.*

I. Course Title : Microbiology and Quality Control of Livestock Products

II. Course Code : LPT 606

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for Quality Control of Livestock Products

V. Aim of the Course

To develop an understanding about microbial spoilage of different livestock products, quality control and legal standards.

VI. Theory

Unit I (9 Lectures)

Microorganisms associated with spoilage of livestock products - Factors affecting microbial growth - Contamination of livestock products - Microbial spoilage of meat, poultry, eggs, milk and their products - Physical and chemical changes produced by microbes in milk, meat, eggs and their products - Meat and milk-borne infections and intoxications - Control of microbial growth in livestock products - Antimicrobial resistance (AMR).

Unit II (8 Lectures)

Introduction to Good Laboratory Practices (GLP), Good Hygienic practices (GHP) and Good Manufacturing Practices (GMP), Sanitary and Phytosanitary measures (SPS) and Food Safety System Certification (FSSC) - Quality Control – Quality Assurance - principles and practices - Quality Management Systems – Food Safety and Standards Act (FSSAI, 2006 Act) - Codex regulation for food products safety - ISO 9001 - ISO 22000 - HACCP concepts - Risk-based quality assessment - Microbial quality control - FSSAI/ BIS standards for milk, meat and poultry, Chemical residues in livestock products and their effects on the health of the consumer.

VII. Practical (17 Classes)

Basic requirements for setting up of quality control laboratory - Sampling methods for the microbiological examination of different processing plants, products and equipment - Development of HACCP plan for milk and meat processing plants - Microbial evaluation of market samples of milk, meat and egg – Total Viable Count, coliform, etc. - Pathogens of Public Health importance - *E. coli, Salmonella, Staphylococcus aureus, Campylobacter* - Rapid detection methods of food pathogens.

VIII. Teaching methods

- Classroom teaching with laboratory analysis.
- Sampling and survey of market, butchers shop, milk and meat processing plants.
- Visits to units having HACCP and ISO certification.

IX. Learning Outcome

Acquiring knowledge on microbiology, quality control and legal standards for different livestock products.

X. Suggested Reading

- Aberle ED, Forrest JC, Gerrard DE and Mills EW. 2013. *Principles of Meat Science*, 5th ed. Kendall Hunt Publishing Company, Iowa.

I. Course Title : Slaughterhouse By-products Technology

II. Course Code : LPT 607

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for better utilization of animal by-products and pollution control

V. Aim of the Course

To impart knowledge about the utilization and processing of animal by-products.

VI. Theory

Unit I (6 Lectures)

Status and scope of slaughterhouse by-products utilization - Trade practices - Planning, design and layout of by-products plant - Classification of by-products - edible and inedible - Rendering methods and products - Yield and characteristics of rendered fat and meat cum bone meal.

Unit II (6 Lectures)

Utilization of blood, horns and hooves, intestine, bones, feathers, bristles, glandular by-products and ruminal contents - Value-added by-products from slaughterhouse and poultry processing plants - Processing of animal by-products for pet foods - High-value low volume by-products – collagen sheets, scaffolds, bone morphogenic proteins, biopeptides, biodiesel, etc.- Legislation and regulations related to animal by-products.

Unit III (5 Lectures)

Flaying - Classification and factors affecting the quality of hides and skin - Physical and chemical characteristics of hide and skin - Grading and processing of hide and skin for the manufacture of leather - Preparation and quality control of gelatine and glue.

VII. Practical (17 Classes)

Preparation of casing, neatsfoot oil, gelatin and glue - Demonstration of preparation of carcass meal, meat meal, bone meal, blood meal, feather meal, slime meal - Grading of casings - Collection and preservation of glandular by-products - Preparation of pet foods -Visit local by-products processing units - Quality evaluation of rendered animal fat.

VIII. Teaching methods

- Classroom teaching, practical demonstration of different by-products preparation in the Divisional laboratory/ slaughter unit
- Visit of municipal slaughterhouse and tanneries.
- Use of Audio-visual Capsules.

IX. Learning Outcome

Gaining knowledge on proper utilization of slaughterhouse by-products

X. Suggested Reading

- Aberle ED, Forrest JC, Gerrard DE and Mills EW. 2013. *Principles of Meat Science*, 5th ed. Kendall Hunt Publishing Company, Iowa.
- Jensen WK, Devine C and Dikeman M. 2004. *Encyclopaedia of Meat Sciences,* Vol. I, II and III, 1st ed., Elsevier Academic Press, UK.
- Mann I. 1962. *Animal By-products: Processing and Utilization*. FAO, Rome. Ockerman HW and Hansen CL. 1999. *Animal By-product Processing and Utilization*. CRC Press.

I. Course Title : In-Plant Training

II. Course Code : LPT 608

III. Credit Hours : 0+2

IV. Why this course?

Development of Entrepreneurial Skill and Human Resources for Meat and Milk Industry

V. Aim of the Course

To impart industrial exposure and develop entrepreneurial skill among postgraduate students.

VI. Practical (*34 sessions/ Hours equivalent to 34 credit hours of practical*)

LPT students shall undergo in-plant training in any one of the specialized area of

Livestock Products Technology in an institute/ industry – private or public sector. After completion of the training, the student will submit a training report. The evaluation will be based on attendance, report submission and viva-voce examination.

VII. Teaching methods

- Deputation to slaughterhouse/ meat/ milk processing plants
- Use of Audio-visual Capsules.

VIII. Learning Outcome

Students after undergoing training will have a good understanding of the functioning of the industry and capable of starting their own enterprises.

IX. Suggested Reading

- Interaction with Industry Persons.
- *Selected articles from Journals.*

I. Course Title : Egg and Egg Products Technology

II. Course Code : LPT 609

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for Egg Processing Industry/ Plants

V. Aim of the Course

To impart knowledge about the status of egg production, composition, nutritive value, preservation, grading, processing packaging and marketing of eggs and egg products.

VI. Theory

Unit I (9 Lectures)

Status of egg production and processing in India - Structure, composition, nutritive value and functional properties of eggs - Grading, preservation, packaging and marketing of shell eggs - Quality evaluation of shell eggs and factors influencing egg quality - Defects and Spoilage of eggs.

Unit II (8 Lectures)

Layout and design of egg processing Unit - Principles and procedures involved in pasteurization, chilling, freezing, desugarization and drying of egg products - Quality standards of egg products - Packaging of egg products - Designer egg products.

VII. Practical (17 Classes)

Evaluation of physical, chemical, functional and microbial quality of egg and egg products - Preservation of eggs - Preparation of value-added egg products - Visit egg-processing plant.

VIII. Teaching methods

- Classroom teaching, practical demonstration in Divisional laboratory.
- Visit egg processing plant.

IX. Learning Outcome

Gaining knowledge on composition, nutritive value, preservation and marketing of eggs. Quality maintenance and development of designer egg products.

X. Suggested Reading

- Romanoff AL and Romanoff AJ. 1949. *Avian Egg*. John Wiley and Sons.
- Stadelman WL and Cotterill OJ. 2002. *Egg Science and Technology*, 4th ed. CBS.
- *Selected articles from Journals.*

I. Course Title : Market Milk Processing and Dairy Plant Practices

II. Course Code : LPT 610

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Milk Processing Industry and Dairy Plants.

V. Aim of the course

To impart knowledge about procurement of milk, assessment of milk quality, legislation for quality control, milk processing techniques, the layout of milk processing and dairy effluent plants and preparation of special milk.

VI. Theory

Unit I (5 Lectures)

Organization of procurement and pricing plans of raw milk - Operation of automatic milk collection stations - Reception of milk at Raw Milk Reception Dock (RMRD) - Assessing raw milk quality - Sanitary handling of milk - Milk standards and legislations.

Unit II (6 Lectures)

Unit operations in milk processing plants - Clarification – Bactofugation - Different chilling methods - Standardization - Homogenization (theories, methods and effects) - Heat treatments (thermization, boiling, pasteurization, sterilization (UHT and In-container) - Separation technologies (Microfiltration, Ultrafiltration, reverse osmosis, diafiltration, nanofiltration etc).

Unit III (2 Lectures)

Distribution methods for liquid milk - Consumer pricing - Traceability - Handling of unsold and returned milk- - Adulteration of milk and detection - Residues in milk and preventive steps

Unit IV (4 Lectures)

Fortified, special and functional market milk - A1 and A2 milk Design and layout of dairy plants of different capacities - Dairy by-products - Treatment of Dairy Effluents.

VII. Practical (17 Classes)

Platform tests - Principles of rapid milk analyzers including milko-tester and operation of automatic milk collection stations - Raw milk quality, somatic cell count, bacteriological count - Estimation of homogenization efficiency - Assessment of efficiency of pasteurization, sterilization and boiling- Detection of adulterants.

VIII. Teaching methods

- Classroom teaching and laboratory analysis.
- Visit milk processing plants.

IX. Learning Outcome

Acquaintance with the processing of market milk and other dairy plant practices.

X. Suggested Reading

- FAO. 2013. *Milk and Dairy Products in Human Nutrition*. FAO, Rome.
- Fuquay JW, Fox PF and McSweeney PLH. 2011. *Encyclopaedia of Dairy Sciences*, 2nd ed. Elsevier Academic Press, UK.
- Walstra P, Wouters JTM and Geurts, TJ. 2006. *Dairy Science and Technology*, 2nd ed., Taylor and Francis Group.

I. Course Title : Processing and Marketing of Wool

II. Course Code : LPT 611

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Wool Processing Industry

V. Aim of the Course

To impart knowledge about the growth and structure of wool and fibres and their use. Grading, processing, marketing and specifications of wool and speciality fibres.

VI. Theory

Unit I (10 Lectures)

Status and prospects of wool industry - Wool types and their uses - Growth and molecular structure of wool fibre - physical and chemical properties of wool - Grading of wool, Characteristics of speciality hair fibres and their uses- factors influencing the quality of wool and speciality hair fibres - principles and steps involved in the processing of wool and speciality hair fibres, Impurities in wool and their removal, Defects in wool.

Unit II (7 Lectures)

Physical, chemical and mechanical testing of wool - by-products of wool industry - Trade and Marketing of wool, specification and regulation for quality control - Characteristics of natural and synthetic fibres

VII. Practical (17 Classes)

Physical, chemical and mechanical testing of wool and speciality hair fibres - Characterization of wool - grading of wool - Identification of natural and synthetic fibres - Visit the wool processing industry and acquaintance with various steps in the processing of wool and speciality hair fibres.

VIII. Teaching methods

- Classroom teaching and laboratory analysis.
- Visit wool processing units.

IX. Learning Outcome

Gaining knowledge on the quality and processing of wool.

X. Suggested Reading

- Bergen WV. 1963. *Wool Hand Book*, Vols. I and II. Interscience.
- Houck MM. 2009. *Identification of Textile Fibres*. Woodhead Publishing Limited, Cambridge, England.

- Johnson NAG and Russell IM. 2009. *Advances in Wool Technology*. Woodhead Publishing Limited, Cambridge, England.

I. Course Title : Biotechnology of Foods of Animal Origin

II. Course Code : LPT 612

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for meat and milk processing Industry with understanding of the latest biological techniques

V. Aim of the Course

To impart knowledge about new biotechnological techniques and tools for improving livestock productivity, quality control and food value.

VI. Theory

Unit I (10 Lectures)

Role of Biotechnology in improving productivity and quality of Meat, Milk and their products - Application of biotechnological tools in food preservation and packaging - Transgenic meat animal production - techniques - Genes influencing meat quality traits – Production of meat and milk with the desired composition - Application of enzymes in dairy and meat industry - Genetically modified enzymes - Biotechnologically produced food flavours and colours for animal products.

Unit II (7 Lectures)

Starter cultures in Meat and milk - Pre and probiotics, and their supplementation in animal origin foods - Biopreservation- Bacteriocin - Fermentation technology - Upstream and Downstream processing - Biosensors - Antimicrobial Peptides - Meat Species Identification- Molecular tools.

VII. Practical (17 Classes)

Introduction of basic biotechnological techniques such as western blotting, enzyme isolation and identification, DNA extraction, amplification, different types of PCR, Acquaintance with RT-PCR, Multiplex PCR, gene identification and characterization - Biotechnological techniques for meat species identification and meat quality - Electrophoresis, Chromatography for fatty acids- Operation of Fermenters.

VIII. Teaching methods

- Classroom teaching.
- Use of Audio-visual capsules.

IX. Learning Outcome

Gaining knowledge on utilization of biotechnology as a tool to improve production, shelf life and nutritive value of livestock products.

X. Suggested Reading

- Kerry J, Kerry J and Ledward D. 2005. *Meat Processing - Improving Quality*. Woodhead Publishing Ltd., UK.
- Kowale BN, Kulkarni VV and Keshava Rao V. 2008. *Methods in Meat Science*. Jaypee Brothers Medical Publishers, New Delhi.

- Toldra F. (Ed). 2008. *Meat Biotechnology*, Springer Science, New York
- Webb BH, Johnson AH and Alford JA. 2005 *Fundamentals of Dairy Chemistry*, 2nd ed. CBS Publishers and Distributors Pvt. Ltd.
- Selected articles from Journals.

I. Course Title : Fish and Fish Products Technology

II. Course Code : LPT 613

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Fish Processing Industry

V. Aim of the Course

To impart knowledge about fish resources, structure and composition of fish muscles, preservation and processing of fish, marketing of fish products, deterioration of quality and legislations for quality control.

VI. Theory

Unit I (9 Lectures)

Fishery resources, marine and freshwater fishes- Transportation and hygienic handling of fish - Fish Muscle structure, composition and nutritive value - Processing of fish - gutting, filleting, beheading, peeling, deveining, etc. - Preservation - chilling, freezing, etc. - Principles and procedure of canning, curing, smoking, dehydration - Surimi and other Fish based products.

Unit II (8 Lectures)

Quality control- identification of freshness of fish - Chemical and Microbial spoilage of fish, labelling and marketing of fish and fish products, utilization of fish processing waste. National and international regulations, standards, quality control and marketing of fish and fish products.

VII. Practical (17 Classes)

Visit fish processing plant - Grading of live fish for freshness - Filleting and other techniques for the processing of fish - Proximate Composition of Fish - Physico-chemical and Microbial evaluation of fish quality - Preparation of Value added fish products.

VIII. Teaching methods

- Classroom teaching.
- Practical demonstration in the laboratory.

IX. Learning Outcome

Acquiring knowledge on the structure of fish muscle, preservation, processing and quality control of fish and fish products.

X. Suggested Reading

- Pearson AM. 1994. *Quality Attributes and their Measurement in Meat, Poultry and Fish Products*. Springer, New York.
- Suzuki T. 1981. *Fish and Krill: Protein Processing Technology*. Applied Science Publ.
- *Selected articles from Journals.*

LPT 792	Seminar II	1+0
LPT 799	Research	75

*Core courses

Course Contents
Ph.D. in Livestock Products Technology

I. Course Title : Modern Abattoir Practices and Animal By-Products Technology

II. Course Code : LPT 701

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Slaughterhouses, Tanneries and other by-products industries.

V. Aim of the Course

To impart knowledge about advances in abattoir practices and animal by-products utilization.

VI. Theory

Unit I (5 Lectures)

Current scenario of slaughterhouses and processing plants in India - Establishment and operation of a modern abattoir - Basic machinery and tools of slaughterhouse - Automation/ Robotics in meat and by-product processing – Latest developments in the evaluation of carcass quality – Chilling and freezing of carcass - Maintenance of cold storages.

Unit II (8 Lectures)

Latest machinery and tools used in by-products processing plant - New technologies for utilization of animal by-products as food, feed, pharmaceuticals and other miscellaneous products - Leather chemistry and processing technology - Latest Techniques in handling, preservation, tannery procedure, manufacture and testing of leather - Value addition in leather processing - Developments in gelatin, glue and natural casings production - Characterization, processing, yield and quality control of rendered fat and meat cum bone meal.

Unit III (4 Lectures)

Organization, layout and operation of dry and wet rendering plants. Latest trends in the disposal of slaughterhouse effluents and control of environmental pollution. Designs and function of effluent treatment plants.

VII. Practical (17 Classes)

Plan and outlay of various components of a modern abattoir. Designs of ETP. Estimation of TS (suspended and dissolved) BOD and COD from abattoir effluents. Ante-mortem inspection of food animals, methods of stunning, stunning instruments. Slaughter and dressing of food animals. Electrical stimulation of carcasses. Post mortem inspection of carcasses of food animals - Visit municipal slaughterhouse, by-product processing plant, Effluent treatment plant and tanneries.

VIII. Teaching methods

- Classroom teaching, practical demonstration in laboratory/ slaughter unit.
- Visit municipal slaughterhouse and tanneries.
- Demonstration through charts, video films and models.

IX. Learning Outcome

Understanding of latest techniques employed in abattoir practices and slaughterhouse by-products utilization.

X. Suggested Reading

I. Course Title : Advances in Meat Production and Fresh Meat Technology

II. Course Code : LPT 702

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Meat Industry

V. Aim of the Course

To impart knowledge about the latest trends in meat production, the ultrastructure of muscle fibres, strategies for improving meat production and traceability of meat products.

VI. Theory

Unit I (7 Lectures)

Current status of meat production trends in India - Government policies - economics and viability – Traceability in the meat industry – Strategies for augmenting meat production - Salvaging male buffalo calf - Non-conventional meat resources.

Unit II (10 Lectures)

Pre- and Post-natal development of Muscle fibres - Genetic, nutritional and physiological aspects of muscle development - Ultrastructure of skeletal muscle - Modern tools for fibre typing of muscle - Chemical and biochemical aspects of rigor mortis and fresh meat quality – Odour, colour, water holding capacity - Texture profile - Artificial tenderization - Myofibrillar, sarcoplasmic and connective tissue proteins - Cytoskeletal proteins - Lipid profile - Meat in human nutrition - Meat and health issues.

VII. Practical (17 Classes)

Economics of establishing commercial meat animal production Unit - Extraction of sarcoplasmic and myofibrillar proteins and their fractionation - Estimation of Collagen content of Meat - Histochemistry of muscle tissues - Muscle fibre typing - Meat tenderization techniques.

VIII. Teaching methods

- Classroom teaching, practical demonstration in laboratory/ slaughter unit
- Visit municipal slaughterhouse and meat plants
- Use of Audio-visual capsules.

IX. Learning Outcome

Knowledge of latest trends in meat production and fresh meat technology.

X. Suggested Reading

I. Course Title : Developments in Processed Meat Technology

II. Course Code : LPT 703

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for Meat Processing Industry

V. Aim of the Course

To impart knowledge about the advances in the technology for processing of meat and development of value-added meat products.

VI. Theory

Unit I (5 Lectures)

Current trends in meat processing techniques - Functional properties of the tissue component in meat processing - Approaches for new product development - Latest equipment used for processing of meat products - Indigenous and heritage meat products - Curing and smoking - purpose, composition and methods of smoking - Liquid smoke - Processing of Ham, bacon, sausages, patties, meatloaves and tandoori chicken- Novel meat products - Non-thermal processing - Irradiation techniques - Canning/ retorting.

Unit II (8 Lectures)

Marination, massaging, tumbling and flaking techniques - Restructured/ reformed, intermediate moisture, fermented, enrobed, shelf-stable and dried meat products - Meat analogues and substitutes - Thermal processing of meat- Enzymatic and non-enzymatic browning reactions - Protein changes in processed meat products - Lipid changes - Protein and lipid interaction - Protein and carbohydrate interaction - Bioactive peptides.

Unit III (4 Lectures)

Functional and designer meat products - Role of omega-3 fatty acids in animal foods - Role of n-3 in PUFA enriched and CLA enriched meat and eggs - Packaging of meat and meat products - smart, active, intelligent packaging - Developments in sensory evaluation of meat products.

VII. Practical (17 Classes)

Evaluation of textural characteristics of meat products – Estimation of emulsifying capacity, emulsion stability- Estimation of Nitrosamines and PAHs - Preparation of emulsion-based, restructured, enrobed, cured and smoked, dried, fermented, intermediate moisture, ready to eat, and shelf-stable meat products-objective and subjective evaluation of meat products.

VIII. Teaching methods

- Classroom teaching, practical performance in Divisional Pilot Processing Plant.
- Visit Meat Processing Unit.
- Demonstration by videos.

IX. Learning Outcome

Acquaintance with the knowledge of the latest techniques used in meat processing and packaging and development of functional meat products.

X. Suggested Reading

I. Course Title	:	**Current Trends in Processing of Milk And Milk Products**
II. Course Code	:	**LPT 704**
III. Credit Hours	:	**1+1**

IV. Why this course?

Human resource development (Manager, Supervisor and other Technocrats) for the milk processing industry

V. Aim of the Course

To impart knowledge about current trends in the processing of milk and milk products and their effect on physico-chemical and nutritional quality of milk, the scope of mechanization in the production of indigenous milk products and advances in the utilization of dairy by-products.

VI. Theory

Unit I (8 Lectures)

Principles and practices of production of quality raw milk - Advances in methods of chilling of milk - Thermal processing of milk – Principles and methods - types of UHT processing plants - Advances in the packaging of milk and milk products - Rheology of milk products - Preservatives, antioxidants, antibiotics and different toxic residues in milk - Advances in bacteriological and physico-chemical analysis of milk and milk product – Different legal and voluntary standards for milk and milk products - A1 and A2 milk and their significance.

Unit II (4 Lectures)

Bacteriological, physical, chemical and nutritional effects of processing on milk - New concepts in milk processing – radiation, microwave processing and conduction heating of milk – By-products from the dairy industry and their utilization.

Unit III (5 Lectures)

Innovative mechanization in the manufacture of Indigenous dairy products - Advances in the utilization of dairy by-products - preservation of milk products - Application of immobilized enzymes in dairy products – Latest trends in cleaning and sanitation of dairy plant

VII. Practical (17 Classes)

Quality evaluation of milk and milk products - Preparation of novel and indigenous milk products and their economics of production, quality and sensory evaluation - Use of Starter cultures - Maintenance of cultures - Demonstration of membrane processing technology - Preparation of DPR for Dairy plants of different capacities.

VIII. Teaching methods

- Classroom teaching and laboratory analysis.
- Visit the milk processing plant.
- Use of Audio-visual Capsules.

IX. Learning Outcome

Gaining knowledge of advances in the processing of milk and milk products.

X. Suggested Reading

- Fuquay JW, Fox PF and McSweeney PLH. 2011. *Encyclopaedia of Dairy Sciences*, 2nd ed. Elsevier Academic Press, UK.
- Herrington BL. 2000. *Milk and Milk Processing*. Green World Publishers.
- Walstra P, Wouters JTM and Geurts, TJ. 2006. *Dairy Science and Technology*, 2nd ed. Taylor and Francis Group.
- *Selected articles from Journals.*

I. Course Title : Biotechnological Techniques and Quality Control of Livestock Products

II. Course Code : LPT 705

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor and other Technocrats) for production of high-quality livestock products and their quality assurance.

V. Aim of the Course

To impart knowledge about advances in the application of biotechnological techniques for improving the production and quality of livestock products. To familiarize with the agencies responsible for maintaining the quality of livestock products, quality standards and legislations

VI. Theory

Unit I (10 Lectures)

Biotechnological tools for microbial testing of food - Industrial cell culture – Bioreactor types and design – Upstream and downstream processing - Bacterial food additives and supplements - Characteristics and application of microbial starters in milk and meat fermentation - Biotechnology in production of designer livestock products - Bio-production of flavours and colour and their application in dairy products - Enzyme applications in dairy technology. - Utilization of nanotechnology in livestock products - Biotechnology for food safety - Cultured meat - Biotechnology in meat species identification.

Unit II (7 Lectures)

Importance of quality control for livestock products - Concept and application of HACCP - BIS, FSSAI and AGMARK standards - GMP and total quality management in the processing of livestock products - ISO-9000, ISO-14000 and ISO-22000 - Codex regulations of food product safety.

VII. Practical (17 Classes)

Demonstration of the latest biotechnological techniques including DNA and protein-based techniques. Operation of bioreactors - Gene identification and characterization. Visit Milk/ Meat processing plants for an understanding of HACCP and other quality management systems.

VIII. Teaching methods

- Laboratory analysis.
- Visit of ISO and HACCP certified food processing plant.
- Use of Audio-visual Capsules.

IX. Learning Outcome

Gaining knowledge on the application of biotechnology for augmenting production and quality assurance.

X. Suggested Reading

- Fuquay JW, Fox PF and McSweeney PLH. 2011. *Encyclopaedia of Dairy Sciences*, 2nd ed. Elsevier Academic Press, UK.
- Jensen WK, Devine C and Dikeman M. 2004. *Encyclopaedia of Meat Sciences*, Vol. I, II and III, 1st ed. Elsevier Academic Press, UK.
- Kerry J, Kerry J and Ledward D. 2005. *Meat Processing-Improving Quality*. Woodhead Publishing Ltd., UK.
- *Selected articles from Journals.*

I. Course Title : Ethnic and Organic Meat and Milk Products

II. Course Code : LPT 706

III. Credit Hours : 1+1

IV. Why this course?

Improving the production, processing and marketing of ethnic and organic meat and milk and their products.

V. Aim of the Course

To impart knowledge about the production of ethnic and organic meat and milk products.

VI. Theory

Unit I (9 Lectures)

Historical developments, present scenario and prospects of ethnic meat and milk products in various parts of India - Ethnic meat products - haleem, biryani, chettinad recipe, pork vindaloo, Kebab, Goan sausages, Kashmiri wazwan and meat products of North Eastern Region (NER) - Ethnic milk products – churpi, kalari, kunda, etc. - Constraints in promoting ethnic meat products - Approaches for development and commercialization of ethnic meat products - Fermented and non-fermented ethnic milk and meat foods – Impact of Globalization and role of WTO in promoting ethnic meat and milk products from India.

Unit II (5 Lectures)

Entrepreneurship Development for Ethnic meat and milk Products – Formulation, composition, quality, safety and shelf life of ethnic meat and milk products of India - Geographical indicators for recognition of ethnic meat and milk products.

Unit III (3 Lectures)

Organic meat and milk products - introduction, registration, certification, marketing and scope.

VII. Practical (17 Classes)

Preparation of ethnic meat products - haleem, biryani, chettinad recipe, pork vindaloo, Kebab, Goan sausages, Kashmiri wazwan and meat products of NER/ local region, Preparation of Ethnic milk products – churpi, kalari, Kunda, etc. - Composition, physico-chemical and microbial quality of ethnic milk and meat products - Packaging and marketing of ethnic milk and meat products.

VIII. Teaching methods

- Classroom teaching, practical demonstration in the laboratory
- Through the study of reports published by Govt. agencies time to time

IX. Learning Outcome

To acquaint with the knowledge for the production of ethnic and organic meat and milk products.

X. Suggested Reading

- Books on Indian Food.
- *Selected articles from Journals*

I. Course Title : Industrial and Entrepreneurial Training

II. Course Code : LPT 707

III. Credit Hours : 0+2

IV. Why this course?

Human Resource Development for catering to livestock products and related industry.

V. Aim of the Course

To prepare students to venture into various start-ups for self-reliant enterprises.

VI. Practical (34 Classes)

Preparation of basic feasibility report including raw material availability, marketing potential, economic viability and regulatory requirements for different livestock products related industry. Entrepreneurial training in an industrial establishment related to livestock products (17 sessions/ Hours equivalent to 17 credit hours of practical).Preparation of Detailed project reports (DPR) for the establishment of livestock products enterprises, viz. slaughterhouses, milk and meat processing plants, effluent treatment and byproducts utilization plants, etc..

VII. Teaching methods

- Visiting processing units
- Web surfing

VIII. Learning Outcome

Students envisioned having adequate knowledge and skills for setting up livestock products enterprises.

IX. Suggested Reading

- *Selected articles from Journals.* Through Interaction with Industry personnel.

I. Course Title : Current Trends in Disposal and Utilization of Waste From Meat and Dairy Industry

II. Course Code : LPT 708

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development (Manager, Supervisor, Meat inspector and other Technocrats) for better utilization of animal wastes and effluent treatments.

V. Aim of the Course

To impart knowledge about disposal and handling of wastes from the meat and dairy industry, Agencies involved and their norms for pollution control from meat and dairy industries.

VI. Theory

Unit I (8 Lectures)

Terminologies used in solid and liquid waste management systems - Public health significance - Classification, composition, functional elements and sources of solid waste from Meat and Dairy Processing plants and their management - Aerobic and anaerobic systems of liquid waste management.

Unit II (9 Lectures)

Waste handling, separation, storage, processing and utilization of Solid waste - Common solid waste disposal methods like rendering, composting, deep burial and incineration - Scope for zero waste management - Properties of dried sludge and its utilisation as manure - Economical aspects of waste treatment and disposal - Utilization of meat and dairy processing wastes - Application of nanotechnology in waste management - State and Central Pollution Control Board norms.

VII. Practical (17 Classes)

Visit Sewage and Effluent Treatment Plants - Estimation of pH, dissolved oxygen, TSS, BOD and COD - Estimation of micronutrients in treated effluents - Design and schematic layout of various solid and liquid waste treatment plants.

VIII. Teaching methods

- Classroom teaching
- Visit Sewage Treatment Plant

IX. Learning Outcome

Gaining knowledge on advances in the utilization of wastes from the meat and dairy industry.

X. Suggested Reading

- *Selected articles from Journals.* Through Interaction with personnel of Municipal Corporation and Pollution Control Board.

I. Course Title : Advances in Egg and Egg Products Technology

II. Course Code : LPT 709

III. Credit Hours : 1+1

IV. Why this course?

Human Resource Development for Egg Processing Industry and Egg Processing Plants

V. Aim of the Course

To impart knowledge about the status of egg production, composition, nutritive value, preservation, grading, processing packaging and marketing of eggs and egg products.

VI. Theory

Unit I (5 Lectures)

Advanced preservation techniques for egg and egg products - Maintenance of quality of eggs - Microbiology of egg - Spoilage of eggs and its prevention.

Unit II (8 Lectures)

Preparation of fast foods and role of egg in fast foods chains - Egg breaking and processing plants - lay-out and organization Preservation methods viz pasteurization, desugarization, freezing, dehydration, etc. – process and methods - Quality estimation of egg and egg products - Designer egg and egg products.

Unit III (4 Lectures)

Specifications, Standards and marketing of egg and egg products - Quality control of egg products.

VII. Practical (17 Classes)

Evaluation of physical, chemical and functional quality of egg and egg products - Detection of egg rots - Evaluation of microbiological quality of egg and egg products - Preservation techniques of eggs - Preparation of convenient, dehydrated and value-added egg products -Visit a modern egg processing plant

VIII. Teaching methods

- Classroom teaching, practical demonstration in the laboratory.
- Visit the egg processing plant.

IX. Learning Outcome

Gaining knowledge on composition, nutritive value, preservation and marketing of eggs. Quality maintenance and development of designer egg products.

X. Suggested Reading

- Romanoff AL and Romanoff AJ. 1949. *Avian Egg*. John Wiley and Sons.
- Stadelman WL and Cotterill OJ. 2002. *Egg Science and Technology*, 4th ed. CBS.
- *Selected articles from Journals.*

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 3

Animal Production Sciences
– Poultry Science

Preamble
(Poultry Science)

Poultry industry in India has made a remarkable growth ever since its inception and is presently emerging as a sunrise sector with a growth rate of 8.51 and 7.52 percent in egg and broiler production respectively (BAHS, 2019) as against 2.5 percent for agricultural crops. Within the poultry sector, broiler and layer segment constitutes about 65.3 and 34.7 percent with the monthly turnover of 400 million chicks and 8400 million eggs, respectively (ICRA, 2020). In poultry farming activities around one million farmers are engaged with 85 percent of them having less than 2 ha of land or the landless. With the annual poultry production of 851.8 million, poultry in India has emerged as the most dynamic and diversified subsector with third largest egg producing and fourth largest broiler producing country in the world with an estimated production of 103.3 billion eggs and 4.1 million metric tons (MMT) of broiler meat (BAHS, 2019).

Indian poultry industry has witnessed a radical and robust transformation from backyard poultry farming in villages to environmental controlled house coupled with high end automation. Industry is continuously updating with the evolvement and enrichment of newer technologies for achieving maximum efficiency in poultry at production and post-harvest levels. These developments demand the requirement of poultry veterinarians experts and managers for optimized production practices. In order to keep pace in the race of advancing poultry farming technology, a realistic update at academic level in poultry science is highly mandatory and demands of the hour. Hence, an academic curriculum of poultry science involving the industrial visits, automation in poultry farms, market research skills and winning bankable project reports for poultry startups can shape and equip poultry veterinarians so as to cater the needs of the poultry industry. The current designed syllabus provides the students regarding working knowledge in farms, decision making and troubleshooting analytical skills at different stages of poultry production.

Recently, waste disposal from poultry farms is emerged as an alarming issue for which knowledge on efficient wealth from waste technological intervention is required to pave a way for Go Green Poultry and the current syllabus has been designed to include the course on this emerging and much needed requirement to train veterinary post graduates to tackle this problem. Since waste recycling is very important to address environmental concerns and also to rduce use of energy sources used in disposal of waste. Hence, the course on waste recycling has also been designed so as to teach newer and innovative techniques of waste recycling for production of useful end products with concept of waste to wealth.

As changing environmental scenario is also posing problems in disease incidence and survivability of pathogens leading to constant threat of emerging and re-emerging diseases in poultry, the contents has been designed in such a way to impart knowledge on the sensitive and precise aspects of disease detection and also the segment has been incorporated to gain an knowledge on disease preventive measure including designing vaccination programme. Since biosecurity measures remains the cheap and effective means of disease preventive measures and it becomes essential to teach the basic concept of disease prevention so the poultry industry is helped with trained veterinarians with knowledge and skills in prevention of disease incidence.

The syllabus has also been designed in such a way so that the students can get practical exposure with farm/ lab/ field visits to the advanced environmentally controlled houses, feed manufacturing units, processing plants, advanced disease diagnostic labs on–filed poultry farms so that they can learn the practices being followed in these units so that they can think and plan to get more knowledge in the problems faced in the field conditions and can think of devising mechanisms to solve the problems.

Emphasis has been given to include the courses on commercial poultry nutrition. As nutrition in poultry production remains important segment and constitutes around 60-70% costs of production. Hence, emphasis has been laid to teach more basic aspects related to commercial aspects so that the cost of production can be minimized with knowledge in estimating the precise nutrient requirements in different poultry species, commercial uses of feed ingredients and use of non-conventional feed ingredients in poultry. Further practical emphasis has also been given to standardize the seasonal changes in feeding practices, use of advanced analytical techniques for estimating the feed nutrient contest and also to learn other feeding practices for better poultry production and profitability.

Since diversified poultry species like quails, duck, guinea fowl, geese, ostrich and emu which are also important poultry species and these contribute to the economy of our country. In some segment of the country the diversified poultry species remains important for poor farmers due to geographical conditions of those regions. So it becomes imperative to train the veterinarians on all aspects of these species for optimum production and profitability. As breeding, feeding, health requirement are different chickens and thus, the contents of newly added course have been focused on different aspects related breeding, feeding, housing and health care management.

Emphasis has also been given on new scientific techniques, value-addition, post-harvest management, methods of organic poultry production, formulation of bankable projects with minimal expenditure in poultry production and also on utilizing the by-products from poultry processing and waste Overall the course has been designed in such a way so as to focus to enhance skills for tackling emerging problems in this sector, increase employment and also focus has been given to cope up the post-covid-19 challenges. The newly designed syllabus will greatly enhance the capacity of the veterinarians in the areas of emerging nature and will meet new education policy requirement

Summary of changes in syllabus

	Old courses	New course **title**	Changes
M.V.Sc. courses			
1.	**PSC-603:** Commercial layer production 2+1 **PSC-604:** Commercial broiler production 2+1	**PSC-603**: Commercial layer and broiler management [2+1]	Two courses (PSC-603 and PSC-604) merged
2.	**PSC-605:** Breeder stock, flock health and hatchery management	**PSC-605**: Poultry health and biosecurity	Health aspect delinked from old PSC-605 and title modified
3.	**PSC-607**: Poultry products technology and marketing	**PSC-607**: Poultry products technology	Title changed
4.		PSC-**610**: Commercial poultry nutrition	New course added
5.		**PSC-611**: Poultry welfare and waste management	New course added
Ph.D. courses			
1.	**PSC-703**: Developments in poultry products technology	**PSC-703:** Developments in poultry processing and products technology	Title modified
2.	**PSC-704**: Emerging diseases of poultry and flock health	**PSC-704**: Emerging and re-emerging diseases of poultry and health management	Title modified
3.	**PSC-705**: Advanced poultry breeding methods	**PSC-705**: Applied poultry breeding	Title merged
4.		**PSC-707** Diversified poultry production	New course added

Course Title with Credit Load
M.V.Sc. in Poultry Science

Course Code	Course Title	Credit Hours
PSC 601*	Poultry Breeding and Genetics	2+1
PSC 602*	Poultry Nutrition and Feeding	2+1
PSC 603*	Commercial Layer and Broiler Management	2+1
PSC 604*	Breeder Stock and Hatchery Management	2+1
PSC 605	Poultry Health and Biosecurity	2+1
PSC 606	Management of Other Avian Species	3+1
PSC 607*	Poultry Products Technology	2+1
PSC 608	Poultry Economics, Project Formulation and Marketing	2+1
PSC 609*	Physiology of Poultry Production	1+1
PSC 610	Commercial Poultry Nutrition	1+1
PSC 611	Poultry Welfare and Waste Management	2+0
PSC 691	Seminar	1+0
PSC 699	Research	30

*Core courses

Course Contents
M.V.Sc. in Poultry Science

I. Course Title : Poultry Breeding and Genetics
II. Course Code : PSC 601
III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on different systems of breeding, selection methods, design and implementation of the breeding programme in developing egg-type and meat-type birds. Modern tools in poultry breeding.

V. Theory

Unit I (12 Lectures)

Genetic classification of Poultry – Origin and breed characteristics of poultry-Mendel's laws of inheritance related to poultry - Qualitative and Quantitative traits in Poultry breeding – Additive and Non-additive – Dominance, Incomplete dominance, Epistasis and complementary gene actions – Lethals and mutations in poultry – Sex-linked, Sex limited and Sex influenced traits – Economic traits – Partitioning of variance - Heritability – Quantitative inheritance – Phenotype, Genotype and environment interactions.

Unit II (10 Lectures)

Systems of Breeding – Systems of Mating – Selection methods – Breeding programme for developing egg-type, meat type and rural poultry strains - Developing hybrids - Breeding and management of other species of Poultry- Formation and Management of inbred pure lines, grandparent and parent stock - Industrial breeding.

Unit III (12 Lectures)

Artificial insemination in chicken –Autosexing–Random Sample Test - Use of molecular genetics in poultry breeding-Quantitative trait loci and marker-assisted selection- Conservation of poultry genetic resources.

VI. Practical (17 Classes)

Breeds of poultry – Estimation of qualitative and quantitative traits in poultry – Exercises on individual and family selection – Constructing multi-traits selection index and Osborne index-Estimating heritability – Breeding program for developing commercial hybrid layers, broilers and Japanese quail– Breeding programmes for rural poultry - Semen collection, evaluation, dilution and insemination in chicken and turkey – Breeding records –Use of computers to maintain breeding records and for selection– Estimation of effective population size, rate of inbreeding, response to selection and genetic and phenotypic responses.

VII. Teaching methods

- Classroom teaching with laboratory support and farm visits
- Use of computers for quantitative genetic analysis

VIII. Learning outcome

Gaining knowledge on poultry breeding and genetics

IX. Suggested Reading

- Crawford RD. 1990. *Poultry Breeding and Genetics*. Elsevier.
- Falconer DS. 1997. *Introduction to Quantitative Genetics*. Benjamin Cummings.
- Hutt FB. 1949. *Genetics of the Fowl*. McGraw-Hill
- Muir WM and Aggrey SE. 2003. *Poultry Genetics, Breeding and Biotechnology*. CABI.
- Singh RP and Kumar J. 1994. *Biometrical Methods in Poultry Breeding*. Kalyani Publications

I. Course Title : Poultry Nutrition and Feeding

II. Course Code : PSC 602

III. Credit Hours : 2+1

IV. Aim of the course

Teaching about nutrients and their functions, nutrient requirements of poultry and factors influencing the same. Imparting knowledge of different types of feeds and feeding methods.

V. Theory

Unit I (8 Lectures)

Digestive system, digestion, metabolism and absorption of nutrients in poultry – Factors influencing the feed consumption in birds – Macro and micro-nutrients – Protein and amino acids - Nutrient requirements for various species of poultry – Factors influencing the nutrient requirements - Partitioning of energy - Calorie: protein ratio – Nutrient interrelationships.

Unit II (12 Lectures)

Feed ingredients composition - Feed storage techniques - Milling and quality control-Processing of feed – Types and forms of feeds and feeding methods - Commonly occurring antinutrients and toxicants in poultry feed ingredients – Mycotoxins and their prevention – Feeding chicks, growers, layers, broilers and breeders – Principles of computing feed – Balanced feeds - Least cost feed formulation and programming – Feeding in different seasons and stress conditions - Nutritional and metabolic disorders in poultry.

Unit III (8 Lectures)

Systems of feeding – restricted, forced, controlled and phase feeding -Use of Additives and Non-additives- enzymes, probiotics, prebiotics, antibiotics, herbs and other performance enhancers – Utilization of non-conventional feedstuff - Feeding of ducks, turkeys, Japanese quails and Guinea fowls.

Unit IV (6 Lectures)

Organic, functional, designer and SPF feed production - Production of feeds free from drug residue, pesticide residue and toxins – Regulations for Import and Export of feed and feed supplements.

VI. Practical (17 Classes)

Physical and sensory evaluation of feed ingredients- sampling techniques for ingredients and compounded feed-Estimation of proximate principles of feed and feed ingredients – Computing various poultry feed formulae based on commonly available feed ingredients – Computer applications in feed formulations - Estimation of Aflatoxin, Calcium, Phosphorus, Sand, Silica and Salt – Mash, pellet and crumble feed preparation – Feeding procedures. Visit to feed mills –Hands-on training in feed analytical lab.

VII. Teaching methods

- Classroom teaching with laboratory support and feed mill visits
- Use of computers in feed formulations

VIII. Learning outcome

Gaining knowledge on poultry nutrition and feeding

IX. Suggested Reading

- Bell DD and Weaver WD JR. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- ICAR. 2013. *Nutrient Requirements of Poultry*. ICAR Publication.
- Leeson S and Summers JD. 2001. *Scott's Nutrition of the Chicken*. University Books.
- Leeson S and Summers JD. 2008. *Commercial Poultry Nutrition*, 3rd ed. University Books.
- Singh RA and Panda B. 1992. *Poultry Nutrition*. Kalyani Publishers.

I. Course Title : Commercial Layer and Broiler Management

II. Course Code : PSC 603

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on different systems of rearing and management of commercial layer and broilers for maximum egg and meat production

V. Theory

Unit I (10 Lectures)

Development of Poultry Industry in India and the World – Systems of layer and broiler farming – Location and layout of the farm – Systems, types and design of houses – Poultry farm equipment - Automation in poultry houses and its maintenance - Environmentally controlled houses and their management -Deep litter and cage system of management- Litter materials -All in All out and Multiple batch systems of rearing layers and broilers –Brooding management - Lighting programme for egg-type and meat-type birds- Water quality standards, watering and water sanitation - Biosecurity and health management – Production indices for broilers and layers – Integration in broiler and layer production.

Unit II (12 Lectures)

Cages and modified cages for egg-type birds – Feeding management in layers - Medication and vaccination schedules and procedure for layers –Brooder, grower, pre-layer, layer and cockerel management – Management of layers during peak egg production and maintaining the persistency in production – Strategies to prolong the egg production beyond 72 weeks of age - Factors causing uneven growth and low egg production - Monitoring egg production curve - Culling of unproductive birds – Record keeping –Management during different seasons – Induced moulting.

Unit III (10 Lectures)

Management of broilers during different seasons -Mash, crumble and pellet feeding of Broilers – Weekly growth rate, feed conversion and livability in broilers- Sex separate feeding – Feeding broilers for optimum growth rate and feed efficiency – Broiler farm records - Broiler farm routine, medication and vaccination schedule – Transport of broilers - Regulations and specifications for the production of export quality broilers.

VI. Practical (17 Classes)

Layer farm layout– Design of different chick, grower and layer houses, their specifications – Selection and culling of layers, debeaking, dubbing, deworming, delicing, vaccination and other farm routines and operations – Farm sanitation, disinfection and waste disposal – Visit commercial layer farms including environmental controlled houses – Record keeping – Calculating Hen day egg production, Hen housed egg production and other economic traits – Calculating the cost of production of eggs and meat and economics–Location and layout for a broiler farm – Broiler house design – Visit to commercial broiler farms including environmental controlled houses – Broiler brooding, Medication, vaccination, transportation and farm routines - Record keeping - Calculating the cost of production of broilers – Feeding of broilers at different ages – Working-out feed efficiency.

VII. Teaching methods

- Classroom teaching with farm visits
- Using different housing models
- Using Audio-visual capsules
- Demonstration of different management practices at farms

VIII. Learning outcome

Gaining knowledge of commercial broiler and layer production

IX. Suggested Reading

- Bell DD and Weaver WD, Jr. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- Narahari D. 1997. *Commercial Broiler Production*. Emkay Publishers.
- Rajini RA. 2012. *Simply Poultry Science*. Alpha Publishers.
- Sapcota D, Narahari D and Mahanta JD. 2017. *Avian Poultry Production*, 2nd rev ed. New India Publishing Agency.
- Scanes CG, Brant G and Ensminger ME. 2003. *Poultry Science*, 4th ed. Prentice-Hall.
- Sreenivasaiah PV. 2015. *Textbook of Poultry Science*. Write and Print Publications.

I. Course Title : Breeder Stock and Hatchery Management

II. Course Code : PSC 604

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge about care and management of breeders and hatchery operations.

V. Theory

Unit I (9 Lectures)

Different types of commercial breeder flocks –Special care of breeder chicks – Breeder male and female management – Feeding the breeder flocks: Separate sex feeding, feed restriction in broiler breeders. Management for improving fertility and hatchability, Management of parent and grandparent farms - Management of pure lines – Artificial Insemination - Care and management of Hatching eggs.

Unit II (4 Lectures)

Vaccination of layer and broiler parents - Nutrient supplementation – Seasonal management of breeders – Lighting management in breeder farms - Flock testing and culling.

Unit III (12 Lectures)

Natural and Artificial incubation –Stages of embryonic development -Incubation principles – Location of hatchery – Layout and design of hatchery - hatchery equipment– Hatchery management - Ventilation and temperature control –Pre-incubation storage, Fumigation and sanitation – Hatchery operations, routine and schedule – Egg candling -Packaging and transportation of hatching eggs and chicks, hatchery troubleshooting- Factors affecting fertility and hatchability - Biosecurity and hatchery waste disposal – Control of vertically transmissible and hatchery borne diseases – Special incubator management during hot summer – Hatch analysis.

Unit IV (9 Lectures)

SPF egg production - Import and export regulations – Maintaining Salmonella and Mycoplasma free breeding flock –Application of HACCP and Good Management Practices (GMP) in hatchery management for better chick quality.

VI. Practical (17 Classes)

Layout and blueprints for breeder farm and hatchery –Incubator management – Candling - Hatchery sanitation, fumigation procedures and hatchery hygiene – Pedigree hatching – Hatchery waste disposal and recycling – Calculating the cost of production of hatching eggs and day-old-chicks, management of bangers– Attending breeder farm routines and operation – Flock testing and culling of reactors – Analyzing hatchability results – Use of computers in hatchery operations - Economics of setting up of layer and broiler hatchery. Vaccinating day-old chicks and concept of in-ovo vaccination, visit to commercial breeder farm and hatchery.

VII. Teaching methods

- Classroom teaching with breeder farm and hatchery visits
- Using Audio-visual capsules

VIII. Learning outcome

Gaining knowledge of breeder flock and hatchery management

IX. Suggested Reading

- Bell DD and Weaver WD, Jr. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- Leeson S and Summers JD. 2009. *Broiler Breeder Production*. Context Products.
- Sreenivasaiah PV. 2006. *Scientific Poultry Production: A Unique Encyclopaedia*. International Book Distributing Co.
- Taylor LW. 2003. *Fertility and Hatchability of Chicken and Turkey*. John Wiley and Sons.

I. Course Title : Poultry Health and Biosecurity

II. Course Code : PSC 605

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge about common diseases and disorders of poultry, diagnosis, vaccination, prevention, control and treatment. Biosecurity measures in the control of common poultry diseases.

V. Theory

Unit I (7 Lectures)

Common bacterial diseases: *Salmonella*, *Pasteurella*, *E.coli,* Fowl typhoid, Mycoplasma, Infectious *Coryza*, *Gallibacterium*, *Clostridium*

Unit II (9 Lectures)

Common Viral diseases: Newcastle, Infectious bronchitis, Infectious laryngeotracheitis, Marek's, Fowl pox, Infectious Bursal disease, Egg drop syndrome-76, Avian Encephalomyelitis, Avian influenza, Duck viral hepatitis, Chicken Infectious Anaemia, etc.

Unit III (8 Lectures)

Common Fungal, parasitic and metabolic diseases: Aspergillosis, Mycotoxicosis, Fatty liver haemorrhagic syndrome(FLHS), Gout, Ascites, leg weakness - Coccidiosis, Ecto- and endo-parasitic infestation of poultry, etc.

Unit IV (5 Lectures)

Diagnosis, vaccination, prevention, treatment and control of various poultry diseases.

Unit V (5 Lectures)

Principles of biosecurity - Locational, structural and operational biosecurity in Poultry farms – Water sanitation and control of water-borne diseases – Quarantine of poultry - Farm sanitation and disinfection procedures.

VI. Practical (17 Classes)

Ante-mortem and Post-mortem examination of birds – Sample collection – Despatch of samples – Processing of samples and detection of pathogens/ etiological agents -Different sanitizers and disinfectants available and their uses. Care and contraindication of using different products. Personal hygiene and isolation – Different vaccines and routes of administration – Methods of medication – Water quality analysis, Field visit to poultry diagnostic lab.

VII. Teaching methods

- Classroom teaching with laboratory diagnosis
- Post-mortem examination
- Using Audio-visual capsules

VIII. Learning outcome

Gaining knowledge on poultry health and bio-security

IX. Suggested Reading

- Gordon RF and Jordan FTW. 1982. *Poultry Diseases*. ELBS
- Pattison M, McMullin P, Bradbury JM and Alexander D. 2008. *Poultry Diseases*, 6th ed. Elsevier.

- Saif YM. 2008. *Diseases of Poultry*. Blackwell Publishing House.

I. Course Title : Management of Other Avian Species

II. Course Code : PSC 606

III. Credit Hours : 3+1

IV. Aim of the course

Care and management of different breeds, varieties of poultry other than chicken, methods of rearing and common diseases affecting them and their control measures.

V. Theory

Unit I (15 Lectures)

Breeds and varieties of Turkey, Duck, Goose, Guinea fowl, Japanese quail, Emu and Ostrich – Incubation periods and incubation procedure for different species – Production standards - Housing, cage and equipment for other avian species under different systems of rearing.

Unit II (15 Lectures)

Management and rearing of Turkey, duck, goose, Guinea fowl, Japanese quail, emu and ostrich- Feeding standards and feeding, watering and rearing systems and procedure for different species of poultry - Breeding programmes for egg and meat production in different species.

Unit III (10 Lectures)

Different types of pet birds - Management and rearing of pet birds of regional importance (Pigeon, budgerigar, parakeets, love birds, macaws, doves, parrots, etc.) – Housing for pet birds, their habitat, feeding and breeding under captivity.

Unit IV (8 Lectures)

Common diseases affecting other avian species and their control – Regulations for import and export of different species of poultry – Prevention of exotic diseases through the import of live birds.

Unit V (3 Lectures)

Concept and definition of organic poultry – status, certification and guidelines for organic poultry production – Government policies on organic poultry farming.

VI. Practical (17 Classes)

Layout and design of housing and cages for other species of poultry. Visit commercial Japanese quail, turkey and duck farms. Incubation and care of hatching eggs and young ones – Rearing practices followed by duck, quails and turkey farmers under field conditions - Sexing of pet birds – Preparing project reports for different species and calculating the cost of production – Feeding pet birds and their chicks.

VII. Teaching methods

- Classroom teaching with farm visits
- Visit pet bird farms
- Using Audio-visual capsules

VIII. Learning outcome

Gaining knowledge on rearing different poultry species other than chicken

IX. Suggested Reading

I. Course Title : Poultry Products Technology

II. Course Code : PSC 607

III. Credit Hours : 2+1

IV. Why this course?

V. Aim of the course

Composition and nutritive value of eggs and chicken meat, grading and preservation methods of eggs and meat, functional and value-added poultry products.

VI. Theory

Unit I (15 Lectures)

Physical and chemical composition and nutritive value of eggs and meat – Grading of eggs and meat by different standards - Egg quality deterioration - Factors affecting egg quality – Handling, processing, packaging materials, packaging, transport and marketing of eggs.

Unit II (8 Lectures)

Quality control of poultry meat – Preservation of egg and meat-Functional and value-added egg and meat products – Further processing of eggs and meat – Various egg and meat fast foods.

Unit III (11 Lectures)

Sanitary and phytosanitary measures to ensure food safety – Pre and Post oviposition value addition to the eggs and Post-processing value addition to the meat for export–Microbial safety of poultry products – Import and export of poultry products – Further processing of poultry for export – Implementation of GMP and HACCP procedures for food safety – Codex regulations for poultry products safety – Traceability and branding of poultry products.

VII. Practical (17 Classes)

Measuring internal and external egg qualities – Measurement of meat quality - Preservation of table eggs, grading of eggs – Processing of chicken – Further processing of poultry – Preservation of poultry meat – Preparation of various eggs and poultry meat products and fast foods – Preservation, packaging and transport – Quality control of value-added poultry products – Measures of microbial safety of poultry products for export, visit to poultry processing plant.

VIII. Teaching methods

- Classroom teaching with laboratory analysis
- Visit egg and meat processing plants
- Using Audio-visual capsules

IX. Learning outcome

Gaining knowledge of poultry products technology

X. Suggested Reading

- Biswas A and Kondaiah N. 2014. *Meat Science and Technology*. Jaya Publishing House.
- Mead G. 2004. *Poultry Meat Processing and Quality*. Elsevier

- Stadelman WJ and Cotterill OJ. 1995. *Egg Science and Technology*, 4th ed. CRC Press.

I. Course Title : Poultry Economics, Project Formulation and Marketing

II. Course Code : PSC 608

III. Credit Hours : 2+1

IV. Aim of the course

To study about measures of performance efficiency in poultry farms and its allied sector, components of project reports and preparation of viable projects related to poultry Industry.

V. Theory

Unit I (10 Lectures)

Glossary of terms used in poultry economics and projects – Measures of performance efficiency in the broiler, layer, breeder and other poultry species, hatcheries and other poultry-related operations – Production standards and goals for layer, broiler and breeders.

Unit II (12 Lectures)

Planning poultry enterprise – Minimum viable units - Bank norms for poultry projects – Poultry insurance– Methods to improve the production efficiency and reduce the production cost - Components of project reports and preparing projects and return on investment.

Unit III (12 Lectures)

Integration in Poultry production and marketing – Marketing channels for eggs and meat - Cost of production of the egg, broiler, hatching egg, day-old chick and compounded feed –New regulations on cage rearing of layers. Traceability and branding of poultry products. Export norms for poultry products.

VI. Practical (17 Classes)

Preparing different poultry projects for bank finance – Calculating the cost of production of various products under various systems-case study – Preparation of Balance sheet, break-even points, Cost: Benefit ratio and other farm economic indices- Preparation of feasibility and viability reports.

VII. Teaching methods

- Classroom teaching with calculations
- Using Audio-visual capsules

IX. Learning outcome

Gaining knowledge of poultry marketing and project preparations.

X. Suggested Reading

- Bell DD and Weaver WD, Jr. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- Narahari D and Asha Rajini R. 2005. *Poultry Economics and Projects*. Pixie Publication India (P) Ltd.

I. Course Title : Physiology of Poultry Production

II. Course Code : PSC 609

III. Credit Hours : 1+1

IV. Why this course?

V. Aim of the course

To study the basic principles of physiology of poultry production in relation to egg production, incubation, stress and role of environment.

VI. Theory

Unit I (7 Lectures)

Skeletal system of poultry – Comb pattern and plumage - Physiology of poultry digestive system- Digestion, metabolism and absorption of feed and water – Role of enzymes – Poultry circulatory system – Respiratory system – Physiology of growth.

Unit II (7 Lectures)

Poultry nervous system and its function – Excretory system – Male and female reproductive system - Semen production-semen characteristics- Semen extenders – Egg formation- Egg laying pattern-photo periodic responses – Role of endocrine glands and their functions - Neuroendocrine control of egg production - Ovulation and Oviposition – Clutch and Pause.

Unit III (3 Lectures)

Thermoregulatory mechanism – Stress due to adverse environmental factors – Acid-base balance

VII. Practical (17 Classes)

Demonstration of various systems of birds – the structure of feather - Identification of endocrine glands and demonstration of hormones estimation in poultry production and reproduction - Haematology of poultry species - SGOT, SGPT, free fatty acids - Morphology of Poultry spermatozoa. Demonstration of artificial insemination in poultry.

VIII. Teaching methods

- Classroom teaching with laboratory techniques
- Using Audio-visual capsules

IX. Learning outcome

Gaining knowledge on the physiology of poultry production

X. Suggested Reading

- Etches RJ. 1995. *Reproduction in Poultry*. CAB International.
- Scanes CG. 2014. *Sturkie's Avian Physiology*. Elsevier.

I. Course Title : Commercial Poultry Nutrition

II. Course Code : PSC 610

III. Credit Hours : 1+1

V. Aim of the course

To impart knowledge on advanced poultry nutrition with respect to commercial egg and meat production

VI. Theory

Unit I (7 Lectures)

Breed specific nutrient requirements. Factors influencing the digestibility of nutrients – Reasons to assist the birds for digestion – Gut health management.

Unit II (4 Lectures)

Commercial use of feed ingredients by the industry – their drawbacks - Use of different feed additives and supplements: Enzymes, prebiotics, probiotics, postbiotics, phytobiotics, nucleotides, acidifiers, emulsifiers, and essential oils, etc. – Trace minerals: organic, inorganic and nanoparticles – Pre-digested proteins.

Unit III (6 Lectures)

Unconventional feed ingredients: Merits and demerits – Measures to counteract the demerits – Responsible use of them for reducing the cost of production – Least cost feed formulation – Phase feeding for layers and broilers – Juvenile nutrition.

VII. Practical (17 Classes)

Analytical methods for quick estimation of proximate principles and other nutrients – Use of latest technologies like NIR – Force-feeding, Challenge feeding – Factors preventing the birds from optimum feeding: Particle size, feed milling technologies, etc.– Seasonal variations in feeding practices, in-ovo feeding, visit to commercial poultry nutrition lab and feed mill.

VIII. Teaching methods/ activities

- Classroom teaching with laboratory support and feed mill visits
- Use of computers in feed formulations

IX. Learning outcome

Gaining knowledge on advances in poultry nutrition

X. Suggested Reading

- ICAR. 2013. *Nutrient Requirements of Poultry*. ICAR Publication.
- Leeson S and Summers JD. 2001. *Scott's Nutrition of the Chicken*. University Books.
- Leeson S and Summers JD. 2008. *Commercial Poultry Nutrition*, 3rd ed. University Books.
- Singh RA and Panda B. 1992. *Poultry Nutrition*. Kalyani Publishers.

I. Course Title : Poultry Welfare and Waste Management

II. Course Code : PSC 611

III. Credit Hours : 2+0

IV. Aim of the course

To provide knowledge on the concept of poultry welfare and safe disposal of wastes generated from poultry farms

V. Theory

Unit I (14 Lectures)

Concept of poultry welfare – Different freedoms to the birds – Present housing systems with relation to the welfare – Welfare and productivity – Feed restriction – Economics - Welfare cages – Welfare in relation to country's requirement. Precautions and requirements before, during and after transport of birds from one place and another, thermal imaging, assessment of welfare in poultry

Unit II (20 Lectures)

Waste generated from poultry farms and hatcheries – Male chicks disposal - Hazards of waste for humans and environment – Spread of diseases – Fly problems – Leaching of toxic substances in groundwater – Emission of gases – Dust and smell problem – Disposal of carcasses – Means to mitigate the hazardous effects of wastes – Composting of manure and dead birds - Generation of biogas, electricity, rendering plant products for feeding other species – Wastewater recycling – Usage of slurry – Preparation of bio-fuel pellets, methods of recycling poultry feathers.

VI. Teaching methods

- Classroom teaching
- Visit various waste disposal units

VII. Learning outcome

Gaining knowledge on the welfare of poultry and methods for safe disposal of poultry wastes

VIII. Suggested Reading

- Collins E (Ed.). 1999. *Poultry Waste Management Handbook*. NARES Series 132. Natural Resources.
- DAHD. 2015. *Poultry Farm Manual*. Department of Animal Husbandry, Dairy and Fisheries, GOI.

PSC 799	Research	75

*Core courses

Course Contents
Ph.D. in Poultry Science

I. Course Title : Applied Poultry Nutrition

II. Course Code : PSC 701

III. Credit Hours : 2+1

IV. Aim of the course

Teaching about nutrients and their functions, nutrient requirements of poultry and factors influencing the same. Different methods and forms of feeds and feeding of poultry.

V. Theory

Unit I (10 Lectures)

Developments in the nutrient requirement for egg and meat-type chicken - Concepts in various poultry feeding procedures and methods for optimal production - Factors influencing the nutrient requirements, feed intake and feed efficiency in poultry - Nutritional deficiencies - Protein and energy utilization – Digestibility of nutrients – Ileal digestibility of amino acids - Vitamins, minerals and their interactions in poultry rations.

Unit II (10 Lectures)

In ovo - juvenile nutrition for optimal growth rate and feed efficiency – Care in grower and pre-layer feeding - Nutrition and feeding of layers/ breeders during peak egg production - Nutritional requirements for higher egg production, broiler meat production, fertility and hatchability and other special purposes.

Unit III (10 Lectures)

Feeding of broilers for uniform growth and feed efficiency – Feeding to enhance egg quality and nutrients – Nutritive and non- nutritive feed additives in feed production – organic, functional and designer feed. Advances in feed milling technology – Specialty feed production to produce microbial safe foods, SPF eggs and organic foods.

Unit IV (4 Lectures)

HACCP implementation in feed quality control – Production of feed free from antibiotics, mycotoxins and pesticide residues.

VI. Practical

Computation of specific and functional feeds – Estimation of available carbohydrate/ Metabolizable energy, Aflatoxin, anti-nutritional factors and other toxins in the feed. Evaluation of various feeds for its quality – Field methods of feed quality control including feed microscopy – Estimation of carotenes, cholesterol and peroxides. Quality control of functional poultry feeds – Maintaining the feed quality from production to consumption.

VIII. Teaching methods

- Classroom teaching with laboratory support and feed mill visits
- Use of computers in feed formulations

IX. Learning outcome

Gaining advanced knowledge in poultry nutrition.

X. Suggested Reading

- Bell DD and Weaver WD, Jr. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- ICAR. 2013. *Nutrient Requirements of Poultry*. ICAR Publication.
- Leeson S and Summers JD. 2001. *Scott's Nutrition of the Chicken*. University Books.

- Singh RA and Panda B. 1992. *Poultry Production*. Kalyani Publishers.
- *Selected articles from journals.*

I. Course Title : Recent Trends in Commercial Poultry Production

II. Course Code : PSC 702

III. Credit Hours : 2+1

IV. Aim of the course

To impart knowledge on different systems of poultry rearing, care and management of commercial layers/ broilers for optimal egg and meat production.

V. Theory

Unit I (7 Lectures)

Global trends in poultry production - Advances in broiler production in India – concepts in egg production – Latest concepts in breeder management – advances in hatchery operations for higher hatchability and chick quality – Use of artificial intelligence in poultry production.

Unit II (8 Lectures)

Optimal microclimatic condition in poultry houses and cages for higher production – Management of poultry in environmentally controlled houses – Management of poultry under adverse climatic conditions – advances in the management of other species of poultry - Behavioural patterns of poultry in different growing systems.

Unit III (7 Lectures)

Advanced management techniques for egg and meat production - advances in lighting management, feeding management, litter management and manure management.

Unit IV (5 Lectures)

Factors influencing egg production in different species of poultry – Factors influencing growth rate and egg production - Automation in poultry production.

Unit V (7 Lectures)

Regulations for cage-free egg production and organic chicken production – Functional feeds for functional foods – Production of HACCP and GMP certified table eggs, meat, chicks, hatching eggs and other value-added products for export. Advances in Biosecurity, welfare and waste management - Role of integration in poultry production.

VI. Practical (17 Classes)

Performance study in the commercial layer, broiler, Japanese quail, duck, turkey and other species of poultry farms by Interpretation of the farm records - Management routines of different species of poultry - calculating the cost of production – Estimation of microclimatic conditions and comparing the productive traits– Modern poultry house and cage design for optimal efficiency and cost reduction.

VII. Teaching methods

- Classroom teaching with farm visits
- Use of Audio-visual capsules

VIII. Learning outcome

Gaining knowledge of advanced commercial poultry production practices

IX. Suggested Reading

- Bell DD and Weaver WD, Jr. 2002. *Commercial Chicken Meat and Egg Production*, 5th ed. Kluwer Academic Publishers.
- Sreenivasaiah PV. 2006. *Scientific Poultry Production: A Unique Encyclopaedia*. International Book Distributing Co.
- Online sources of equipment manufacturers
- *Selected articles from journals.*

I. Course Title : Developments in Poultry Processing and Products Technology

II. Course Code : PSC 703

III. Credit Hours : 2+1

IV. Aim of the course

Composition and nutritive value of eggs and chicken meat, grading, packaging and preservation methods of eggs and meat, functional and value-added poultry products, marketing of eggs and poultry meat.

V. Theory

Unit I (9 Lectures)

Global trends in egg and poultry processing -Indian scenario of poultry processing industry - Nutrients and Non-nutrient components in regular and value-added poultry products – various measures of egg and meat quality control – advances in value addition to poultry products.

Unit II (12 Lectures)

Concepts in poultry meat and egg preservation – Newer concepts in meat tenderization, canning, dehydration, curing, irradiation, etc. - Modified atmosphere packaging and other packaging techniques – Other processed products - Room temperature preservation of poultry fast foods by multi hurdle technology – Further processing to produce ready to eat products.

Unit III (5 Lectures)

Egg powder production - Egg desugarization - pasteurization – Functional properties of eggs – Industrial uses of eggs – Marketing trends in poultry meat and eggs.

Unit IV (8 Lectures)

Improving the product quality to meet Codex and European standards – Standards for the egg, meat and their products -Production of immunoglobulins, lecithin, lysozyme, sialic acid and other pharmaceutical products from eggs – Sanitary and phytosanitary measures for food safety.

VII. Practical (17 Classes)

Preparation of value-added products suitable for preservation at room temperature– Further processing – Barbecuing and Tandoori preparation – preparation of local specific poultry meat and egg products – Meatballs, meat patties, etc. - Quality estimation of egg, meat and their products - Preservation of meat and eggs - Measuring the microbial quality of poultry foods.

VIII. Teaching methods

- Classroom teaching with laboratory analysis
- Preparation of value-added meat and egg products
- Use of Audio-visual capsules

IX. Learning outcome

Gaining knowledge of advanced poultry products and processing technology.

X. Suggested Reading

- Biswas A and Kondaiah N. 2014. *Meat Science and Technology*. Jaya Publishing House.
- Mead G. 2004. *Poultry Meat Processing and Quality*. Elsevier.
- Mountney GJ and Parkhairst CR. 1995. *Poultry Products Technology*, 3rd ed. AVI Publ.

- Stadelman WJ and Cotteril OJ. 1995. *Egg Science and Technology*, 4th ed. CRC Press.
- *Selected articles from journals.*

I. Course Title : Emerging and Reemerging Diseases of Poultry and Health Management

II. Course Code : PSC 704

III. Credit Hours : 2+1

IV. Aim of the course

To study about common diseases and disorders of poultry, their diagnosis, vaccination, prevention and treatment, emphasis on control of emerging poultry diseases of zoonotic importance, disease diagnostic techniques.

V. Theory

Unit I (6 Lectures)

Concepts of disease prevention in poultry – Emerging and re-emerging avian diseases -Factors influencing immunosuppression/ immunity – Enhancing immunity in poultry.

Unit II (10 Lectures)

Water sanitation, hatchery sanitation procedures - Control of vertically transmissible diseases, hatchery borne diseases – non-infectious, metabolic and parasitic diseases in poultry and their control –Mycotoxins and their control.

Unit III (12 Lectures)

Stress alleviation – prevention and control of bacterial and viral diseases in poultry – Biosecurity measures – Control measures of problematic re-emerging diseases of poultry like Ranikhet, Avian influenza, Marek’s disease, Infectious bursal disease, Infectious Bronchitis, Infectious laryngotracheitis, etc.

Unit IV (6 Lectures)

Flock management for Specific pathogen-free egg production – Maintaining the

HACCP standards in poultry farms – developments in the EXIM policies for flock health – Concept of compartmentalization and zoning as per terrestrial code., geographical information system in disease control.

VI. Practical (17 Classes)

Studying the Immune status of birds – Egg inoculation techniques in laboratory diagnosis – differential diagnosis of various poultry diseases by post-mortem, and laboratory techniques – Molecular diagnosis of diseases - Antibiotic sensitivity test – Designing Vaccination schedule for different poultry species – Disinfection and sanitation - Ectoparasite control, medication procedures.

VII. Teaching methods

- Classroom teaching with laboratory techniques
- Post-mortem examination and sample collection
- Use of Audio-visual capsules

VIII. Learning outcome

Gaining knowledge of the emerging disease of poultry and health management.

IX. Suggested Reading

- Davison F, Kaspers B and Schat KA. 2008. *Avian Immunology*. Elsevier
- Pattison M, McMullin P, Bradbury JM and Alexander D. 2008. *Poultry Diseases*, 6th ed. Elsevier.
- Thyagarajan D. 2011. *Diseases of Poultry*. Satish Serial Publishing House.
- Vegad JL. 2015. *Poultry Diseases Farmers. A Guide for Farmers and Poultry Professionals*. International Book Distributing Co.
- *Selected articles from journals.*

I. Course Title : Applied Poultry Breeding

II. Course Code : PSC 705

III. Credit Hours : 1+1

IV. Aim of the course

To impart knowledge about different systems of breeding, selection methods and implementation of the breeding programme in developing egg and meat type hybrids. Modern tools in poultry breeding.

V. Theory

Unit I (7 Lectures)

Gene and genotypic frequency - Sex-linked, limited and influenced traits-Auto sexing- Qualitative and quantitative traits and its inheritance in poultry- methods of selection – family selection – selection for multi characteristics and construction of selection indices –Reciprocal recurrent selection – Recurrent selection, Marker assisted selection – Random bred control populations - Selection limit - Osborne's index – construction of selection index for multiple traits - Use of molecular genetics in poultry breeding.

Unit II (5 Lectures)

Exploitation of additive and non-additive gene action for commercial poultry production - Heterosis – Exploitation of hybrid vigour for commercial production of layers and broilers - Formation of synthetic lines – Development of strains in poultry - Comparative efficiency of different selection methods in poultry.

Unit III (5 Lectures)

Modern methods in commercial layer and broiler breeding, performance testing – Pure line-breeding – Inbreeding and hybridization - Diallele mating. Pedigree hatching. Genotype × Environment interaction.

VI. Practical (17 Classes)

Construction of selection index – Analysis of breeding data collected from breeding records – Estimation of qualitative and quantitative inheritance - Estimation of variance, heritability and standard error of heritability by different methods – Repeatability - analysis of heritability for different traits – Estimation of inbreeding coefficient – Artificial insemination in poultry.

VII. Teaching methods

- Classroom teaching with breeding farm visits
- Utilizing computer for quantitative genetic analysis
- Use of Audio-visual capsules

VIII. Learning outcome

Gaining knowledge on applied poultry breeding methods

IX. Suggested Reading

- Crawford RD. 1990. *Poultry Breeding and Genetics*. Elsevier.
- Muir WM and Aggrey SE. 2003. *Poultry Genetics, Breeding and Biotechnology*. CAB International.
- Singh R and Kumar J. 1994. *Biometrical Methods in Poultry Breeding*. Kalyani Publishers.
- *Selected articles from journals.*

I. Course Title : Poultry Economics, Marketing and Integration

II. Course Code : PSC 706

III. Credit Hours : 2+1

IV. Aim of the course

To study about measures of performance efficiency in poultry farms and its allied sectors, hatcheries and developing poultry projects.

V. Theory

Unit I (11 Lectures)

Present practices and future trends in the production of egg and meat – Present trends in consumption – Demand and supply - Seasonal variations in production and consumption. Marketing channels- procedures of marketing for eggs and meat - Market intelligence -Advertising and branding of poultry products.

Unit II (14 Lectures)

Various poultry enterprises – choice of production size of business – input and output analysis – calculating cost of various inputs – calculating cost of production – Break-even point analysis - Price determination – Role of NECC, BroMark and other marketing agencies - Least demand and supply indices of performance – Performance targets and achievements - marketing and business management - market managerial skills and human resource development - cost and financial management.

Unit III (9 Lectures)

Future trends in broiler and egg production – Factors influencing the profit margin in poultry enterprises – Role of integration in Poultry business – Different types of integration.

VI. Practical (17 Classes)

Study of marketing channels of egg and meat, calculating the cost of production of eggs, meat, day-old chick and feed – Calculating marketing costs - Preparing other related poultry projects. Use of social media in popularizing poultry and poultry products – Study of successful business models in the poultry sector.

VII. Teaching methods

- Classroom teaching and interaction with the poultry industry
- Use of Audio-visual capsules

VIII. Learning outcome

Gaining knowledge of market intelligence and marketing techniques

IX. Suggested Reading

- Narahari D and Asha Rajini R. 2005. *Poultry Economics and Projects*. PIXIE Publications India (P) Ltd.
- Vashisht K. 2006. *Practical Approach to Marketing Management*. Atlantic.
- Online sources of NABARD website4. *Selected articles from journals*.

I. Course Title : Diversified Poultry Production

II. Course Code : PSC 707

III. Credit Hours : 2+1

IV. Aim of the course

To provide knowledge on care and management of different breeds, varieties of poultry other than chicken, methods of rearing and common diseases affecting them and their control measures.

V. Theory

Unit I (9 Lectures)

Commercial hybrid strains of ducks for egg and meat production – Feeding and management – Housing – Specific diseases of ducks, prevention and their control – Slaughter and processing of ducks – Economics of production of ducks, indigenous duck production system including polythene duck pond.

Unit II (8 Lectures)

Varieties of Japanese quail for meat and egg production – Cage and deep litter system of rearing of quails – Feeding and management – Housing – Emerging diseases affecting Japanese quail – Nutritive value of Japanese quail meat and egg - Economics of production of Japanese quail.

Unit III (9 Lectures)

Varieties/ breeds of Turkey, Guinea fowl, Geese, Emu and Ostriches – System of rearing – Feeding and management – Housing – Emerging diseases and their prevention – Nutritive value of Turkey, Geese and Guinea fowl – By-products of Geese, Emu and Ostriches.

Unit IV (8 Lectures)

Scope and constraints in the marketing of diversified poultry products – Rearing and management of common pet birds and other birds of regional importance – Common diseases affecting pet birds and their prevention and treatment - Economics of production of different pet birds.

Learning outcome

Gaining advanced knowledge of diversified poultry production

VI. Practical (17 Classes)

Layout and design of housing for other species of poultry. Visit commercial Japanese quail, turkey and duck farms. Incubation and care of hatching eggs and young ones – Rearing practices followed for duck, quails and turkey farmers under field conditions – Designing of aviaries for pet birds - Different types of feed prepared for pet birds – Vaccination and medication for diversified poultry species - Preparing project reports for different species and calculating the cost of production.

VII. Teaching methods

- Classroom teaching and visit to other avian species farms
- Use of Audio-visual capsules

VIII. Suggested Reading

Foreword

THE ICAR has been continuously striving to bring necessary reforms for quality assurance in agricultural education. The Council has appointed National Core Group and BSMA Committees for revision and restructuring of Post-graduate and Doctoral syllabi in consultation with all the stakeholders to meet the challenges and harness opportunities in various disciplines of agriculture and allied sciences. It has been observed that a paradigm shift is necessary in academic regulations to comply with various provisions of National Education Policy-2020. It is heartening to note that the respective Committees have taken due care by following flexible, multi-disciplinary and holistic approach while developing the syllabus and academic regulations. The students are given opportunities to select the courses to support their planned research activities, to register for online courses and to pursue internship for development of entrepreneurship during Masters' programme. Further, the Teaching Assistantship has been introduced to provide experience to the Ph.D. scholars on teaching, evaluation and other related academic matters. This is an important part of doctoral training all over the world and it is expected to address the shortage of faculty in many institutions/universities. By intensive discussion with the subject experts and based on the feedback from the faculty and students, the syllabus of Masters' and Doctoral programmes in 79 disciplines was restructured and new courses were introduced. The syllabus has been revised suitably with the view to equip the students to gain knowledge, enhance their employability and skill sets to mould towards entrepreneurship and build themselves to prepare for global competitiveness. The opinions and suggestions invited from the concerned institutions, eminent scientists and other stakeholders were also reviewed by the Committees.

The Council sincerely thanks Dr Arvind Kumar, Chairman of the National Core Group and its members for the guidance to develop the syllabus in line with contemporary and projected national and global agricultural trends. The Council acknowledges the dedicated efforts and contribution of all the Chairpersons and members of 19 BSMA Committees for preparation of the syllabus. It gives me immense pleasure to express profuse thanks to the Agricultural Education Division for accomplishing this mammoth task under the guidance of Dr N.S. Rathore, former DDG and Dr R.C. Agrawal, DDG. I compliment Dr G. Venkateshwarlu, former ADG (EQR) for his sincere efforts and overall coordination of the meetings. Special thanks to DKMA for bringing out the entire syllabus in six volumes.

(T. Mohapatra)

Date: 13th August 2021
Place: New Delhi-110 001

Preface

THE curricula development is a part of the continued process and effort of the ICAR in this direction for dynamic improvement of national agricultural education system. In this resolve, the ICAR has constituted a National Core Group (NCG) for restructuring of Master's and Ph.D. curriculum, syllabi and academic regulations for the disciplines under agricultural sciences. On the recommendations of the NCG, 19 Broad Subject Matter Area (BSMA) Committees have been constituted by the ICAR for revising the syllabus. These Committees held discussions at length in the meetings and workshops organized across the country. The opinions and suggestions invited from institutions, eminent scientists and other stakeholders were also reviewed by the Committees. The respective BSMA Committees have examined the existing syllabus and analysed carefully in terms of content, relevance and pattern and then synthesized the new syllabus.

The revised curricula of 79 disciplines has been designed with a view to improve the existing syllabus and to make it more contextual and pertinent to cater the needs of students in terms of global competitiveness and employability. To mitigate the concerns related to agriculture education system in India and to ensure uniform system of education, several changes have been incorporated in common academic regulations in relation to credit load requirement and its distribution, system of examination, internship during Masters programme, provision to enrol for online courses and take the advantage of e-resources through e-learning and teaching assistantship for Ph.D. scholars. As per recommendations of the National Education Policy-2020, the courses have been categorized as Major and Minor/Optional courses. By following the spirit of Choice Based Credit System (CBCS), the students are given opportunity to select courses from any discipline/department enabling the multi-disciplinary approach.

We place on record our profound gratitude to Dr Trilochan Mohapatra, Director General, ICAR, New Delhi, for providing an opportunity to revise the syllabi for PG and Ph.D. programs in agriculture and allied sciences. The Committee is deeply indebted to Dr R.C. Agrawal, DDG (Agri. Edn), and to his predecessor Dr N.S. Rathore for their vision and continuous support. Our thanks are due to all Hon'ble Vice Chancellors of CAUs/SAUs/DUs for their unstinted support and to nominate the senior faculty from their universities/institutes to the workshops organized as a part of wider consultation process.

The revised syllabi encompass transformative changes by updating, augmenting, and revising course curricula and common academic regulations to achieve necessary quality and need-based agricultural education. Many existing courses were upgraded with addition and deletion as per the need of the present situation. The new courses have been incorporated based on their importance and need both at national and international level. We earnestly hope that this document will meet the needs and motivate different stakeholders.

G. Venkateshwarlu
Member-Secretary

Arvind Kumar
Chairman, National Core Group

Overview

A National Core Group has been constituted by ICAR for development of Academic Regulations for Masters and Ph.D. programmes, defining names and curricula of Masters' and Ph.D. disciplines for uniformity and revision of syllabi for courses of Masters' and Ph.D. degree disciplines. On the recommendations of the members of National Core Group, 19 Broad Subject Matter Area (BSMA) Committees have been constituted for revising the syllabus. These committees have conducted several meetings with the concerned experts and stakeholders and developed the syllabus for their respective subjects. While developing the syllabi, various provisions of National Education Policy-2020 have also been considered and complied to provide quality higher education and develop good, thoughtful, well-rounded, and creative individuals. Necessary provisions have been made in the curricula to enable an individual to study major and minor specialized areas of interest at a deep level, and also develop intellectual curiosity, scientific temper and creativity.

I express my gratefulness to Dr Arvind Kumar, Vice-Chancellor, Rani Lakshmi Bai Central Agricultural University, Jhansi and Chairman, National Core Group under whose guidance the syllabi for Master's and Doctoral programme is completed. His vast experience in agricultural education and research helped in finalising the syllabi. I wish to place on record the suggestions and directions shown by Dr N.S. Rathore, former Deputy Director General (Education) and Dr G. Venkateswarlu, ADG (EQR) and Member Secretary, National Core Group throughout the period without which the present target could not have been achieved. I am extremely thankful to 19 BSMA Committees for their stupendous job in restructuring and articulating curricula in the light of technological developments and employability prospects in agriculture and allied sciences. I also appreciate and acknowledge the efforts made by Dr S.K. Sankhyan, Principal Scientist (EQR), Dr S.K. Singh, Project Director (DKMA), Mr Punit Bhasin, Incharge, Production Unit (DKMA), Dr Kshitij Malhotra and Dr Sumit Saini, Research Associates to take up the work of editing, proof reading, finalizing and bringing out these six volumes of BSMA in this shape.

I also take this opportunity to express a deep sense of gratitude to Dr Trilochan Mohapatra, Secretary, DARE and Director General, ICAR for his guidance, cordial support and valuable input throughout the revision of the syllabus by BSMA, which helped in completing this task through various stages. The support and help extended by all Deputy Director Generals and the staff of Education Division is also greatly acknowledged.

During this comprehensive exercise of upgrading the course contents, the much-needed academic support, hospitality and participation rendered by Hon'ble Vice-Chancellors of CAUs/SAUs/DUs is greatly acknowledged. My deep sense of gratitude goes to Deans, Directors, Professors, Heads, faculty members and students at the universities who contributed by their effective participation and interaction.

R.C. Agrawal

Contents

Common Academic Regulations for PG and Ph.D. Programmes

1. Academic Year and Registration

- An academic year shall be normally from July to June of the following calendar year otherwise required under special situations. It shall be divided into two academic terms known as semesters. Dates of registration, commencement of instructions, semester end examination, end of semester and academic year, etc. The Academic Calendar shall be developed by the concerned University from time to time and notified accordingly by the Registrar in advance.
- An orientation programme shall be organized by the Director (Education)/ Dean PGS for the benefit of the newly admitted students immediately after commencement of the semester.
- On successful completion of a semester, the continuing students shall register for subsequent semester on the date specified in the Academic/ Semester Calendar or specifically notified separately. Every enrolled student shall be required to register at the beginning of each semester till the completion of his/ her degree programmes.

2. Credit requirements

2.1 Framework of the courses

The following nomenclature and Credit Hrs need to be followed while providing the

syllabus for all the disciplines:

		Masters' Programme	Doctoral Programme
(i)	**Course work**		
	Major courses	20	12
	Minor courses	08	06
	Supporting courses	06	05
	Common courses	05	–
	Seminar	01	02
(ii)	**Thesis Research**	30	75
	Total	70	100

Major courses: From the Discipline in which a student takes admission. Among the listed courses, the core courses compulsorily to be taken may be given *mark

Minor courses: From the subjects closely related to a student's major subject

Supporting courses: The subject not related to the major subject. It could be any subject considered relevant for student's research work (such as Statistical Methods, Design of Experiments, etc.) or necessary for building his/ her overallcompetence.

Common Courses: The following courses (one credit each) will be offered to all students undergoing Master's degree programme:

1. Library and Information Services
2. Technical Writing and Communications Skills
3. Intellectual Property and its management in Agriculture
4. Basic Concepts in Laboratory Techniques
5. Agricultural Research, Research Ethics and Rural Development Programmes

Some of these courses are already in the form of e-courses/ MOOCs. The students may be allowed to register these courses/ similar courses on these aspects, if available online on SWAYAM or any other platform. If a student has already completed any of these courses during UG, he/ she may be permitted to register for other related courses with the prior approval of the Head of Department (HoD)/ Board of Studies (BoS).

2.2 Supporting Courses

The following courses are being offered by various disciplines (The list is only indicative). Based on the requirement, any of the following courses may be opted under the supporting courses. The syllabi of these courses are available in the respective disciplines. If required, the contents may be modified to suit the individual discipline with approval of the concerned BoS:

Code	Course Title	Credit Hours
STAT 501	Mathematics for Applied Sciences	2+0
STAT 502	Statistical Methods for Applied Sciences	3+1

Course Code	Course Title	Credit Hours
STAT 511	Experimental Designs	2+1
STAT 512	Basic Sampling Techniques	2+1
STAT 521	Applied Regression Analysis	2+1
STAT 522	Data Analysis Using Statistical Packages	2+1
MCA 501	Computers Fundamentals and Programming	2+1
MCA 502	Computer Organization and Architecture	2+0
MCA 511	Introduction to Communication Technologies, Computer Networking and Internet	1+1
MCA 512	Information Technology in Agriculture	1+1
BIOCHEM 501	Basic Biochemistry	3+1
BIOCHEM 505	Techniques in Biochemistry	2+2

2.3 Syllabus of Common Courses for PG programmes

LIBRARY AND INFORMATION SERVICES (0+1)

Objective

To equip the library users with skills to trace information from libraries efficiently, to apprise them of information and knowledge resources, to carry out literature survey, to formulate information search strategies, and to use modern tools (Internet, OPAC, search engines, etc.) of information search.

Practical

Introduction to library and its services; Role of libraries in education, research and technology transfer; Classification systems and organization of library; Sources of information- Primary Sources, Secondary Sources and Tertiary Sources; Intricacies of abstracting and indexing services (Science Citation Index, Biological Abstracts, Chemical Abstracts, CABI Abstracts, etc.); Tracing information from reference sources; Literature survey; Citation techniques/ Preparation of bibliography; Use of CD-ROM Databases, Online Public Access Catalogue and other computerized library services; Use of Internet including search engines and its resources; e-resources access methods.

TECHNICAL WRITING AND COMMUNICATIONS SKILLS (0+1)

Objective

To equip the students/ scholars with skills to write dissertations, research papers, etc. To equip the students/ scholars with skills to communicate and articulate in English (verbal as well as writing).

Practical (Technical Writing)

- Various forms of scientific writings- theses, technical papers, reviews, manuals, etc.;
- Various parts of thesis and research communications (title page, authorship contents page, preface, introduction, review of literature, material and methods, experimental results and discussion);
- Writing of abstracts, summaries, précis, citations, etc.;

- Commonly used abbreviations in the theses and research communications;
- Illustrations, photographs and drawings with suitable captions; pagination, numbering of tables and illustrations;
- Writing of numbers and dates in scientific write-ups;
- Editing and proof-reading;
- Writing of a review article;
- Communication Skills - Grammar (Tenses, parts of speech, clauses, punctuation marks);
- Error analysis (Common errors), Concord, Collocation, Phonetic symbols and transcription;
- Accentual pattern: Weak forms in connected speech;
- Participation in group discussion;
- Facing an interview;
- Presentation of scientific papers.

INTELLECTUAL PROPERTY AND ITS MANAGEMENT IN AGRICULTURE (1+0)

Objective

The main objective of this course is to equip students and stakeholders with knowledge of Intellectual Property Rights (IPR) related protection systems, their significance and use of IPR as a tool for wealth and value creation in a knowledge-based economy.

Theory

Historical perspectives and need for the introduction of Intellectual Property Right regime; TRIPs and various provisions in TRIPS Agreement; Intellectual Property and Intellectual Property Rights (IPR), benefits of securing IPRs; Indian Legislations for the protection of various types of Intellectual Properties; Fundamentals of patents, copyrights, geographical indications, designs and layout, trade secrets and traditional knowledge, trademarks, protection of plant varieties and farmers' rights and biodiversity protection; Protectable subject matters, protection in biotechnology, protection of other biological materials, ownership and period of protection; National

Biodiversity protection initiatives; Convention on Biological Diversity; International Treaty on Plant Genetic Resources for Food and Agriculture; Licensing of technologies, Material transfer agreements, Research collaboration Agreement, License Agreement.

Suggested Readings

1. Erbisch FH and Maredia K.1998. *Intellectual Property Rights in Agricultural Biotechnology*. CABI.
2. Ganguli P. 2001. *Intellectual Property Rights: Unleashing Knowledge Economy*. McGraw-Hill.
3. *Intellectual Property Rights: Key to New Wealth Generation*. 2001. NRDC and Aesthetic Technologies.
4. Ministry of Agriculture, Government of India. 2004. *State of Indian Farmer*. Vol. V. Technology Generation and IPR Issues. Academic Foundation.
5. Rothschild M and Scott N. (Ed.). 2003. *Intellectual Property Rights in Animal Breeding and Genetics*. CABI.
6. Saha R. (Ed.). 2006. *Intellectual Property Rights in NAM and Other Developing Countries: A Compendium on Law and Policies*. Daya Publ. House.

BASIC CONCEPTS IN LABORATORY TECHNIQUES (0+1)

Objective

To acquaint the students about the basics of commonly used techniques in laboratory.

Practical

- Safety measures while in Lab;
- Handling of chemical substances;
- Use of burettes, pipettes, measuring cylinders, flasks, separatory funnel, condensers, micropipettes and vaccupets;
- Washing, drying and sterilization of glassware;
- Drying of solvents/ chemicals;
- Weighing and preparation of solutions of different strengths and their dilution;
- Handling techniques of solutions;
- Preparation of different agro-chemical doses in field and pot applications;
- Preparation of solutions of acids;
- Neutralisation of acid and bases;
- Preparation of buffers of different strengths and pH values;
- Use and handling of microscope, laminar flow, vacuum pumps, viscometer, thermometer, magnetic stirrer, micro-ovens, incubators, sandbath, waterbath, oilbath;
- Electric wiring and earthing;
- Preparation of media and methods of sterilization;
- Seed viability testing, testing of pollen viability;
- Tissue culture of crop plants;
- Description of flowering plants in botanical terms in relation to taxonomy.

Suggested Readings

1. Furr AK. 2000. *CRC Hand Book of Laboratory Safety*. CRC Press.

2. Gabb MH and Latchem WE. 1968. *A Handbook of Laboratory Solutions*. Chemical Publ. Co.

AGRICULTURAL RESEARCH, RESEARCH ETHICS AND RURAL DEVELOPMENT PROGRAMMES (1+0)

Objective

To enlighten the students about the organization and functioning of agricultural research systems at national and international levels, research ethics, and rural development programmes and policies of Government.

Theory

UNIT I History of agriculture in brief; Global agricultural research system: need, scope, opportunities; Role in promoting food security, reducing poverty and protecting the environment; National Agricultural Research Systems (NARS) and Regional Agricultural Research Institutions; Consultative Group on International Agricultural Research (CGIAR): International Agricultural Research Centres (IARC), partnership with NARS, role as a partner in the global agricultural research system, strengthening capacities at national and regional levels; International fellowships for scientific mobility.

UNIT II Research ethics: research integrity, research safety in laboratories, welfare of animals used in research, computer ethics, standards and problems in research ethics.

UNIT III Concept and connotations of rural development, rural development policies and strategies. Rural development programmes: Community Development Programme, Intensive Agricultural District Programme, Special group – Area Specific Programme, Integrated Rural Development Programme (IRDP) Panchayati Raj Institutions, Co-operatives, Voluntary Agencies/ Non-Governmental Organisations. Critical evaluation of rural development policies and programmes. Constraints in implementation of rural policies and programmes.

Suggested Readings

1. Bhalla GS and Singh G. 2001. *Indian Agriculture - Four Decades of Development*. Sage Publ.
2. Punia MS. *Manual on International Research and Research Ethics.* CCS Haryana Agricultural University, Hisar.
3. Rao BSV. 2007. *Rural Development Strategies and Role of Institutions - Issues, Innovations and Initiatives*. Mittal Publ.
4. Singh K. 1998. *Rural Development - Principles, Policies and Management*. Sage Publ.

2.4 Mandatory requirement of seminars

- It has been agreed to have mandatory seminars one in Masters (One Credit) and two in Doctoral programmes (two Credits).
- The students should be encouraged to make presentations on the latestdevelopments and literature in the area of research topic. This will provide training to the students on preparation for seminar, organizing the work, critical analysis of data and presentation skills.

3. Residential requirements

- The minimum and maximum duration of residential requirement for Masters'

Degree and Ph.D. Programmes shall be as follows:

P.G. Degree Programmes	Duration of Residential Requirement	
	Minimum	Maximum
Masters' Degree	2 Academic Years (4 Semesters)	5 Academic Years (10 Semesters)
Ph.D.*	3 Academic Years (6 Semesters)	7 Academic Years (14 Semesters)

*Student may be allowed to discontinue temporarily only after completion of course work

In case a student fails to complete the degree programme within the maximum duration of residential requirement, his/ her admission shall stand cancelled. The requirement shall be treated as satisfactory in the cases in which a student submits his/ her thesis any time during the 4^{th} and 6^{th} semester of his/ her residentship at the University for Masters' and Ph.D. programme, respectively.

4. Evaluation of course work and comprehensive examination

- For M.Sc., multiple levels of evaluation (First Test, Midterm and Final semester) is desirable. However, it has been felt that the comprehensive examination is redundant for M.Sc. students.
- For Ph.D., the approach should be research oriented rather than exam oriented. In order to provide the student adequate time to concentrate on the research work and complete the degree in stipulated time, the examination may have to be only semester final. However, the course teacher may be given freedom to evaluate in terms of assignment/ seminar/ first test.
- For Ph.D., the comprehensive examination (Pre-qualifying examination) is required. As the students are already tested in course examinations, the comprehensive examinationshould be based onoral examinationby an external expert and the evaluation should cover both the research problem and theoretical background to execute the project. This shall assess the aptitude of the student and suitability of the student for the given research topic. The successful completion of comprehensive examination is to obtain the "Satisfactory" remark by the external expert.

5. Advisory System

5.1 Advisory Committee

- There shall be an Advisory Committee for every student consisting of not fewer than three members in the case of a candidate for Masters' degree and four in the case of Ph.D. degree with the Advisor as Chairperson. The Advisory Committee should have representatives from the major and minor fields amongst the members of the Post-graduate faculty accredited for appropriate P.G. level research. However, in those departments where qualified staff exists but due to unavoidable reasons Post-graduate degree programmes are not existing, the staff having Post-graduate teaching experience of two years or more may be included in the Advisory Committee as member representing the minor.
- At any given time, a P.G. teacher shall not be a Chairperson, Advisory Committee (including Master's and Ph.D. programmes) for more than five students.

- The Advisor should convene a meeting of the Advisory Committee at least once in a Semester. The summary record should be communicated to the Head of Department, Dean of the College of concerned, Director (Education)/ Dean PGS and Registrar for information.

Advisor/ Co-guide/ Member, Advisory Committee from other collaborating University/ Institute/ Organization

- In order to promote quality Post-graduate research and training in cutting edge areas, the University may enter into Memorandum of Understanding (MOU) with other Universities/ Institutions for conducting research. While constituting an Advisory Committee of a student, if the Chairperson, Advisory Committee feels the requirement of involving of a faculty member/ scientist of such partnering university/ Institute/ Organization, he/ she may send a proposal to this effect to Director (Education)/ Dean PGS along with the proposal for consideration of Student's Advisory Committee (SAC).
- The proposed faculty member from the partnering institution can be allowed to act as Chairperson/ Co-guide/ Member, SAC, by mutual consent, primarily on the basis of intellectual input and time devoted for carrying out the research work at the particular institution. The faculty member/ scientist of partnering institutions in the SAC shall become a temporary faculty member of the University by following the procedure approved by the Academic Council.

Allotment of students to the retiring persons

Normally, retiring person may not be allotted M. Sc. Student if he/ she is left with less than 2 years of service and Ph.D. student if left with less than 3 years of service. However, in special circumstances, permission may be obtained from the Director (Education)/ Dean PGS, after due recommendation by the concerned Head of the Department.

Changes in the Advisory Committee:

(i) Change of the Chairperson or any member of the Advisory Committee is not ordinarily permissible. However, in exceptional cases, the change may be effected with due approval of the Director of Education/ Dean PGS.

(ii) Normally, staff members of the university on extra ordinary leave or on study leave or who leave the University service will cease to continue to serve as advisors of the Post-graduate students of the University. However, the Director (Education)/ Dean PGS may permit them to continue to serve as advisor subject to the following conditions:

   (a) The concerned staff member must be resident in India and if he/ she agrees to guide research and must be available for occasional consultations;

   (b) An application is made by the student concerned duly supported by the Advisory Committee;

   (c) In case of a Ph.D. student, he/ she must have completed his/ her comprehensive examinations and the research work must be well in progress and it is expected that the student will submit the thesis within a year;

   (d) The Head of the Department and the Dean of the College concerned agree to the proposal;

(e) The staff member, after leaving the University service is granted the status of honorary faculty's membership by the Vice-Chancellor on the recommendation of the Director (Education)/ Dean PGS for guiding as Chairperson or Member, Advisory Committee the thesis/ theses of the student(s) concerned only.

(iii) In case the Chairperson/ member of a Student's Advisory Committee retires, he/ she shall be allowed to continue provided that the student has completed his course work and minimum of 10 research credits and the retiring Chairperson/ member stays at the Headquarters of the College, till the thesis is submitted.

(iv) If the Chairperson/ member proceeds on deputation to another organization, he/ she may be permitted to guide the student provided his/ her new organization is at the Headquarters of the College and his/ her organization is willing for the same.

(v) The change shall be communicated to all concerned by the Head of Department.

6. Evaluation of research work

- It is highly desirablefor Ph.D. programme and this should be done annually as an essential part of research evaluation. The Student Advisory Committee shallreview the progress of research and scrutinize annual progress reports submitted by the student.
- Midterm evaluation of Ph.D. (to move from JRF to SRF) is a mandatory requirement for all the funding agencies. Hence, the second review of annual progress report need to be done after completion of two years. The successful completion enables the students to become eligible for SRF.

6.1 Prevention of plagiarism

- An institutional mechanism should be in place to check the plagiarism. The students must be made aware that manipulation of the data/ plagiarism is punishable with serious consequences.

7. Learning through online courses

- In line with the suggestion in new education policy and the initiatives taken by ICAR and MHRD in the form of e-courses, MOOCs, SWAYAM, etc. and also changes taking place globally in respect of learning through online resources it has been agreed to permit the students to enrol for online courses. It is expected that the provision of integrating available online courses with the traditional system of education would provide the students opportunities to improve their employability by imbibing the additional skills and competitive edge.

The Committee recommends the following points while integrating the online courses:

1. Board of Studies (BoS) of each Faculty shall identify available online courses and a student may select from the listed courses. The interested students may provide the details of the on-line courses to the BoS for its consideration.
2. A Postgraduate student may take up to a maximum of 20% credits in a semester through online learning resources.
3. The host institute offering the course does the evaluation and provide marks/ grades. The BoS shall develop the conversion formula for calculation of GPA and it may do appropriate checks on delivery methods and do additional evaluations, if needed.

8. Internship during Masters programme

Internship for Development of Entrepreneurship in Agriculture (IDEA)

Currently, a provision of 30 credits for dissertation work in M.Sc./ M.Tech/ M.F.Sc./ M.V.Sc. programmes helps practically only those students who aspire to pursue their career in academic/ research. There is hardly any opportunity/ provision under this system to enhance the entrepreneurship skills of those students who could start their own enterprise or have adequate skills to join the industry. Therefore, in order to overcome this gap, an optional internship/ in-plant training (called as IDEA) in lieu of thesis/ research work is recommended which will give the students an opportunity to have a real-time hands-on experience in the industry.

It is envisaged that the internship/ in-plant training would enhance the interactions between academic organizations and the relevant industry. It would not only enable the development of highly learned and skilled manpower to start their-own enterprises but also the industry would also be benefitted through this process. This pragmatic approach would definitely result in enhancedpartnerships between academia and industry.

The main objectives of the programme:

1. To promote the linkages between academia and industry
2. To establish newer University – Cooperative R&D together with industry for knowledge creation, research and commercialization
3. Collaboration between Universities and industries through pilot projects
4. To develop methods for knowledge transfer, innovation and networking potential
5. To enhance skill, career development and employability

Following criteria for IDEA will be taken into consideration:

- At any point of time there will not be more than 50% of students who can opt under IDEA
- Major Advisor will be from Academia and Co-advisor (or Advisory Committee member) from industry
- Total credits (30) will be divided into 20 for internship/ in-plant training and10 for writing the report followed by viva-voce similar to dissertation
- Work place will be industry; however, academic/ research support would be provided by the University or both. MoU may be developed accordingly
- The IPR, if any, would be as per the University policy

9. Teaching assistantship

- Teaching assistantship shall be encouraged. This will give the required experience to the students on how to conduct courses, practical classes, evaluation and other related academic matters. This is an important part of Ph.D. training all over the world and it is expected to address the shortage of faculty in many institutions/ universities.
- The fulltime doctoral students of the University with or without fellowship may be considered for award of Teaching Assistantships in their respective Departments. The Teaching Assistantship shall be offered only to those doctoral students who have successfully finished their course work. Any consideration for award of Teaching Assistantships must have the consent ofthe supervisor concerned.
- Teaching Assistantships shall be awarded on semester to semester basis on the recommendation of a screening/ selection committee to be constituted by the

ViceChancellor. All classes and assignments given to the Teaching Assistants, including tutorials, practicals and evaluation work shall be under the supervision of a faculty member who would have otherwise handled the course/ assignment.

- Each Ph.D. student may be allowed to take a maximum of 16 classes in a month to UG/ Masters students.
- No additional remuneration shall be paid to the students who are awarded ICAR JRF/ SRF. The amount of fellowship to be paid as remuneration to other students (who are receiving any other fellowship or without any fellowships) may be decided by the concerned universities as per the rules in force.However, the total amount of remuneration/ and fellowship shall not exceed the amount being paid as JRF/ SRF of ICAR.
- At the end of each term, Teaching Assistants shall be given a certificate by the concerned Head of the Department, countersigned by the School Dean, specifying the nature and load of assignments completed.

10. Registration of project personnel (SRF/ RA) for Ph.D.

- A provision may be made to enable the project personnel (SRF/ RA) to register for Ph.D. However, this can be done only if they are selected based on some selection process such as walk-in-interview. The prior approval of PI of the project is mandatory to consider the application of project personnel (SRF/ RA) for Ph.D. admission
- The candidates need to submit the declaration stating that the project work shall not be compromised because of Ph.D. programme. Further, in order to justify the project work and Ph.D. programme, the number of course credits should not be more than 8 in a semester for the project personnel (SRF/ RA) who intend to register for Ph.D.

11. Compliance with the National Education Policy-2020

- While implementing the course structure and contents recommended by the BSMA Committees, the Higher Education Institutions (HEIs) are required to comply with the provisions of National Education Policy-2020, especially the following aspects:
- Given the 21st century requirements, quality higher education must aim to develop good, thoughtful, well-rounded, and creative individuals. It must enable an individual to study one or more specialized areas of interest at a deep level, and also develop character, ethical and Constitutional values, intellectual curiosity, scientific temper, creativity, spirit of service, and 21st century capabilities across a range of disciplines including sciences, social sciences, arts, humanities, languages, as well as professional, technical, and vocational subjects. A quality higher education must enable personal accomplishment and enlightenment, constructive public engagement, and productive contribution to the society. It must prepare students for more meaningful and satisfying lives and work roles and enable economic independence (9.1.1. of NEP-2020).
- At the societal level, higher education must enable the development of an enlightened, socially conscious, knowledgeable, and skilled nation that can find and implement robust solutions to its own problems. Higher education must form the basis for knowledge creation and innovation thereby contributing to a growing national economy. The purpose of quality higher education is, therefore, more than the creation of greater opportunities for individual employment. It represents the key to more vibrant, socially engaged, cooperative communities and a happier,

cohesive, cultured, productive, innovative, progressive, and prosperous nation (9.1.3. of NEP-2020).

- Flexibility in curriculum and novel and engaging course options will be on offer to students, in addition to rigorous specialization in a subject or subjects. This will be encouraged by increased faculty and institutional autonomy in setting curricula. Pedagogy will have an increased emphasis on communication, discussion, debate, research, and opportunities for cross-disciplinary and interdisciplinary thinking (11.6 of NEP-2020).
- As part of a holistic education, students at all HEIs will be provided with opportunities for internships with local industry, businesses, artists, crafts persons, etc., as well as research internships with faculty and researchers at their own or other HEIs/ research institutions, so that students may actively engage with the practical side of their learning and, as a by-product, further improve their employability (11.8 of NEP-2020).
- HEIs will focus on research and innovation by setting up start-up incubation centres; technology development centres; centres in frontier areas of research; greater industry-academic linkages; and interdisciplinary research including humanities and social sciences research (11.12. of NEP-2020).
- Effective learning requires a comprehensive approach that involves appropriate curriculum, engaging pedagogy, continuous formative assessment, and adequate student support. The curriculum must be interesting and relevant, and updated regularly to align with the latest knowledge requirements and to meet specified learning outcomes. High-quality pedagogy is then necessary to successfully impart the curricular material to students; pedagogical practices determine the learning experiences that are provided to students, thus directly influencing learning outcomes. The assessment methods must be scientific, designed to continuously improve learning and test the application of knowledge. Last but not least, the development of capacities that promote student wellness such as fitness, good health, psycho-social well-being, and sound ethical grounding are also critical for high-quality learning (12.1. of NEP-2020).

Definitions of Academic Terms

Chairperson means a teacher of the major discipline proposed by the Head of Department through the Dean of the College and duly approved by the Director of Education/ Dean Post Graduate Studies (or as per the procedure laid down in the concerned University regulations) to act as the Chairperson of the Advisory Committee and also to guide the student on academic issues.

Course means a unit of instruction in a discipline carrying a specific number and credits to be covered in a semester as laid down in detail in the syllabus of a degree programme.

Credit means the unit of work load per week for a particular course in theory and/ or practical. One credit of theory means one class of one clock hour duration and one credit practical means one class of minimum two clock hoursof laboratory work per week.

Credit load of a student refers to the total number of credits of all the courses he/ she registers during a particular semester.

Grade Point (GP) of a course is a measure of performance. It is obtained by dividing the per cent mark secured by a student in a particular course by 10, expressed and rounded off to second decimal place.

Credit Point (CP) refers to the Grade point multiplied by the number of credits of the course, expressed and rounded off to second decimal place.

Grade Point Average (GPA) means the total credit point earned by a student divided by total number of credits of all the courses registered in a semester, expressed and rounded off to second decimal place.

Cumulative Grade Point Average (CGPA) means the total credit points earned by a student divided by the total number of credits registered by the student until the end of a semester (all completed semesters), expressed and rounded off to second decimal place.

Overall Grade Point Average (OGPA) means the total credit points earned by a student in the entire degree programme divided by the total number of credits required for the P.G. degree, expressed and rounded off to second decimal place.

Broad Subject Matter Area Committee in Dairy Science and Technology was constituted by Director General, Indian Council of Agricultural Research for assisting the National Core Group in developing academic regulations, defining names and curricula and revising syllabi for courses of Masters' and Ph.D. degree disciplines of Dairy Technology, Dairy Engineering, Dairy Chemistry and Dairy Microbiology.

The committee is indebted to Dr Trilochan Mohapatra, Secretary, DARE and Director General, ICAR, for providing this opportunity to the committee and for his incessant support and leadership during the entire progression of this exercise. The committee is deeply indebted to Dr N.S. Rathore and his successor Dr R.C. Agarawal, Deputy Director Generals (Education Division), ICAR, New Delhi for their administration and guidance provided during the meetings and deliberations. Sincere thanks are also due to Dr G. Venkateshwarlu, Assistant Director General (EQR) and Dr K.L. Khurana, Former Principal Scientist, Education Division, ICAR, New Delhi for their effective facilitation and admirable coordination between the BSMA and the ICAR.

The committee sincerely recognizes the contribution of Dr Arvind Kumar, Hon'ble Vice Chancellor, Rani Laxmibai Central Agricultural University, Jhansi and Chairman of the National Core Group for the guidelines provided and the instructions released for the entire process of revising the syllabus and developing the academic regulations.

The committee places on record its gratitude to Dr N.C. Patel, Honourable Vice Chancellor, Anand Agricultural University (AAU), Dr Y. Hari Babu, Honourable Vice Chancellor, Sri Venkateswara Veterinary University (SVVU), Tirupati and Dr A.S. Nanda, Honourable Vice Chancellor, GADVASU for their kind permission for organizing workshops at their Universities and tremendous support to enable the stakeholders to have valuable deliberations for improving the syllabus of the courses. The committee expresses its gratitude to all the Honourable Vice Chancellors, Directors of Institutes and Deans of all the Dairy Science Colleges for their active participation in the workshops. The committee also gratefully acknowledges the faculty members of National Dairy Research Institute, Karnal; AAU, Anand and SVVU, Tirupati for their worthy suggestions provided during the workshops. Sincere gratitude is expressed to the management and representatives of the dairy industries for their participation in the workshops to provide valuable inputs for aligning the revised courses to the future requirements of the human resources for the dairy industries.

The committee also extends special thanks to all the staff members of the Education Division, ICAR and NDRI, Karnal for the support rendered during organization of various BSMA workshops and meetings.

The committee thankfully acknowledges the contributions of Dr Diwas Pradhan (DM), Mr. Saurabh Kadyan (DM), Dr Yogesh Khetra (DT), Dr Richa Singh (DC) and Dr Priyanka (DE), Scientists from ICAR-NDRI and Dr Sunil Kumar from GADVASU – for their contributions in compilation and editing of this document.

Dr R.R.B. Singh Chairman, BSMA (Dairy Science and Technology) Joint Director (Academics) National Dairy Research Institute, Karnal

Dr Anil Kumar Puniya Convener, BSMA (Dairy Science and Technology) Principal Scientist and Head Dairy Microbiology Division National Dairy Research Institute, Karnal [Ex-Dean, Dairy Science and Technology, GADVASU, Ludhiana]

Preamble

The contents of the master's and doctoral courses were critically examined for introducing new dimension to the curriculum in light of the advances made in the scientific knowledge in thefour major disciplines of Dairy Processing and allied disciplines during the last ten years. In Dairy Technology discipline, two new courses at Master's Levelhavebeen added.The course on Production and Applications of Dairy Ingredients covers the principles of conventional and novel approaches for separation, concentration and fractionation of milk components and the second course on Advances in Cheese Technology primarily focuses on the new developments in rennet and acid coagulated cheeses. For doctoral level program in this discipline, Advances in Carbohydrate Technology has been added as a new course. Two other courses namely Advances in Food Processing and Non-Conventional Processes for Dairy and Food Industry have been significantly modified while minor changes have been incorporated in the contents and titles of the other courses. In Dairy Microbiology discipline, two old courses 'Methods in Microbiology' and 'Feed and Rumen Microbiology' have been removed and three new courses 'Microbiology of Fluid Milk and Dairy Products'; 'Microbiology of Cheese and Fermented Dairy Foods' and 'Research Techniques' have been introduced in Masters' Degree Programme to make the students abreast with the emerging trends and scope of microbiology of milk and milk products along with the conventional and innovative analytical instrumentationsrelevant during the research work.In doctoral programme, the course 'Microbiology of Food-borne Pathogens' has been replaced with two new courses 'Advances in Food Safety of Dairy Products' and 'Advances in Probiotics and Functional Foods' to address the recent development in rapid changing fields of food safety and functional foods. In Dairy Engineering discipline, five new courses for Master level program, viz. Industrial Automation and Robotics, Unit Operations, Engineering Properties of Dairy and Food Products, Mechanization in Manufacturing of Indigenous Dairy Products and Energy Management and Auditing in Dairy and Food Plants and two new courses for doctoral program, viz. Advances in Food Process Engineering and Package Permeability and Shelf-Life Modelling have been added in the course curriculum. The idea for inclusion of these courses was conceived based on the feedback from the students working in the industry and educational institutions. In addition to their relevance to the dairy operations, thesenew courses would cover a wide spectrum of application of engineering principles and would be particularly helpful to the students in comprehensive understanding of the subject and in several competitive examinations which require sound basic engineering knowledge. In Dairy Chemistry discipline, although no new course has been introduced; significant changes in the course content were made in the existing courses. The course on Physico-chemical Aspects of Milk Constituents has been modified to better understand the physico-chemical properties of milk constituents in light of the emergence of new analytical techniques, along with the addition of topics related to their recent application in food processing, storage and quality assurance. The courseon Chemistry of Food Constituents has been restructured in such a way that different constituents both major and minor are covered with their specific properties for better applications in the food processing. Additionally, the credit load and the nomenclature of many other courses have been suitably revised for their better understanding and applications.

Course Contents
M. Tech. in Dairy Technology

I. Course Title : Advances in Dairy Processing

II. Course Code : DT 511

III. Credit Hours : 3+1

IV. Why this course?

The basic principles of dairy processing have been understood at undergraduate level. Any dairy plant has to be abreast with the latest developments taking place in the arena of dairy processing, dairy product preservation, quality assurance and public health safety, automation, mechanization, etc. Knowledge of such aspects will help in controlling milk solids losses, aid in process optimization and help in catering to quality dairy products to the consumers.

V. Aim of the course

To provide in-depth knowledge about the various unit operations and basic concepts in dairy processing

VI. Theory

Unit I

Use of bio-protective factors for preservation of raw milk: effects on physico-chemical, micro-bial and nutritional properties of milk and milk products; Present status of preservation of raw milk.

Unit II

Methods of determining lethality of thermal processing; UHT processed milk products, their properties and prospects, types of UHT plants, aseptic fillers, heat stability and deposit formation aspects, effect on milk quality; techno-economic considerations; Nutritional aspects of UHT treated milk vis-à-vis retort sterilized/ HTST treated milk.

Unit III

Principles and equipment for bactofugation and bactotherm processes; Partial homogenization and its application in dairy industry, Low pressure homogenization; Microfluidization of milk: Principle, equipment, effects and applications.

Unit IV

Concentration processes and their impact on quality of finished products; Dehydration: advances in drying of milk and milk products; Freeze dehydration: physico-chemical changes and in-dustrial developments; Glass Transition Temperature and its relevance to dried milks.

Unit V

Water activity; Sorption behaviour of foods, energy of binding water, control of water activity of different milk products in relation to their chemical, microbiologi-cal and textural properties; Hurdle technology and its application in development of shelf-stable and intermediate-moisture foods; Use of carbonation in extending the shelf life of dairy products.

Unit VI

Current trends in cleaning and sanitization of dairy equipment; Automation, Ultrasonic techniques in cleaning; Bio-films; Bio-detergents, innovations in sanitizers - chemical, radiation; Mechanism of fouling and soil removal; Assessing the effectiveness of cleaning and sanitization of dairy equipment, Water conservation methods.

VII. Practical

- Measurement of thiocyanate in milk system
- LP system for extending the keeping quality of raw milk
- Determination of HCT-pH profile of milk
- Determination of water activity and sorption isotherms of milk products
- Determination of WPNI of milk powders
- Functional properties of milk powders
- Determination of HMF content in dried milks
- Freeze drying of milk and milk products
- Homogenization efficiency
- Cleaning and sanitization efficiency of dairy equipment
- Visit to a UHT Processing plant.

VIII. Teaching Methods/Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work and Group Discussion
- Visit to various dairy plants

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge to ensure delivery of safe and quality product from the dairy plant to the consumers
- To process the milk and dairy products in such a manner that losses of milk solids are minimal
- Be able to suggest to the dairy plant personnel, the latest type of tools that can be harnessed to produce quality products, without impairing the nutritive value of milk
- To suggest the dairy industry personnel regarding the formulation of detergent and/or acid and sanitizers which would help in efficient cleaning and sanitization of dairy equipment?

I. Course Title : Advances in Food Processing

II. Course Code : DT 512

III. Credit Hours : 3+1

IV. Why this course?

The basic principles of food processing, including dairy processing has been understood at undergraduate level. Any food plant has to be abreast with the latest developments taking place in the sphere of food processing, food product preservation, quality assurance and public health safety, automation, mechanization, etc. Information on composite foods may give an idea about foods formed using amalgamation of dairy foods with other food materials and ingredients. Knowledge of such aspects will help in developing value-added food products, cater to functional (health promoting) foods, adopting non-thermal processing methods to obtain food products having freshness and preserved nutrients and colour, etc.

V. Aim of the course

To provide in-depth understanding of advances in theoretical and practical aspects of food processing keeping in mind the nutritive value of product and its perishability

VI. Theory

Unit I

Status of food processing industry in India and abroad; Prospects and constraints in development of Indian food industry.

Unit II

Development in Post-harvest management of Fruits and Vegetables (Controlled and Modified Atmospheric Storage, Designing aspects of CAS/MAS, Components of CAS/MAS), hypobaric storage, harvesting indices for fruits and vegetables.

Unit III

Newer methods of drying of foods (Super-heated steam drying, Freeze drying, infra-red drying and microwave drying; Osmodrying process), Concepts of UHT and retort sterilization of food products, packaging materials for thermally processed foods.

Unit IV

Basic principles involved in fermentation, Technological aspects of pickled vegetables like sauerkraut, cucumbers, Technology of wine, beer and distilled alcoholic beverages, defects in alcoholic beverages.

Unit V

Advances in milling of rice (solvent extractive milling) and Turbo milling of wheat. Emerging concepts in cereal processing including gluten free products, Low calories bakery products, Technologies for breakfast cereals, Utilization and importance of dairy ingredients in bakery products.

Unit VI

Definition, classification and technologies of fabricated and formulated foods and their nutritional aspects. Imitation dairy products and dairy analogues; meat analogues. Principle of extrusion processing, design and working of extruder, classification, application in food and dairy processing. Food additives, including stabilizers, emulsifiers, antioxidants, preservatives, etc. for formulated foods. Fortification of staples.

Unit VII

Non-thermal processing technologies for food: Principles, Effect on food constituents and Salient application in food sector/industry.

Unit VIII

Enzymes in food processing; newer concepts in food processing including organic foods; Processing of organic raw material; Genetically modified foods; Space foods, Nutrigenomics, metabolomics and other Omics concepts in food processing.

VII. Practical

- Experiments on MAS of fruits and vegetables
- Application of microwave for blanching and drying of foods
- Osmoair drying of fruits and vegetables

- Retort processing of food products
- Application of milk ingredients in caramel, egg-less cake, mayonnaise
- Enzymatic extraction and clarification of fruit juices
- Preparation of soymilk and tofu, Manufacture of sauerkraut/ fermented vegetables
- Preparation of protein isolates
- Application of extrusion processing for breakfast cereal and meat analogue manufacture
- Application of hydrocolloids in stabilization of proteins in acidified beverages
- Manufacture of low calorie and gluten-free cereal products.

VIII. Teaching Methods/Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work and Group Discussion
- Visit to various food plants

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the latest post-harvest management of fresh produce with limited shelf life
- To have an idea about the processing methods that do not diminish the quality attributes of food being processed
- To know about the recent packaging methodologies that can enhance the shelf life of fresh as well as processed produce/food.
- To have any idea about the enzymes that can be used as processing aids.

I. Course Title : Rheology of Dairy and Food Products

II. Course Code : DT 513

III. Credit Hours : 2+1

IV. Why this course?

The mouth feel of processed food product is one of the parameters for the acceptance of foods. The sensory textural quality of food is closely related to the rheology of that pertinent food product. Any technological treatment meted out to dairy/food product leads to change in its rheological characteristics. Such treatment can be specifically practiced to improve the textural quality of food product. Rheology can be used as a quality control tool to monitor the quality of food product being processed or manufactured.

V. Aim of the course

To explain the basics of food rheology, and to familiarize the students with rheological instruments and their use in relation to dairy and food products

VI. Theory

Unit I

Introduction to rheology of foods: Definition of texture, rheology and psychophysics – their structural basis; Physical considerations in study of foods; Salient definitions of stress tensor and different kinds of stresses.

Unit II

Rheological classification of Fluid Foods: Shear-rate dependence and time dependence of the flow-curve; Non-Newtonian fluids; Mechanisms and relevant models for non-Newtonian flow; Effect of temperature on rheology; Compositional factors affecting flow behaviour; Viscosity of food dispersions: dilute and semi-dilute systems, concentration effects.

Unit III

Viscometers; Types (Co-axial cylinders, Spindle or Impeller type, Cone-plate, Capillary, Falling sphere, Vibratory, Extrusion, and Orifice), comparative assessment, merits and limitations; Rheometer: principles and operational features.

Unit IV

Rheological characterization of semi-solid and solid foods; Mechanical models for viscoelastic foods (Maxwell, Kelvin, Burgers and generalized models) and their application; Dynamic measurement of viscoelasticity.

Unit V

Large Deformations and failure in foods: Definitions of fracture, rupture and other related phenomena; Texture Profile Analysis; Instrumental measurements: Empirical and fundamental methods; Rheometers and Texture Analyzers; Measurement of extensional viscosity; Acoustic measurements on crunchy foods.

Unit VI

Rheological and textural properties of selected dairy products; Measurement modes and techniques; Effect of processing and additives (stabilizers and emulsifiers) on food product rheology; Relationship between instrumental and sensory data; Microstructure of dairy products; Tribology and its applications.

VII. Practical

- Study of different types of viscometers.
- Flow behaviour of fluid dairy products.
- Thixotropy in ice-cream mix.
- Force-deformation study in selected dairy products using Texture Analyzer.
- Effect of test conditions on the texture profile parameters of dairy products.
- Stress relaxation studies in solid foods.
- Use of Cone Pen-etrometer and FIRA-NIRD extruder for measurement of butter texture.
- Assessment of pasting profile of starch/flours using viscoanalysers.
- Oscillatory measurements using Rheometer.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– Classify food products based on their rheological characteristics
– Understand the relationship between instrumental rheology and sensory perception of food
– To recommend use of textural analysis of dairy and food product for its quality control aspect
– To recommend specific type of instrument for textural analysis of specific type of food (fluid or solid)

I. Course Title : Biotechnology for Dairy Applications

II. Course Code : DT-514

III. Credit Hours : 2+1

IV. Why this course?

Biotechnology is a tool for the value addition to dairy foods. Genetic techniques have been employed to manipulate bacteria that have significance to the dairy industry. Biotechnological means can be used to regulate the production of flavour enhancing metabolites and to develop starter cultures that are resistant to bacteriophage and bacteriocins. Genetic engineering will be able to deliver dairy foods that can be tolerated by lactose intolerant persons or for persons who are allergic to milk proteins too.

V. Aim of the course

To project the importance of biotechnology in dairy processing and imparts knowledge on all aspects of dairy process biotechnology in production and preservation of dairy products employing the principles of biotechnology.

VI. Theory

Unit I

Introduction to process biotechnology; Principles of recombinant DNA technique; Development and impact of biotechnology on dairy and food industry.

Unit II

Microbial rennet and recombinant chymosin - characteristics and applications in cheese making; exogenous free and microencapsulated enzymes. Immobilized enzymes - their application in continuous coagulation of milk in cheese making; Enzyme modified cheeses (EMC) - their utilization in various food formulations.

Unit III

Technological requirements of modified micro-organisms for applications in cheese, Probiotic and fermented milk products; physiologically active bio-peptides/ nutraceuticals.

Unit IV

Protein hydrolysates - production, physico-chemical, therapeutic properties and application in food formulations; Enzymatic hydrolysis of lactose for preparation of whey and UF-permeate beverages; Continuous lactose hydrolysis of whey.

Unit V

Microbial polysaccharides - their properties and applications in foods; Production of alcoholic beverages; Bio-sweeteners - Types, properties and their applications in dairy and food industry.

Unit VI

Bio-preservatives - characteristics and their applications in enhancing the shelf life of dairy and food products.

VII. Practical

- Effect of exogenous enzymes on hydrolysis of protein and fat in culture containing milk sys-tems
- Factors affecting the coagulation of milk by microbial and vegetable rennets
- Manu-facture and evaluation of probiotic cheese and fermented milks
- Preparation of Enzyme Modified Cheese
- Determination of glycolysis, proteolysis and lipolysis in cheese and fermented milks
- Enzymatic process for manufacture of low lactose milk/whey products
- Preparation of casein hydrolysates
- Visit to a bio-processing unit.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To have any idea about the enzymes that can be used as processing aids.
– Have knowledge on the latest biotechnological approaches to add value to the dairy product
– Ability to produce protein hydrolysates
– Application of biotechnology for bio-preservation of dairy foods

I. Course Title : Advances in Traditional Indian Dairy Products

II. Course Code : DT 515

III. Credit Hours : 2+1

IV. Why this course?

Traditional Indian dairy products (TIDP) especially the sweetmeats have its own significance in Indian diet and have tremendous export potential. The application of strict hygiene in manufacture of such TIDPs is the need of the day and its technology up gradation (especially mechanization and automation) from research level to industry level needs to be harnessed. Even there is an urgent need to have knowledge about the 'Techno-economic aspects for establishing commercial units for traditional dairy products'. Enhancement in the shelf life of TIDPs has been still a challenging task in the dairy industry.

V. Aim of the course

To project the present status, modernization and globalization of production of traditional Indian dairy products with a focus on process innovation, shelf life, quality and functionality enhancement.

VI. Theory

Unit I

Global prospects and export potential of traditional Indian dairy products.

Unit II

Differences in quality of traditional dairy products from cow, buffalo, goat, camel, and sheep milks; Process innovations in commercial production of heat-desiccated, coagulated and fermented traditional dairy products; Mechanized production of traditional milk based sweets; Automation for manufacture of ghee, *paneer*, *dahi*, *lassi*and traditional sweetmeats.

Unit III

Composite traditional milk products; Application of membrane technology and microwave processing for industrial production of traditional Indian dairy products.

Unit IV

Technologies for region specific traditional Indian dairy products and their value addition, their application as a vehicle for delivering functional ingredients; Manufacture of dietetic traditional dairy products.

Unit V

Techno-economic aspects for establishing commercial units for traditional products.

Unit VI

Convenience traditional dairy products; Food safety issues; Shelf life extension of food using newer techniques; Novel packaging and preservatives.

VII. Practical

- Production of reduced calorie, composite and functional traditional Indian dairy products.
- Microwave heating of traditional Indigenous milk delicacies for shelf life extension.
- Membrane technology for improving the quality of traditional Indigenous products made from cow and buffalo milk.
- Preparation of feasibility report for establishing commercial units for traditional dairy products.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– Have an idea about the global prosper and export potential of TIDPs.
– Be an entrepreneur in delivering mechanized production of certain TIDPs including automation, wherever feasible.
– Be able to recommend the methods to enhance the shelf life of perishable TIDPs and recommend the type of packaging technology to be used for safety and shelf life extension.

I. Course Title : Non-Conventional Processes for Dairy and Food Industry

II. Course Code : DT 516

III. Credit Hours : 2+1

IV. Why this course?

Unravelling the truths based on the knowledge of 'science and technology' has paved the way for development of several non-conventional technologies. These when used judiciously can have advantage in minimizing the changes in the colour, nutritive value and textural quality of dairy and food products. Certain non-conventional processes may be used as adjunct to the conventional processing technology to reap the benefits from use of such synergistic effects.

V. Aim of the course

To develop an understanding of the basic principles underlying the novel/non-conventional food processing techniques, equipment required, features and actual and potential applications

VI. Theory

Unit I

Irradiation: sources and properties of ionizing radiation; Mechanism of interaction with microorganisms and food components; Chemi-cal effects; Industrial irradiation systems, benefits and limitations; UV pasteurization of milk; Safety aspects in radiation processing; National and international regulations in relation to radiation processing; Cold plasma processing.

Unit II

High frequency heating (Microwave and Radio frequency processing): Principles, merits and demerits; Design and working of processing units; Applications in dairy and food processing; Microwavable packaging; Safety aspects.

Unit III

Infra-red (IR) heating and Ohmic heating: Principle, equipment and applications.

Unit IV

Ultrasonic treatment of food: Mechanism of ultrasound induced cell damage, generation of ultrasound, design of power ultrasonic system, types of ultrasonic reactors, application of power ultrasound in food processing, effects on food constituents, ultrasound in amalgamation with other food processing operations – thermo-sonication, manosonication, thermo-manosonication, advantages and future prospects.

Unit V

High hydrostatic pressure (HHP) processing: Principle of microbial inactivation, barotolerance of microorganisms, effect on food constitu-ents; equipment; dairy and food applications; Merits and demerits of HHP.

Unit VI

Pulsed electric field processing; Description/ mechanism and factors affecting microbial inactivation; effects on food com-ponents; Present status and future scope for food applications.

Unit VII

Super-critical Fluid Extraction; Principle, instrumentation and applications.

VII. Practical

- Market survey of food products processed using non-conventional technologies
- Pasteurization and concentration of milk using ohmic heating
- Degassing of fluids using ultrasound
- Determination of power output and temperature profile of a microwave oven
- Effect of chemical composition on heating behaviour of milk and milk products
- Microwave pasteurization of milk
- Effect of shape and size of container on microwave heating
- Preparation of 'instant' products in a microwave oven
- Visit to a commercial food processing facility.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To recommend use of feasible non-conventional technology for processing and shelf life extension of food
– Application of non-conventional processing technology as adjunct processing for accomplishing hurdle technology for dairy and food products
– To visualize the difference in the physico-chemical properties and microbial changes in dairy/food product when adopting traditional vs. non-conventional technology

I. Course Title : Membrane Processing for Dairy Applications

II. Course Code : DT 521

III. Credit Hours : 2+1

IV. Why this course?

Amongst non-thermal processes for dairy applications, membrane processing is one of the significant illustrations. Membrane processing has helped the dairy industry, not only to obtain dairy ingredients with high protein and low lactose content, but even to recover the important whey proteins from the by-product – whey. Salient application of use of membrane processed milk concentrate is in cheese making and in concentrated and dried milk manufacture.

V. Aim of the course

To elucidate the basics of membrane technology and its applications in dairy processing

VI. Theory

Unit I

Membrane techniques; Classification and characteristics of filtration pro-cesses; types of commercially available membranes; membrane hardware, design of membrane plants, modelling of ultrafiltration (UF) processes, mass transfer model, resistance model; Membrane fouling-problems and mitigation strategies; Cleaning and sanitization of different types of membranes.

Unit II

Factors affecting permeate flux during ultrafiltration and reverse osmo-sis of milk and sweet/sour whey, energy requirements for membrane processing of milk and whey.

Unit III

Applications of ultrafiltration (UF), reverse osmosis, nanofiltration and microfiltration in the dairy industry: food and pharmaceutical grade lactose, low lactose milk powder, dairy whiteners, WPC, WPI, MPC, MPI, Native micellar casein powder, etc. Preparation, properties and uses of Milk Protein Concentrate (MPC) and Milk Protein Isolate (MPI); Manufacture of some cheeses and fermented milk products and impact of membrane processing on quality of such products. Use of membrane processing techniques for separating prophylactic biological from milk.

Unit IV

Demineralization: principles, processes, equipment and applications.

Unit V

Functional properties of whey proteins (WPC and WPI), micellar casein and UF milk retentate and their modifications.

VII. Practical

- Factors affecting permeate flux during membrane processing (type of feed, temperature, transmembrane pressure, etc.)
- Effect of microfiltration of skim milk and whey on fat content and microbial count
- Preparation of WPC, WPI, MPC, native micellar casein, etc.
- Evaluating the functional properties of milk proteins.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To recommend use of membrane processed milk in manufacture of selected dairy products
- Application of specific membrane processes for milk/whey to prepare certain prophylactic biological
- To recommend the suitable cleaning and sanitization agents to take care of cleaning and sanitization of specific type of membrane used in membrane processing of milk.

I. Course Title : Advances in Dairy and Food Packaging

II. Course Code : DT 522

III. Credit Hours : 2+1

IV. Why this course?

Packaging of food though carried out towards the end of product manufacture has a great role to play in conserving the processed food in its original state – including freshness of fresh food. Packaging plays a crucial role in acceptance of the food product by the consumer and the extensibility of the shelf life of the food being packaged, especially using advanced techniques such as MAP, active packaging, etc.

V. Aim of the course

To impart basic and advanced knowledge of dairy and food packaging

VI. Theory

Unit I

Trends in packaging industry; designing framework for packaging; Testing of packaging materials.

Unit II

Adhesives; Graphics; Coding (Barcode and Quick Response code), and labeling used in food packaging.

Unit III

Protective packaging of foods; Effect of light, oxygen and moisture on packaged food.

Unit IV

Packaging of dairy products, convenience foods, fresh produce and fruits and vegetable products, Packaging of fats and oils, spices, meat, poultry, fish and other sea foods.

Unit V

Modified atmosphere packaging, Shrink and stretch packaging; Self-heating and self-cooling cans.

Unit VI

Retort pouch technology, microwavable, biodegradable, and edible packages; Principles and applications of Active Packaging, Smart and Intelligent Packaging, Antimicrobial packaging.

Unit VII

Industrial packaging: unitizing, palletizing, containerizing, distribution systems for packaged foods.

Unit VIII

Safety aspects of packaging materials; sources of toxic materials and migration of toxins into food materials, packaging and flavour interaction.

VII. Practical

- Testing of packaging materials for qual-ity assurance: thickness, GSM, grease resistance, bursting strength, tearing resistance, WVTR, puncture resistance
- Estimation and prediction of shelf life of packaged foods
- Development of edible, biodegradable and antimicrobial films
- MAP of perishable foods
- Effect of edible coatings on respiration behaviour of fruits and vegetables
- Application of oxygen scavengers in packaged foods.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To recommend the type of package suitable for specific type of dairy or other food products

- To employ intelligent packaging techniques in food packaging to warn the public in case of impeding health hazard
- Recommending SOPs to the food industry personnel to avoid migration of toxic substances from the package into the food system

I. Course Title : Technology of Food Emulsions, Foams and Gels

II. Course Code : DT 523

III. Credit Hours : 2+1

IV. Why this course?

In order to improve the viscosity or rheological characteristics of food systems, certain food additives such as stabilizers, emulsifier and even foaming agents play a significant role. The chances of probability of defect in certain food products can be circumvented through use of such food additives. Emulsifiers play a great role in maintaining emulsion of two or multiple phases in the food system till its consumption. Foaming agents are of significance in ice cream, whipping cream, meringue, certain baked goods, etc.

V. Aim of the course

To impart basic knowledge regarding food dispersion systems, their formation, behaviour, and factors affecting their stability.

VI. Theory

Unit I

Food dispersions, their characteristics and factors affecting food dispersions.

Unit II

Food emulsions; Emulsifiers and their functions in foods; HLB concept for food emulsifiers; Emulsion formation and stability; Surfactants.

Unit III

Dairy based foams and their applications, structure of foams; Egg foams and uses; Foam formation and stability.

Unit IV

Theory of gel formation; Carbohydrate and protein based gels. Gelled milk products. Advances in food gels (organogel, hydrogel and nanogel).

Unit V

Structure of dairy based emulsions, foams and gels; blend of stabilizers and emulsifiers; Effect of stabilizers and/or emulsifiers on functional properties of dairy foods; Aerosols and propelling agents in foamed dairy products.

Unit VI

Techniques for evaluating the structure of food emulsions, foams and gels

VII. Practical

- Determination of emulsifying efficiency and emulsion stability
- Examination of foaming capacity and foam stability
- Gel formation and gel properties
- Preparation of hydrogels and organogels
- Preparation of single and double emulsions.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To be able to recommend specific type of food additive from amongst stabilizers and emulsifiers for stability of the food system
- Be able to recommend solution to the food processor to improve upon the textural quality of food products through use of food additives like stabilizers and/or emulsifiers
- To make the food processors understand how the type of emulsion in question in the food product has a bearing on the functional property of that specific food product

I. Course Title : Functional Foods and Nutraceuticals
II. Course Code : DT 524
III. Credit Hours : 3+1

IV. Why this course?

Ingestion of food possessing nutraceuticals can sustain and maintain human health – free from diseases. Today's consumers are aware about the health promoting foods and if the industry launches functional foods, there are takers for such foods. Several herbs and spices are known to contain components that have nutraceutical value. Ayurveda system is built on such naturally available materials. However, consumer does want to seek food that can sustain their health and nutritional requirement – not to rely on medicines. Fermented probiotic foods are the latest prominent functional foods.

V. Aim of the course

To impart knowledge about functional ingredients and nutraceuticals and their utilization in developing physiologically beneficial health foods, functional foods and speciality foods

VI. Theory

Unit I

Classes of functional foods and their status.

Unit II

Functional ingredients; Classification; Dietary and therapeutic significance.

Unit III

Food fortification; Significance and techniques of fortifying foods with functional ingredients.

Unit IV

Infant nutrition; Dietary formulations, special needs, additives; Geriatric Foods: Design considerations, ingredients, special needs; Sports foods: Significance, strategies and design considerations.

Unit V

Reduced calorie foods: Significance, strategies, additives (fat replacers, bulking agents, non-nutritive sweeteners).

Unit VI

Low sodium and low lactose foods: Nutritional and health significance.

Unit VII

Herbs; Classification; Therapeutic potential, applications; Phytochemicals; Classes; Physiological role; Applications; Bioactive ingredients from animal and marine sources.

Unit VIII

Probiotic, prebiotic and synbiotic foods: Concept and applications.

VII. Practical

- Determination of soluble and insoluble fibre
- Determination of antioxidant activity of functional ingredient/food

- Determination *of in vitro* bioavailability of nutrients
- b-galactosidase activity for low-lactose dairy products
- Prebiotic potential of selected plant/milk components
- Probiotic potential of selected microorganisms
- Preparation of functional foods

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:
- Be able to identify food in which fortification with necessary nutrients are required
- Be able to evolve Geriatric foods and food for infants based on their requirement and physiological functions
- To make food available to the consumers amalgamated with functional ingredients such as herbs, phytochemicals, etc.

IX. Selected Reading

I. Course Title : Production and Applications of Dairy Ingredients

II. Course Code : DT 525

III. Credit Hours : 2+1

IV. Why this course?

Milk is a source of several components, which may contribute to nutrients, nutraceuticals, flavour, colour, texture to the food products in which they may be incorporated. Nowadays, we have perfected technologies to separate the dairy components having specified function for use in dairy as well as food products. The by-products such as whey and buttermilk can be salvaged through separation of components, which are of significance to the dairy and food industries alike.

V. Aim of the course

The aim of this course is to give comprehensive information of various milk components used as ingredients in food processing with regard to their separation, properties and applications.

VI. Theory

Unit I

An overview of dairy ingredients for food processing; Composition, nutritive value and health attributes of dairy ingredients; Important quality indices; National and international regulatory standards.

Unit II

Principles of conventional and novel approaches for separation, concentration and fractionation of milk components(Ig, lf, b-Lg): centrifugal separation, concentration, drying, membrane processing, enzyme-assisted separation, supercritical fluid extraction, electric field assisted membrane technique, etc.

Unit III

Chemical, physical and functional characteristics of concentrated and dried dairy ingredients (SMP, WMP, lactose, whey powder, WPC, WPI, MPC, casein and caseinates, cream powder, butter powder, cheese powder, yogurt powder, buttermilk powder, etc.).Miscellaneous dairy ingredients, viz. dairy permeates, hydrolysates, coprecipitates andlactoferrin.

Unit V

Interactions of dairy ingredients with other food components and its effect on product quality.

Unit V

Applications of dairy ingredients in food industry: bakery and confectionery; Infant, adult and sports nutrition; Processed meat products; spreads; functional Foods; edible films and coatings.

VII. Practical

- Manufacture of whey powder, caseinates, whey protein/milk protein concentrates, lactose, sweet cream butter milk powder, cream powder, yogurt powder and cheese powder.
- Determination of functional and nutraceutical properties of dried dairy ingredients.
- Manufacture of enzyme-modified dairy ingredients
- Production of eggless cakes using WPC
- Production of processed meat products incorporating caseinates
- Visit to a dairy ingredients manufacturing industry.

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Be able to separate the various important components from milk/dairy byproduct having significance in dairy and food industries
- Be able to recommend the required type of specialized dairy ingredient for use in formulated and composite foods
- To be able to erect a dairy factory producing specialized dairy ingredients with immense value addition

I. Course Title : Advances in Cheese Technology

II. Course Code : DT 526

III. Credit Hours : 2+1

IV. Why this course?

There is an array of cheese varieties; use of different starter cultures can lead to the development of specific cheese variety too. However, the technological principles involved in Cheddar cheese making are common to several varieties of cheeses with some modifications. Cheese is getting popularized in India, especially the Pizza cheese variety that is preferentially used as a topping on pizza pie. The functional properties of cheese dictate its end use functionality in food system. Basically, some cheese varieties can be produced by two methods – starter culture and direct acidification. Wheyless cheese making from ultra-filtrated milk concentrate is one unique possibility. There has been trend to produce cheeses having low-fat and low salt for the health conscious consumers.

V. Aim of the course

To impart advanced knowledge on milk coagulants, theory of milk coagulation, the technology, biochemistry and microbiology of cheese.

VI. Theory

Unit I

Rennet coagulation: Measurement of milk clotting activity and gelation properties, Catalytic mechanism and milk-clotting properties of rennet and rennet substitutes. Advances in renneting of milk; recombinant rennet.

Unit II

Acid coagulated milk gels: formation, rheology, structural properties, etc.

Unit III

Advances in cheese starters; genetics of Lactic Acid Bacteria (LAB); Exo Polysaccharide (EPS) starters; Genetic engineering of LAB.

Unit IV

Biochemistry of cheese ripening: Metabolism of residual lactose and lactate, protein hydrolysis, lipid hydrolysis, amino acid catabolism; Development of cheese flavour, and body and texture; Cheese microstructure. Accelerated cheese ripening.

Unit V

Mold-ripened cheeses; Starter cultures, technology, ripening process (Blue, Roquefort, Camembert, etc.)

Unit VI

Low fat and low-sodium cheeses: challenges, strategies and advances; Membrane technology in cheese; Cheese as an ingredient in food systems.

Unit VII

Technology of non-bovine cheese: popular varieties, challenges, strategies; Technology of cheeses prepared by coagulation other than rennet and acid (Ricotta, Brown whey cheese, etc.); Advances in cheese packaging; Automation in cheese making; Cheese analogues.

VII. Practical

- Instrumental determination of rennet coagulation time
- Rheology of acid-coagulated milk gels
- Fermentation dynamics of common cheese starters
- Evaluation of cheese ripening behaviour
- Manufacture of mold ripened-, low sodium-, low fat-cheeses
- Manufacture of Goat and Ewemilk cheeses
- Manufacture of Ricotta cheese
- Microstructure of cheese

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Be able to manufacture various varieties of cheeses
- Try to employ various non-thermal pre-treatment to milk to obtain value added cheese
- Be able to develop low-calorie and low-salt cheeses
- Recommend the cheese makers for appropriate mechanization

IX. Suggested Readings

Course Title with Credit Load
Ph.D. in Dairy Technology

Course Code	Course Title	Credit Hours
DT 611	Advances in Lipid Technology	3 (3+0)
DT 612**	Advances in Protein Technology	3 (3+0)
DT 621**	Product Monitoring and Process Control	3 (3+0)
DT 622	R and D Management in Dairy Industry	3 (3+0)
DT 623	Advances in Carbohydrates Technology	3 (3+0)
DT 691	Doctoral Seminar-I	1 (1+0)
DT 692	Doctoral Seminar-II	1 (1+0)
DT 699	Doctoral Research	75 (0+75)

Minor Courses

The courses will be selected from the allied disciplines of Dairy Engineering, Dairy Chemistry and Dairy Microbiology to meet the minimum credit requirements.

Supporting Courses

The supporting courses will be picked from the basket of courses offered inagricultural statistics, computer applications and IT, and other related relevant disciplinesto meet the minimum credit requirements.

Common Courses

1.	Library and Information Services	1
2.	Technical Writing and Communications Skills	1
3.	Intellectual Property and its Management in Agriculture	1
4.	Basic Concepts in Laboratory Techniques	1
5.	Agricultural Research, Research Ethics and Rural Development Programmes	1

*Core courses for Master's programme; **Core courses for Doctoral programme

Course Contents
Ph.D. in Dairy Technology

I. Course Title : Advances in Lipid Technology

II. Course Code : DT 611

III. Credit Hours : 3+0

IV. Why this course?

Fats have multifarious effect on human beings. These are source of saturated fats, unsaturated fats, sterols (including cholesterol), phospholipids, etc. The essential fatty acids have a significant role in human health. There are however, some relations between certain type of fats (i.e. cholesterol, certain saturated fats and trans-fats) and cardiovascular disease in humans. There are several technological means to modify fat such as inter-esterification, fractionation of fat, hydrogenation, bleaching, refining, etc. Repeated frying of fat can lead to formation of toxic substances, unfit for consumption. Consumers have started accepting the modified fats for health reasons.

V. Aim of the course

To study the physico-chemical and nutritional characteristics of fats and oils, their processing and application in food products.

VI. Theory

Unit I

Current trends in the fats and oil industry in India and abroad: Sources and classification of commercial edible fats and oils from animal, vegetable and marine origin; Non-conventional fats/oils for edible purpose – rice bran oil, microbial lipids, etc.

Unit II

Structural aspects of fats and oils in relation to their processing, properties and utilization; Polymorphism and polytypism, crystallization kinetics.

Unit III

PUFA, MUFA, CLA, Medium Chain Triglycerides (MCTs), Omega fatty acids, Trans-fatty acids: Nutritional and technological interventions; Phytosterols and their significance.

Unit IV

Advances in extraction and refining of oils and fats; Application of membrane techniques in oil refining.

Unit V

Physical, chemical and enzymatic modification approaches to tailor-made fats. Cholesterol reducing treatments; structured lipids; Fat replacers; Isolation of emulsifiers.

Unit VI

Applications of fats and oils: Margarine and low-fat table spreads; Bakery and confectionery fats; Coatings; Shortenings; Salad dressings; Technology of cooking oils, salad oils and oil based dressings.

Unit VI

Frying process and systems; Changes in fats and oils during frying; Snack foods - Processing sys-tems; Modified fats and oils for use in bakery and confectionery products, shortenings and spreads; Cocoa butter substitutes.

VII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– Able to recommend the type of fat suitable for given application (i.e. for frying).
– Prepare modified fats with reduced cholesterol, reduced long chain saturated fats, etc.
– Make the food processor understand the principle of polymorphic transformation of fat for texture development in fatty food system.
– Can modify the fat to suit physiological needs of the people.

I. Course Code : DT 612

II. Course Title : Advances in Protein Technology

III. Credit Hours : 3+0

IV. Why this course?

Protein is an essential major nutrient in the diets. Essential amino acids play an important role. Cheaper sources of protein are being constantly unearthed possibly from several sources, viz. plants, animals, microbes and mushrooms. Protein malnutrition, especially in children is being tackled today. Use of membrane processing (especially ultrafiltration) and food texturization technologies has led to the development of newer type of high protein food ingredients and products. The state of protein – un-denatured and denatured can play a role in functionality of resultant food as well as in digestion of the nutrient. Protein hydrolysates have their own application even in pharmaceuticals.

V. Aim of the course

To study the characteristics of food proteins and to familiarize the students with their nutritional role, implications in processing and their interactions in food systems

VI. Theory

Unit I

Characteristics, functional properties and applications of proteins from plant, animal, microbial and non-conventional sources.

Unit II

Denaturation of proteins: effect of processing parameters on denaturation; effect of denatur-ation on the physico-chemical and biological properties of proteins in food systems.

Unit III

Structure-functional relationship of food proteins; Protein interactions with food constituents and their significance: protein-protein interactions. Protein--lipid interactions, protein-polysaccharide interactions, protein-ion interactions.

Unit IV

Nutritional aspects of dietary proteins: Protein nutrition and digestion; protein quality evaluation methods; effect of processing on nu-tritive value of proteins.

Unit V

Food protein concentrates and isolates: types, production, characterization and applications Protein hydrolysates: production and processing; de-bittering; bioactive peptides: classification, production and properties.

Unit VI

Texturization of proteins; Selection of ingredients and processes; Microstructure of texturized foods, Protein based fat substitutes; Protein engineering; Protein genetic polymorphism.

VII Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Tackle the problem of protein malnutrition.
- Adopt some recent technological means to produce high protein food ingredients such as WPC, WPI, MPC, Micellar casein powder, etc.
- Modify the native protein (i.e. protein hydrolysate) to have specific applications in composite food products

I. Course Title : Product Monitoring and Process Control

II. Course Code : DT 621

III. Credit Hours : 3+0

IV. Why this course?

Whatever food products are processed at the food plant needs to be monitored for product quality and safety. Recent developments in advanced control techniques have opened up novel possibilities for food process control. Food processes have been particularly difficult to automate and control owing to non-uniformity and variability in raw-materials, and lack of sensors for real-time monitoring of key process variables and quality attributes. Model-based control, distributed control systems together with field communication protocols, and other computer-aided advanced control strategies have proven themselves in selected food processing applications. The benefits of advanced control techniques include reduced costs, increased quality and improved food safety.

V. Aim of the course

To develop the understanding of the concept of monitoring and optimization of food quality/characteristics and familiarize the students with the techniques involved.

VI. Theory

Unit I

The concept of Product-Process Monitoring in dairy and food industries; Definition of ‘quality’, optimization paradigm, quality-prediction model based on quality kinetics and process state equations, simulation modelling; Process/Product Optimization: optimization procedures – search methods, Response surface, differentiation and programming methods; neural networks, optimization software.

Unit II

Process Control: objectives, control loop, loop elements and their functions; Modes of process control; Control techniques; Control equipment.

Unit III

Real-time instrumentation: sensors, their classification based on proximity, working principle, examples of applications in process control; Requirements of on-line sensors; Biosensors – construction, types, working principles, applications, merits and limitations; Time-temperature indicators – partial-history and full-history indicators; Commercial devices; Applications and limitations; E-Nose and E-Tongue – Simulation of natural organs, components and their functions, applications.

Unit IV

Flavour analysis: flavour bioassays – Gas Chromatography-Olfactometry techniques; Isolation, separation and detection/identification of flavour compounds – GC-MS, LC-MS, NMR, FTIR; Analysis of chiral compounds.

Unit V

Formation of flavour compounds in milk and milk products during heat processing (including UHT processing, caramelization and extrusion cooking), fermentation and ripening (cultured products and cheese flavour, with special reference to bitterness) and storage (Maillard browning); Aroma losses/retention during the drying process (in rela-tion to milk powder, cheese powder and dry cultured products); Industrial processes for extraction of desirable and undesirable volatile components from fresh and/or stored products by supercritical fluid (SCF) technique.

Unit VI

Monitoring of food structure: Application of analytical techniques (Differential Thermal Analysis, Differential Scanning Calorimetry, X-ray crystallography, circular dichroismspectroscopy, dynamic light scattering, laser diffraction, image analysis and Nuclear Magnetic Resonance) to monitor the effect of processing and storage on structure of foods.

Unit VII

Emerging spectroscopic techniques in assessment of foods: Raman Spectroscopy and Electron Spin Spectroscopy – working principles and applications; Monitoring of irradiated foods, detection of lipid auto-oxidation, etc.; Microwave and NIR absorption/reflection methods for Compositional analyses; Automated milk analysers; Proximate principles in cheese and milk powder.

Unit VIII

Colour Characterization: colour and appearance (gloss and translucence) monitoring through visual colorimeter, tri-stimulus colorimeters and reflectance spectrophotometer, CIE, Hunter-Lab, Munsel and other systems of three-dimensional expression of colour; Colour-based sorting of foods; Computer vision – principles, applications and benefits.

VII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Prepare a protocol for specific food industry in which all critical processes are to be monitored
- Avoid chances of occurrence of structure defect in food product through monitoring of the food structure using latest methodologies (i.e. DSC, NMR, etc.)
- Improve and stabilize the color of the food system through color characterization methods

– Elucidate the development of flavor for flavor rich foods (i.e. cheese, Enzyme modified cheese, fermented dairy products, etc.)

I. Course Title : R&D Management in Dairy Industry

II. Course Code : DT 622

III. Credit Hours : 3+0

IV. Why this course?

Several dairy industries have separate R and D cell to carry out product innovation or to bring in more returns to the organization. Managing the R&D in a planned manner helps to deliver the goods to reap its benefit. Once patenting procedure is known, those research findings of extreme utility in dairy industry can be filed for patenting. The researches that have far reaching impact value should be taken for transfer of technologies within the limited time frame.

V. Aim of the course

To provide in-depth knowledge to students about selection and management of research projects and in patenting and transfer of technology processes.

VI. Theory

Unit I

Global scenario of R&D efforts in dairy processing; Determinants of Consumer Preferences; Competitive positioning and value chain configuration in global market.

Unit II

Management of human resources in dairy Industry: Structure and design of Research and Development organization; Analysis of organization behaviour – Transactional analysis; Personnel management – Typology analysis, individual and the organization, team building, human behaviour at work, motivation.

Unit III

Skill requirements of an R and D manager; New product development: strategies, models and life cycle analysis.Food innovation dynamics; innovation opportunities; innovations in traditional and functional foods; consumer driven food innovation; implementation of latest technology and assessment.

Unit IV

Management of R&D functions: Criterion for selection of R&D projects; Technology development process, Techniques for monitoring R and D functions.

Unit V

Patenting Laws; Indian Patenting Act/International Protocols for technology transfer; Transfer of technology from Lab to Plant, ISO 9001, ISO 14001, ISO 22000, ISO 50001, OHSAS; Laboratory Quality Management System- ISO 17025, Retailer Standards -BRC Food and BRC/IoP Standards, International Food Standard (IFS), SQF 1000 and SQF 2000, Global GAP and India GAP., Six-Sigma concept.

Unit VI

Project proposal writing for research funding, Development of feasibility and technical report for dairy plant establishment, Report writing of projects and its evaluation

VII. Learning outcome

After undergoing this course, the students are expected to deliver the following:
- Identify whether the researches carried out are suitable for patenting
- Help in selecting proper R and D projects for the benefit of the industry as well as for the consumers
- Can write Project proposals to bring in Research funding from external agencies for mutual benefit

I. Course Title : Advances in Carbohydrate Technology

II. Course Code : DT 623

III. Credit Hours : 3+0

IV. Why this course?

Besides proteins and fats, carbohydratesareother important nutrients. The flavour, colour and structure of food product also depend on the type and amount of carbohydrates present and their reactivity with other constituents during processing. Modified starches have been the recent addition to the list of stabilizers available for the food industry. Lactose – the carbohydrate of milk origin has a special role to play in dairy and food industry. Modifications of carbohydrates such as inversion, enzymic hydrolysis, maillard reaction can lead to value-addition in some food products.

V. Aim of the course

To study the physico-chemical and nutritional characteristics of carbohydrates, and their applications in food processing and health

VI. Theory

Unit I

Introduction to Carbohydrates: Classification, Sources of carbohydrates, Structure of major groups, Non-conventional sources of carbohydrates.

Unit II

Characterization and functional properties of Carbohydrates; Various classes of sweeteners; Production technologies for Corn Syrup Solids (CSS), High fructose corn syrup (HFCS); Maltodextrins; Phenomenon of retrogradation of starch and interventions in foods and methods to control it.

Unit III

Milk Carbohydrates: Manufacturing technologies and their functional, nutritional and technological properties; Lactose hydrolysed dairy products.

Unit IV

Nutritional and therapeutic aspects of carbohydrates: Role in dental caries, obesity, cardiovascular diseases (CVD), colon health, diabetes; resistant starches, Prebiotics, Non-digestible carbohydrates (NDC) and their health benefits.

Unit V

Modified starches: Technologies for starch modification; Properties, applications, safety and toxicity. Carbohydrate based edible packaging films.

Unit VI

Hydrocolloids: Classification, structures, functional properties, and applications.

Unit VII

Cyclodextrins; Carbohydrates as fat replacers/fat substitutes; microencapsulating agents; Techniques for production of protein-polysaccharide conjugates and their applications.

VII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Unravel the unconventional sources of carbohydrate for human nutrition
- To produce dairy foods free of allergenicity i.e. lactose-free for lactose intolerant persons
- Able to ameliorate defects in food product through knowledge about interaction of carbohydrates with other constituents in food during processing and/or storage
- To recommend reducing calorie in food (formulate dietetic food) through use of carbohydrate source to mimic properties of fat

Potential Areas for Research

1. Active, intelligent and biodegradable packaging
2. Application of non-thermal processes for value-added dairy products
3. Bioactives from plant/plant bio-waste for human nutrition
4. By-products from agri-food industry: Recovery, utilization and revalorization
5. Composite dairy foods
6. Dairy based analogues
7. Dairy derived ingredients and their applications
8. Green technologies for dairy and food products
9. Health foods for conferring physiological benefits
10. Innovations in fermented dairy and food products
11. Nanotechnology in dairy and food applications
12. Non-bovine milk and milk products
13. Novel extruded food based on dairy and cereal/legume based solids.
14. Novel products utilizing membrane processed dairy solids.
15. Sensory characterization, technology standardization, value addition and shelf life extension of traditional Indian dairy products
16. Target delivery of nutraceuticals/active functional ingredients through dairy matrices
17. Technology of novel and exotic cheeses
18. Utilization of dairy by-products

Course Contents
M.Tech. in Dairy Engineering

I. Course Title : Dairy and Food Engineering-I
II. Course Code : DE 511
III. Credit Hours : 3+0

IV. Why this course?

The development in mechanization and automation of the dairy and food processing are dependent on deeper knowledge of rheological, thermal and physical properties of the dairy and food products. Energy conservation and preservation of food quality during processing using emerging and non-thermal processes are the need of the hour. Therefore, this course is designed to provide the students a deeper understanding of the role of rheology and other food properties in the design, handling and operation of various processing equipment. Also, newer and emerging technologies are introduced to reduce the impact of processing on food quality.

V. Aim of the course

- To familiarize with the study of rheological properties of food and their measurements.
- To introduce the developments in thermal and non-thermal processing of foods

VI. Theory

Unit I

Viscoelastic characterisation of materials, stress-strain behaviour, creep, stress relaxation, solving problems on creep and stress relaxation of foods, non-Newtonian fluids; Viscometry-capillary and rotational viscometers, derivation on principle of operation of capillary and rotational viscometers, fitting of flow models; Rheometers: types and applications, temperature sweep, amplitude sweep and frequency sweep; identification of LV region.

Unit II

Freezing: IQF, Cryogenic freezing- process and equipment details, freezing curves, freezing time calculations, design of freezing equipment, freeze drying, freeze concentration.

Unit III

Design of single and multi-effect evaporators, design of TVR and MVR, design and selection of evaporator pumps, calculation of wetting rate, concept of condenser free design of evaporator, design of condenser (barometric and surface), flash vessel, preheater design for bacterial destruction, DSI, vacuum pump, concept of fanless cooling tower, aroma recovery unit.

Unit IV

Design of spray drier and its components, design of three stage drier, selection of fans, roots blower, selection of nozzle, HPP cum homogeniser used for automation, CIP, cleanable bag filter, concept of cyclone free spray drier operation, use of computer software in design of evaporators and spray driers.

Unit V

Novel processing methods and equipment: high pressure processing, ohmic heating, ultraviolet light, pulsed electric field, pulsed light field, micro and nano-encapsulation, microwave heating, cold plasma, ultrasound processing and low dose e-beams.

Unit VI

Ultra-high temperature processing (UHT): concept, process, system; Design: plate and tubular type, their merits and demerits and selection; heat balances and concept of differential temperature; steam cleaning systems. Analysis of sterilization performance and validation, determination of residence time distribution.Pouch forming, can and carton filling systems for UHT. Cleaning and sterilization of UHT processing plants

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Case Analysis and case studies
- Guest Lectures
- Industry Visit

VIII. Learning outcome

The students will be more confident in design and operation of dairy and food process equipment. They will also be familiar with non-thermal processes and emerging processing methods in the manufacture of dairy and food products.

I. Course Title : Analytical Heat and Mass Transfer

II. Course Code : DE 512

III. Credit Hours : 2+1

IV. Why this course?

Heat and mass transfer are the basic transport processes occurring in all the unit operations. These are complex processes because these occur mostly simultaneously and under unsteady state conditions with continuous changes in product characteristics. These also affect the efficiency and productivity of food processing lines. Deeper analytical solutions to heat and mass transfer operations are therefore needed. This course is aimed to provide solutions to such complex heat and mass transport processes, which will help in the design of efficient process equipment.

V. Aim of the course

- To introduce two dimensional and unsteady state of heat transfer.
- To introduce the forced convective heat transfer and relationships with dimensionless numbers.
- To learn appropriate design and analytical tools to investigate heat and mass transport phenomena
- To apply various computational techniques to obtain numerical solutions of these phenomena

VI. Theory

Unit I

One-dimensional steady state heat conduction through fins (Extended surfaces): actual and approximate solution. Efficiency, effectiveness and design of profile area of fins.

Unit II

Two-dimensional steady state heat conduction: analytical and numerical solution.

Unit III

Unsteady state heat conduction: Concept of Biot number, Lumped parameter analysis, transient heat flow in semi-infinite solids, use of Heisler charts.

Unit IV

Forced convection heat transfer in flow over a flat surface: hydrodynamic and thermal boundary layer, continuity equation, momentum equation and energy equation, heat transfer coefficient/ Nusselt number in laminar and turbulent region of boundary layer. Stanton number; Colburn analogy; empirical co-relations.

Unit V

Forced convection heat transfer in flow through tubes: Nusselt number in the entrance region and fully developed laminar and turbulent region.

Unit VI

Condensation and boiling heat transfer: Film wise condensation on vertical surface; Nusselt equation, regimes of boiling, boiling heat transfer.

Unit VII

Performance analysis of parallel flow and counter flow heat exchangers. LMTD and effectiveness NTU approach. Application of computational software for process heat transfer applications.

Unit VIII

Mass transfer - Fick's law of diffusion, diffusion of gases and liquids through solids, equimolar diffusion, isothermal evaporation of water into air, mass transfer coefficients. Governing equation for mass transfer; boundary conditions. Various non-dimensional numbers and their analogy to heat transfer. Examples of simultaneous heat and mass transfer

VII. Practical Topics

- Steady state heat conduction through fins
- Two-dimensional steady state heat conduction
- Solving problems in unsteady state heat conduction and use of Heisler charts
- Experiments on forced convection heat transfer
- Experiments on drop and film-wise condensation
- Determination of heat transfer coefficient
- Solving problems in condensation and boiling heat transfer
- Solving problems on mass transfer in diffusion and evaporation
- Experiments in parallel flow/ counter flow heat exchanger test rig
- Determination of mass transfer coefficient
- Design of engineering systems involving thermofluid phenomena.

VIII. Teaching Methods

– Lecture
– Assignment Writing
– Student presentation
– Solving problems
– Familiarising with relevant software

IX. Learning outcome

Students have better understanding of heat and mass transfer processes and the skills to obtain solutions to such complex problems. They will develop competence in the design of process equipment using the analytical solutions of heat and mass transfer.

I. Course Title : Transport Phenomena

II. Course Code : DE 513

III. Credit Hours : 3+0

IV. Why this course?

An understanding of uniform approach to mass, energy and momentum transfer is necessary in modelling and predicting the above phenomena in food processing operations. This course provides engineering students advance methods to solve problems involving transports of momentum, energy and mass in biological, mechanical and chemical systems using a unified approach. Emphasis is given on developing the mathematical models to describe the flow phenomena.

V. Aim of the course

- To introduce the transport phenomena of mass, energy and momentum.
- To study the transport phenomena with the help of dimensional analysis.

VI. Theory

Unit I

Introduction to vector analysis, dot product and cross product and its physical significance, Stress tensor, total and partial derivatives, total acceleration, Eulerian and Lagragian frames of reference, Reynolds transport theorem, Different three-dimensional co-ordinate systems (Cartesian and Polar).

Unit II

Introduction to transport phenomena - transport processes and similarities in momentum, energy and mass transfer; Application of transport phenomena in CFD, practical examples in food engineering. Classification of flows and flow visualization; vorticity and potential and stream function, Potential flow, Cauchy Reimann equations.

Unit III

Steady-state equations - Momentum transport equations for Newtonian and non-Newtonianfluids, continuity equation in different co-ordinates; Derivation for Cartesian, cylindrical and spherical coordinate system.

Unit IV

Equations of motion - Navier-Stokes equations and their application in viscous fluid flow between parallel plates and through pipes.

Unit V

Turbulent transport mechanism - Mathematical analysis; Eddy viscosity and eddy diffusivity; Velocity, temperature and concentration distribution; time smoothing equations. Inter-phase transport in isothermal system -friction factors for various geometries.

Unit VI

Dimensional analysis- Buckingham Pi-theorem and matrix method, application to transport phenomena, analysis among mass, heat and momentum transfer, Reynolds' and Chilton –Colburn analogy.

Unit VII

Non-dimensional numbers in transport phenomena- definition, mathematical relation and physical significance; Boundary layer concept - Theoretical and exact solutions for heat, mass and momentum transfer. Governing equations, Blassius solution and Von-Karmen integral equation

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Familiarising with relevant software
- Industry Visit

VIII. Learning outcome

Student will obtain the knowledge and analytical skills to modelling and predicting the action of mass, energy and momentum transfer. They will be able to solve, using rigorous mathematics, fundamental and elucidating problems involving momentum, energy, and mass transport phenomena and apply this knowledge in design and operation of processing equipment.

I. Course Title : Advances in Refrigeration Engineering

II. Course Code : DE 514

III. Credit Hours : 2+1

IV. Why this course?

Refrigeration engineering is an essential technology to preserve the food products. It is an integral part of dairy industry as milk and milk products have very short shelf life. This course is intended to impart knowledge on design aspects of refrigeration and air conditioning systems, system analysis and load calculations. Troubleshooting techniques are explained with the use of wiring diagrams, schematics and 3D sketches.

V. Aim of the course

- To study the various components and the parameters that affect the performance of vapour compression refrigeration
- To study the vapour absorption refrigeration systems

- To study heat pumps and their applications in dairy industry
- To study design and maintenance of cold stores.
- To study controls of refrigeration systems

VI. Theory

Unit I

Vapour compression refrigeration system: major components and their different types; Theoretical vapour compression cycle, theoretical COP; Effect of operating parameters on COP; actual vapour compression cycle; Multi-pressure commercial refrigeration systems.

Unit II

Vapour absorption refrigeration system; Ammonia-water system, lithium bromide - water system, vapour absorption refrigeration cycle and its representation on enthalpy-concentration diagram; Absorption system calculations.

Unit III

Heat Pumps: different heat pump circuits; analysis of heat pump cycle; Use of heat pumps in dairy plant for energy conservation.

Unit IV

Non-conventional refrigeration systems; Steam jet refrigeration, thermoelectric refrigeration, vortex tube, cooling by adiabatic demagnetization.

Unit V

Design elements of refrigeration equipment: compressor, condenser, evaporator, cooling tower, spray pond, etc. Balancing of different components. Design of brazed PHE for condensers

Unit VI

Design of cold storage and air-conditioning systems: types of cooling loads and their calculation, design of cold storage for food products, construction of cold storage, equipment selection, insulating materials, vapour barriers, ice bank tank. Concept of Ice silos, centralised distribution of ammonia through pump, PUF panel design.

Unit VII

Control and maintenance of a commercial refrigeration plant: Pressure regulating valves, Thermostatic valves, LP/ HP cut-outs, high to low side bypass valve, condenser water regulating valve, capacity control devices, pump down control, defrosting methods, liquid charging, advanced intelligent control systems; General preventive maintenance of refrigeration plant.

VII. Practical

- To find and compare the theoretical and actual COP of a small refrigeration unit on Refrigeration Tutor.
- Study and design of refrigeration components of a bulk milk chiller.
- Visit to a commercial refrigeration plant for cold storage/ ice bank unit and calculation of its theoretical COP by making cycle on P-h chart.
- Calculation of theoretical work and comparing it with actual work for some specified cooling job in a commercial plant.
- Study of various control and safety devices in a commercial refrigeration plant.

- Design problems on cold storage for different food/ dairy products.
- Use of computer software specific to cold store AC design
- Study the working of heat pump system.
- Study and design of refrigeration components of a walk-in-cooler
- Evaluate actual performance of a heat pump on heat pump tutor.
- Study of compressors used in vapour compression refrigeration system.
- Study of condensers and expansion devices used in vapour compression refrigeration system
- Study of cooling towers used in vapour compression refrigeration system.
- Industry visit

VIII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Case Analysis and case studies
- Guest Lectures
- Industry Visit

IX. Learning outcome

The students will be familiar with newer technologies like heat pumps, improved VAR systems and cold store prefabricated designs. Students will also be familiar with improved application of energy efficiencies and automation in refrigeration systems. They can apply this knowledge to perform cooling load calculations and service and troubleshoot commercial refrigeration systems.

I. Course Title : Design of Food and Dairy Processing Equipment

II. Course Code : DE 515

III. Credit Hours : 2+1

IV. Why this course?

The knowledge of various design codes and steps are needed to understand the design and fabrication of dairy and food processing equipment. These are also essential to design new equipment as well as prevent equipment failure. The challenges are to develop machines/gadgets that are responsive to the customer with high quality and low cost. This course is aimed to provide the students with working knowledge of design principles as applied in food and dairy processing operations. In this course, the students will learn how to design major equipment common to most unit operations using relevant CAD/CAM software.

V. Aim of the course

To study design and various codes for pressure vessels, heat exchangers and reactors

VI. Theory

Unit I

Design of vessels: codes and regulations, Design for pressure and temperature, loading; allowable stress, minimum thickness after forming, design for internal and external pressure, cylindrical and spherical shells, formed heads, reinforcement openings; fabrication requirements, inspection, tests and non-destructive examination, pressure tests, design and stress evaluation, design problem.

Unit II

Design of storage vessels/ tanks, horizontal and vertical tanks, design of insulated and un-insulated tanks, nozzles and mountings, Design problems.

Unit III

Design of high-pressure vessels: constructional features, material for high pressure, multi shell construction, solid walled vessel.

Unit IV

Supports for vessel: bracket support or Lug support, web (gusset plates), skirt support, skirt design, skirt bearing plate, saddle support, Design problems.

Unit V

Heat exchangers: shell and tube heat exchangers, construction codes, general design considerations, U- tube heat exchangers, double pipe exchanger, scraped surface exchanger, spiral tube exchangers, joints; welded tube joints, baffles and tube bundles, tube sheet, double tube sheet construction; plate type heat exchanger; air cooled heat exchangers; Computer software for design of heat exchanger, Design problems.

Unit VI

Design of reactor vessel: material of construction, agitation, classification, heating systems, design consideration, tank coils, design of agitation system components, baffles, power requirement for agitation, Hygienic engineering design.

Unit VII

Fundamentals of CAD/ CAM for design of dairy and food processing equipment.

VII. Practical

- Design of storage tanks and silos
- Design of supports for silos and tanks
- Design of high pressure vessels
- Design of plate heat exchanger
- Design of scraped surface heat exchanger

- Design of air cooled heat exchangers
- Computation of power requirement of agitators
- Exercises on use of CAD/CAM software for design of heat exchangers
- Use of computational software for design of heat exchangers

VIII. Teaching Methods

– Lecture
– Assignment Writing
– Student presentation
– Case Analysis and case studies
– Guest Lectures
– Industry Visit

IX. Learning outcome

The students will understand the impact of various constraints on product design and process planning. The knowledge and understanding of design codes and procedures would help to understand, operate the processing equipment as well as design new equipment that are efficient and safe to operate. The students can analyse structures using computer software and expedite the design process of various equipment used in the dairy and food industry.

I. Course Title : Engineering Properties of Dairy and Food Products

II. Course Code : DE 516

III. Credit Hours : 2+1

IV. Why this course?

The successful and efficient design and operation of process equipment depend on the information and knowledge of engineering properties of dairy and food products. This course is to acquaint the students with different techniques of measurement of engineering properties of biological materials and their importance in the design of food processing equipment. The student will be taught to design and conduct experiments for measuring different properties of biological materials, as well as to analyze and interpret data. Also, the students will acquire knowledge on the application of physical properties to design a system, component, or engineering process to meet desired needs.

V. Aim of the course

- To familiarize with the engineering properties of food products and their measurement.
- To study the application of the properties in design of food process equipment.

VI. Theory

Unit I

Geometrical Properties; Shape, size, volume, density, porosity, surface areas, friction, rolling resistance, angle of repose, specific surface area, mean diameter, sphericity, particle size analysis, Hausner's ratio, Carr's index.

Unit II

Aerodynamic, Hydrodynamic and Frictional Properties; Drag coefficient, terminal velocity, Relation between drag coefficient and Reynolds number, terminal velocity from time distance relation. Pressure drop through packed beds.

Unit III

Thermal properties; Specific heat, thermal conductivity, thermal diffusivity, methods of determination, steady state and transient heat flow, enthalpy, surface heat transfer coefficient freezing point. Measurement of thermal properties and prediction techniques.

Unit IV

Electrical conductivity, capacitance, inductance, Dielectric properties, viz. dielectric and microwave, dielectric constant, Dielectric loss factor, loss tangent, energy absorption, heating; Optical properties, colorimetry, transmittance and reflectance.

Unit V

Non-destructive quality evaluation techniques; Measurement techniques and instruments for food quality determination, destructive and non-destructive quality evaluation, UV-VIS NIR spectroscopy, X-ray, CT, NMR, machine vision system. FTIR, DSC, machine vision system, particle size determination by laser diffraction, e-nose, biosensors, etc.

Unit VI

Application of engineering properties in equipment design, processing and handling of dairy and food products.

VII. Practical

- Determination of geometric mean diameter, sphericity and surface area
- Determination of angle of repose and coefficient of internal friction
- Determination of bulk density, tapped density, true density, porosity, Hausner's ratio and Carr's index
- Particle size distribution analysis
- Determination of aerodynamic properties such as terminal velocity, lift and drag force for grains and particulates.
- Use of empirical equations for determination of thermal properties
- Determination of thermal conductivity, thermal resistivity and specific heat of food materials
- Estimation of surface heat transfer coefficient
- Measurement of electrical conductivity and dielectric properties
- Colour measurement and determination of CIELAB colour parameters
- Study of machine vision system

VIII. Teaching Methods

– Lecture

– Assignment Writing
– Student presentation
– Solving problems
– Familiarising with relevant software

IX. Learning outcome

The student will be familiar with engineering properties of food products and methods to determine these properties. They will be able to apply the fundamentals of engineering sciences to characterize the physical and rheological properties of biological materials. The students can apply the physical, aerodynamic and rheological data in the design of agricultural and food processing machines and processing systems and to various unit operations in the food industry.

I. Course Title : Mechanization in Manufacturing of Indigenous Dairy Products

II. Course Code : DE 517

III. Credit Hours : 3+0

IV. Why this course?

The focus of the industry today is now on hygienic, mechanized and mass production of indigenous dairy products. This trend is due to the greater urbanization and higher disposable income and life style change. This course is going to cover all these aspects.

V. Aim of the course

- To design equipment suitable for manufacture of indigenous dairy products.
- To adopt, modify SSHE for continuous manufacture of indigenous dairy products.
- To upscale these equipment for a large scale, hygienic and safe production of indigenous dairy products

VI. Theory

Unit I

Present status of mechanization in manufacture of indigenous dairy products.

Unit II

Preliminary design calculations and material selection, design considerations like force alignment and vibration. Analysis of stresses and strains in rectangular and polar coordinates; Cauchy's formula, principal stresses and principal strains. Failure modes and effects analysis. Manufacturing system types and principles, manufacturing models- physical and mathematical models, realistic model building and design of prototypes.

Unit III

Design of liquid-filled SSHE for preheating applications; Design of equipment for batch and continuous mechanized manufacture of khoa, khoa-based sweets, chhana and chhana-based sweets; Conical process vat, single SSHE, triple SSHE, etc. Equipment for manufacture of batch and continuous manufacture of fermented dairy products, paneer, butter and ghee. Sizing and optimization. Cooling systems for viscous products. Machining standards for stainless steel.

Unit IV

Instrumentation and automation in manufacturing of indigenous dairy products. Automatic filling machines. Changes in engineering properties of milk during manufacture of indigenous dairy products.

Unit V

Design, layout and preparation of project report for establishing unit for the manufacture of indigenous dairy products. Scaling up of prototypes to commercial capacity.

VII. Teaching Methods

– Lecture
– Assignment Writing
– Student presentation
– Familiarising with relevant software
– Industry visit

VIII. Learning outcome

The student familiarizes with equipment manufacture suitable for the typical indigenous dairy products. Also the ability to adopt heat exchanger design suitable to manufacture these products in large scale, continuous manufacture under hygienic condition

I. **Course Title** : **Dairy and Food Engineering-II**
II. **Course Code** : **DE 521**
III. **Credit Hours** : **3+0**

IV. Why this course?

Shelf life of a food is governed by internal and external factors and the type of packaging used. Thus, water activity, package permeability and temperature determine the shelf life of a food. This course is aimed to acquaint the students to integrate these factors to evaluate, model and validate the shelf life of a food product. Also newer methods of non-thermal preservation process like membrane technology and also some of the efficient thermal processes like microwave heating to be better understood and applied.

V. Aim of the course

- To study role of water activity in food preservation.
- To study different packaging material, their properties and effect on shelf life of food products
- To study membrane processing and microwave heating of food products

VI. Theory

Unit I

Water activity and states: a thermodynamic quantity, water sorption isotherms, hysteresis, theories of sorption hysteresis, water activity measurement methods, water binding, control of water activity and moisture; Relationship between water activity and glass transition. Diffusion and sorption kinetics of water in foods

Unit II

Different types of packaging materials, their key properties and applications, Plastic packaging, different types of polymers used in food packaging and their barrier properties. Recent innovations in packaging, identification and testing of packaging materials

Unit III

Permeability and shelf-life: theoretical considerations, permeability to gases and vapours, measurement methods, permeability of multiplayer materials, permeability in relation to packaging requirements of food products. Development of shelf-life models based on moisture gain, lipid oxidation and light.

Unit IV

Calculation of shelf life and requirements for packaging, deteriorative reactions accelerated testing, relationship between transport properties of the package and shelf life of packaged products, simulation of product package- environment interaction, shelf life simulation for moisture, oxygen and light sensitive products.

Unit V

Theory of ultra-filtration, reverse osmosis and electrodialysis, selection and types of membrane and properties, concentration polarization, mathematical description of flow through membrane, application and use in dairy industry. Design calculation and selection of various membrane systems.

Unit VI

Microwave energy absorption, physical parameters in microwave heating processes, heat transfer phenomena, equipment and application in dairy food industry. Types of waveguides, electromagnetic resonators and microwave tubes.

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Familiarising with relevant software
- Industry visit

VIII. Learning outcome

Students can design and select packaging material to achieve desired shelf life of a wide variety of food and dairy products. An understanding of application of newer technologies such as Membrane processing, and Microwave heating is also achieved.

I. Course Title : Bio-Thermal Process Engineering

II. Course Code : DE 522

III. Credit Hours : 3+0

IV. Why this course?

The trend towards longer shelf life milk products is necessitating a closer look at the reaction kinetics and the areas of thermo-bacteriology and fermenters for controlled reaction studies. Also, the field of bioprocessing is developing very rapidly and needs skilled engineers with the background to design, build, control, and operate bioreactors and fermenters. This course provides students with advanced concepts and prepares them to meet the challenges of the new and emerging area of bioprocessing in the food industry.

V. Aim of the course

- To study biochemical reaction kinetics, reaction vessel design and operation.
- To study thermal effects on the UHT processed food products.

VI. Theory

Unit I

Introduction to biochemical engineering: biochemical kinetics, kinetics of substrate utilization, enzyme reaction, growth of microorganisms, fermenters, pasteurization and sterilization and thermal destruction.

Unit II

Design and analysis of fermentation vessels: residence time distribution, reactors in food processing, reactor types, analysis of reactor systems.

Unit III

Mixing in reactors: mixing equipment, power consumption, gas-liquid mixing, liquid-liquid dispersion, solids suspension and solid-liquid mass transfer. Scale-up of mixers and alternative mixing devices.

Unit IV

UHT systems and recent advances: factors affecting spoilage of food, Aseptic packaging systems and conditions.

Unit V

Thermo-bacteriology: Survivor curve, thermal death curve, Arrhenius curve, techniques for determination of heat resistance of microorganisms, analysis of thermal resistance data, processing in containers, process time, lethality, design of batch and continuous sterilisation cycles in vat.

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Familiarising with relevant software

VIII. Learning outcome

Student will be familiar with biochemical reaction kinetics and the design of equipment to study the same. The student will also understand the mixing equipment and their dynamic and scale up relationships. A better understanding of UHT processes in perspective of reactions will be achieved.

I. Course Title : Industrial Instrumentation and Process Control

II. Course Code : DE 523

III. Credit Hours : 2+1

IV. Why this course?

With the advancements in electronics, automation has become the trend in dairy industry. Automation enables better control of the process operations resulting in improved efficiency. Therefore, understanding of computer control of instrumentation and automation is essential in the rapidly developing field of Automation in Dairy and Food Industry.

V. Aim of the course

- To study microprocessor based instruments used in industries.
- To study various control systems for process control.
- To study computer based control systems.

VI. Theory

Unit I

Introduction; Instrumentation systems and its classification, measuring instruments, characteristics of instruments, intelligent versus dumb instruments, Microprocessor based instrumentation, Function of measurement systems, its elements and applications. Industrial instrumentation, Structure of industrial instrumentation in real time applications

Unit II

Control Systems; Feedback principles. Mechanical, hydraulic and pneumatic system components. Characteristics of liquid system, gas system, thermal system. Mathematical model of liquid process, gas process, flow process, thermal process, mixing process, Chemical reaction, D.C. and A.C. Servomotors, D.C. and A.C. Tachogenerators, Potentiometers and optical encoders, Synchro and stepper motors, Modelling and objectives of modelling for batch and continuous processes, Self-regulation. Pneumatic valves

Unit III

Process Control and Controllers; Principles of automatic process control, Process characteristics, control system parameters, Process control loop, Elements of process control, process variables, Process facility considerations, controller modes, lag time, error signals, and correction signals, Actuators and Control valves; on-off, P, PI, P-I-D, cascade, feed forward, and ratio controllers, Fuzzy controllers. Data loggers and data acquisition, Introduction to computer based control systems, PLC, DCS, SCADA, HMI, etc.

Unit IV

Modern Transducers and Display Devices; Silicon micro transducers, optical transducer principles, types, characteristics of fibres and fibre optic transducers, Introduction to smart transducers and their applications, displays and their classification - Storage CRTs, Flat CRTs, LEDs, LCD display, Gas discharge plasma displays, Incandescent display, Electrophoretic image displays (EPID), Liquid vapour display (LVD).

Unit V

Introduction to computer based control; Computer based controller, data logging, supervisory control, flow chart, control system networks, basic structure and operation of programmable logic controllers (PLCs).

VII. Practical

- Study and analysis of electric switches, networks, electromechanical relays, MCB, SCR etc.
- Study of CRO and digital display devices.
- Study of automation techniques to control temperature by using PID controller.
- Study and application of digital timer to control timing of various processes, working of controllers in constant temperature water baths
- Make ladder diagrams and flow sheet diagrams for control logics in PLC.
- Study programme of a PLC and computer interface of a PLC.
- Study the characteristics of resistance transducer potentiometer and calibration of ammeter, voltmeter using DC potentiometer.
- Characteristics of LDR, photo diode, and phototransistor:
  – Variable illumination.
  – Linear displacement.
- Study of storage oscilloscope and transient response of RLC circuit.
- Study the characteristics of one solid state sensor/ fibre optic sensor
- Design and test a signal conditioning circuit for the transducers.
- Visit to a microprocessor controlled dairy plant

VIII. Teaching Methods

– Lecture
– Assignment Writing
– Student presentation
– Solving problems
– Industry visit

IX. Learning outcome

Students will get an insight on advanced data acquisition, processing and monitoring systems that provide dynamic responses of various systems. The student will learn about various systems and levels of automation involved in operation and control of dairy plant and the link up of computer software to it.

I. Course Title : Industrial Automation and Robotics

II. Course Code : DE 524

III. Credit Hours : 3+0

IV. Why this course?

The understanding of the Microprocessor controls, SCADA and Robotics and their application in material handling, process control and supervision is essential in large food industry. This course is going to cover all these aspects.

V. Aim of the course

- To study automation, role in material handling and manufacturing systems.
- To study computer based industrial automation, SCADA, etc.
- To study elements of Robotics.

VI. Theory

Unit I

Introduction; Automation in Production System, principles and strategies of automation, basic elements of an automated system, advanced automation functions, levels of automation. Flow lines and transfer mechanisms, fundamentals of transfer lines.

Unit II

Material handling and Identification Technologies: Overview of Material Handling Systems, Principles and Design Consideration, Material Transport Systems, Storage Systems, Overview of Automatic Identification Methods.

Unit III

Automated manufacturing systems; Components, classification and overview of manufacturing systems, Manufacturing cells, GT and Cellular manufacturing, FMS, FMS and its planning and implementation. Quality control systems: Traditional and modern quality control methods, SPC tools, inspection principles and practices, inspection technologies.

Unit IV

Control technologies in automation; Industrial control systems. Manufacturing industries, continuous versus discrete control, computer process and its forms.

Unit V

Computer based industrial control; Introduction and automatic process control building blocks of automation systems; LAN, Analog and Digital I/O modules, SCADA systems and RTU. Distributed control system: Functional requirements, configurations and some popular distributed control systems. Industrial control applications in dairy and food processing industry. Microcontroller units (MCU); Arduino, Raspberry Pi sensors compatible with MCUs: temperature- RH, ultrasound and infrared sensors.

Unit VI

Basic principles of robotics, configurations, control. Application of machine vision systems, Image processing and analysis. Typical pick and place, loading and unloading, packaging and palletizing applications.

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Familiarising with relevant software

VIII. Learning outcome

Student will have knowledge of application of Robotics in the operations of the food processing industry. Also acquire knowledge of microcontroller applications and the components of automation in using them.

I. Course Title : Unit Operations

II. Course Code : DE 525

III. Credit Hours : 2+1

IV. Why this course?

Many of processing steps are categorized and studied under independent operations called Unit Operations. It is important to study these individually, so that in the larger context, these can be seamlessly integrated into the industrial operations. Treatment of the process in terms of individual unit operations allows process engineers to move away from product specific operation to one which is general. In order to manufacture a product of desired quality with the maximum yield, each unit operation must be designed correctly. Mathematical treatment of the process can lead to prediction of conditions that give the highest efficiency. This course is specifically designed for students of food processing disciplines, so that these can be exposed to various unit operations that would enable them to improve the design and operation of food processing plants.

V. Aim of the course

- To study various unit operations in food processing.
- To study crystallization and distillation in food processing.
- To study extrusion, extraction, expelling in food processing.

VI. Theory

Unit I

Grading, cleaning, washing, sorting, shelling, dehusking, decortication, milling, polishing, pearling, drying (evaporative, osmotic and freeze drying), Mixing, clarification, coagulation, mechanical separation, sedimentation.

Unit II

Handling of food products; Mechanics of bulk solids, selection of bulk handling equipment, operation and construction of conveyors and elevators, viz. belt conveyors, screw/auger conveyors, bucket elevators and drag/chain conveyors. Estimation of energy requirement, damage to products during mechanical handling. Operation and maintenance of conveying equipment.

Unit III

Mechanical cleaning and sizing of food products – size reduction, size characteristics, particle geometry, energy for size reduction of granular materials and dry powders, size- reduction equipment, performance characteristics of size reducers. Different milling methods, cryogenic grinding.

Unit IV

Crystallization; Material and energy balance in crystallizers, Principles of crystal growth, super saturation and nuclei formation, operation of batch and continuous crystallizers.

Unit V

Distillation; Flash-off distillation, binary mixtures, differential distillation, steam distillation.

Unit VI

Flow through porous media, adsorption, pressing, expelling, extraction, palletizing, and extrusion.

VII. Practical

- Performance evaluation of cleaning and sorting equipment- destoners, spiral separators, graders, etc.
- Performance evaluation of size reduction equipment- disc grinders, hammer mill, ball mill, etc.
- Calculation of energy for size reduction through Kick's, Bond's and Rittinger's laws.
- Determination of particle size distribution of powders by ASTM sieve analysis
- Application of rotary and vacuum evaporator for concentration of liquid foods
- Use of distillation for solvent extraction of oleoresins and essential oils
- Performance evaluation of conveying equipment- screw conveyors, belt conveyors, bucket elevators, etc.

VIII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Industry visit

IX. Learning outcome

Student will have good understanding of the unit operations like size reduction, crystallization, distillation, material handling and the energies involved in these operations. This course serves to integrate the fundamental concepts learned with various industrial operations of manufacturing of food products. Also the knowledge gained in the treatment of one process can be used to a completely new process.

I. Course Title : Environmental Engineering

II. Course Code : DE 526

III. Credit Hours : 2+0

IV. Why this course?

There is a continuous change in the environmental norms and regulatory standards of the country and all industries including dairy and food industry have to follow them. This requires up gradation of techniques for treatment of wastewater and solid waste from the industries. Hence, it is important to have good understanding of the latest methods of treatment of the dairy industry effluents and their safe, economic and legal disposal.

V. Aim of the course

- To study waste water characteristics, measurement and its treatment methods.
- To study air pollution and methods to control it.

VI. Theory

Unit I

Waste water sources, characteristics, standards for disposal of dairy waste water.

Unit II

Physical, chemical and biological characteristics of waste water, measurement of organic content in waste water

Unit III

Physical unit operations in waste water treatment: screening, racks, mixing, flocculation, sedimentation, floatation, elutriation, vacuum filtration and incineration.

Unit IV

Chemical unit operations in waste water treatment: reaction kinetics, chemical precipitation, aeration and gas transfer process, rate of gas transfer, adsorption and disinfection.

Unit V

Biological unit operations- aerobic and anaerobic cycles, kinetics of biological growth, application of kinetics to treatment systems, aerobic waste treatment, anaerobic waste treatment

Unit VI

Air conditioning systems: clean – room air conditioning; important pollutants of air; properties of particulate matter and air pollution control methods. Dairy plant fire hazards.

VII. Teaching Methods

- Lecture
- Assignment Writing
- Student presentation
- Solving problems
- Industry visit

VIII. Learning outcome

Student will be able to learn the advances in physical, chemical and biological operations of dairy waste treatment and effluent disposal. This will enable them to identify and implement scientific and technological solutions to various environmental problems. Also, they will learn about control methods to provide clean and conditioned air for enclosures in dairy plant operations.

I. Course Title : Energy Management and Auditing in Dairy and Food Plants

II. Course Code : DE 527

III. Credit Hours : 3+0

IV. Why this course?

The energy cost is increasing as fossil fuels are being depleted. Lot of energy is used for heating and refrigeration purpose in the dairy industry. Therefore, there is a need for understanding and implementing various methods of 'Energy Conservation and Management' in the dairy industry. This is important in view of reducing environmental pollution too.

V. Aim of the course

- To study methods of identifying various Energy Conservation opportunities in dairy and food plants.
- To study various methods involved in Energy Management in dairy and food plants
- To study methods and steps involved in Energy Auditing in dairy and food plants.

VI. Theory

Unit I

Energy audit; its need and types. Bench marking of energy costs. Matching energy use to requirement. Optimizing the input energy requirements. Fuel and energy substitution. Energy Balance and computation of efficiency of energy.

Unit II

High efficiency boilers, improved combustion techniques, energy conservation in steam distribution systems, upkeep and maintenance of steam auxiliaries and fittings.

Unit III

Electrical load management; Demand management, Energy saving controllers, Power factor and its improvement. Transformer; Energy saving in transformers.

Unit IV

Electric motor; Selection and application, energy efficient motors. Variable speed drives and Variable Frequency drives. Industrial lighting

Unit V

Energy conservation in Refrigeration and Cold storages, cooling towers, pumps and pumping systems, fans, blowers, air compressors, Maintenance and upkeep of vacuum and compressed air pipelines.

Unit VI

Processing equipment; Improving efficiency and energy conservation opportunities in kettles, PHEs, Evaporators and Driers. Hot air generator, thermic fluid heater, steam radiator, waste heat recovery and thermal energy storage in food processing facilities, condensate recovery and reuse.

VII. Practical

- Bench marking for various dairy plant operations
- Computation of energy conservation in boilers and steam distribution
- Computation of energy demand management of a dairy plant
- Computation of energy savings in induction motors and transformers
- Exercise on variable frequency drive applications
- Computation of cooling load and energy savings in refrigeration plant and cold stores
- Computation of energy savings in air compressor and compressed air distribution
- Computation of energy savings in counter-current plate heat exchangers and HTST pasteurizer

- Computation of energy saving in multiple effect evaporators and modern dryers
- Energy audit of a dairy plant

VIII. Teaching Methods

– Lecture
– Assignment Writing
– Student presentation
– Solving problems
– Industry visit

IX. Learning outcome

Student will gain knowledge of different types of Energy Auditing, Energy Conservation and substitution with Renewable Energy. Important aspects of Electrical load management and selection and up gradation of equipment to higher energy efficiency to save energy will be covered.

Course Title with Credit Load
Ph.D. in Dairy Engineering

Course Code	Course Titles	Credit Hours
Major Courses		
DE 611**	Advances in Dairy Process Engineering	3+1
DE 612	Advances in Heat Transfer	3+0
DE 613	Physicochemical Processes	3+0
DE 621**	Computational Methods and Simulation in Dairy and Food Engineering	2+1
DE 622	Package Permeability and Shelf-Life Modelling	3+0
DE 624	Special Problems	0+2
DE 691	Doctoral Seminar I	1+0
DE 692	Doctoral Seminar II	1+0
DE 699	Doctoral Research	0+75

Minor Courses

The courses will be selected from the allied disciplines of Dairy Technology, Dairy Chemistry and Dairy Microbiology to meet the minimum credit requirements.

Supporting Courses

The supporting courses will be picked from the basket of courses offered in agricultural statistics, computer applications and IT, and other related relevant disciplines to meet the minimum credit requirements.

Common Courses

1.	Library and Information Services	1
2.	Technical Writing and Communications Skills	1
3.	Intellectual Property and its Management in Agriculture	1
4.	Basic Concepts in Laboratory Techniques	1

*Core courses for Master's programme;
**Core courses for Doctoral programme

Course Contents
Ph.D. in Dairy Engineering

I. Course Title : Advances in Dairy Process Engineering
II. Course Code : DE 611
III. Credit Hours : 3+1

IV. Why this course?

To provide the latest methodologies of simulation and modelling for designing of process equipment, problem solving in operation and maintenance of evaporators, driers and mixing equipment. This course is going to cover all these aspects.

V. Aim of the course

To impart knowledge on design and analysis of selected dairy equipment.

VI. Theory

Unit I

Evaporator designs and selection, piping and instrumentation diagrams of evaporator systems, heat and mass balance in single effect system, vapour recompression and impact on efficiency, layout and design calculations of multiple effect evaporator, estimation of residence time in film evaporators, fouling of evaporators and cleaning, entrainment separators.

Unit II

Drying; Design data, performance and selection and design of dryers: tray dryer, drum dryer, freeze dryer, fluidized bed dryer. Design of powder recovery systems; Automation in spray dryers, management of explosions and fire hazards in spray dryers.

Unit III

Mixing of materials; Factors in mixing, types of mixers, operation, mixing gas, liquid and solid; heat transfer in mixers, power requirement, transmission, scale-up of models.

Unit IV

Material handling; System and devices, design and applications of screw, belt, flight, apron conveyors, bucket elevators; power requirements, feeding and discharge mechanisms.

Unit V

Mathematical modelling in food processing operations; Process modelling and optimisation approaches, framework and challenges, transport phenomena models for food process simulation for optimal design and operation. Stochastic finite element analysis of thermal food processes. Neural networks approach to modelling food processing operations.

VII. Practical

- Problems on design of evaporators- effect of temperature and pressure on heat

transfer and efficiency
- Effect of boiling point rise and enthalpy of concentration on heat transfer in evaporators
- Study of vacuum pan
- Reading Piping-Instrumentation diagrams of evaporator systems
- Analysis of drying rate curves of different types of dryers
- Design of tray, drum and fluidized bed dryers
- Design of agitators for liquid systems
- Analysis of heat transfer in agitated vessels
- Effectiveness of mixing of liquids, dispersions and emulsions
- Design of belt, bucket and screw conveyors

VIII. Learning outcome

Students will acquire thorough understanding of recent advances in the design and operation of Evaporators, driers, Mixers and material handling equipment, using Modelling and optimization techniques.

I. Course Title : Advances in Heat Transfer

II. Course Code : DE 612

III. Credit Hours : 3+0

IV. Why this course?

To enable the students to solve problems on heat transfer under steady and unsteady state conditions in 1, 2 and 3 dimensional geometries and turbulent flow conditions. This course is going to cover all these aspects.

V. Aim of the course

To develop analytical and numerical approaches for heat transfer operation

VI. Theory

Unit I

Steady state one - dimensional problems, Bessel functions, composite structures, Principal of superposition, Heterogeneous solids, Power series solutions, Properties of Bessel functions, Extended surfaces, Approximate solutions for extended surfaces.

Unit II

Steady state two- and three- dimensional problems, Separation of Variables; Orthogonal functions; Boundary value problems; Characteristic value problems; Orthogonality of characteristics functions; Fourier series. Separation of variables; Steady two-dimensional Cartesian geometry, selection of coordinates, steady two-dimensional spherical geometry, Legendre polynomials, Steady three-dimensional geometry.

Unit III

Unsteady problems - Separation of Variables, Orthogonal functions, Distributed systems having stepwise disturbances, Use of one-dimensional chart, Time - dependent boundary conditions, Duhamel's superposition integral, Laplace transforms.

Unit IV

Heat transfer in turbulent flow: turbulent flow, boundary layer, Prandtl analogy, temperature distribution in turbulent flow, empirical and practical correlation for convection heat transfer, heat transfer in packed beds. Use of computational software for modelling heat and moisture transfer in various unit operations.

VII. Learning outcome

The students will learn problem solving skills on heat transfer under steady and unsteady state conditions encountered in unit operations such as frying, baking, cooling, freezing, evaporation, drying, etc.

- Kumar DS. 2013. *Basics of Heat and Mass Transfer*. S K Kataria and Son Publishers. ISBN-13: 978-9350140604.

I. Course Title : Physicochemical Processes

II. Course Code : DE 613

III. Credit Hours : 3+0

IV. Why this course?

Physicochemical processes are like cog in the wheels of various unit operations. These help in deeper understanding of the various chemical unit operations and mass separation processes in the industry. This course will impart advance knowledge of mass transfer in various chemical engineering processes, which form the backbone of dairy and food engineering operations.

V. Aim of the course

- To develop understanding of advanced physical and chemical processes, their unit operations and design.

VI. Theory

Unit I

Types of separation processes; Adsorption process; Relationship between surface tension and adsorption, adsorption equilibrium and adsorption isotherm; Commercial adsorbents; Sorption kinetics in continuous flow reactors, factors influencing adsorption; Design of fixed adsorption columns and breakthrough adsorption curve.

Unit II

Membrane processing-computation of osmotic pressure of various solutions; Mathematical description of mass transport through reverse osmosis membrane; Water and solute diffusion, mechanisms of membrane transport, membrane transport models; Factors affecting membrane performance: membrane properties, concentration polarization; Types of flow: difference between gas and liquid permeation processes; Extraction: Liquid-solid extraction, single and multi-stage extraction, liquid-liquid extraction, supercritical fluid extraction, classification and properties of supercritical fluids, design and applications.

Unit III

Electrodialysis: Minimum energy requirements, selective ion transport, power requirement of electrodialysis, design of an electrodialysis systems; Ion-exchange process: exchange resins, kinetics of exchange and resin capacity, equilibrium relations in ion exchange, ion-selectivity: Design of fixed bed ion exchange columns.

Unit IV

Aeration and gas transfer, gas transfer processes, rates of gas transfer, power requirement of aerations systems, film transfer, theories of gas transfer, liquid-phase transport involving chemical reactions.

VII. Learning outcome

The students will learn mass transfer in various physical and chemical processes which will help them to better understand dairy and food processing unit operations.

I. Course Title : Computational Methods and Simulation in Dairy and Food Engineering

II. Course Code : DE 621

III. Credit Hours : 2+1

IV. Why this course?

With the advent of powerful computers and software, there is a paradigm shift in the computation and simulation methods used to solve complex and advanced problems in the field of dairy and food engineering. This is a mathematical course for engineers and scientists designed to solve various engineering and natural problems. It deals with the approximate solution formations of various mathematical models. This course is aimed to impart knowledge on the recent developments in Computational and Simulation techniques, with practical applications in the field of Dairy and Food Engineering.

V. Aim of the course

To develop competence in developing statistical/theoretical models.

VI. Theory

Unit I

Taylor's series expansion in development of numerical differentiation; numerical differentiation procedures, forward difference, backward difference, central difference.

Unit II

Numerical integration trapezoidal rule, Simpson's rule, improper integrals, Gauss-Legrendre Quadretuse method, numerical methods to solve ordinary differential equations.

Unit III

Euler method, improved Euler method, Runge-Kutta method, Adam's P-C method, initial value problems, numerical solution of partial differential equation: explicit method, implicit method.

Unit IV

Simulation concept, simulation methods and their limitations, statistical and theoretical models.

Unit V

Problem formulation and development of models; solution and validation of models; data collection; processing and analysis; basic modeling problems on unit operations involved in dairy and food processing.

VII. Practical

- Solution to Taylor's series approximation
- Exercises on numerical differentiation – central difference, forward difference and backward difference
- Numerical integration by Simpson's rule, trapezoidal rule, Gauss-Legrendre approximation
- Exercises on Euler's method approximation
- Exercises on Runge-Kutta method
- Numerical solution to partial differential equations

- Problem solving on unit operations in dairy and food processing
- Application of computational software for solving numerical integration, differentiation and boundary layer problems
- Concepts of simulation and validation

VIII. Learning outcome

The skills and knowledge taught in this course are fundamentally useful to students who do simulations and research in computational engineering. The students will be trained on solving complex and advanced problems in the field of dairy and food engineering using computational and simulation approaches in software such as MATLAB, CFD, COMSOL Multiphysics, etc.

X. Software

1. MATLAB version 9.6
2. CONSOL multi-physics version 5.4
3. CFD software like ANSYS, Fluidyn

I. Course Title : Package Permeability and Shelf-Life Modelling

II. Course Code : DE 622

III. Credit Hours : 3+0

IV. Why this course?

Traditional dairy products have very short shelf life due to poor packaging. Their shelf life can be improved by designing appropriate tailor made packaging. This course will impart the required knowledge on deteriorative reactions, their kinetics that affect the shelf life of the food and the design/ selection of appropriate flexible packaging materials for dairy products. Also, integration of water activity, deteriorative reactions and package permeability will be covered to predict the shelf life of foods.

V. Aim of the course

To impart knowledge on design of specific packaging for indigenous dairy products and to determine their shelf life.

VI. Theory

Unit I

Thermodynamics of water activity; Composition based water activity prediction models; determination of sorption isotherms; Moisture sorption types and hysteresis: Theory and Everett's classification of hysteresis, models for prediction of sorption isotherms; Composition based moisture sorption isotherm models.

Unit II

Temperature and moisture control in foods; Moisture management systems; Importance of temperature control and temperature management; Adiabatic saturation of air and its applications.

Unit III

Protective packaging of foods: Cushioning and G-factor, Use of moisture vapours permeability rates in design for a definite shelf-life; Design problems; Rates of deteriorative reactions and factors influencing them, prediction and simulation of shelf-life of foods; Validation of predictive shelf-life models.

Unit IV

Iterative procedures for moisture sensitive products, oxygen sensitive products; error analysis, water vapour permeability and oxygen barrier properties of composite packaging materials and fabricated package systems.

Unit V

Nanocomposites from biopolymers: production, mechanical properties and applications; Influence of nanocomposites and clays on barrier properties of packaging materials.

VII. Learning outcome

The students will acquire knowledge on design of packaging for indigenous dairy products and understand the intricacies among deteriorative reaction kinetics and package permeability affecting the shelf life of food. Also the students will learn about testing, prediction and validation of shelf life of dairy products in various packaging environment.

Suggested Broad Topics of Research

- Application of high pressure processing in indigenous dairy products
- Pulsed electric field and pulsed light treatment of milk and indigenous dairy products
- Studies on irradiation of dairy products
- Application of thermo and manosonification during manufacture of dairy products
- Micro- and nanoencapsulation of active food ingredients
- Energy and exergy performance evaluation of evaporators and dryers.
- Performance evaluation of agitated tanks and solids blenders
- Performance evaluation of conveyor systems
- Design modifications and upgradation of process equipment for better performance
- Hygienic design solutions
- Design of evaporators and dryers
- Freezing of dairy products
- Simultaneous momentum, heat and mass transfer analysis of thermal processing of dairy products
- Application of computational methods for heat and mass transfer analysis and simulation of dairy process equipment
- Development of computer software for the performance analysis and design of heat exchange equipment.
- Biosensors, E-nose, machine vision and non-destructive analysis and evaluation of dairy products
- Application of MATLAB in design of biothermal processes and equipment
- Recovery of heat energy and reuse for improvement of efficiency in dairy plant
- Studies on use of heat pumps in dairy plant for energy conservation
- Water activity characterization of milk products
- Shelf life simulation and modelling of moisture and oxygen sensitive products
- Design of fermenters and aeration systems
- Design of improvised wastewater treatment techniques
- Model-based fault-detection for process engineering instrumentation
- Instrumentation for measurement of engineering properties of dairy and food materials
- Controlled atmosphere storage for enhancing the shelf-life of foods
- Non-thermal processing of dairy products
- Development of simulation models for various unit operations in dairy and food processing.
- Engineering and rheological properties of food materials and characterization of food powders
- Extrusion technologies and sub-baric frying of dairy products
- Supercritical extraction of bioactive compounds
- Small scale milk processing equipment and farm level cooling and chilling systems
- Novel, edible and biodegradable packaging for dairy products
- Enhancement of thermal performance of dairy equipment by nanocoatings

Dairy Science and Technology
– Dairy Chemistry

Course Title with Credit Load
M.Tech. in Dairy Chemistry

Course Code	Course Title	Credit Hours
DC 511	Physico-chemical Aspects of Milk Constituents	2+1
DC 512*	Milk Carbohydrates, Minerals and Water Soluble Vitamins	2+1
DC 513*	Chemistry of Milk Lipids	2+1
DC 514	Chemistry of Food Constituents	2+1
DC 521*	Chemistry of Milk Proteins	3+1
DC 522*	Chemistry of Processed Dairy Foods	3+1
DC 523	Chemical Quality Assurance and Management Tools	2+1
DC 524	Research Techniques	1+2
DC 591	Master's Seminar	1+0
DC 599	Master's Research	0+30

Course Contents
M.Tech. in Dairy Chemistry

I. Course Title : Physico-Chemical Aspects of Milk Constituents
II. Course Code : DC 511
III. Credit Hours : 2+1

IV. Why this course?

This course will help the students while working in dairy industry/research institutes for better understanding of behaviour of milk constituents with respect to their chemical reactions and physical state. This course is going to cover all these aspects.

V. Aim of the course

To impart knowledge on the physico-chemical aspects of milk and milk products with special reference to their processing and quality assurance.
The course is organized as follows:

No.	Blocks	Units
1.	Reaction Kinetics	I Chemical and Enzymatic reactions
		II Electrochemistry
2.	Surface and colloidal Chemistry	III Surface Chemistry
		III Foams and Emulsions
		V Micelles and Gelation

VI. Theory

Block 1: Reaction Kinetics

Unit I: Chemical and Enzymatic reactions

Basics of chemical reaction kinetics, Order and molecularity of a reaction. Kinetics of denaturation of whey proteins and Maillard browning. Kinetics of enzymatic reactions; the role of enzymes as biological catalysts; factors affecting the rate of enzyme reaction: concentration of substrate, concentration of enzyme, concentration of reaction products, pH, temperature, time, activators and inhibitors. Thermal inactivation of enzymes present in milk. Concept of activation energy

Unit II: Electrochemistry

Electrolytic dissociation: activity, ionic strength and dissociation constants of acids and bases; effect of ionic strength on dissociation constants. Buffer, buffer capacity and buffer index of milk and milk products. Redox reactions and photo-oxidation of milk.

Block 2: Surface and colloidal Chemistry

Unit III: Surface Chemistry

Adsorption at solid – vapour interphase; Monolayer and multilayer adsorption; capillary condensation; adsorption isotherms; Hysteresis. Sorption of water on milk constituents and milk products and its relation to stability of dairy products.

Unit IV: Foams and Emulsions

Colloidal and surface phenomena in milk; adsorption at solid-liquid and liquid-liquid interphases; Gibb's equations. Interfacial tension, surface tension, surface active agents, general aspects of foaming, churning and whipping of cream; emulsion and emulsion stability; coalescence and dispersion; an introduction to the concept of Nano emulsion and Nano micelles.

Unit V: Micelles and Gelation

Micelles: definition, critical micelle concentration, formation and stability; Colloidal stability of casein micelles in milk, zeta potential, size distribution of casein micelles and fat globules. Gels and their formation, structure and stability; acid and rennet gels.

VII. Practical

- Determination of the order of hydrolysis of an ester and measurement of activation energy.
- Measurement of the order of hydrolysis of a carbohydrate and measurement of activation energy.
- Assessment of the progress curve obtained during the hydrolysis of p-nitrophenyl phosphate by milk alkaline phosphatase.
- Analysis of effect of substrate concentration on hydrolysis of p-nitrophenyl phosphate by milk alkaline phosphatase.
- Study of effect of enzyme concentration on hydrolysis of p-nitrophenyl phosphate by milk alkaline phosphatase.
- Michaelis constant determination for the digestion of casein by trypsin.
- Measurement of pH and buffering capacity of different types of milk.
- Preparation of a buffer of a given molarity/ionic strength and pH and determination of pH of the buffer.
- Stability analysis of an oil-in-water emulsion stabilised by milk proteins
- Foaming capacity and foam stability of caseins/whey proteins.
- Study of the gel formation and gel stability of milk proteins.
- Drawing of an adsorption isotherm of water on casein.
- Measurement of thermal inactivation of enzymes (Alkaline phosphatase, Lactoperoxidase).

VIII. Teaching Methods/ Activities

– Lecture
– Assignment (Reading/Writing)
– Student's Book/Publication Review
– Student presentation
– Group Work
– Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

– Apply basics of reaction kinetics in understanding different phenomenon in milk during processing and storage.
– Role of different constituents of milk in formation and stability of emulsions, foams and gel

I. Course Title : Milk Carbohydrates, Minerals and Water Soluble Vitamins

II. Course Code : DC-512

III. Credit Hours : 2+1

IV. Why this course?

This coursewill givean overview of carbohydrates, minerals and vitamins present in milk. This knowledge will help the students to understand the various physicochemical reactions occur during processing and storage of dairy foods.

V. Aim of the course

To impart basic knowledge on aspects of milk carbohydrates, minerals and water soluble vitamins and to project the importance of these milk constituents on the quality of milk and milk products as well as in human health.

The course is organized as follows:

No.	Blocks	Units
1.	Lactose	I. Chemistry of lactose
		II. Physical properties of lactose
		III. Chemical properties of lactose
2.	Mineral	IV. Minerals in milk
		V. Physical equilibrium amongst milk salts
		VI. Effect of Processing on Minerals
3.	Vitamins	VII. Water soluble vitamins:

VI. Theory

Block 1: Lactose

Unit I: Chemistry of lactose

Lactose: occurrence, isomers, molecular structure, levels in milk of different species.

Unit II: Physical properties of lactose

Physical properties of lactose: crystalline habits, hydrates, lactose glass, specific rotation, equilibrium of different isomers in solution, solubility, density, sweetness.

Unit III: Chemical properties of lactose

Chemical properties of lactose: hydrolysis; Pyrolysis; Oxidation; Reduction; Degradation with strong bases; Derivatives; Dehydration and Fragmentation; Browning reaction; Oligosaccharides in milk-health significance.

Block 2: Mineral

Unit IV: Mineral in Milk

Minerals: major and minor minerals; Factors affecting variation in salt composition of milk; Distribution and importance of trace elements in milk.

Unit V: Physical equilibrium amongst milk salts

Physical equilibrium amongst milk salts; Effect of various treatments on salt equilibrium; Partitioning of salts and factors affecting them.

Unit VI: Effect of Processing on Minerals

Salt balance and its importance in the processing of milk; Protein-mineral interactions.

Block 3: Vitamins

Unit VII: Water soluble vitamins

Water soluble vitamins: molecular structure, levels in milk and milk products; factors affecting their levels; Biological significance; Ascorbic acid structure; Relation with redox potential (Eh) of milk and milk products.

VII. Practical

- Estimation of lactose in milk by volumetric method
- Estimation of lactose in milk by gravimetric method
- Estimation of lactose in milk by polarimetric method
- Estimation of lactose in milk by colorimetric methods
- Determination of sodium and potassium by (flame photometry)
- Determination of calcium and magnesium by EDTA method
- Determination of phosphorus by colorimetric method (Fiske and Subba Rao)
- Estimation of citric acid by colorimetric methods
- Determination of iron by colorimetric methods
- Estimation of vitamin C in milk by volumetric method
- Determination of HMF content in heated milk

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

- Appreciate the significance of milk as a source of carbohydrates, minerals and water soluble vitamins.
- Understand the importance of these constituents in chemical, physical, technological, nutritional and physiological properties of milk.

X. Suggested Reading

I. Course Title : Chemistry of Milk Lipids

II. Course Code : DC 513

III. Credit Hours : 2+1

IV. Why this course?

The course will provide in-depth coverage of milk lipids. It makes the students capable to understand various chemical reactions occur during processing and storage of milk and milk products. This course is going to cover all these aspects.

V. Aim of the course

To impart the basic knowledge on different aspects of milk lipids and to project the importance of milk lipids in the quality of dairy products as well as in human health.

The course is organized as follows:

No.	Blocks	Units
1.	Milk Lipids	I. Classification of milk lipids II. Properties of milk lipids III. Unsaponifiable matter
2.	Chemical properties of milk lipids	IV. Chemical Reaction of milk fat V. Oxidation of milk fat

VI. Theory

Block 1: Milk Lipids

Unit I: Classification of milk lipids

Milk lipids: General classification, neutral and polar lipids (phospholipids) in milk, gross composition of milk lipids in different species, physico-chemical properties of milk lipids; role of major milk lipids in milk and milk products and biological significance of milk lipids; Composition of milk fat globule membrane.

Unit II: Properties of milk lipids

Fatty acid profile of milk lipids; factors affecting the profile of fatty acids; Different properties of fatty acids

Unit III: Unsaponifiable matter

Unsaponifiable matter and its importance; Composition of unsaponifiable matter; Chemistry, levels and physiological functions of sterols; Fat soluble vitamins and carotenoids in milk.

Block 2: Chemical properties of milk lipids

Unit IV: Chemical Reaction of milk fat

Chemical properties of milk lipids: hydrolysis by alkali, water and enzymes; hydrogenation, halogenation, transesterification, inter-esterification and fractionation.

Unit V: Oxidation of milk fat

Autoxidation: Definition, theories, induction period, secondary products of autoxidation, factors affecting, prevention and measurement; various methods for evaluating primary and secondary oxidation products; Antioxidants: Definition, types, reaction mechanism and estimation. Thermal oxidation of fat

VII. Practical

- Determination of melting point/slip point and B.R reading of milk fat.
- Determination of conjugated dienes, peroxide value and anisidine value of milk fat.
- Analysis of milk fat for its thiobarbituricacid-(TBA) value.
- Estimation of carbonyl value of milk fat
- Determination of unsaponifiable matter in milk fat.
- Total cholesterol estimation in milk fat.
- Determination of vitamin A and D in milk fat
- Estimation of total phospholipids and free fatty acids in milk fat.
- Preparation of fatty acid methyl esters and their analysis by GLC.
- Quantitative determination of butylatedhydroxylanisole (BHA) in milk fat.

VIII. Teaching Methods/ Activities

– Lecture
– Assignment (Reading/Writing)
– Student's Book/Publication Review
– Student presentation
– Group Work
– Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

– Understand the basic aspects of milk lipids in terms of quality of dairy products and human health
– Understand the different reactions taking place during processing and storage of milk fat

X. Suggested Reading

I. Course Title : Chemistry of Food Constituents

II. Course Code : DC 514

III. Credit Hours : 2+1

IV. Why this course?

This course will help the students to get more insight into chemistry of food constituents such as water, carbohydrates, protein, lipids, phytochemicals and food additives. This course will also enrichthe knowledge of students for working in food industry/research institutes for better understanding of processed food products development.

V. Aim of the course

To impart knowledge on different chemical aspects of food components
The course is organized as follows:

No.	Blocks	Units
1.	Major Constituents of Foods	I. Water II. Carbohydrates III. Proteins IV. Food Lipids
2.	Minor constituent of foods	V. Phyotchemicals VI. Food Additives

VI. Theory

Block 1: Major Constituents of Foods

Unit I: Water

Water: Forms of water in foods; water- solute interactions, and food stability in relation to water activity; solute mobility; property of ice crystals; role of ice in the stability of food at sub-freezing temperatures.

Unit II: Carbohydrates

Carbohydrates: Starch; Types, swelling behaviour, gelatinization and their role in bread making; modification of starches for industrial applications, physico-chemical changes taking place during malting. Oligosaccharides: Structural units of commercially available oligosaccharide, their properties and preparation methods, Hydrocolloids, their properties and utilization in different food preparations; mutual interactions among hydrocolloids and interactions with proteins.

Unit III: Proteins

Proteins: Classification, distribution and physico-chemical properties of food proteins from various sources; structure-function relationship and their modifications; denaturation of food proteins. Application of enzymes in food Industry; Immobilized enzymes, Browning reactions in foods: enzymatic browning and non-enzymatic browning (caramelization and maillard reaction).

Unit IV: Food Lipids

Food Lipids: Physico-chemical properties of food lipids and their modifications; Composition of various types of edible oils/fats with special reference to their quality; auto-oxidation of food lipids.

Block 2: Minor constituent of foods

Unit V: Phyotchemicals

Phytochemicals: Chemistry of polyphenols, phenolic acid, flavonoids, phytosterols, phytostanol.

Unit VI: Food Additives

Food Additives: Sweeteners, anticaking agents, antioxidants, humectants, preservatives, neutralizers, stabilizers, emulsifiers, texture modifiers, flavours and colours etc.

VII. Practical

- Estimation of fat content in cereal products by Soxhlet method.
- Determination of total nitrogen in cereal products.
- Determination of gluten content in wheat flour.
- Analysis of starch in flour by polarimetric method.
- Estimation of crude fibre in food product.
- Determination of polyphenol content in tea and coffee.
- Determination of antioxidant activity in various foods using DPPH/FRAP methods
- Detection of adulteration of mustard oil with argemone oil.
- Detection of artificial colours in various spices.
- Determination of level of artificial sweeteners (saccharin and aspartame)
- Visit to a food plant.

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

- Forms of water in food and its role in stability of food during storage at low temperature
- Types of carbohydrates, proteins, lipids in various types of foods, changes in such constituents during processing, interaction of carbohydrates and proteins, application of enzymes in food industry including immobilization of enzymes
- Types of phytochemicals in foods and role of additives to impart various functions in foods.

I. Course Title : Chemistry of Milk Proteins

II. Course Code : DC 521

III. Credit Hours : 3+1

IV. Why this course?

This course will help the students of dairying to get more insight into chemistry of milk proteins and in understanding the various physicochemical reactions occur during milk processing. This course is going to cover all these aspects.

V. Aim of the course

To impart knowledge on different aspects of milk proteins
The course is organized as follows:

No.	Blocks	Units
1.	Milk proteins	I. Basic concept of milk proteins
		II. Major milk proteins
		III. Whey proteins
		IV. Minor milk proteins
2.	Properties of milk proteins	V. Denaturation of proteins
		VI. Enzymes

VI. Theory

Block 1: Milk proteins

Unit I: Basic concept of milk proteins

Milk proteins of different species and their variability. Distribution and fractionation of different nitrogen fractions of milk proteins; nomenclature of milk proteins; genetic polymorphism and biological significance of milk proteins.

Unit II: Major milk proteins

Major milk proteins: caseins (acid and micellar), methods of isolation; Fractionation of casein and heterogeneity; Physico-chemical properties; amino acid composition; Casein micelle models; Primary structure of different caseins; Modification of casein: Physical, chemical (glycosylation, phosphorylation) and enzymatic.

Unit III: Whey proteins

Alpha-lactalbumin and beta-lactoglobulin, bovine serum albumin: distribution and methods of isolation and their physico-chemical properties.

Unit IV: Minor milk proteins

Minor milk proteins: Proteose-peptone, immunoglobulins, lactoferrin, and fat globule membrane proteins.

Block 2: Properties of milk proteins

Unit V: Denaturation of proteins

Denaturation of milk proteins, various factors affecting denaturation; Casein-whey protein interactions.

Unit VI: Enzymes

Indigenous milk enzymes: Properties and their significance with particular reference to lipases, proteases, phosphatases, catalase, peroxidase, xanthine oxidase, lysozyme, lactoperoxidase and galactosyltransferase

VII. Practical

- Estimation of different nitrogen fractions of milk by Kjeldahl method.
- Preparation of acid and rennet casein; urea fractionation of acid casein; isolation of alpha-lactalbumin and beta-lactoglobulin by ammonium sulphate precipitation.
- Milk protein estimation by Folin method.
- Polyacrylamide gel electrophoresis of milk proteins.
- Assay of indigenous milk enzyme activity like protease, lipase, alkaline phosphatase and lactoperoxidase.
- Estimation of hexoses and sialic acid in casein.
- Measurement of degree of hydrolysis of milk proteins.
- Measurement of denaturation of whey proteins.

VIII. Teaching Methods/ Activities

– Lecture
– Assignment (Reading/Writing)
– Student's Book/Publication Review
– Student presentation
– Group Work
– Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

– Understand the basic aspects of milk proteins in terms of major and minor milk proteins
– Understand the effect of different processing of milk on interaction of milk proteins

X. Suggested Reading

I. Course Title : Chemistry of Processed Dairy Foods

II. Course Code : DC 522

III. Credit Hours : 3+1

IV. Why this course?

To gain insights in the underlying chemical changes during processing of milk for preparation of concentrated, dried, fermented and fat rich dairy products and frozen desserts. This course is going to cover all these aspects.

V. Aim of the course

To understand the physico-chemical changes and effects of various milk constituents of milk products during manufacture and storage of processed dairy foods.

The course is organized as follows:

No.	Blocks	Units
1.	Concentrated and Dried milks and dried milks	I. Process induced changes in concentrated II. Human milk and infant food III. Heat induced changes in milk
2.	Chemistry of Dairy Products	IV. Cheese and other fermented dairy products V. Cream, butter and ghee VI. Ice cream and frozen desserts

VI. Theory

Block 1: Concentrated and Dried milks

Unit I: Process induced changes in concentrated and dried milks

Process induced changes in milk constituents during preparation and storage of concentrated and dried milks.

Unit II: Human milk and infant food

Role of biologically active components in human milk; Standards, composition and properties of infant milk and infant food formulations

Unit III: Heat induced changes in milk

Heat induced changes in milk leading to coagulation; Heat stability of concentrated milk as affected by different process variables, Milk constituents and additives; Age gelation: Mechanism and control.

Block 2: Chemistry of Dairy Products

Unit IV: Cheese and other fermented dairy products

Biochemical changes during ripening of different varieties of cheese; Lactic acid fermentation in cheese and other fermented dairy products; chemical defects in cheese.

Unit V: Cream, butter and ghee

Storage stability of cream, butter and ghee. Physico-chemical properties of ghee; Ghee flavour, texture (grains) and colour in ghee.

Unit VI: Ice cream and frozen desserts

Role of different ingredients during processing and storage of ice cream/ frozen desserts; Concept of antifreeze protein/ice structuring protein in ice cream

VII. Practical

- Determination of lactose and sucrose in condensed milk and ice-cream.
- Determination of weight per litre of ice-cream.
- Determination of heat stability of milk and concentrated milks.
- Determination of WPNI of skim milk powder.
- Determination of fat in cream and butter by Mojonnier method.
- Determination of salt in butter.
- Determination of diacetyl and acetyl methyl carbinol in butter/ cultured products.
- Determination of RM, Polenske value, iodine value, saponification value of ghee.
- Determination of soluble proteins, salt and free fatty acids in cheese.
- Determination of rennet clotting time of milk.

VIII. Teaching Methods/ Activities

– Lecture
– Assignment (Reading/Writing)
– Student's Book/Publication Review
– Student presentation
– Group Work
– Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:

– Understand the basic aspects of dairy chemistry in terms of processing of different dairy products
– Understand the different reactions taking place during storage of dairy products

X. Suggested Reading

I. Course Title : Chemical Quality Assurance and Management Tools

II. Course Code : DC 523

III. Credit Hours : 2+1

IV. Why this Course?

The course will provide in depth knowledge in preparing the reagents, testing methodologies and quality tools to understand the concept of 'Quality Assurance' in dairy industries. This course is going to cover all these aspects.

V. Aim of the course

To project the importance of chemical quality assurance and safety in relation to dairy industry and impart basic knowledge on all aspects of chemical quality and safety assurance

The course is organized as follows:

No.	Blocks	Units
1.	Quality Management Tools and Quality Assurance Organizations	I. Quality Tools and Management System II. International and National organisations
2.	Analytical Methods	III. Assessment of Quality of milk and milk products IV. Contaminants and Food Traceability

VI. Theory

Block1: Quality Management Tools and Quality Assurance Organizations

Unit I: Quality Tools and Management System

Concept of quality assurance and quality control in relation to dairy industry; Quality management systems - good manufacturing practices (GMP); HACCP certification; ISO 9001, ISO 22000, FSSC, total quality management (TQM); Lean and Six sigma, Five –S, Kaizen, Kanban and other quality tools; Good laboratory practices (GLP), laboratory accreditation

Unit II: International and National Organisations

Role of international organisations such as ISO, IDF, CAC, AOAC, WTO and national organisations like BIS, FSSAI, AgMark and APEDA in dairy industry, Quality Council of India (QCI), Export Inspection Council (EIC); Guidelines for setting up quality control laboratory and chemical safety aspects; sampling of milk and milk product; Food labeling guidelines.

Block 2: Analytical Methods

Unit III: Assessment of Quality of milk and milk products

Detergents, sanitizers and disinfectants; Calibration of milk testing glassware; Preparation of standard reagents; Detection of adulterants in milk and milk products; Quality of packaging material for dairy products; Instrumentation in analysis of milk and milk products.

Unit IV: Contaminants and Food Traceability

Agro-chemicals/veterinary drug residues; occurrence of pesticide residues, antibiotic residues, heavy metals etc. in dairy products and their testing methods, Laboratory auditing, Food traceability systems, Food recall and withdrawal

VII. Practical

- Preparation of standard solutions
- Testing of available chlorine content in hypochlorites/ bleaching powder
- Determination of purity of common salt to be used for butter and cheese making
- Detection of common adulterants in milk and foreign fat/ oil in ghee
- Checking the accuracy of calibration of hydrometers/ lactometers, butyrometers, milk pipette and thermometer
- Qualitative colour tests to distinguish between azo dyes and natural dyes in butter

- Maintenance of records as per NABL and ISO criteria.
- Visit to a food analytical laboratory.

VIII. Teaching Methods/ Activities
- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

IX. Learning outcome

After successful completion of this course, the students are expected to be able to:
- Understand the requirements and policy relating to implementation of various quality management tools.
- Apply the food safety standards to specific situations

X. Suggested Reading

I. Course Title : Research Techniques

II. Course Code : DC 524

III. Credit Hours : 1+2

IV. Why The Course?

This course concentrates on instrumental methods of analysis. The course will beof importance to all the students, who rely on the use of instrumental analysis in their field of research while conducting research as part of their postgraduate studies.

V. Aim of the course

To impart the advanced knowledge on the use of analytical techniques in Dairy Chemistry

The course is organized as follows:

No.	Blocks	Units
1.	Separation and Purification of Biomolecules	I. Electrophoresis II. Chromatography III. Membrane processing and centrifugation
2.	Laboratory Analytical Techniques	IV. Instrumental Techniques V. ELISA and lateral flow assay

VI. Theory

Block1: Separation and Purification of Biomolecules

Unit I: Electrophoresis

Electrophoresis: principles and types, isoelectric focussing

Unit II: Chromatography

Chromatographic techniques: Principles and types (Paper and Column Chromatography, TLC, GLC, HPLC, gel-permeation, ion-exchange, affinity).

Unit III: Membrane processing and centrifugation

Separation of bio-molecules using membranes; Centrifugation: principle, types and applications.

Block 2: Laboratory Analytical Techniques

Unit IV: Instrumental Techniques

Spectrophotometry: UV, visible, IR and flame photometry; Potentiometry: principles, ion-selective electrodes; buffers. Measurement of size and zeta potential of colloidal solution or emulsion using dynamic light scattering/ particle size analyser

Unit V: ELISA and lateral flow assay

Immuno based analytical techniques such as ELISA and Lateral flow assay.

VII. Practical

- Paper chromatography, TLC separation of amino acids.
- Gel-filtration of biomolecules.
- Preparation of a buffer and measurement of its pH electro-metrically and using indicators.
- SDS gel electrophoresis and molecular weight determination.
- Plotting of UV-visible absorption spectra of a standard analyte.
- Demonstration of Beer's law using standard protein.
- Estimation of minerals using AAS.
- Separation of milk proteins using ion-exchange chromatography and affinity chromatography.
- Detection of analytes using ELISA and lateral flow assay.
- Separation of biomolecules using HPLC.
- Preparation of methyl esters of fatty acids of milk fat and analysis by GLC.
- Separation of fat/casein using centrifugation.

VIII. Learning outcome

After successful completion of this course, the students are expected to be able to:

– Provides a sound foundation to the theory and application of modern analytical techniques.

– Impart the concept of good laboratory practice and protocol, and hands-on experience of modern analytical instrumentation.

Course Title with Credit Load
Ph.D. in Dairy Chemistry

Major Courses

Course Code	Course Title	Credit Hours
DC 611	Advances in Chemistry of Milk Proteins	3+0
DC 612	Advances in Chemistry of Milk Lipids	3+0
DC 621	Advances in Chemistry of Dairy Processing	3+0
DC 622	Advances in Analytical Techniques in Dairy Chemistry	3+0
DC 691	Doctoral Seminar-I	1+0
DC 692	Doctoral Seminar-II	1+0
DC 699	Doctoral Research	0+75

Minor Courses

The courses will be selected from the major courses of the allied disciplines of Dairy Technology, Dairy Microbiology, Dairy Engineering and Animal Biochemistry to meet the minimum credit requirements.

Supporting Courses

The supporting courses will be picked from the basket of courses offered in agricultural statistics, computer applications and IT, and other related relevant disciplines to meet the minimum credit requirements.

Common Courses

1.	Library and Information Services	1
2.	Technical Writing and Communications Skills	1
3.	Intellectual Property and its Management in Agriculture	1
4.	Basic Concepts in Laboratory Techniques	1
5.	Agricultural Research, Research Ethics and Rural Development Programmes	1

Course Contents
Ph.D. in Dairy Chemistry

I. Course Title : Advances in Chemistryof Milk Proteins

II. Course Code : DC-611

III. Credit Hours : 3+0

IV. Why this course?

To gain insights in the underlying structure-function aspects of milk proteins, biological role of bioactive milk proteins, properties of bioactive peptides and allergy aspects of milk proteins.

V. Aim of the course

To understand the advances in area of functionality of milk proteins
The course is organized as follows:

No.	Blocks	Units
1.	Biosynthesis and Structure Function relationship of milk Proteins	I. Biosynthesis of milk proteins II. Structure of milk protein with respect to function III. Modification of milk proteins with respect to function
2.	Biological role of milk proteins	IV. Antimicrobial protein in milk V. Significance of bioactive peptides VI. Nutritive and therapeutic aspects of milk proteins

VI. Theory

Block 1: Biosynthesis and structure Function relationship of milk Proteins

Unit I: Biosynthesis of milk proteins

Biosynthesis of milk proteins, milk fat globule membrane (MFGM) proteins.

Unit II: Structure of milk protein with respect to function

Primary structure of casein, structural properties of casein and whey proteins and their structure-functional relationship

Unit III: Modification of milk proteins with respect to function

Physical, chemical and enzymatic modification of milk proteins and their functional characteristics

Block 2: Biological roles of milk proteins

Unit IV: Antimicrobial protein in milk

Mechanism of action and biological role of specific and non-specific antimicrobial factors in milk- immunoglobulins, lactoferrin, lactoperoxidase and lysozyme

Unit V: Significance of bioactive peptides

Milk protein derived bioactive peptides – their properties; significance and application; bitter peptides in cheese; growth factors in milk.

Unit VI: Nutritive and therapeutic aspects of milk proteins

Nutritive and therapeutic aspects of milk proteins and peptides;
Milk protein allergy: mechanism and method of their reduction in dairy products

Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

VII. Learning outcome

After successful completion of this course, the students are expected to be able to:

- Understand the basic mechanism on functionality of major milk proteins and bioactive milk proteins
- Understand the aspects on biosynthesis of milk proteins, bioactive peptides and nutritive properties of milk proteins

VIII. Suggested Reading

- Damodaran S and Paraf A. 1997. *Food Proteins and their Applications*. Marcel Dekker.

I. Course Title : Advances in Chemistry of Milk Lipids

II. Course Code : DC-612

III. Credit Hours : 3+0

IV. Why this course?

This is an advanced course for in-depth understanding of milk fat including recent research work in the area of milk fat. This course is going to cover all these aspects.

V. Aim of the course

To impart the students with the in-depth understanding of various facets of milk fat including synthesis, changes during processing, various constituents of milk fat including minor components. The course also gives the opportunity to learn the

recent research work being done in the area of milk fat.
The course is organized as follows:

No.	Blocks	Units
1.	Composition and Structure	I. Origin, composition, structure and physical chemistry of milk fat globule membrane II. Lipolytic enzymes in milk of different species III. Fatty acids and other components in milk fat
2.	Stability and Health Significance	IV. Deterioration of milk fat due to oxidization and heating V. Significance of milk fat in human health

VI. Theory

Block 1: Composition and Structure

Unit I: Origin, composition, structure and physical chemistry of milk fat globule membrane

Origin, composition, structure and physical chemistry of milk fat globule membrane; Comparative aspects of milk lipids from different species such as human, bovine, buffalo, sheep, goat, and camel. Changes in milk fat globule membrane during processing and its effect on digestion.

Unit II: Lipolytic enzymes in milk of different species

Lipolytic enzymes in milk of different species including human; Bile salt stimulated lipase and esterases, induced and spontaneous lipolysis in milk. Assay for lipase activity; Biosynthesis of fatty acids, glycerol, neutral lipids, phospholipids, sphingolipids and cholesterol.

Unit III: Fatty acids and other components in milk fat

Essential fatty acids, prostaglandins and flavour compounds. Conjugated linoleic acids – different isomers, factors affecting their levels in dairy products and their significance.

Unit IV: Deterioration of milk fat due to oxidization and heating

Chemistry of oxygen in relation to autoxidation of milk fat including effect of milk components and environmental factors; Types of oxidations; Thermal oxidation; Chemical and biological properties of heated and oxidized fats.

Unit V: Significance of milk fat in human health

Significance of milk lipids in human health. Role of milk lipids in consumer acceptance of dairy products. Polymorphism and milk fat crystallization

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student’s Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

VIII. Learning outcome

After successful completion of this course, the students are expected to be able to:
- Have in-depth understanding of milk fat including its origin in mammary gland
- Lipolytic enzyme in milk of various species including lipolysis
- Types of minor milk components and their structure
- Deterioration of milk fat due to oxidation
- Significance of milk fat in human health.

I. Course Title : Advances in Chemistry of Dairy Processing

II. Course Code : DC 621

III. Credit Hours : 3+0

IV. Why this course?

This course covers the physicochemical changes during processing of milk and chemistry of different additives and ingredients with respect to their effect on functional properties of dairy foods. This course is going to cover all these aspects.

V. Aim of the course

To highlight the impact of processing parameters on the milk constituents with special reference to chemical changes involved and also to impart the basic knowledge on the chemistry and significance of bio active compounds and additives

The course is organized as follows:

No.	Blocks	Units
1.	Physicochemical changes during processing	I. Heat induced changes and interactions II. Physical changes in the fat globules after homogenisation III. Specific and non-specific enzymatic coagulation of milk IV. High Pressure Processing of milk
2.	Food additives/ ingredients	V. Encapsulation of bioactive compounds VI. Micronutrients, Stability of sweeteners and Milk fat replacers

VI. Theory

Block 1: Physicochemical changes during processing

Unit I: Heat induced changes and interactions

Heat induced changes and interactions between protein, lipids, carbohydrates and minerals during processing of milk. Effect of heat on the proteins of concentrated milk systems. Inactivation of indigenous milk enzymes during processing.

Unit II: Physical changes in the fat globules after homogenisation

Physical changes in the fat globules in unhomogenized and homogenized milk; cold agglutination – its mechanisms and role.

Unit III: Specific and non-specific enzymatic coagulation of milk

Specific and non-specific enzymatic coagulation of milk.

Unit IV: High Pressure Processing of milk

Physico-chemical and structural changes occurring in milk constituents during high pressure processing of milk.

Block 2: Food additives/ ingredients

Unit V: Encapsulation of bioactive compounds

Chemistry involved in encapsulation of bioactive compounds and factors affecting their stability during processing.

Unit VI: Micronutrients, Stability of sweeteners and Milk fat replacers

Chemistry involved in the fortification of milk with vitamins, minerals and nutraceuticals. Stability of high intensity sweeteners during processing of milk and milk products. Milk fat replacers.

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

VIII. Learning outcome

After successful completion of this course, the students are expected to be able to:

- Understand the effect of processing on milk constituents
- Analyse the stability of different additives including micronutrients added to milk as affected by different processing treatments

IX. Suggested Reading

- Shortt C and Brien JO. 2004. *Handbook of Functional Dairy Products*. CRC Press.
- Deeth HC and Lewis MJ. 2017. *High Temperature Processing of Milk and Milk Products*. Wiley-Blackwell.
- Fox PF and McSweeney PLH. 1998. *Dairy Chemistry and Biochemistry*.Blackie Academic Professional, Chapman and Hall.

I. Course Title : Advances in Analytical Techniques in Dairy Chemistry

II. Course Code : DC 622

III. Credit Hours : 3+0

IV. Why this course?

To gain insights in the underlying principle of newer instrumental techniques and their application in the dairy science research. This course is going to cover all these aspects.

V. Aim of the course

To highlight the application of advance analytical techniques used for analysis of milk and milk products

The course is organized as follows:

No.	Blocks	Units
1.	Electrophoresis and Chromatographic techniques	I. Isoelectric focusing, 2-D gel electrophoresis, Immuno assays
		II. High performance liquid chromatography
		III. Mass spectroscopy
2.	Protein structure determination and Spectroscopy	IV. Protein sequencing
		V. X-ray crystallography
		VI. Circular dichroism spectroscopy
		VII. Atomic spectroscopy
		VIII. Infrared, Fluorescence
		IX. Differential scanning calorimetry, NMR and FTIR

VI. Theory

Block 1: Electrophoresis and Chromatographic techniques

Unit I: Isoelectric focusing, 2-D gel electrophoresis, Immuno assays

Electrophoresis: Isoelectric focusing and 2-D polyacrylamide gel electrophoresis; Capillary zone electrophoresis, Enzyme linked immune-sorbentassay, blotting techniques

Unit II: High performance liquid chromatography

High performance liquid chromatography; Theory, instrumentation and application in analysis of dairy foods

Unit III: Mass spectroscopy

Mass spectroscopy: Principle, instrumentation and application in milk proteins/ milk fat analysis

Block 2: Protein structure determination and Spectroscopy

Unit IV: Protein sequencing

Protein sequencing; Chemical reactions involved in analysis of primary structure of proteins.

Unit V: X-ray crystallography

Circular dichroism spectroscopy; Theory and application for determination of secondary structure of proteins.

Unit VI: Circular Dichroism Spectroscopy

X-ray crystallography; Theory and application for determination of tertiary structure of milk proteins.

Unit VII: Atomic spectroscopy

AAS (Atomic Absorption Spectroscopy, Atomic Emission Spectroscopy, ICPS (Inductively coupled plasma spectroscopy); Principle and application in analysis of milk and milk products.

Unit VIII: Infrared, Fluorescence

Infrared Spectroscopy, Fluorescence Spectroscopy: principle and application.

Unit IX: Differential scanning calorimetry, NMR and FTIR

Differential scanning calorimetry: principle and application for milk fat and protein analysis.
NMR (Nuclear Magnetic Resonance), FTIR (Fourier Transform Infrared). Principle, application for quality analysis of milk and milk products.

VII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Publication Review
- Student presentation
- Group Work
- Guest Lectures

VIII. Learning outcome

After successful completion of this course, the students are expected to be able to:

- Understand the basic principle on advance analytical techniques for quality assessment of milk and milk products
- Understand the aspects on structure determination of milk proteins

IX. Suggested Reading

Suggested Broad Topics for Master's and Doctoral Research

1. Profiling of milk from indigenous breeds of cattle, buffalo, goat and other minor species for their composition, physico-chemical properties and health benefits.
2. Encapsulation of bioactive compounds using milk and food grade constituents for their use in functional foods.
3. Physico-chemical changes in milk and milk products on fortification with micronutrients and nutraceuticals.
4. Flavour profiling of indigenous dairy products.
5. Shelf life enhancement of dairy products using natural and synthetic additives.
6. Development and evaluation of new generation methods for detection of adulterants and contaminants in milk and milk products based on biotechnological and nanotechnological approaches.
7. Development and validation of methods for detection of emerging contaminants and adulterants.
8. Validation of existing methods for quantification of different claimed constituents in various dairy products.
9. Stability of newer additives in milk and milk products and development of methods for their quantification.
10. Migration from food contact materials into food products.
11. Development of methods for detection of mixed milk and ghee-species and breeds.
12. Physico-chemical changes in milk proteins and lipids during processing and storage of dairy products.
13. Isolation and purification of growth factors and bioactive peptides from colostrum, milk and whey.
14. Enzymatic modification of milk proteins and incorporation of biopeptides into food system.
15. Incorporation of whey/whey constituents in milk and milk products for enhancement of biofunctional properties.
16. Evaluation of microstructure of dairy products.

DM 599	Master's Research	0+30

Course Contents
M.Tech. in Dairy Microbiology

I. Course Title : Microbial Physiology
II. Course Code : DM 511
III. Credit Hours : 2+1

IV. Why this course?

Microbial physiology is the study of how microbial cell structures, growth and metabolism function in living organisms. It covers the study of nutritional transport system of bacteria, electron transport chain in prokaryotes and nutritional requirements of bacteria for their growth.

V. Aim of the course

To familiarize the student with various aspects of growth and energy generating activities of bacteria for the betterment of human life.

VI. Theory

Unit I

Bacterial growth: Growth phases and kinetics; synchronous, continuous, and associative growth; factors affecting bacterial growth; growth measurement; sporulation.

Unit II

Effect of environment on the growth of bacteria: Temperature, air, osmotic pressure, pH, hydrostatic pressure, surface tension, metals, electromagnetic and other waves, sonics, various chemicals, their application in dairy industry; mechanism of action of antimicrobials.

Unit III

Bacterial nutrition; Nutrient media; Nutritional groups of bacteria; Role of growth factors; Active and passive transport.

Unit IV

Energy metabolism: Electron transport chain, fermentation, respiration and photosynthesis.

VII. Practical

- Measurement of bacterial growth by direct methods (cell number, SPC, DMC) and indirect methods (turbidometric methods, MPN, cell mass).
- Preparation of growth curve; determination of generation time.
- Determination of cell activity; Carbohydrate fermentation; Acid production/pH alteration; Starch, lipid, casein and gelatin hydrolysis.
- Effect of different factors, viz. physical (temperature, pH, osmotic pressure, surface tension), chemical (dyes, antibiotics, phenol) and nutritional (amino acid supplements, vitamin supplements, protein hydrolysates, casamino acids) on bacterial growth.

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the effect of environmental factors on microbial growth of bacteria
- To have an idea about nutritional transport system of bacteria
- To know about the electron transport chain in prokaryotes.
- To have any idea about the nutritional requirements of bacteria during their growth using various growth measurement techniques.

I. Course Title : Microbiology of Processed Dairy Foods

II. Course Code : DM 512

III. Credit Hours : Credit: 3+1

IV. Why this course?

Different types of processing are done in dairy and foods industry for improving the quality and shelf life of the products. Each processing step affects microbial quality. Students should have idea about such changes. Course will also coverbio-preservation system of processed dairy foods, antimicrobial or bioactive packaging systems and GMO and their regulatory systems.

V. Aim of the course

To understand the microbiology of processed foods, types of processing and their effect on microbiological quality, significance of different food microorganisms, their control and other related aspects.

VI. Theory

Unit I

Introduction to microbes in foods, history and development of food microbiology, microorganisms important in foods, microbial ecology of processed foods and food ecosystem, factors influencing microbial growth in foods; Intrinsic factors and extrinsic factors.

Unit II

High temperature food preservation, factors affecting heat resistance in microorganisms, thermal destruction of microorganisms, low temperature food preservation, food preservation by irradiation, food preservation by drying and fermentation, modern processing techniques-ohmic heating, high pressure processing, infra-red heating, cold plasma, pulsed electric field, ultra sound etc., bio preservation of foods - concepts: metabolites of lactic acid bacteria; Bacteriocins, Antifungal substances etc., protective cultures and other antimicrobials (herbs, spices and other natural antimicrobial compounds), Nanoscience in food preservation; microencapsulation.

Unit III

Microbial stress response in the food environment; Stress adaptation, sublethal stress and injury, antibiotic resistance in food bacteria, predictive modelling for food spoilage, industrial strategies for ensuring safe foods, HACCP; GMP, GHP

Unit IV

Antimicrobial packaging; concepts and development, modified atmosphere packaging (MAP), intermediate moisture foods (IMF), and hurdle technology in processed foods.

Unit V

New prospects and problems in processed dairy foods. Genetically modified foods

VII. Practical

- D and Z-value calculation of common food pathogens.
- Production of antimicrobial substances-bacteriocins.
- Production of antifungal substances.
- Application of bacteriocins for bio preservation of foods.
- Application of hurdle concepts for enhanced shelf stability of processed foods.
- Induction of bacterial cell injury and recovery of injured cells.
- Antibiotic resistance of food pathogens.
- Shelf life enhancement using antimicrobial packaging.

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the latest technologies for processing of foods, biopreservation system of processed dairy foods
- To have an idea about the processing methods that do not diminish the quality attributes of food being processed
- To know about the recent antimicrobial or bioactive packaging systems that can enhance the shelf life of fresh as well as processed produce/food.
- To have any idea about the GMO and their regulatory systems.

I. Course Title : Microbial Morphology and Taxonomy

II. Course Code : DM 513

III. Credit Hours : 3+1

IV. Why this course?

Morphology is the study of the form of bacteria. This covers morphological features such as shape, size, cell structure, motility (ability to move in a liquid), and spore and capsule formation, different staining methods and micrometry etc.

V. Aim of the course

To educate the students about the morphological features and taxonomy of the various microorganisms, viz. bacteria, fungi and viruses

VI. Theory

Unit I

Evolution of life on earth, history and diversity of microorganisms

Unit II

Principles of classification and taxonomy of Eubacteria (Bacteria and Archaea); Major characteristics used in taxonomy; Cultural, Morphological, Biochemical; Physiological, Genetic and Molecular; Numerical Taxonomy (Taxometrics) and Chemotaxonomy. Assessing Microbial Phylogeny: Chronometers; Phylogenetic trees, r-RNA, DNA and proteins as indicators of phylogeny.

Unit III

Cell ultra-structure (prokaryotes and eukaryotes); Cell wall- structure, chemical composition, synthesis and inhibition; cell membrane, cytoplasmic inclusions, cytoskeleton, cell appendages- capsule, flagella, pili; sporulation - structure of endospore, composition and function of spore constituents, induction and germination.

Unit IV

Fungi: Distribution, importance and recent classification, study of yeasts and moulds in dairy foods

Unit V

History, development and scope of virology; classification and nomenclature, characteristics of viruses (acellular organization and viral genome), viral reproduction, brief account of viroidsand prions

VII. Practical

- Staining: Simple staining; differential staining - Gram's staining, spore staining, acid fast staining; special staining - cell wall staining, flagella staining, nucleoids staining, capsule staining, inclusion/storage bodies staining
- Preparation of bacterial protoplasts and spheroplasts
- Measuring dimensions of microorganisms (bacteria) using micrometry
- Morphology of fungi: yeast and moulds
- Application of computer software in bacterial identification

VIII. Teaching Methods/ Activities

– Lectures
– Assignment (Reading/Writing)
– Student's Book/Journal Articles
– Student presentation
– Group Work
– Routine Practical as per the schedule
– Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:
– To have knowledge on the Principles of classification and taxonomy of Eubacteria
– To have knowledge on the advanced techniques help in classification of organisms
– To know about the ultrastructure of microorganisms.
– To acquire the knowledge on different staining methods and micrometry.

I. Course Title : Microbiology of Fluid Milk and Dairy Products

II. Course Code : DM-514

III. Credit Hours : 2+1

IV. Why this course?

Milk is a complex biological fluid secreted in the mammary glands of mammals. It contains all the nutrients which help the organisms to grow well. For the safe processing and production of milk and milk products, student should have good knowledge of various handling and processing practices on market milk. Novel technologies must be applied in milk and milk product processing for the inactivation of food borne microorganisms or toxins produced by the organisms during transportation or storage or raw milk.

V. Aim of the course

To familiarize the students with microbes in milk and milk products, microbiological aspects of processing, microbiology of milk products and safety aspects

VI. Theory

Unit I

Common microbes in milk and their significance, Microflora of mastitis milk and its importance in dairy industry, Sources of microbial contamination of raw milk and their relative importance in influencing quality of milk during production, collection, transportation and storage; Clean milk production and natural antimicrobial systems in raw milk, Microbial changes in raw milk during long storage, Microbiological grading of raw milk.

Unit II

Microbiological aspects of processing techniques like bactofugation, thermization, pasteurization, sterilization, boiling, UHT, non-thermal processes (pulsedelectric field) and membrane filtration of milk; Role of psychrotrophic, mesophillic, thermophilic and thermoduric bacteria in spoilage of processed milks, their sources and prevention; Heat induced damage in bacteria and role of resuscitation in recovery of injured microbial cells. Microbiological standards (BIS/ FSSAI) of heat-treated fluid milks

Unit III

Microbiological quality of dairy products; fat rich (cream and butter), frozen (ice cream), concentrated (evaporated and condensed milk), dried milks (roller and spray dried), infant dairy foods and legal standards; Sources of contamination and factors affecting microbial quality of these products during processing, storage and distribution; Microbiological defects associated with these products and their control.

Unit IV

Microbiological quality of traditional dairy products in India; heat desiccated (khoa, burfi, peda, kheer, etc.), acid coagulated (paneer, chhana, rasogolla, etc.), fermented (dahi, lassi, srikhand, etc.) and frozen (kulfi); Sources of microbial contaminants and their role in spoilage; Importance of personnel and environmental hygiene on quality of traditional milk products; Microbiological standards for indigenous dairy foods.

Unit V

Food poisoning- Food intoxications, Food infections and Toxi-infections, pathogens associated with fluid milks, dairy products and their public health significance; Sources of pathogens and their prevention; Importance of biofilms, their role in transmission of pathogens in dairy products and preventive strategies.

VII. Practical

- Grading of raw milk based on SPC, coliforms and dye reduction tests.
- Effect of different storage temperatures on microbiological quality of fluid milk.
- Tests for mastitic milk and brucellosis.
- Microbiological quality evaluation of cream and butter for coliforms, yeasts and moulds, lipolytic and proteolytic bacteria.
- Detection of *Cronobacter sakazakii* in infant dairy foods.
- Microbial evaluation of burfiand pedafor SPC, *S. aureus*, yeast and mould counts.
- Detection of *Bacillus cereus, Salmonella,Shigella* and coagulase positive staphylococci in milk powder.
- Evaluation of ice cream for coliforms and *Escherichia coli*.
- Microbiological quality of paneer.
- Enumeration of aerobic and anaerobic spores in condensed, sterilized and dried milks.
- Line testing for determining the source of contamination of dairy products.
- Detection of toxins (staphylococcal, aflatoxins/mycotoxins) in dairy foods

VIII. Teaching Methods/ Activities

– Lectures
– Assignment (Reading/Writing)
– Student's Book/Journal Articles
– Student presentation
– Group Work
– Routine Practical as per the schedule
– Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To have knowledge on the novel technologies applied in milk and milk product processing for the inactivation of food borne microorganisms.
– To have an idea about the latest standards formulated by FSSAI on milk and milk products (Microbiological Standards).
– To know about the different toxins produced by microorganisms in milk and milk products.
– To have knowledge on Microbiological quality of traditional dairy products in India.

I. Course Title : Microbial Genetics

II. Course Code : DM 515

III. Credit Hours : Credit: 2+1

IV. Why this course?

Microbial genetics is a subject area within microbiology and *genetic* engineering. *Microbial genetics* provides powerful tools for deciphering the regulation, as well as the functional and pathway organization, of cellular processes.

V. Aim of the course

To understand the fundamentals of structure, functions and synthesis of macromolecules and their genetic manipulation.

VI. Theory

Unit I

Macromolecules: DNA, RNA and their structure, types, organization, function and properties of macromolecules, DNA replication.

Unit II

Regulation and Gene Expression: Gene Expression and its regulation in Prokaryotes-Transcription, Genetic Code, Translation, Negative and Positive regulation in gene expression, Operon Models - Lac, Trp.

Unit III

Mutations: Mutations - Spontaneous and Induced, Type of mutations, Mutagenic agents – physical and chemical, Damage and repair system operating in Prokaryotes.

Unit IV

Plasmids and gene transfer systems: Plasmids and their properties, transposable elements, bacterial recombination, transformation, transduction and conjugation.

Unit V

Recombinant DNA technology, Fundamental aspects of genetic engineering/ recombinant DNA technology, restriction enzymes, plasmid vectors (cloning as well as expression vectors), PCR and real time PCR.

VII. Practical

- Isolation and quantitative estimation of chromosomal DNA from *E. coli* and *Lactobacillus* by mini prep method.
- Isolation of plasmid DNA from *E. coli* by miniprep method.
- Calcium chloride induced transformation of *E. coli* hosts with plasmids.
- Digestion of plasmid DNA with restriction enzymes and ligation into plasmid vector for transformation
- PCR based detection of microorganisms
- Demo of real time PCR machine

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the macrostructure of DNA and RNA
- To have an idea about the genetic expression and regulation in Prokaryotic system
- To know about the recent advancements in genetic engineering/recombinant DNA technology.
- To have exposure on different types of PCR and their applications.

I. Course Title : Environmental Microbiology

II. Course Code : DM 516

III. Credit Hours : 2+1

IV. Why this course?

Environmental microbiology is the study of the composition and physiology of microbial communities in the environment. This includes: structure and activities of microbial communities, processing of waste water using microbes, microbial interactions with bioecosytem, environmentally transmitted microbial pathogens, various bio-geochemical cycles etc.

V. Aim of the course

To understand the fundamentals of environmental microbiology for overall effects of microorganisms in combating the pollution in the environment.

VI. Theory

Unit I

Environmental microbiology; Aero-microbiology; Airborne pathogens, toxins, aerosols, nature and control of bio-aerosols, aquatic environments and microbial habitats; Soil as a microbial environment; Microbes in extreme environments.

Unit II

Bio-geochemical cycles; Carbon cycles (fixation, energy flow and respiration), nitrogen cycle (fixation, ammonia assimilation, nitrification and nitrate reduction) sulphur cycle (assimilatory sulphate reduction, sulphur mineralization, oxidation and reduction), iron cycle; microbial influenced metal corrosion, acid mine drainage, metal recovery and desulfurization.

Unit III

Environmentally transmitted microbial pathogens (*Salmonella*, *E. coli*, *Campylobacter, Yersinia* etc.) and viruses (enteric and respiratory); indicator microorganisms (concept, total and faecal coliforms, faecal streptococci, bacteriophage etc.); Biofouling and biofilms; microorganisms as indicators of environment pollution; microbial toxicants and bio-organic pollutants.

Unit IV

Waste water treatment: physical - screening, racks, mixing, flocculation, sedimentation, floatation, elutriation, vacuum filtration and incineration; biological unit operations- aerobic and anaerobic cycles; kinetics of biological growth, application of kinetics to treatment systems, aerobic waste treatment, anaerobic waste treatment; waste water utilization for value addition, disposal and reuse of Waste water after treatment, solid wastes management; environment laws.

VII. Practical

- Determination of composite microflora (i.e. total bacteria, coliforms, yeasts and moulds etc.) of soil, water, air.
- Determination of BOD in dairy and food industrial wastes.
- Determination of composite microflora of waste water samples.
- Detection of residual antibiotics/pesticides in waste water samples.
- Isolation of bacteria capable of degrading organic and microbial pollutants from waste water samples.
- Isolation and characterization of bio-indicators from environmental samples.
- Utilization of waste water for production of ethanol, microbial and biomass.
- Visit to a sewage and sludge treatment plant.

VIII. Teaching Methods/ Activities

– Lectures
– Assignment (Reading/Writing)
– Student's Book/Journal Articles
– Student presentation
– Group Work
– Routine Practical as per the schedule
– Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To have knowledge on the environmental bioecosytem (aero-microbiology).
– To have an idea about the processing of waste water using microbes
– To know about the various bio-geochemical cycles
– To have idea on environmentally transmitted microbial pathogens.

X. Suggested Reading

I. Course Title : Biotechnology in Dairy Industry

II. Course Code : DM 517

III. Credit Hours : 2+1

IV. Why this course?

Biotechnology is a tool for value addition to dairy foods. Genetic techniques have been employed to manipulate bacteria that have significance to the dairy industry. Biotechnological means can be used to regulate the production of flavour enhancing metabolites and to develop starter cultures that are resistant to bacteriophage and bacteriocins. Genetic engineering will be able to enhance the technological functions of Lactic acid bacteria for industrial applications using genetic approaches.

V. Aim of the course

To impart knowledge in the application of biotechnology in dairy/ food Industries

VI. Theory

Unit I

History and development of biotechnology; Status of biotechnology industries in India to meet the demands of dairy and food Industries.

Unit II

Genetic improvement of lactic starters to enhance their technological functions for industrial applications, e.g. acid, flavour, EPS, probiotic functions; Metabolic engineering of lactic acid bacteria; Production of recombinant dairy/ food enzymes/ proteins, e.g. chymosin, lactoferrin, lysozyme, lipases, proteases, immunoglobulins etc. Detection of GMOs and GM foods and their safety from public health point of view.

Unit III

Dairy based functional foods/ health foods and nutraceuticals. Value addition in dairy products through fortification/supplementation with bioactive components and probiotic cultures, Nutrigenomics.

Unit IV

Application of molecular tools, biosensors, etc. for detection of foodborne pathogens and spoilage microorganisms.

Unit V

Molecular tools for studying biodiversity; Regulatory standards, value added products for GMOs and GM foods.

VII. Practical

- Plasmid isolation from *E. coli*.
- Agarose gel electrophoresis.
- Transformation of *E. coli* with plasmid (Amp^r).
- Growth of starter cultures on MRS for "lac" marker.
- Induction of "lac"mutation using UV rays or ethidium bromide
- PCR assays for identification of LAB and foodborne pathogen detection
- Production of enzymes:protease/ â galactosidase
- Preparation of value added dairy products: fruit and probiotic based dahi/yoghurt/ lassi.

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the nutrigenomics.
- To have knowledge on how to enhance the technological functions of Lactic acid bacteria for industrial applications using genetic approaches.
- To know about the advanced molecular tools for the detection of pathogens.
- To have knowledge on Biosensor and its application on dairy industry

X. Suggested Reading

- Pometto A, Shetty K, Paliyath G and Levin RE. 2005. *Food Biotechnology*. CRC Press, USA.
- Ratledge C and Kristiansen B. 2001. *Basic Biotechnology*. Cambridge University Press, USA.

I. Course Title : Dairy Starter Cultures

II. Course Code : DM 521

III. Credit Hours : 2+1

IV. Why this course?

Starter cultures are those microorganisms that are used in the production of cultured dairy products such as dahi, yogurt, cheese etc. A starter culture can provide particular characteristics in a more controlled and predictable fermentation. This study covers isolation and characterization of Lactic acid bacteria, methods for selection and preservation, preparation of DVS cultures, control of starter slowness and control of phage in dairy industry.

V. Aim of the course

To familiarize the students with the starter organisms, their metabolism and genetics; different types of starters, propagation, preservation and applications of starters

VI. Theory

Unit I

Taxonomy and characteristics of starter cultures: Taxonomy and natural habitat of starter cultures, Desirable properties of starter cultures with respect to various fermented milk products, Characteristics of starter organisms, bacteria (*Lactococcus, Leuconostoc, Streptococcus, Pediococcus*, *Lactobacillus*, *Bifdobacterium, Enterococcus, Propionibacterium, Brevibacterium*), yeasts and moulds.

Unit II

Carbohydrate, citrate and protein metabolism; Lactose, galactose and glucose metabolism-transport of sugars across the cell boundaries, homolactic and heterolactic fermentations, other pathways of sugar metabolism, formation of flavouring agents from citrate fermentation, proteolytic systems and protein metabolism in lactic acid bacteria: Genetics of starter bacteria: Plasmids and plasmid instability; Industrially significant genes; Genetic modification of lactic acid bacteria, transposons and insertion sequences. Genetics of flavor formation in starter bacteria; Major enzymes and pathways involved.

Unit III

Classification of starters: Single, mixed and multiple strain, mesophilic and thermophilic starter cultures; propagation and preservation of starter cultures; factors affecting propagation of starter, functional starters producing exopolysaccharides, vitamins and antimicrobial compounds, commercial starter preparations: concentrated and super concentrated starters; Production systems for bulk cultures: Lewis, Jones and Tetra-pack systems; growth media: nutritional requirements of lactic acid bacteria, growth media formulations; PIM/PRM, pH control during culturing- external and internal pH control systems; preservation of bulk starter cultures- frozen and freeze dried, spray dried cultures; direct vat starter cultures.

Unit IV

Growth inhibition of lactic acid bacteria by antibiotics, bacteriocins, bacteriophages, cleaning and sanitizing agents and naturally occurring antimicrobial systems in raw milk; sources, types and characteristics of phages associated with starters, morphology and taxonomy, phage host interaction, prevention and control of phages during starter handling and fermented milk products manufacturing, mechanisms of phage resistance in lactic acid bacteria, inhibitory substances produced by lactic acid bacteria.

VII. Practical

- Morphological examination of dairy starter cultures.
- Isolation of lactic acid bacteria from fermented milk products.
- Examination of purity and activity of starter cultures.
- Effect of physical and chemical factors on starter cultures.
- Evaluation of homo and hetero fermentation by starter cultures.
- Production of bulk starter culture.
- Preservation of starter cultures by liquid, freeze drying and other methods.
- Preparation and quality evaluation of concentrated starters.

- Inhibition of starters by antibiotic residues and other inhibitors.
- Production of bacteriocins by lactic acid bacteria.
- Production of exopolysaccharides by lactic acid bacteria.
- Detection of bacteriophages in cheese whey.

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the isolation and characterization of Lactic acid bacteria
- To have an idea about biochemical pathways of Lactic acid bacteria for carbohydrate metabolisms
- To know about the freeze drying and preparation of DVS cultures.
- To have idea about causes of slowness of starter and control of phage.

X. Suggested Reading

I. Course Title : Microbial Safety and Quality

II. Course Code : DM 522

III. Credit Hours : 2+1

IV. Why this course?

Food Quality and Standards Service is committed to the enhancement of *food safety and quality* along the *food* chain to prevent diseases and trade disruptions. This course covers principles of safety in a food microbiological laboratory, conventional and rapid methods for detection of hygiene indicators or pathogens, antibiotic resistance in bacteria etc.

V. Aim of the course

To impart knowledge pertaining to quality and safety functions in dairy processing unit and measure to control quality and safety of dairy products.

VI. Theory

Unit I

Principles of quality and safety functions in dairy processing unit:
Introduction to ISO standards– ISO: 9000:2000; ISO: 9004:2000; ISO: 9001:2000: Brief concept and principles of QMS and standard requirements for certification HACCP, Hazard Analysis and Risk-Based Preventive Controls (HARPC), SAFE, GMP, SSOP, FSMS, personnel hygiene and food handling in dairy industry.
Principles of safety in a food microbiological laboratory-Bio-safety concept, Biosafety level-1-4 containment design and layout; Standard microbiological practices for safe handling in food laboratory, safety equipment, facility design.

Unit II

General principles for establishment of microbiological criteria
Definition, purpose and components of microbiological criteria; mandatory and advisory criteria
Sampling methods - two and three class sampling plan as per International council for microbiological standards for foods (ICMSF)
Establishment of microbiological standards, guidelines and specifications for different dairy foods as recommended by ICMSF, CODEX, FSSAI

Unit III

Conventional and rapid methods for detection of hygiene indicators;
definition, selection criteria of indicator organisms as an index of food quality
Conventional detection methods for indicator organisms – Standard plate count (SPC), coliforms, *E. coli*, yeast and mould Counts (YMC), spore counts; enterobacteriaceae count; Faecal streptococci count; Dye reduction tests
Rapid techniques like D-count, petrifilm, ATP bioluminance including commercial kits for monitoring hygiene indicators

Unit IV

Conventional and rapid methods for detection of safety indicators;
definition, selection criteria of indicator Organisms as an index of food safety;
Conventional detection methods for detection of pathogenic organisms as per ISO protocol specified by FSSAI – *Staphylococcus aureus*; *Bacillus cereus*; Pathogenic *E.coli*; *Salmonella*; *Shigella*; *Listeria monocytogenes*; *Enterobacter sakazakii*; Sulphite reducing clostridia (SRC), *Campylobacter jejuni*;
Rapid techniques like–VIDAS, SPR, RT-PCR including commercial kits, for monitoring safety indicators.

Unit V

Bio-sensors and micro-techniques for rapid monitoring of contaminants;
definition, history, basic characteristics of bio-sensors; classification based on bio-recognition molecule - Microbial, spore, Aptamer, DNA, immune and enzyme etc.
Biosensors based on Transducers - electrochemical, optical, mechanical and calorimetric etc.
Bio-sensors for rapid detection of hygiene indicators, pathogenic bacteria, antibiotics, pesticides, heavy metal, aflatoxin M1 in milk.

VII. Practical

- Demonstration of safety principles in a food microbiological laboratory.

- Aseptic technique for ensuring safety of personnel, product and environment.
- Conventional and rapid methods for hygienic assessment of milk for SPC, coliforms, *E. coli*, YMC, Spore counts, Enterobacteriaceae count, faecal streptococci count, Dye reduction tests
- Conventional ISO methods for enumeration of safety indicators in dairy foods for *S. aureus*; *B. cereus*; *E.coli*; *Salmonella*; *Shigella*; *L. monocytogenes*; *E. sakazakii*; SRC; *Campylobacter jejuni* as per FSSAI standards.
- Rapid tests for detection of antibiotics, aflatoxin M1 and pesticides in milk.
- Determination of antibiotic resistance in bacteria using phenotypic methods.
- Shelf life studies of dairy products; effect of storage condition and packaging material on microflora of dairy foods.
- Determination of efficacy of detergents and sanitizers using capacity and suspension tests.

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on principles of safety in a food microbiological laboratory
- To have an idea about the principles for establishment of microbiological criteria
- To know about the conventional and rapid methods for detection of hygiene indicators/pathogens
- To have knowledge on antibiotic resistance in bacteria.

I. Course Title : Microbiology of Cheese and Fermented Dairy Foods

II. Course Code : DM 523

III. Credit Hours : 2+1

IV. Why this course?

There are several types of cheeses in the world; use of different starter culture can lead to development of specific cheese variety too. However, the technological principles involved in Cheddar cheese making are common to several varieties of cheeses, with some modifications. Cheese is getting popularized in India, especially the Pizza cheese variety that is preferentially used as a topping on pizza pie. The functional properties of cheese depend on the starter cultures used and ripening of cheeses. Specific cheese has its own typical flavour and aroma depending on type of starter cultures used for particular ripening conditions.

V. Aim of the course

To impart knowledge on basic and applied aspects of cheese and fermented dairy foods

VI. Theory

Unit I

Evolution and classification of cheeses and fermented Dairy foods; Introduction, classification and types of cheeses and fermented dairy foods. Market share and recent market trends

Unit II

Microbiology of cheese, Cheese starter cultures involved in the manufacture, their types, roles, Current classification and metabolic pathways. Rennet, rennet substitutes; Microbial and recombinant rennet used in cheese preparation. Bacteriophages of cheese starters. Microbes associated with spoilage, defects, causative organisms and preventive measures. Health aspects of cheese.

Unit III

Microbiology of cheese ripening

Microbiological changes, Factors Influencing Growth of Microorganisms, Flavour development, Role of starter flora and supplementary flora in cheese ripening.

Accelerated cheese ripening through biotechnological approaches, Cheese with high linoleic acid content, Enzyme-modified cheese, GMO

Microbiological and biochemical aspects of major cheese varieties - Cheddar, Swiss-Type Cheeses - Emmental, Very hard cheese - Parmesan, Dutch cheese varieties - Edam, Gouda, Pasta Filata/Pizza Cheese - Mozzarella, Unripened cheese - Cottage, Internal mould ripened cheese - Roquefort, Surface mould ripened cheese - Camembert, Bacterial surface ripened cheese- Limburger; Microbiology of processed cheese.

Unit IV

Microbiology of Fermented dairy foods; Dahi, lassi, yoghurt, Kefir, Koumiss, functional fermented dairy based beverages, fermented whey drinks, and dairy based fermented cereal foods, fortified fermented dairy foods - Microbes associated with spoilage and preventive measures. Safety and standards of fermented foods.

Unit V

Functional cheeses, Cheese as matrix for probiotic delivery.

Health aspects of cheese and fermented foods: nutritional value, and therapeutic benefits.

VII. Practical

- Preparation and evaluation of ethnic fermented dairy products
- Preparation of cheese with mesophilic dairy starter cultures and different microbial rennets.

- Preparation of functional/probiotic cheese
- Microbial analysis of cheeses
- Identification and characterization of specific starter cultures from different varieties of cheeses (*Leuconostoc* for Dutch type cheese, *Propioni bacterium* for Swiss type cheese).
- Determination of ß-galactosidase activity of microorganisms
- Accelerated cheese ripening using different interventions

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group work
- Routine practical as per the schedule
- Visit to the relevant industry or laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Be able to manufacture various varieties of cheeses using cheese specific starter cultures
- To have knowledge on Bacteriophages of cheese starters
- Be able to develop different fermented milk products, particularly traditional fermented milk products
- To develop the probiotic cheese using probiotic cultures

X. Suggested Reading

I. Course Title : Probiotics and Prebiotics

II. Course Code : DM 524

III. Credit Hours : 2+1

IV. Why this course?

Probiotics are live microorganisms intended to provide health benefits when consumed, generally by improving or restoring the gut flora. This study covers Gut microbiota and its role in human health, mechanism of action of probiotics/prebiotics, safety and regulations on probiotics or probiotic food products.

V. Aim of the course

To understand the concept of probiotics and prebiotics in relation to food formulations and health effects.

VI. Theory

Unit I

Probiotics, Prebiotics and Synbiotics: Concepts, definitions and history. Gut microbiota and its role in human health and disease

Unit II

Identification of probiotic strains isolated from different niches by polyphasic approach using phenotypic, biochemical and genotypic tools/techniques. Characterization and selection of candidate probiotic strains on the basis of FAO/WHO or ICMR/DBT guidelines.

Unit III

Mechanism of action of probiotics: Colonization in the gut; Adhesion to intestinal mucosal surface – role of surface proteins; Antimicrobial/antagonistic activity of probiotics, Pathogen exclusion; Immuno-modulatory action; Impact on gut homeostasis; Host microbe interaction and their cross talk; Role of biomarkers for probiotic functionality.

Unit IV

Mechanism of action of prebiotics and synbiotics: Selective stimulation of beneficial bacteria in the gut microbiota; Effect on gastric emptying and intestinal transit rate; Production of short chain fatty acids (SCFA); Effect of SCFA on host metabolism and immunomodulation; Anti-adhesive prebiotics. Synbiotics and their action through improved viability of probiotic microorganisms and provision of specific health benefits

Unit V

Dairy based foods as carrier of probiotics: Dairy based products as delivery vehicles – Stability towards manufacturing conditions, enhancing stability through encapsulation or drying strategies for lyophilized formulations etc., co-culture compatibility with starters, minimum effective dose, and large-scale production of probiotic biomass through fermentation for application in foods and as drugs/supplements.

Unit VI

Designer probiotics: Genetically modified probiotics as oral vaccines, enhanced adhesion properties and health promoting functions.

Unit VII

Safety, human trials and regulatory guidelines: *In vitro* and *in vivo* safety assessment of probiotics; designing human trials; regulatory guidelines - US, Canada, Europe and India.

VII. Practical

- Isolation of probiotic organisms from human milk and faecal samples.
- Tentative identification by microscopic examination, catalase and biochemical tests.
- Identification of isolates by genus and species-specific PCR.
- Evaluation of bacterial isolates for probiotic properties.

- Acid tolerance; Bile tolerance; Hydrophobicity; Antimicrobial activity.
- Specific utilization of prebiotics by probiotic bacteria.
- Survival of probiotic culture in fermented dairy products.
- Microencapsulation of probiotic bacteria.

VIII. Teaching Methods/ Activities

- Lecture
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Have knowledge on the Gut microbiota and its role in human health
- To have knowledge on identification, characterization and selection of probiotic strains using phenotypic, biochemical and genotypic tools/techniques
- To know about the different mechanism of action of probiotics/prebiotics establishing through in vitro and in vivo studies.
- To have any idea about the safety and regulations on probiotics or probiotic food products.

I. Course Title : Research Techniques

II. Course Code : DM-525

III. Credit Hours : 2+1

IV. Why this course?

Research techniques are required to study the tools and techniques that are used in quantitative and qualitative methods. This study covers microscopic analysis of different types of bacteria, activities of enzyme using spectrophotometric based assays, identification and characterization of microorganisms by PCR etc.

V. Aim of the course

To impart knowledge and skills related to microbiological analytical systems in microbiology and related sciences.

VI. Theory

Unit I

Microscopy: Principles, design and application of bright field, dark field, phase contrast, fluorescence, atomic force, confocal laser and electron microscopes.

Unit II

Cell fractionation: Physical and chemical methods of microbial cell lysis: Ultrasonication, glass bead lysis, micro-fluidization, enzymatic and solvent induced techniques.

Unit III

Molecular separation: Ultrafiltration, crystallography, isoelectric focusing, chromatography, SDS-PAGE, micro and ultracentrifugation.

Unit IV

Assay methods: Spectrophotometric methods, ELISA, protein and enzyme assays, microbiological assay, and microbial receptor assay.

Unit V

Studying nutritional and therapeutic attributes of microorganisms and fermented dairy foods - Use of cell culture and small animal models.

VII. Practical

- Familiarization with the construction and design of a compound microscope; use of light microscope accessories; microscopic analysis of different types of bacteria by bright field, dark field, phase contrast and fluorescence microscopes
- Disruption of bacterial cells by ultra-sonification
- Demonstration of chromatographic techniques and SDS-PAGE
- Demonstration of aerobic and anaerobic culturing techniques
- Demonstration of use of animal models in toxicity studies
- Identification and characterization of microorganisms by PCR

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Be able to do the microscopic analysis of different types of bacteria
- To measure the activities of enzyme using spectrophotometric based assays
- To know about the identification and characterization of microorganisms by PCR

X. Suggested Reading

I. Course Title : Microbial Fermentation Technology

II. Course Code : DM-526

III. Credit Hours : 2+1

IV. Why this course?

Fermentation technology is the use of organisms to produce food, pharmaceuticals and alcoholic beverages on a large scale industrial basis. The basic principle involved in the industrial fermentation technology is that organisms are grown under suitable conditions, by providing raw materials meeting all the necessary requirements such as carbon, nitrogen, salts, trace elements and vitamins in a suitably designed bioreactor.

V. Aim of the course

To disseminate recent information on basic and applied aspects of fermentation technology and its industrial application to the students.

VI. Theory

Unit I

Fermentation for enhancing shelf life of foods, types of fermentation - submerged/ solid state and semi-solid.

Unit II

Microbial growth, metabolism, death, membrane transport, fermentation kinetics and fermentation modelling, batch, fed batch, continuous culture systems.

Unit III

Bioreactor design, measurement and control in fermentation.
Different types of fermenters, scaling up of fermentation, sterilization, agitation; pH, Eh, temperature measurement and control, downstream processing and product recovery, immobilization in fermentation

Unit IV

Biosensors in fermentation applications
Biosensors, basic principles; application in detection of sugars, alcohol, amino acids

Unit V

Industrial production of microbial cell biomass, organic acids, enzymes, antibiotics, micro-nutrients, amino acids, vitamins, ethanol, SCP and alcoholic beverages

VII. Practical

- Bacterial growth in batch culture.
- Different methods of microbial cultivation.

- Fermenter operation and measurement.
- Production of antimicrobial substances/ bacteriocins
- Production of microbial enzymes
- Production of baker yeast, SCP/microbial biomass.
- Production of alcohol, lactic acid.
- Production of alcoholic beverages and whey beverage

VIII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Routine Practical as per the schedule
- Visit to the relevant industry or Laboratory

IX. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the Bioreactor design, measurement and control in fermentation
- Be able to produce the microbial cell biomass, organic acids, enzymes, antibioticsetc. using fermenter
- To have an idea about the construction, design and application of biosensor
- Be able to produce alcoholic and whey beverages.

X. Suggested Reading

Course Title with Credit Load
Ph.D. in Dairy Microbiology

Course Code	Course Title	Credit Hours
DM 611**	Advances in Microbial Physiology	3+0
DM 612	Advances in Microbial Genetics	3+0
DM 621**	Advances in Dairy and Food Microbiology	3+0
DM 622	Advances in Food Safety of Dairy Products	3+0
DM 623	Advances in Probiotics and Functional Foods	3+0
DM 691	Credit Seminar-I	1+0
DM 692	Credit Seminar-II	1+0
DM 699	Doctoral Research	0+75

Minor Courses

The courses will be selected from the major courses of the allied disciplines of Dairy Chemistry, Dairy Technology, Dairy Engineering and Animal Biochemistry to meet the minimum credit requirements.

Supporting Courses

The supporting courses will be picked from the basket of courses offered in agricultural statistics, computer applications and IT, and other related relevant disciplines to meet the minimum credit requirements.

Common Courses

1. Library and Information Services 1
2. Technical Writing and Communications Skills 1
3. Intellectual Property and its Management in Agriculture 1
4. Basic Concepts in Laboratory Techniques 1
5. Agricultural Research, Research Ethics and Rural Development Programmes 1

*Core courses for Master's programme; **Core courses for Doctoral programme

Course Titles with Credit Load
Ph.D. in Dairy Microbiology

I. Course Title : Advances in Microbial Physiology

II. Course Code : DM 611

III. Credit Hours : 3+0

IV. Why this course?

Microbial physiology deals with metabolism and energy provision; reproduction and death; and regulation of vital activity on the intracellular level and on the level of microbe-microbial interactions and interactions of microorganisms with plants, animals, and man. This study covers growth kinetics of microorganisms, genetical changes during endospore formation, interactions of bacterial communities and diversity in natural eco-systems

V. Aim of the course

To understand the advances in microbial physiology and diversity for its interface with all other branches of microbiology.

VI. Theory

Unit I

Microbial growth and stress response; Mathematics and kinetics of bacterial growth, Continuous culture system (chemostat and turbidostat), Diauxic and synchronous growth, Unrestricted versus nutrient-limited growth; Advances in growth measurement, counting viable but non-culturable microbes, Growth in natural environments and limitations. Osmotic stress and osmoregulation, high and low osmolality, osmotic control of gene expression, Aerobic to anaerobic transitions, oxidative stress, regulation of the oxidative stress response,pH stress and acid tolerance,Thermal stress and heat shock response, Nutrient stress and starvation stress response, starvation protecting proteins.

Unit II

Peptidoglycans of bacterial cell walls; peptidoglycan hydrolases and synthesis; teichoic and lipo-teichoic acids, Outer membranes of Gram-negative bacteria; lipo-polysaccharide biosynthesis; Outer membranes of Gram-negative bacteria, Bacterial flagella; Chemotaxis; Swarming motility; motility in spirochetes, Endospore formation in bacillus; molecular design of a spore; Stages, physiological changes and genetic aspects of sporulation; Sporulating genes; initiation, transition, forespore development and final stages of sporulation; spore cortex and coat synthesis; Biochemical changes during sporulation, heat resistance in spores; Activation, germination, and outgrowth of bacterial endospores.

Unit III

Energy generation and transport of metabolites: Substrate-level and oxidative phosphorylation; Measurement of proton motive force; Electron transport systems;

Anaerobic respiration; Conversion of proton motive force to energy; Structure of F1F0 and the ATP operon; Energy yield; Generating ATP in alkalophiles; Energetics of chemolithotrophs; Metabolite transport; Facilitated diffusion; Mechanosensitive channels; ATP-binding cassette transporter family; Chemiosmotic-driven transport; Establishing ion gradients; New insight into Respiration and fermentation mechanism in Lactic Acid bacteria, specific transport systems; ATP-linked ion motive pumps, the histidine permease, iron, phosphotransferase system. Sugar transport in Lactic Acid bacteria.

Unit IV

Metabolic Pathways: Alternate pathways of carbohydrate metabolism; Fructose bisphosphatealdolase pathway; Alternate pathways of glucose utilization; Entner-doudoroff or ketogluconate pathway; phosphoketolase pathway; oxidative pentose phosphate cycle; Gluconeogenesis, regulation, glycogen synthesis, tricarboxylic acid cycle, glyoxylate cycle. Utilization of sugars other than glucose, lactose, galactose; maltose, mannitol, fucose and rhamnose, melibiose, raffinose, stachyose; Cellulose degradation; metabolism of starch and glycogen.

Unit V

Microbial (bacterial, archaeal, fungal and viral) diversity, Bacterial communities and diversity in natural eco-systems with special reference to Lactic Acid bacteria. Extremophiles: hyperthermophiles, extreme acidophiles, psychrophiles, barophiles halophiles, alkaliphiles, oligotrophs, radiation-resistant microorganisms, extremophiles habitats and microorganisms, Biochemistry and physiology of adaptation, biotechnology of extremophiles.

VII. Teaching Methods/ Activities

– Lectures
– Assignment (Reading/ Writing)
– Student's Book/ Journal Articles
– Student presentation
– Group Work
– Visit to the relevant industry or Laboratory

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

– To have knowledge on the growth kinetics of microorganisms
– To have an idea about the genetical changes during endospore formation
– To know about the energy generation using electron transport chains
– To have idea on interaction of bacterial communities and diversity in natural eco-systems.

I. Course Title : Advances in Microbial Genetics

II. Course Code : DM 612

III. Credit Hours : 3+0

IV. Why this course?

Microbial genetics is the study of inheritance in microorganisms, including bacteria and fungi. This study covers the advancement of genetic expression and regulation in Prokaryotic system, genetic engineering/recombinant DNA technology, mutations, gene editing using advanced tools, etc. The course will also highlight applications of genetic tools.

V. Aim of the course

To familiarize the students with basic concepts of Microbial Genetics and impart them knowledge in advancements of Microbial Genetics and Genetic Engineering

VI. Theory

Unit I

Nucleic Acids: Structure of DNA – A, B and Z and triplex DNA, Function of DNA, RNA, DNA Replication models, Protein-Nucleic acid Interactions and helix-turn-helix (HTH) motif, Genetic Code.

Unit II

Mutations – Spontaneous and Induced mutations, Types of mutations; Mutagenic agents (Physical and Chemical), Molecular basis of Mutagenesis, DNA Damage and Repair – Molecular Mechanisms, Photoreactivation, Excision repair, mismatch repair, post replication repair and SOS repair. Site Directed Mutagenesis, Directed evolution, Targeted Genome Editing and CRISPR/Cas9.

Unit III

Prokaryotic Transcription; Promoters- Constitutive and Inducible; Operators; Regulatory elements; Initiation; Attenuation; Termination-Rho-dependent and independent; Transcriptional regulation-positive and negative; Operon models, - Lac, Gal and Trp. Translation: Translation machinery, translation process, Initiation, elongation, termination, factors of Protein Synthesis, peptide bond formation and translocation, Regulation of prokaryotic translation.

Unit IV

Plasmid - Structure and replication, types of plasmids, moveable genetic elements: Transposons, IS and Tn elements, molecular mechanism of transposition, Recombination in bacteria, homologous and non-homologous, 'illegitimate' recombination, and site-specific recombination; Transformation and competence factors, Transduction and Conjugation, structure of F plasmids, Hfr, Recombination methods as a tool for Gene mapping.

Unit V

Genetic Engineering/ rDNA–Restriction Enzymes – Types, Mode of action and application as a tool for gene manipulation, Vectors – Cloning and expression vectors, Construction of genomic and cDNA library, construction of full length cDNA, Microarray, Gene Silencing, Gene knock out.

Unit VI

Intracellular Signaling in microorganisms, cell-cell communication (quorum sensing), Signal transduction mechanism or pathways

Unit VII

Pyrosequencing, Illumina, Ion torrent, Nanopore sequencing technologies for whole genome and metagenome sequencing.

VII. Teaching Methods/ Activities

– Lectures
– Assignment (Reading/Writing)
– Student's Book/Journal Articles
– Student presentation
– Group Work
– Visit to the relevant industry or Laboratory

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:
– To have knowledge on the biological significance of DNA and RNA
– To have an idea about the genetic expression and regulation in Prokaryotic system
– To know about the recent advancements in genetic engineering/recombinant DNA technology.
– To have exposure on gene editing using advanced tools.

I. Course Title : Advances in Dairy and Food Microbiology
II. Course Code : DM 621
III. Credit Hours : 3+0

IV. Why this course?

Functional foods have potentially positive effects on health beyond basic nutrition and promote optimal health and help to reduce the risk of life style diseases. This course covers biochemical pathways of Lactic acid bacteria for carbohydrate metabolisms or protein metabolisms, bacteriocins and their application as biopreservatives, encapsulation of microorganisms and enzymes for the delivery to the target site etc.

V. Aim of the course

To study and understand the current trends and recent concepts related to microbiology of dairy and other foods products.

VI. Theory

Unit I

Lactic acid bacteria in food fermentations, Important metabolic pathways of microorganisms, Current status of metabolism of starters cultures; Antibiotic resistance in lactic acid bacteria, Current trends in lactic starter for industrial applications and functional foods, Special additional cultures, Biofilm and their remedies, Future aspects in research and development of LAB.

Unit II

Current concepts in starter technology, Novel starter preservation techniques, DVS, Improving starter cultures for food fermentation by genetic manipulation/metabolic engineering, Development/formulation of new products based on dairy by-products, Bioactive metabolites and biogenic amines, Designer milk, Modern concepts in cheese ripening, Nutraceuticals and functional foods, Genetically modified foods/ products, Safety aspects of genetic engineered foods.

Unit III

Bacteriocins of lactic acid bacteria, Structure, function, transport and mode of action, Application of bacteriocins in food bio preservation, Non-bacteriocin antimicrobial compounds- reuterin, antifungal compounds, milk and food derived bioactive peptides and other antimicrobial compounds, Protective cultures, Antimicrobial packaging system, active packaging.

Unit IV

Newly emerging pathogens, Concepts in food toxicology, Food borne toxins, Rapid methods for detection in food borne pathogens, Current concepts in food quality and safety management, Control of food borne pathogens, Pasteurization, dehydration, freezing, fermentation, irradiation and chemical additives, microwave processing, microfiltration, bactofugation, Hurdle technology, modified atmosphere packaging and storage, novel technology in control of food based pathogens, Use of non-thermal technologies (ultra-high voltage electric fields, thermosonication hydrostatic pressure technology, cold plasma etc.) alternate-thermal technologies (ohmic heating, dielectric heating, infrared and induction heating etc.), Biological technologies (antibacterial enzymes, proteins and peptides) in food processing.

Unit V

Encapsulation as a means for delivery of bacteria and functional ingredients-microencapsulation and nanoencapsulation, nanotechnology, Immobilization of cell and enzymes and their use in dairy and food industry.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Visit to the relevant industry or Laboratory

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- Have knowledge on the functional dairy foods
- To have an idea about biochemical pathways of Lactic acid bacteria for carbohydrate metabolisms or protein metabolisms
- To know about the Bacteriocins and their application as biopreservatives.
- To have any idea about the encapsulation of microorganisms and enzymes for the delivery to the target site.

IX. Suggested Reading

- Suvendu Bhattacharya. 2014. *Conventional and Advanced Food Processing Technologies*. Wiley Publishing.

I. Course Title : Advances in Food Safety of Dairy Products

II. Course Code : DM 622

III. Credit Hours : 3+0

IV. Why this course?

Food safety is used as a scientific discipline describing handling, preparation, and storage of food in ways that prevent food-borne illness. This study covers principles of safety in advanced food microbiological laboratory, general mechanism of microbial pathogenesis, emerging food borne pathogens, antimicrobial resistance in bacteria etc.

V. Aim of the course

To develop knowledge, understanding and application of foodborne pathogens at an advanced level to ensure safety of dairy products.

VI. Theory

Unit I

Milk borne diseases, public health concern and epidemiology Trends in food borne disease and implication; Methods of diseases transmission; Changing patterns in epidemiology of milk borne diseases; Impact of agricultural and modern food manufacturing practices in transmission of food borne diseases. Public health concern associated with milk and milk products; type of microbial spoilage, defects and control measures.

Unit II

General mechanism of microbial pathogenesis: Food borne infection by colonization and adhesion factors like Pilli or fimbriae, adhesion proteins, Food borne infection by biofilm formation; invasion and intracellular residence factors; Food borne infection by phagocytosis, invasion mediated induced phagocytosis; Food borne infection by iron acquisition; motility and chemotaxis; Food borne infection by invasion of immune system; Intoxication; Toxi-infection. Structure and function of exotoxins and endotoxin; Genetic regulation and secretary system for virulence factors.

Unit III

Growth, survival characteristics, virulence and infectivity of dairy pathogens; Growth and survival characteristics of *E. coli, Enterobacter sakazaki*, Salmonella, Shigella, *Yersinia enterocolitica,* Streptococcus sp., *L. monocytogenes*, *Mycobacterium avium* subsp. *paratuberculosis*, *Brucella* sp., *Campylobacter jejuni*, *Staph.aureus*, *B. cereus, Clostridium perfringens*, toxigenic fungi and viruses in milk and milk products, their pathology of illness, mode of transmission, incidence of illness, virulence and infectivity.

Unit IV

Microbiological risk assessment of dairy foods: Risk analysis principle and concept; Hazard identification and characterization; Exposer assessment;Risk characterization in dairy products; Risk assessment models (dose response/ exposer assessment models);Risk factors affecting microbial safety of raw and processed dairy foods; Risk profiling of pathogens in milk and milk products; Risk management issues and control strategies for dairy products.

Unit V

Antimicrobial resistance in dairy animals and public health concern: Global and national perspective of AMR in dairy sector; WHO priority list/ guidelines on AMR bacteria; National action plan on AMR. Surveillance/ Incidence of AMR bacteria in dairy food chain and public health concern Mechanisms of resistance development in AMR bacteria; Conventional and rapid diagnostics for detection of AMR bacteria in dairy foods.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/ Writing)
- Student's Book/ Journal Articles
- Student presentation
- Group Work
- Visit to the relevant industry or Laboratory

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on principles of safety in advanced food microbiological laboratory
- To have an idea about the general mechanism of microbial pathogenesis
- To know about the emerging food borne pathogens
- To have knowledge on antimicrobial resistance in bacteria

IX. Suggested Reading

I. Course Title : Advances in Probiotics and Functional Foods

II. Course Code : DM 623

III. Credit Hours : 3+0

IV. Why this course?

Probiotics are live microbial food supplements that provide several health benefits, as they help in maintaining excellent stability and composition of the intestinal microbiota and boost the resistance against infection by pathogens. The requirement for probiotic functional foods is rapidly and progressively because of increased awareness of the public regarding the impact of food on health. This study covers prebiotics, synbiotics and postbiotics, functional food ingredients and their role in human health and nutrition, different mechanism of action of probiotics establishing through in vitro and in vivo studies, scientific assessment of probiotics/functional foods, next generation probiotics etc.

V. Aim of the course

To familiarize the student with the advancements in probiotics and functional foods

VI. Theory

Unit I

Probiotics: Characteristics of probiotics for selection, Stability during storage and passage to gastrointestinal tract.

Unit II

Probiotic mode of action and disease control: Homeostasis of disturbed commensal microbial flora in the gut, pathogen exclusion, production of antimicrobial substances, modulation of immune system, alteration of intestinal bacterial metabolite action, alteration of microecology of healthy humans and patients.

Unit III

Prebiotics, synbiotics and postbiotics: Concept and definitions, criteria, types and sources of prebiotics, prebiotics and gut microbiota.

Unit IV

Functional foods; Nutraceuticals, medical/health foods, functional foods ingredients and their role in human health and nutrition.

Unit V

Dairy based functional foods: Dahi, lassi, yoghurt, kefir, cheese, koumiss, functional fermented dairy beverages, and dairy based cereal foods, fortified fermented dairy foods.

Unit VI

Cereals, soya, plant based and other functional foods; Miso, Kimchi, Sauerkraut, Sake, Ogi, Gundruk, Natto, Doenjang, Tempeh, Douchi, Cheonggukjang, and Soy milk based fermented foods:(yoghurt, dahi, beverages and cheese), fermented meat products.

Unit VII

Microbial production of Bioactive compounds: Bacteriocins, Bioactive peptides, Conjugated Linoleic Acids, gamma-Aminobutyric acid, Vitamins (Folate, Riboflavin, Vitamin B12), Low calorie sugars (Xylitol, Sorbitol, Mannitol, Trehalose), Micronutrients (Selenium, Zinc).

Unit VIII

Health benefits of probiotics/functional foods: Gastrointestinal disorders, metabolic syndrome including cardiovascular diseases, diabetes and obesity, Brain health, Immunological disorders, cancer, health and wellbeing in Ageing, alcoholic and non-alcoholic liver disease, Reproductive and Hormonal disorders, mental health.

Unit IX

Scientific Assessment of probiotics/functional foods: Role of Biomarkers, Application of Proteomics, Metabolomics, Nutrigenetics and Nutrigenomics in establishing scientific evidence of functional foods for imparting health benefits.

Unit X

Regulations and Future prospects of probiotics and functional foods: Legal status of probiotics, safety and regulatory aspects and Future prospects.

Unit XI

Next generation probiotics (Designer probiotics): Robust probiotic strains with stress survival systems, enhanced adhesion ability and surface markers etc. and for mucosal delivery of vaccines.

VII. Teaching Methods/ Activities

- Lectures
- Assignment (Reading/Writing)
- Student's Book/Journal Articles
- Student presentation
- Group Work
- Visit to the relevant industry or Laboratory

VIII. Learning outcome

After undergoing this course, the students are expected to deliver the following:

- To have knowledge on the Prebiotics, synbiotics and postbiotics
- To have knowledge on functional food ingredients and their role in human health and nutrition
- To know about the different mechanism of action of probiotics establishing through *in vitro* and *in vivo* studies.
- To have any idea about the Scientific Assessment of probiotics/functional foods.

Suggested Broad Topics for Master's and Doctoral Research

- Application of predictive microbiology:Modeling microbial responses in foods
- A process approach to quality management system
- Air micro-flora as spoilage and infectious agents in dairy industry
- Alternative methods of microbial quantification
- Animal studies of functional attributes of dairy organisms
- Anti-microbial packaging and MAP of foods
- Bioactive peptides and Nutraceuticals
- Biodegradation of pollutants and packaging of food materials in the environment
- Biodiversity of Indian probiotic cultures/ LAB
- Biofilms in dairy industry
- Bioprospecting of dairy foods for identification, characterization and classification of prevailing microbiota
- Bioremediation of food industry wastes and metabolic engineering
- Biosensor Based assays for the detection of pathogens
- Cloning and Expression of prokaryotic and Eukaryotic genes in *E. coli* and yeast systems
- Defined strain cultures for indigenous fermented milks
- Detection and enumeration of conventional and emerging pathogenic organisms and other contaminants in dairy foods
- Detection and enumeration of indicator organisms in dairy foods
- Detection of phages in dairy and food environment
- Development of direct-fed microbial for ruminants
- Development of indicators and biosensors from microbial metabolites
- Development of synbiotic products
- Effect of different nutrients on the growth and production of microorganisms
- Effect of natural environment on microbial growth and production
- Studies on bacterial growth kinetics in batch and continuous culture systems
- Emerging Foodborne pathogens
- Enhancing shelf life of foods through microbial fermentation
- Enrichment of poor-quality roughages by solid-state fermentation
- Evaluation lactic acid bacteria for production of functional biomolecules
- Fermentation Studies for cultivation of lactic acid bacteria
- Food toxins- bioremediation
- Formulation of novel pharmaceuticals and neutraceuticals
- Genetic improvement of starter cultures
- Genetic manipulation of lactic starter cultures
- Genetic modification of dairy cultures by rDNA technology

- Genetic modification of food through the use of food grade vectors
- Genetic modification of LAB
- Genomics and Proteomics of lactic acid bacteria
- Genotypic heterogeneity and diversity of microorganisms in fermented dairy foods
- Harnessing the potential of microbial growth in environmental depollution
- Improving functionality of probiotics through metabolic engineering
- Industrial production of metabolites such as recombinant proteins/enzyme in a bioreactor and downstream processing
- Manipulation of rumen microbial ecosystem
- Metabolic engineering of LAB
- Microbial stress metabolism and ecosystem
- Microorganisms as indicators of environment pollution
- Molecular diagnostics for detection and identification of food pathogens and dairy micro-organisms
- Molecular diagnostics in dairy/food industry
- Molecular techniques for detection of foodborne pathogens and their toxins
- Metagenomic analysis of gut microbiome
- Newly emerging pathogens- rapid method of identification
- Novel bacteriocins of LAB
- Novel bacteriocins of lactic acid bacteria
- Nutrient transport systems through cell-membrane of yeast and bacteria
- Nutritional and therapeutic value of probiotic products
- PCR based identification of dairy cultures and probiotic cultures
- PCR based identification of pathogens
- Phage resistance in lactic acid bacteria
- Plasmid borne genes, chromosomal integration and technological properties of LAB
- Preservation of leguminous/ non-leguminous fodder crops by ensiling
- Principles of bio-safety in establishment of pathogen testing laboratory in food industry
- Principles of food safety control programme on HACCP, standard sanitary operating procedures (SSOP) and GMP for dairy industry
- Probiotics: characterization, product formulations, novel probiotics, validation of health claims through animal and clinical trials
- Production of microbial biomass as single cell protein
- Rapid method for detection and identification of food pathogens
- Rapid methods for detection and identification of pathogens in milk and milk products.
- Recombinant proteins/ enzymes for application in food/ dairy industry
- Recombinant proteins/enzymes for application in dairy industry
- Regulation of metabolism for lactic acid and flavour production
- Resistance of Foodborne pathogens to emerging food processing technologies.
- Role of extremophiles in microbial ecology and industry
- Screening of prebiotics
- Stress induced injury: mechanism and application in hurdle technology
- Biofilms formation in milk handling and dairy processing environment
- Mode of action of antibacterial substances on cellular organelles
- Plasmid linked properties of dairy cultures
- Probiotic organisms by growing them under anaerobic conditions and their identification by PCR method
- Study of production of functional biomolecules by lactic acid bacteria
- Ultra-structure of spore forming and non-spore forming dairy/food microorganisms with

the help of electron microscopy
- Transformation of gene of interest in the bacterial hosts
- Trends in food borne diseases and implications; method of diseases transmission; principles of safety in a food microbiological laboratory
- Understanding probiotic functionality at molecular level and role as potential probiotic markers
- Use of microorganisms in conversion of food wastes in preparation of newer foods
- Whole genome shuffling/ DNA/ Family shuffling

ANNEXURE I

List of BSMA Committee Members for Dairy Science and Technology

(Dairy Technology/Dairy Engineering/Dairy Microbiology/Dairy Chemistry)
(Constituted by ICAR vide Office order No. F.No. 7/6/2017-EQR)

Name and designation	Address	Specialization
Dr R.R.B. Singh Director	ICAR-National Dairy Research Institute, Karnal, Haryana Present Address: Joint Director (Academics), ICAR-National Dairy Research Institute, Karnal, Haryana	Chairman
Dr Anil K. Puniya Dean	College of Dairy Science and Technology, Guru Angad Dev Veterinary and Animal Sciences, University, Ludhiana Present Address: Principal Scientist and Head, Dairy Microbiology Division, ICAR-National Dairy Research Institute, Karnal, Haryana	Convener
Dr J.B. Prajapati Professor and Dean	Dairy Microbiology Division, SMC College of Dairy Science, Anand Agricultural University, Anand, Gujarat	Dairy Microbiology
Dr Bimlesh Mann Principal Scientist and Head	Dairy Chemistry Division, ICAR-National Dairy Research Institute, Karnal, Haryana	Dairy Chemistry
Dr Atanu Jana Professor and Head	Dairy Technology Division, SMC College of Dairy Science, Anand Agricultural University, Anand, Gujarat	Dairy Technology
Dr S. Ravi KumarProfessor and Head (Rtd.)	Department of Dairy Engineering, College of Dairy Technology, Sri Venkateswara Veterinary University, Tirupati, Andhra Pradesh	Dairy Engineering
Dr Savita Sharma Professor	Department of Food Science and Technology, Punjab Agricultural University, Ludhiana, Punjab	Food Technology

Restructured and Revised
Syllabi of Post-graduate Programmes

Vol. 4

Agricultural Engineering
– Farm Machinery and Power Engineering

Preamble

Three major points were kept in mind while preparing course curricula related to Farm Machinery and Power Engineering (1) the syllabus and courses taught at UG level as recommended by 6^{th} Dean committee (2) preparing students to keep pace with future requirement of the human resource in institutions and industry (3) to align the syllabus with ARS/NET examination.

Course curricula and course outlines in Farm Machinery and Power Engineering have been designed keeping in view the courses offered by the faculties from associated/ closely related disciplines, viz. Mechanical Engineering, Mathematics, Renewable Energy Engineering, Electrical, Electronics and Computer Engineering, Processing and Food Engineering, Civil Engineering, etc.

It becomes more important for the post graduate students to not only learn the recent advances but have also to be trained/ hands on experience in the modern and latest techniques in their major disciplines so that they can participate and contribute in the development and advancement in their related fields. Further, the shrinking job opportunities in the National Agricultural Research System (ICAR/SAUs) have put additional pressure on our education system to prepare students in tune with the demands of the corporate sector.

All courses are designed to cover all basic topics and by taking into consideration demands of corporate sector harnessing commercial aspects, modern research tools and their applications, supplementary skills required and enhancing the global competitiveness and employability of students. To meet these objectives new courses were added which covers areas: Machinery for Precision Agriculture, Automation and Control, Machinery for Horticulture and Protected Agriculture, Advance Manufacturing Technologies, Principles of Hydraulic and Pneumatic Systems, Ergonomics in Working Environment, Machinery for Special Farm Operations, Mechanics of Traction and its Application.

Further, existing courses were suitably modified and restructured by deleting topics already covered in UG, removing overlapping topics in different courses, adding topics/ courses to cover ARS/NET exam syllabus and topic important to the farm machinery industry and emerging trends in Farm Machinery & Power Engineering. The modified/revised courses cover the areas: Advances in farm machinery, Computer aided Design of Machinery, Design of Farm Machinery, Ergonomics in Working Environment, Machinery for Special Farm Operations, Mechanics of Traction and its Application.

The course content and syllabus upgraded make it more of practical oriented and as per ARS/NET Syllabus.

The ICAR recommendations for PG courses have been taken into consideration in framing these courses. It is hoped that these will prove very useful to the future students.

Course Title with Credit Load
M.Tech in Farm Machinery and Power Engineering

Major Courses (Requirement: 20 Credits)

Course Code	Course Title	Credit Hours
FMPE 501*	Soil Dynamics in Tillage and Traction	2+1
FMPE 502*	Testing and Evaluation of Agricultural Equipment	2+1
FMPE 503*	Ergonomics and Safety in Farm Operations	2+1
FMPE 504	Design of Tractor systems	2+1
FMPE 505	Design of Farm Machinery-I	2+1
FMPE 506	Design of Farm Machinery-II	1+1
FMPE 507*	Management of Farm Power and Machinery System	2+1
FMPE 511	Principles of Automation and Control	2+1
FMPE 512	Principles of Hydraulic and Pneumatic Systems	2+1
FMPE 513	Applied Instrumentation in Farm Machinery	2+1
FMPE 514	Systems Simulation and Computer Aided Problem Solving in Engineering	1+1
FMPE 515	Computer Aided Design of Machinery	0+2
FMPE 516	Advance Manufacturing Technologies	2+0
FMPE 517	Machinery for Precision Agriculture	2+1
FMPE 518	Machinery for Horticulture and Protected Agriculture	2+0

*Compulsory Course

Minor Courses (Requirement: 08 Credits)

Course Code	Course Title	Credit Hours
PFE 511	Engineering Properties of Biological Materials	2+1
ME 501	Mechatronics and Robotics in Agriculture	2+0
ME-504	Vibrations	2+1
ME-507	Fatigue Design	2+1
ME-515	Computer Aided Design	2+1
REE 503	Biomass Energy Conversion Technologies	2+1
REE 516	Agro Energy Audit and Management	2+1
CE 501	Dimensional Analysis and Similitude	1+1
CE 510	Experimental Stress Analysis	2+1
MATHS 501	Finite Element Methods	1+1
MATHS 502	Numerical Methods for Engineers	2+0
CSE 501	Big Data Analytics	2+1
CSE 502	Artificial Intelligence	2+1
CSE 505	Database Management System	2+1

Any other course(s) of other department other than course(s) from major can be taken as per recommendations of the student's advisory committee.

Supporting Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
*STAT 501	Statistical Methods for Research Works	2+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Compulsory Course

Common Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*PGS 501	Library and Information Services	0+1
*PGS 502	Technical Writing and Communications Skills	0+1
*PGS 503	Intellectual Property and its management in Agriculture	0+1
*PGS 504	Basic Concepts in Laboratory Techniques	0+1
*PGS 505	Agricultural Research, Research Ethics and Rural Development Programmes	0+1

*Compulsory Course

List of Other Essential Requirements

Course Code	Course Title	Credit Hours
FMPE 591	Masters' Seminar	0+1
FMPE 599	Masters' Research	0+30

Course Contents
M.Tech in Farm Machinery and Power Engineering

I. Course Title : Soil Dynamics in Tillage and Traction

II. Course Code : FMPE 501

III. Credit Hours : 2+1

IV. Aim of the course

To have an understanding of the principles of soil mechanics as applied to interaction of tillage tools and traction devices with soil in terms of soil forces and deformation during for soil cutting and generation of traction.

V. Theory

Unit I

Characterization of state of stress in a point: Derivation, representation by Mohr's Circle. Coulomb's law of friction and cohesion. Measurement of soil resistance properties: Direct shear box, torsion shear apparatus, tri-axial apparatus. Soil behaviour considerations: Soil water pressure and movement. Critical state soil mechanics: Soil stress-strain behaviour, shear rate effects.

Unit II

Soil cutting forces: The universal earthmoving equation, two dimensional cases, smooth vertical blade, smooth and rough raked blades in cohesive soil, unconstrained tool to soil adhesion. The shape of failure surfaces. Hettiaratchi's calculations, effect of soil weight. Soil cutting force by method of trial wedges.

Unit III

Extension of theory to three dimension: Hettiaratchi, Reece-Godwin and Spoor. Three dimensional wedges: McKyes and Ali, Grisso models. Dynamic effect: Inertial forces, change in soil strength. Concept of critical depth. Complex tool shapes: Curved tools-shank and foot tools-mould board plough. Soil Loosening and manipulation: Measurement of soil loosening and its efficiency. Draft force efficiency: Loosening and pulverization efficiency. Soil mixing and inversion: Soil properties, tool shape, tool speed and tool spacing.

Unit IV

Traction devices: Tyres, type, size, selection mechanics of traction devices. Maximum traction force: Soil deformation and slip, estimation of contact areas. Sinkage in soil: Rolling resistance, Bekker's formulae, McKyes formulae. Soil compaction by agricultural vehicles and machines.

VI. Practical

Measurements of soil shear strength by in-situ shear box apparatus and soil friction by friction plate. Measuring cone penetrometer resistance and working out tractive coefficients for tyres. Measurement of in-situ shear strength of soil by torsional vane shear apparatus. Solving problems on stress in soil. Solving problems on soil properties. Solving problems of tool forces. Problems on tillage tool forces, wheel slippage, tyre deflection, design and performance of traction devices.

VII. Learning outcome

The student will be able to understand the principles that govern manipulation of soil by tillage tools.

The student will be able to apply the principles of soil mechanics to theoretically calculate the forces on tillage tools during soil cutting and forces generated by tractor wheels.

VIII. Lecture schedule

S.No.	Topic	No of Lectures
1.	**Unit I** Characterization of state of stress in a point: Derivation, representation by Mohr's Circle.	2
2.	Coulomb's law of friction and cohesion.	**1**
3.	Measurement of soil resistance properties: Direct shear box, torsion shear apparatus, tri-axial apparatus.	2
4.	Soil behaviour considerations: Soil water pressure and movement.	1
5.	Critical state soil mechanics: Soil stress-strain behaviour, shear rate effects	2
6.	**Unit II** Soil cutting forces: The universal earthmoving equation, two dimensional cases, smooth vertical blade, smooth and rough raked blades in cohesive soil, unconstrained tool to soil adhesion.	3
7.	The shape of failure surfaces.	2
8.	Hettiaratchi's calculations, effect of soil weight.	2
9.	Soil cutting force by method of trial wedges.	2
10.	**Unit III** Extension of theory to three dimensions: Hettiaratchi, Reece-Godwin and Spoor.	2
11.	Three dimensional wedges: McKyes and Ali, Grisso models. Dynamic effect: Inertial forces, change in soil strength.	2
12.	Concept of critical depth.	1
13.	Complex tool shapes: Curved tools-shank and foot tools-mould board plough.	1
14.	Soil Loosening and manipulation: Measurement of soil loosening and its efficiency.	1
15.	Draft force efficiency: Loosening and pulverization efficiency.	1
16.	Soil mixing and inversion: Soil properties, tool shape, tool speed and tool spacing.	2
17.	**Unit IV** Traction devices: Tyres, type, size, selection mechanics of traction devices.	1
18.	Maximum traction force: Soil deformation and slip, estimation of contact areas.	1
19.	Sinkage in soil: Rolling resistance, Bekker's formulae, McKyes formulae.	2
20.	Soil compaction by agricultural vehicles and machines.	1
		32

IX. List of Practicals

S.No.	Topic	No of Practicals
1.	Measurements of soil shear strength by *in-situ* shear box apparatus and soil friction by friction plate.	3
2.	Measuring cone penetrometer resistance and working out tractive coefficients for tyres.	2
3.	Measurement of *in-situ* shear strength of soil by torsional vane shear apparatus.	1
4.	Solving problems on stress in soil.	2
5.	Solving problems on soil properties.	2
6.	Solving problems of tillage tool forces.	1
7.	Problems on wheel slippage and tyre deflection.	3
8.	Problems on design and performance of traction devices.	1
9.	Practical examination	1
	Total	**16**

I. Course Title : Testing and Evaluation of Agriculture Equipment

II. Course Code : FMPE 502

III. Credit Hours : 2+1

IV. Aim of the course

To enable the student to learn the procedure for testing of different farm machinery and the concept behind evaluation of different performance parameters of farm machinery and the standards adopted therein.

V. Theory

Unit I

Importance and significance of testing and types of testing. Test equipment, usage and limitations. Test procedures and various test codes: National and International.

Unit II

Laboratory and field testing of tillage and sowing machinery: Sub-soiler, laser land leveler, mould board Plough, disc plough, rotavator, cultivator, disc harrow, seed cum fertilizer drill and planter.

Unit III

Laboratory and field testing of manual and power operated intercultural machinery and plant protection machine.

Unit IV

Laboratory and field testing of reaper, thresher and chaff cutter.

Unit V

Laboratory and field testing of straw combine and combine harvester. Review and interpretation of test reports. Importance and need of standardization of components of agricultural equipment.

VI. Practical

Laboratory and field testing of selected farm equipment: Tillage, sowing and planting. Material testing of critical components. Accelerated testing of fast wearing components.

VII. Learning outcome

The student will be able to test farm machinery, prepare performance reports and also analyze the performance reports to find the suitability of a machinery for a given farm operation.

VIII. Lecture Schedule

S.No	Topic	No. of Lectures
1.	Introduction, various test codes, Test programs, testing terminology, procedures and type of testing systems	2
2.	Study of different types of Dynamometer	2
3.	Stationary diesel engine performance testing	2
4.	Tractor Test Codes and Data Interpretation Estimation of error	2
5.	Testing and evaluation of tillage machinery	2
6.	Testing and evaluation of seed-cum-fertilizers drills/planters	3
7.	Testing and evaluation of manually and power operated Sprayers	3
8.	Testing and evaluation of reapers and straw combines	1
9.	Testing and evaluation of combine harvester and threshers	3
10.	Testing and evaluation of manually and power operated chaff cutters	2
11.	Testing and evaluation of advanced machinery	2
12.	Reliability in Engineering with emphasis on agricultural machinery	2
13.	Discussion on Farm machinery codes	2
14.	Interpretations of the information given in different codes on farm machinery	1
15.	Formulation of test-code for machines that do not have any code.	2
16.	Current topics/discussion	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No of Practicals
1.	Lab testing of Stationary diesel engine for full load, variable load and governor test	2
2.	Lab Testing and evaluation of seed-cum-fertilizers drills	1
3.	Lab Testing and evaluation of seed-cum-fertilizers planters	1
4.	Lab Testing and evaluation of knapsack Sprayers	1

S.No.	Topic	No of Practicals
5.	Lab Testing and evaluation of nozzles	1
6.	Field testing of rotavators	1
7.	Lab testing of rotavators for soil sample analysis	1
8.	Testing and evaluation of reapers	1
9.	Testing and evaluation of combine harvester and threshers	1
10.	Testing and evaluation of chaff cutters	1
11.	Testing and evaluation of laser land leveler	1
12.	Case study of test reports of different agricultural implements	3
	Total	**15**

I. Course Title : Ergonomics and Safety in Farm Operations

II. Course Code : FMPE 503

III. Credit Hours : 2+1

IV. Aim of the course

To understand the principles of the science of Ergonomics and its application to farm machinery in order to reduce drudgery in the use of tools and equipment and also make them safe and comfortable to operate.

V. Theory

Unit I

Description of human-machine systems. Ergonomics and its areas of application in the work system. History of ergonomics. Modern ergonomics.

Unit II

Anthropometry: Its role in daily life, principles in workspace and equipment design, design of manual handling tasks and application in equipment design. Human postures: Postural stress and its role in design of farm machinery.

Unit III

Human factors in tractor seat design: Entry system, controls, shape, colour coding, dial and indicators. Modern technology for comfort in driving places.

Unit IV

Physiological parameters: Psychological and mental stresses and their measurement techniques. Human energy expenditure: Calibration of subjects, human workload and its assessment.

Unit V

Safety considerations and operators protective gadgets in farm operations. Standards/codes for tractors and agricultural machinery safety.

VI. Practical

Identifying role of ergonomics in our daily life. Measurement of anthropometric dimensions of agricultural workers and establishing relationship between them. Determination of human requirements for field operation with manually operated equipment. Assessment of psychological/general load for specific agricultural operations. Calibration of human subject on bicycle ergometer and/ or treadmill for its energy output and physiological parameters like heart rate, oxygen consumption rate under laboratory conditions. Case studies of agricultural accidents and safety measure.

VII. Learning outcome

The student will be able to apply the concepts of ergonomics in the design of agricultural tools and equipment and also evaluate the ergonomic suitability of such equipment.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to ergonomics, definition of ergonomics	1
2.	Operator- machine-environment system approach	1
3.	Relative advantages of man and machine, ergonomics in daily life	1
4.	Importance of ergonomics in agriculture and farm machinery	1
5.	History of ergonomics, modern ergonomics	1
6.	Man machine environment components, broad objectives of ergonomics	1
7.	Basic issues and processes under ergonomics for design and development of machine	1
8.	Anthropometry and its uses in daily life	1
9.	First hourly examination	1
10.	Principles of applied anthropometry in ergonomics	1
11.	Availability of anthropometric database for Indian agricultural workers	1
12.	Definitions and possible applications of anthropometric dimensions	2
13.	Workspace and equipment design	1
14.	Different modes of force application	1
15.	Design of manual handling tasks	1
16.	Biomechanics aspects in machine design	1
17.	Mid-semester examination	1
18.	Human posture, posture stresses and its role in design of agricultural machinery	1
19.	Work place design for standing and seated workers	2
20.	Human factors in tractor seat design	1
21.	Entry system, controls, shape, colour coding, dial and indicators	1
22.	Modern technology for safety and comfort in driving place	1
23.	Physiological and psychological parameters for ergonomic evaluation	1
24.	Physiological and psychological stresses and measurements techniques	1
25.	Human work load assessment, human energy expenditure	1
26.	Calibration of subjects – concept, importance and techniques	1
27.	Accidents and safety in agriculture operations, general safety guidelines	1
28.	Safety feeding systems for threshers and chaff cutters	1

S.No.	Topic	No. of Lectures
29.	Safety gadgets for tractors and trailers	1
30.	Standard/ codes for agricultural machinery safety	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No of Practicals
1.	Identify role of ergonomics in our daily life	1
2.	Measurement of anthropometric dimensions of agriculture workers and establishing relation between them	2
3.	Measurement of strength parameters	1
4.	Determination of human requirements of field operation with manual operated equipment	2
5.	Assessment of psychological/ general load for agricultural operations	1
6.	Assessment of stress on eyes by specific agricultural operation	1
7.	Noise measurement in tractors	1
8.	Calibration of human subject on bicycle ergometer	1
9.	Calibration of human subject on treadmill	1
10.	Measurement of physiological parameter, viz. heart/ pulse rate	1
11.	Measurement of oxygen consumption under laboratory conditions	1
12.	Case study of accidents and safety on tractors and trailers	1
13.	Case study of accidents and safety on chaff cutters and threshers	1
14.	Practical examination	1
	Total	**16**

I. Course Title : Design of Tractor Systems

II. Course Code : FMPE 504

III. Credit Hours : 2+1

IV. Aim of the course

To introduce the student to the principles that direct the design of a tractor and its subsystems and enable the student to apply the concept of machine design in designing the subsystems and critical components.

V. Theory

Unit I

Design and types, research, development, design procedure, technical specifications of tractors, modern trends in tractor design and development, special design features of tractors in relation to Indian agriculture.

Unit II

Engine related terminology. Selection of stroke-bore ratio. Design of engine components; Piston, connecting rod, cylinder, cylinder head, crank shaft etc.

Unit III

Design of tractor systems like clutch, gearbox, steering, steering geometry, turning force, hydraulic system & hitching, chassis, operator's seat, work-place area and controls. Tire selection, aspect ratio etc.

Unit IV

Mechanics of tractor stability. Computer aided design and its application in farm tractors.

VI. Practical

Engine design calculations, transmission component design calculations. Extensive practices on the computer aided design packages.

VII. Learning outcome

The student will have an overview of the philosophy guiding the design of a tractor and also design tractor systems and components.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
	Unit I	
1.	Design and types, research, development, design procedure, technical specifications of tractors, modern trends in tractor design and development, special design features of tractors in relation to Indian agriculture.	3
	Unit II	
2.	Engine related terminology. Selection of stroke-bore ratio.	1
3.	Design of engine components: Piston, connecting rod, cylinder, cylinder head, crank shaft etc.	3
	Unit III	
4.	Design of tractor clutch	2
5.	Design of tractor gearbox	3
6.	Tractor steering system, functional requirements, steering geometry, turning force	2
7.	Steering system design parameters and design procedure	2
8.	Hydraulic system & hitching – principles of operation	2
9.	Hydraulic system - Design parameters and design procedures including design of pump, cylinder etc.	2
10.	Design of chassis	2
11.	Human factors in tractor design. Design of operator's seat	2
12.	Work-place area and controls	2
13.	Tire selection, aspect ratio etc.	1
	Unit IV	
14.	Mechanics of tractor stability. Dynamic and static analysis of forces acting on farm tractor, case studies.	3
15.	Computer aided design and its application in farm tractors	2
	Total	**32**

IX. List of Practicals

S.No.	Practical	No. of Practical
1.	Engine design calculations - Stroke-bore ratio determination - Design of radiator - Balancing of crankshaft	2
2.	Engine design calculations - Calculation of volumetric/thermal efficiencies	1
3.	Transmission component design calculations - Design of clutch	1
4.	Transmission component design calculations - Design of gear box and calculation of speed ratios	2
5.	Design of Ackerman steering. Calculation of turning radius.	1
6.	Design of brakes (mechanical and hydraulic)	2
7.	Design of hydraulic system	2
8.	Calculation for determination of centre of gravity of tractor, moment of inertia and stability	3
9.	Practice on the Computer Aided Design (CAD) packages for design of various components	2
	Total	**16**

I. Course Title : Design of Farm Machinery I

II. Course Code : FMPE 505

III. Credit Hours : 2+1

IV. Aim of the course

To understand the interaction of tillage tools with soil and design the components of the tillage tools based on their requirement and also to learn how the systems of planting machinery are designed.

V. Theory

Unit I

Farm machinery design: Modern trends, tasks and requirements, economic considerations of durability, reliability and rigidity. Physico-mechanical properties of soils. Technological process of ploughing. Wedge. Working process of mould board plough, determination of basic parameters. Design of coulters, shares, mould boards.

Unit II

Constructing of mould board working surface. Design of landside, frog, jointer. Forces acting on plough bottom and their effect on plough balance: Trailed, semi mounted and mounted plough. Draft on ploughs, resistance during ploughing. Design disk ploughs: Concave disk working tools, forces acting.

Unit III

Machines and implements for surface and inter row tillage; Peg toothed harrow, disk harrows, rotary hoes, graders, rollers, cultivators. Design of V shaped sweeps. Rigidity of working tools. Rotary machines: Trajectory of motion of rotary tiller tynes, forces acting, power requirement. Machines with working tools executing an oscillatory motion.

Unit IV

Methods of sowing and planting: Machines, agronomic specifications. Sowing inter-tilled crop. Grain hoppers: Seed metering mechanism, furrow openers and seed tubes. Machines for fertilizer application: Discs type broadcasters. Organic fertilizer application: Properties of organic manure, spreading machines. Liquid fertilizer distributors. Planting and transplanting: Paddy transplanters, potato planters.

VI. Practical

Design of mould board working surface; Coulter, frog, share, jointer, mould board plough. Trailed, semi mounted and mounted ploughs. Design of disc plough, disc harrow, peg tooth harrow, cultivators, sweeps. Design of rotary tiller. Design of traction and transport devices.

Design of seed drills; Metering mechanism, hopper, furrow opener. Fertilizer spreader, liquid fertilizer applicators and design of its sub systems. Design of paddy transplanters and potato planters.

VII. Learning outcome

The student will be able to appreciate the principles behind the design of tillage tools and planting machinery. He will be able to arrive at design configurations for such machines.

VIII. Lecture Schedule

S.No.	Topic	No of Lectures
1.	Farm machinery design: Modern trends, tasks and requirements, economic considerations of durability, reliability and rigidity.	3
2.	Farm machinery design: economic considerations of durability, reliability and rigidity.	2
3.	Physio-mechanical properties of soils.	1

I. Course Title : Design of Farm Machinery-II

II. Course Code : FMPE 506

III. Credit Hours : 1+1

IV. Aim of the course

To learn the engineering principles behind application of pesticides and the systems that implements the same. To learn the concepts behind design of crop harvesting and threshing equipment.

V. Theory

Unit I

Pesticide calculation examples. Multidisciplinary nature of pesticide application. Overview of chemical control integrated pest management. Targets for pesticide deposition. Formulation of pesticides.

Unit II

Spray droplets. Hydraulic nozzles. Power operated hydraulic sprayer design principles. Air assisted hydraulic sprayer design principles. Controlled droplet application. Electrostatically charged sprayers. Spray drift and its mitigation. Aerial spraying systems. Use of drones for spraying: Design of spray generation and application issues.

Unit III

Introduction to combine harvesters: Construction, equipment subsystems, power sub systems. Crop harvesting: Plant properties, physical and mechanical properties of plant stem, plant bending modelling. Properties of plant grain: Physical, mechanical, grain damage. Properties of MOG; Mechanical and aerodynamic.

Unit IV

Design of grain header; Orienting and supporting reel. Plant cutting cutter bar: Working process, cutter bar drive. Knife cutting speed pattern area. Design of auger for plant collection. Corn header: Working elements, snapping roll design, stalk grasping and drawing process. Corn ear detachment: Stalk cutting and chopping.

Unit V

Cereal threshing and separation; Design of tangential and axial threshing units. Performance indices of threshing units. Modelling material kinematics in different threshing units. Factors influencing the threshing process and power requirement. Separation process and design of straw walker. Cleaning Unit process and operation. Grain pan; Chaffer and bottom sieve. Blower design and flow orientation. Design of conveying system for grain. Straw choppers and shredders.

VI. Practical

Measurement of spray characters for different nozzles. Problems on sizing of sprayer components. Design of sprayer for special purpose: Orchard and tall trees. Harvesting machine. Problems on design of cutterbars, reels, platform auger, conveyors. Design of threshing drum: Radial and axial flow type. Design of cleaning and grading systems. Design of blowers.

VII. Learning outcome

The student will know the principles behind the design of crop spraying equipments and harvesting and threshing machinery.

VIII. Lecture Schedule

S.No.	Topic	No of Lectures
1.	Overview of chemical control integrated pest management.	1
2.	Targets for pesticide deposition. Formulation of pesticides.	1
3.	Multidisciplinary nature of pesticide application.	1
4.	Pesticide calculation examples.	2

S.No.	Topic	No of Lectures
5.	Spray droplets. Hydraulic nozzles. Power operated hydraulic sprayer design principles.	2
6.	Controlled droplet application. Spray drift and its mitigation.	1
7.	Air assisted hydraulic sprayer design principles. Electrostatically charged sprayers.	2
8.	Aerial spraying systems. Use of drones for spraying:	1
9.	Design of spray generation and application issues.	1
10.	Introduction to combine harvesters; Construction, equipment subsystems, power sub systems.	1
11.	Crop harvesting: Plant properties, physical and mechanical properties of plant stem, plant bending modelling.	1
12.	Properties of plant grain: Physical, mechanical, grain damage.	2
13.	Properties of MOG; Mechanical and aerodynamic.	2
14.	Design of grain header; Orienting and supporting reel. Plant cutting cutter bar.	2

I. Course Title : Management of Farm Power and Machinery System

II. Course Code : FMPE 507

III. Credit Hours : 2+1

IV. Aim of the course

To understand how principles of management are applied to farm machinery systems to make them more effective and profitable.

V. Theory

Unit I

Importance and objectives of farm mechanization in Indian agriculture, its impact, strategies, myths and future needs. Estimation of operating cost of tractors and farm machinery. Management and performance of power, operator, labour. Economic performance of machinery, field capacity, field efficiency and factors affecting field efficiency.

Unit II

Tractor power performance in terms of PTO, drawbar and fuel consumption. Power requirement problems to PTO, DBHP.

Unit III

Selection of farm machinery, size selection, timeliness of operation, optimum width and problem related to its power selection. Reliability of agricultural machinery. Replacement of farm machinery and inventory control of spare parts.

Unit IV

Systems approach to farm machinery management and application of programming techniques to farm machinery selection and scheduling. Network Analysis: Transportation, CPM and PERT, dynamic programming, Markov chain.

VI. Practical

Study of latest development of different agricultural equipment and implements in India and other developing countries. Size selection of agricultural machinery. Experimental determination of field capacity of different farm machines. Study of farm mechanization in relation to crop yield. Determination of optimum machinery system for field crop and machine constraints. To develop computer program for the selection of power and machinery.

VII. Learning outcome

The student will be able to understand how farm machinery is selected and operated to make them economically viable.

VIII. Lecture Schedule

S.No.	Topic	No of Lectures
1.	Importance and scope of farm mechanization in Indian Agriculture	1
2.	Cost analysis of Farm Machinery and tractor, Breakdown analysis, Inflation.	2
3.	Measurement of power performance (PTO power, drawbar power and fuel consumption) of tractor and power tiller	3
4.	Study of field capacity and field efficiency of different farm machinery and factor affecting them	1
5.	Selection of Farm Machinery size wrt to power source and timeliness of operation	4
6.	Application of programming technique to problem of farm power and machinery selection.	4
7.	Replacement models, spare parts and inventory control	2
8.	Maintenance and scheduling of operations.	2
9.	Network analysis – transportation	2
10.	Network analysis – critical path method, PERT	2
11.	Network analysis – dynamic programming	3
12.	Network analysis – markov chain	3
13.	Linear programming, multivariable system, simplex algorithm. Theory of network.	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No of Practicals
1.	Introduction to latest development of advanced agricultural equipment's in India	3
2.	Experimental determination of field capacity of different farm machines	3
3.	Case studies on optimum size selection of agricultural machinery	3
4.	Determination of inventory of different farm machines for a farm of size 50 ha as per regional crop rotations	3
5.	To develop computer program regarding selection of farm machinery size and power requirement for a 10, 50 and 100 ha farm size	3
	Total	**15**

I. Course Title : Principles of Automation and Control

II. Course Code : FMPE 511

III. Credit Hours : 2+1

IV. Aim of the course

To learn the principles behind systems for industrial automation and control especially with respect to electronically implemented systems.

V. Theory

Unit I

Introduction to industrial automation and control: Architecture of industrial automation systems, review of sensors and measurement systems. Introduction to process control: PID control, controller tuning, implementation of PID controllers, special control structures, feed forward and ratio control, predictive control, control of systems with inverse response, cascade control, overriding control, selective control and split range control.

Unit II

Introduction to sequence control: PLCs and relay ladder logic, sequence control, scan cycle, RLL syntax, sequence control structured design approach, advanced RLL programming, the hardware environment, Introduction to CNC machines.

Unit III

Control of machine tools: Analysis of a control loop, introduction to actuators. Flow control valves, hydraulic actuator systems, principles, components and symbols, pumps and motors. Proportional and servo valves. Pneumatic control systems, system components, controllers and integrated control.

Unit IV

Control systems: Electric drives, introduction, energy saving with adjustable speed drives stepper motors, principles, construction and drives. DC motor drives: Introduction to DC-DC converters, adjustable speed drives. Induction motor drives: Introduction, characteristics, adjustable speed drives. Synchronous motor drive-motor principles, adjustable speed and servo drives.

Unit V

Networking of sensors, actuators and controllers, the fieldbus, the fieldbus communication protocol, introduction to production control systems.

VI. Practical

Control system practical: Characteristics of DC servomotor, AC/DC position control system. ON/OFF temperature control system. Step response of second order system, temperature control system using PID level control system. Automation: Introduction to ladder logic, writing logic and implementation in ladder. PLC programming, water level controller using programmable logic controller. Batch process reactor using programmable logic controller. Speed control of AC servo motor using programmable logic controller.

VII. Learning outcome

Understanding of the principles behind implementation of systems for automation and control.

I. Course Title : Principles of Hydraulic and Pneumatic Systems

II. Course Code : FMPE 512

III. Credit Hours : 2+1

IV. Aim of the course

To understand the principles behind operation of hydraulic and pneumatic systems and their components and design simple hydraulic and pneumatic circuits and select components for the same.

V. Theory

Unit I

Hydraulic power, its advantages, applications, properties of hydraulic fluids, viscosity, bulk modulus, density. Concepts of energy of hydraulic systems, laws of fluid flow.

Unit II

Hydraulic pump and motors, principle, capacity, classifications, working, performance. Design of various types of pumps and motors.

Unit III

Actuators, types, design of linear actuator and rotary actuators. Hydraulic rams, gear motors, piston motors and their performance characteristics. Hose, filters, reservoirs, types of circuits, intensifier, accumulator, valves. Valve types: Direction control, deceleration, flow, pressure control, check valve and their working etc.

Unit IV

Hydraulic circuit design. Applications in farm power and machinery: Tractor, combine, farm machinery systems, hydrostatic system etc.

Unit V

Power pack, pneumatic circuits, properties of air. Compressors, types. Design of pneumatic circuits.

VI. Practical

Study of various hydraulic pumps, motors, valves, directional control valves, cylinder piston arrangements, engineering properties of hydraulic fluids, hydraulic system of tractor, power steering system.

VII. Learning outcome

Ability to design simple hydraulic and pneumatic circuits and to select the components for the same. To design hydraulic and pneumatic systems of farm Machinery.

VIII. Lecture Schedule

I. Course Title : Applied Instrumentation in Farm Machinery

II. Course Code : FMPE 513

III. Credit Hours : 2+1

IV. Aim of the course

To understand the operation of instruments that is used in design and evaluation of farm machinery and their application.

V. Theory

Unit I

Strain gauges, types and applications in two and three dimensional force measurement in farm machinery. Various methods of determining strain/stresses experimentally. Design, selection and analysis of strain gauges.

Unit II

Introduction to transducers (sensors). Active and passive transducers, analog and digital modes, null and deflection methods. Performance characteristics of instruments including static and dynamic characteristics.

Unit III

Load cells, torque meters, flow meters types and principles of working. Devices for measurement of temperature, relative humidity, pressure, sound, vibration, displacement (LVDT) etc. Recording devices and their types. Measuring instruments for calorific value of solid, liquid, and gaseous fuels.

Unit IV

Basic signal conditioning devices, data acquisition system. Micro computers for measurement and data acquisition. Data storage and their application including wireless communication. Application of sensors in farm machinery and power: Tractor and selected farm machinery.

VI. Practical

Calibration of load cells, torque meters, flow meters etc. Experiment on LVDT, strain gauge transducer, speed measurement using optical devices, vibration measurement, making of thermocouples etc, application of sensors in farm machinery like wheel hand hoe, etc.

VII. Learning outcome

The student will be able to select and implement suitable systems for measurement of different parameters like force, torque, speed and pressure etc, that are used in design and evaluation of Farm machinery.

I. Course Title : Systems Simulation and Computer Aided Problem Solving in Engineering

II. Course Code : FMPE 514

III. Credit Hours : 1+1

IV. Aim of the course

To give the student orientation in simulation of continuous and discrete systems especially using computer programme and software.

V. Theory

Unit I

Mathematical modeling and engineering problem solving: Conservation laws and engineering. Computers and software: Software development, structured programming, logical representation. Modular programming. Approximation: Round off errors, truncation errors, significant figures, accuracy and precision.

Unit II

Nature of simulation: Systems models and simulation, discreet event simulation, time advance mechanisms, components of discrete event simulation model, simulation of single server queuing system. Program organization and logic, development of algorithm. Simulation of an inventory system.

Unit III

Solving roots of equation using computers. Application in: Ideal and non-ideal gas laws, open channel flows, design of an electric circuit, vibration analysis. Solving linear algebraic equation on computers: Naïve Gauss Elimination, techniques for improving solutions, LU decomposition and matrix inversion. Application in: Steady state analysis of chemical reactors, statically determinate truss, current and voltage in circuits, spring mass systems.

Unit IV

Optimization techniques. Search techniques: Golden Sections, quadratic interpolation. Application: Optimum design of tank, least cost treatment of waste water, power transfer for circuits. Solving ordinary differential equation on computers: Modeling engineering systems with ordinary differential equation, solution techniques using computers.

VI. Practical

Comparison of analytical and numerical solutions using Spread sheet. Generation of random variables. Generation of discreet and continuous random variate-coding. Implementation of single server queue on computer. Exercises with software packages for roots of equation: Solving linear algebraic equation, curve fitting and optimization. Solving simultaneous equation through Gauss elimination, solving steady state analysis of chemical reactors, statically determinate truss, current and voltage in circuits, spring mass systems on computers. Application of ordinary differential equation to solve mixed reactor problems, predator prey models and chaos.

VII. Learning outcome

Ability to analyze problems from a systems perspective and apply the principles to simulation of continuous and discrete engineering systems.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to mathematical modeling in engineering problem solving, comparison of analytical and numerical approaches.	1
2.	Conservation laws applied to engineering, modeling simple system	1
3.	Computer modeling, computing environments software development process.	1
4.	Modular design, top down design, structured programming, – algorithm design.	1
5.	Program composition, quality control- testing and documentation software strategy.	1
6.	Approximation- round off errors- accuracy and precision – definitions, number system in the computer- truncation errors.	1
7.	Nature of simulation, systems models and simulation.	1
8.	Discreet event simulation, time advance mechanisms, components of discreet event simulation model.	1
9.	Principles of simulation of singular server queuing system.	1
10.	Programme organization and logic for single server queuing system.	1
11.	Development of algorithm, single server queuing system.	1
12.	Solving roots of equation in computers, graphical method.	1
13.	Developing algorithm for bisection method, false position method.	1
14.	Application of roots of equation to gas laws, open channel flows.	1
15.	Application of roots of equation to electric circuits, vibration analysis.	1
16.	Solving linear algebraic equation in engineering practices.	1
17.	Developing algorithm for Gaussian elimination.	1
18.	Pitfalls of elimination methods and remedies.	1
19.	Overview of LU decomposition.	1
20.	LU decomposition algorithms, calculating inverse of matrix.	1
21.	Application of linear algebraic equation to statically determinate truss.	1
22.	Application of linear algebraic equation to Circuit analysis.	1
23.	Application of linear algebraic equation to spring mass system.	1
24.	Introduction to optimization in engineering, Formulation of Problems.	1
25.	One dimensional unconstrained optimization, development of algorithm for golden sections.	1
26.	One dimensional unconstrained optimization quadratic interpolation.	1
27.	Application of optimization to design of tank.	1
28.	Application of optimization to waste water treatment problem.	1
29.	Application of optimization to power transfer circuits.	1
30.	Formulating engineering problems using ordinary differential equation.	1
31.	Solving ordinary differential equation using computers, Euler's method.	1
32.	Solving ordinary differential equation using modeling engineering systems, computers, Runge-kutta method.	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Exercises in developing simple programmes in C.	1
2.	Demonstration of solutions using analytical and numerical methods for simple problems.	1
3.	Development of programmes for generation of random variables.	1
4.	Writing programme for generating random variates.	1

S.No.	Topic	No of Practicals
5.	Writing programme for event advance mechanism of single server queuing system.	1
6.	Writing programme for arrival module of single server queuing system.	1
7.	Writing programme for departure module of single server queuing system and statistical performance.	1
8.	Writing programme for solution of roots of equation.	1
9.	Solving simple engineering problems using roots of equation.	1
10.	Development of algorithm for Gaussian elimination.	1
11.	Application of Gaussian elimination to mass balance problems and statically determinate truss.	1
12.	Application of Gaussian elimination to analysis of electrical circuits.	1
13.	Development of algorithm for Golden Sections and application.	1
14.	Application of optimization technique to design of tank.	1
15.	Application of optimization technique to waste water treatment.	1
16.	Predator prey models and chaos.	1
	Total	**16**

I. Course Title : Computer Aided Design of Machinery

II. Course Code : FMPE 515

III. Credit Hours : 0+2

IV. Aim of the course

To learn the practice of designing components and assemblies based on computer aided drafting technique.

V. Practical

Learning 2D drafting: Controlling display settings, setting up units, drawing limits and dimension styles. Drawing and dimensioning simple 2D drawings, keyboard shortcuts. Working with blocks, block commands. Exercise in simple assembly in orthographic. Exercise in measuring and drawing simple farm machinery parts.
Learning 3D Drafting: Advantages of virtual prototyping-starting the 3D drafting environment, self learning tools, help and tutorials. Familiarizing with user interface, creating files and file organization, structuring and streamlining. Features of document window. Concept of coordinate system: Working coordinate system, model coordinate system, screen coordinate system, graphics exchange standards and

database management system. Working with feature manager and customizing the environment. Planning and capturing design intent. Documentation of design. Using design journal and design binder. Preliminary design review and layout.
Practice in drawing 2D sketches with sketcher and modifying sketch entries. Adding Reference geometry: Planes and axes. Adding relations and working with relations. Dimensioning a sketch. Exercises.
Parts and features: Sketched features and applied features, pattern and mirror features. Documenting design. Assembly: Creating and organizing assemblies, connecting parts and subassemblies with mates. Organizing the assembly by using layouts.
Exercise in creating drawing: Setting up and working with drawing formats, creating drawing views from the 3D model, making changes and modifying dimensions.
Case studies: Measuring and drawing assemblies of farm implements and their components.

VI. Learning outcome

The student will be able to conceptualize spatial concepts and design components and assemblies of Farm machinery and make graphic models using commercial CAD software like Solid Works, Catia and AutoCAD.

VII. List of Practicals

S.No.	Topic	No of Practicals
1.	Learning 2D drafting: Controlling display settings, setting up units, drawing limits and dimension styles.	2

I. Course Title : Advanced Manufacturing Technologies

II. Course Code : FMPE 516

III. Credit Hours : 2+1

IV. Aim of the course

To learn the modern manufacturing techniques and their application to manufacture of different components and assemblies.

V. Theory

Unit I

Material and their characteristics, structure and properties of materials, wood, ferrous, Non-ferrous, alloys, plastic, elastomers, ceramics and composites. Material selection and metallurgy: Equilibrium diagram, time temperature transformation curves, heat treatments, surface treatment: Roughness and finishing.

Unit II

Measurement and quality assurance: Quality control, tolerance, limits and clearance. Automated 3-D coordinate measurements. Advance casting processes and powder metallurgy. Forming process: Fundamentals of metal forming, hot and cold rolling, forging processes, extrusion and drawing.

Unit III

Workshop practices applied in prototype production, jigs and fixtures. Traditional machining processes: Cutting tools, turning, boring, drilling, milling and related processes. Non traditional machining processes fuzzy c-mean (FCM), electric discharge machining (EDM), laser beam machining (LBM), Abrasive jet machining (AJM), and Wire-electro-discharge machining (EDM).

Unit IV

Joining processes: Gas flame processes, arc processes, brazing and soldering, adhesive and bonding.

Unit V

Numerical control: Command system codes, programme, cutter position X and Y, incremental movements, linear contouring, Z movements and commands. Manufacturing systems and automation. Robotics and robot arms. 3-D printing. Integrated manufacturing production system.

Practical

Identification of material and their application. Study of heat treatment processes and their suitability with respect to materials. Tool and equipments for measurements: Tolerance limits, clearance and surface finish. Site visits for study of advanced manufacturing techniques. Case studies.

VI. Learning outcome

The students will be able to select suitable manufacturing technique to fabricate different components used in Farm machinery.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Material and their characteristics.	1
2.	Structure and properties of materials wood, ferrous, Non-ferrous, alloys, plastic, elastomers, ceramics and composites.	2
3.	Material selection and metallurgy: Equilibrium diagram, time temperature transformation curves.	1

I. Course Title : Machinery for Precision Agriculture

II. Course Code : FMPE 517

III. Credit Hours : 2+1

IV. Aim of the course

To learn the principles behind precision agriculture and the systems for implanting the same.

V. Theory

Unit I

Importance of precision agriculture. Mapping in farming for decision making. Geographical concepts of PA.Understanding and identifying variability

Unit II

Geographical Position System (GPS) Basics (Space Segment, Receiver Segment, Control Segment), Error and correction, Function and usage of GPS. Introduction to Geographic Information system (GIS), function of GIS, use of GIS for decisions. IDI devices usage in Precision Agriculture Yield monitor, variable rate applicator for fertilizers, seed, chemicals etc. Remote sensing Aerial and satellite imagery. Above ground (non-contact) sensors.

Unit III

Data analysis, concepts of data analysis, resolution, Surface analysis. Analysis application interpretive products (map, charts, application map etc).

Unit IV

Electronics and Control Systems for Variable rate applications, Precision Variable Equipment, Tractor-Implement interface technology, Environmental Implications of Precision Agriculture.

Unit V

Goals based on end results of Precision Agriculture, Recordkeeping, Spatial Analysis, Variable Rate Application, Reducing of negative environmental impact, Crop/ technology cost optimization. Economic of precision agriculture and determining equipment and software, review of Cost/Benefit of Precision Agriculture, System vs. Parcels. Making a selection.

VI. Practical

Calculation of the benefits of Data and Mapping, Determining Latitude/Longitude, UTM or State Plane Position Navigation with Waypoints, Configuring a GPS System. Defining area of field for prescriptive treatment. Making the Grid, The Grid Sampling Process, generation of yield maps, Thematic or Spatial Resolution, Yield

Map Example, Surface Analysis in Arc-View.

VII. Learning outcome

Knowledge about the principles guiding the concept of precision agriculture and Farm Machinery and equipment systems that make muse of this principle.

VIII. Lecture Schedule

S.No.	Topic	No of Lectures
1.	Introduction to precision agriculture, its importance and applications	1
2.	Mapping in farming for decision making and geographical concepts of PA.	2

I. Course Title : Machinery for Horticulture and Protected Agriculture

II. Course Code : FMPE 518

III. Credit Hours : 2+0

IV. Aim of the course

To learn about the different machinery used in cultivation of vegetable crops, orchard crops and also in protected agriculture.

V. Theory

Unit I

Vegetable cultivation, nursery machinery, tray seeders, grafting machines, vegetable trans-planters. Machinery for planting crops on raised beds, mulch laying and planting machines. Harvesting of vegetable crops: Harvesting platforms and pickers.

Unit II

Machinery for orchard crops: Pit diggers, inter-cultivators and basin forming equipment for orchards. Machinery for transplanting of trees. Harvesters for fruit crops: Shaker harvesters, types and principle of operation. Elevated platforms for orchard management and harvesting. Pruning machines.

Unit III

Machinery for orchards, vineyard machinery spraying machines, inter-cultivation machines. High clearance machines and special purpose machinery for crops on trellis. Machinery for special crops: Tea leaf harvesters, pruners and secateurs.

Unit IV

Machinery for lawn and garden: Grass cutters, special machinery for turf maintenance. Turf aerators and lime applicators.

Unit V

Protected agriculture: Principles, mechanical systems of greenhouse, ventilation systems, shading system, water fogging system, irrigation system, sensors, electrical and electronic system. Intelligent Control system for greenhouses. Machinery for processing of growth media, tray filling machines-tray sowing machines, transplanting machines. Robotic grafting machines. Weeding and thinning equipment. Crop protection and harvest under protected agriculture.

VI. Learning outcome

Knowledge about different principles of mechanizing cultivation of horticultural crops and in protected agriculture.

VII. Lecture Schedule

S.No.	Topic	No. of Lecture
1.	History of vegetable cultivation in India and scope of mechanization in Horticulture	1
2.	Methods of Nursery propagation techniques and machinery for nursery and tray seeders	1
3.	Machinery for field preparation for vegetables (Disc harrows, Disc plough, offset rotavator, sub soiler, bed makers)	1
4.	Principles of mulch laying and planting machines. Types of vegetable transplanters and their construction and working	1
5.	Working and construction of subsurface drip laying machine. Types of planters for vegetable crops and its working	1
6.	Principles of Pneumatic vegetable seeders and its working. Machinery for harvesting of vegetable crops like root crop harvester, its construction and working	1
7.	Types of vegetable extraction machine, its working and construction	1
8.	Types of pickers, their construction and working	1
9.	Construction and working of different types of post hole diggers	1
10.	Types of tractors and their uses in orchards	1
11.	Types of inter cultivators and its construction and working.	1
12.	Types of brush cutters and its working	1
13.	Types of basin forming equipment for orchards. Machinery for transplanting of trees and their construction and working	1
14.	Types of elevated platforms for orchard management. Types of Tree Pruners and principles and its working and construction	1
15.	Types of fruit pluckers and its working and construction	1
16.	Principles and working and construction of shaker harvesters	1
17.	Types of vineyard machinery and its working and construction	1
18.	Types of spraying machines and its working and construction. High clearance machines and special purpose machinery for crops on trellis.	1
19.	Types of orchard sprayers, its working and construction	1
20.	Types of Tea leaf harvesters, pruners and secateurs and its working and Construction	1
21.	Special purpose machinery for crops on trellis	1
22.	Types of lawn and garden mowers and its working.	1
23.	Studies on special machinery for turf maintenance working and construction of Turf aerators and lime applicators	1
24.	Introduction to protected agriculture. Principles of protected agriculture	1
25.	Greenhouses - Mechanical systems, ventilation systems, shading system, water fogging system and irrigation system.	2
26.	Sensors, electrical and electronic system. Intelligent Control system for greenhouses	1
27.	Machinery for processing of growth media, tray filling machines-tray sowing machines, transplanting machines	1
28.	Robotic grafting machines. Weeding and thinning equipment	1
29.	Crop protection and harvest under protected agriculture	1

Course Title with Credit Load
Ph.D. in Farm Machinery and Power Engineering

Major Courses (Requirement: 12 Credits)

Course Code	Course Title	Credit Hours
FMPE 601*	Advances in Farm Machinery and Power Engineering	2+1
FMPE 602	Advances in Machinery for Precision Agriculture	2+1
FMPE 603	Energy Conservation and Management in Production Agriculture	3+0
FMPE 604	Mechanics of Tillage in Relation to Soil and Crop	2+1
FMPE 611	Mechanics of Traction and its Application	2+1
FMPE 612*	Farm Machinery Management and Systems Engineering	2+1
FMPE 613	Machinery for Special Farm Operations	2+1
FMPE 614	Ergonomics in Working Environment	2+1
	Total	17+7

Minor Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
REE 615	Energy Planning Management and Economics	3+0
REE 602	Thermo-Chemical Conversion of Biomass	2+1
ME-507	Fatigue Design	2+1
ME-515	Computer Aided Design	2+1
CSE 506	Digital Image Processing	2+1

Any other course (s) of other department other than course(s) from major can be taken as per recommendations of the student's advisory committee.

Supporting Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*CPE-RPE	Research and Publication Ethics	1+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Course has been made compulsory by UGC for PhD students. Course Code and its detailed course outline to be adopted in toto as recommended by UGC.

List of Other Essential Requirements

Course Code	Course Title	Credit Hours
FMPE 691	Doctoral Seminar-I	0+1
FMPE 692	Doctoral Seminar-II	0+1
FMPE 699	Doctoral Research	0+75

Course Contents
Ph.D. in Farm Machinery and Power Engineering

I. Course Title : Advances in Farm Machinery and Power Engineering

II. Course Code : FMPE 601

III. Credit Hours : 2+1

IV. Aim of the course

To familiarize the students about modern developments in construction, design and analysis of farm machinery systems as applied in different areas of agriculture.

V. Theory

Unit I

Advances in mechanization as applicable to Indian context. Future outlook for improving agricultural productivity and reducing cost. Mechanization: Review of the applications of some of the advanced mechanization technologies and constraints in adaptability. Levels of mechanization and transition between levels.

Unit II

Sustainable mechanization management: Management of compaction of agricultural fields. Strategies to develop machinery and systems that reduce compaction. Concept of Controlled Traffic Farming (CTF) systems. Introduction of wide span mechanization to vegetable production systems to enhance productivity and sustainability.

Unit III

Optimization of production processes to minimize energy loss in agriculture. The rationale for the use of photovoltaic systems in farming. The Energy Returned on Energy Invested (EROEI) ratio as an indicator for evaluating the efficiency of renewable energy sources.

Unit IV

board sensors, computing hardware, algorithms and software. Manipulator type ag-robots: Use in food processing, dairy, horticulture, and orchard industries.

Unit V

Precision Livestock Farming (PLF): Individual identification and monitoring of animals, tractability of livestock products. Developments in livestock and building control: Radio telemetry systems to remotely monitor and record physiological parameters. Silage process and their variants. Coordination of machinery system to enhance quality of silage and forage conditioners.

VI. Practical

Case studies and presentations on: Mechanization in India-analysis of machinery data- mechanization index and relation between productivity and mechanization. Levels of mechanization in different crops. Design of traffic lanes-field geometry and generating guideline lanes for operation of machinery. Planning use of multiple machinery-sugarcane harvesting system. Measurement of soil compaction due to heavy machinery using cone penetrometer. Machine vision system design–case studies. Challenges in development of robotic machinery in agricultural operations-case studies.

VII. Learning outcome

The students will be able to design, operate and maintain surface irrigation systems, surface and sub-surface pressurized irrigation systems, and managing crop productivity with poor quality of waters without deteriorating soil conditions.

VIII. Lecture schedule

S.No.	Topic	No. of Lectures
1.	Advances in mechanization as applicable to Indian context.	2
2.	Mechanization in large scale agricultural fields	1
3.	Mechanization in small scale agricultural fields	1
4.	Future outlook for improving agricultural productivity and reducing cost.	1
5.	Requirements of energy and fuels for machinery operations	2
6.	Case studies of the applications of some of the advanced mechanization technologies and constraints in adaptability.	2
7.	Case studies of Technology transfer mechanisms in India	1
8.	Levels of mechanization and transition between levels.	1
9.	Sustainable mechanization management.	1
10.	Management of compaction of agricultural fields.	1
11.	Strategies to develop machinery and systems that reduce compaction.	1
12.	Concept of Controlled Traffic Farming (CTF) systems.	1
13.	Introduction of wide span mechanization to vegetable production systems to enhance productivity and sustainability.	2
14.	Optimization of production processes to minimize energy loss in agriculture.	2

16.	The Energy Returned on Energy Invested (EROEI) ratio as an indicator for evaluating the efficiency of renewable energy sources.	2
17.	Machine vision system-hardware and software technologies, and machine learning and image analysis techniques.	1
18.	Unmanned agricultural ground vehicles (UAGVs)	1
19.	UAGVs instrumented mobile platform, on board sensors, computing hardware, algorithms and software.	1
20.	Manipulator type ag-robots: Use in food processing, dairy, horticulture, and orchard industries.	2
21.	Precision Livestock Farming (PLF): Individual identification and monitoring of animals, tractability of livestock products.	1
22.	Developments in livestock and building control: Radio telemetry systems to remotely monitor and record physiological parameters.	2
23.	Silage process and their variants. Coordination of machinery system to enhance quality of silage and forage conditioners.	1
24.	Silage and forage conditioners.	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No of Practicals
1.	Case studies of Mechanization in India	1
2.	Case studies of Mechanization in SAARC countries	1
3.	To find mechanization index.	1
4.	Relation between productivity and mechanization in India and Punjab.	1
5.	Relation between productivity and mechanization in developed countries.	1
6.	Levels of mechanization in cereal crops like paddy, Wheat etc.	1
7.	Levels of mechanization in Horticulture crops	1
8.	Levels of mechanization in cotton crop and pulses and oilseed crops	1
9.	Design of traffic lanes-field geometry and generating guideline lanes for operation of machinery.	1
10.	Planning use of multiple machinery-sugarcane harvesting system.	1
11.	Measurement of soil compaction due to heavy machinery using cone penetrometer.	1
12.	Machine vision system design–case studies.	1
13.	Machine vision system design–case studies.	1
14.	Unmanned agricultural ground vehicles (UAGVs) for different applications like spraying, imaging etc.	1
15.	Challenges in development of robotic machinery in agricultural operations-case studies.	1
16.	Developments in livestock and building control: Radio telemetry systems to remotely monitor and record physiological parameters.	1

I. Course Title : Advances in Machinery for Precision Agriculture

II. Course Code : FMPE 602

III. Credit Hours : 2+1

IV. Aim of the course

Detailed study of the hardware system used in precision agriculture (PA) and techniques of using them in precision agriculture.

V. Theory

Unit I

Global navigation satellite system (GNNS). Satellite ranging: Accuracy, standards, components of GIS, data layers, map component, attribute table component, function of a GIS, resolution. Data formats: Vector or raster. GIS for precision farming, data analysis, field calculator, convert to grid, interpolation, reclassification, image classification, band math, interpretation of analysis, farm management information systems, and crop intelligence.

Unit II

Yield Monitors: Components, Differential GPS Receiver, GNSS Receiver, mass flow sensors. Impact plates, measuring volume with a photoelectric sensor. Using microwave radiation, and Gamma rays to estimate volume, volumetric flow sensing and alternatives. Grain moisture sensor, fan speed sensor, elevator speed sensor, header position, yield monitor data, cotton yield monitors.

Unit III

Sources of soil variability, general soil sampling basics, systematic variability, selecting a soil sampling strategy. Parameters: Electrical conductivity, electromagnetic sensors, sensing mechanical impedance. Proximal plant sensing systems, crops canopy reflectance and fluorescence. Machine vision thermal sensors, mechanical sensors, acoustic sensors.

Unit IV

Remote sensing platforms: Aircraft or satellite. Sensors: Imaging or non imaging, active or passive. Making use of reflected energy or emitted energy. The spectral signature of vegetation, vegetation indices, application to agriculture, nutrient management, weed management, disease and insect management, water management.

VI. Practical

Simple programming for automating precision farming calculations. Mathematics of longitude and latitude. Spatial statistics, soil sampling and understanding soil testing results for precision farming, calculations. Supporting management zones, understanding soil, water and yield variability in precision farming. Developing prescriptive soil nutrient maps, essential plant nutrients, fertilizer sources, and application rates calculations. Deriving and using an equation to calculate economic optimum fertilizer and seeding rates cost of crop production.

VII. Learning outcome

Ability to understand design and operate PA systems.

VIII. Lecture schedule

S.No.	Topic	No. of Lectures
1.	Introduction about Global navigation satellite system (GNNS	1
2.	Satellite ranging including accuracy, standards etc.	1
3.	Differential GNSS Receiver, RTK etc.	1
4.	Components of GIS, data layers, map component,	1
5.	Attribute table component, function of a GIS, resolution.	1
6.	Data formats: Vector or raster.	1
7.	GIS for precision farming, data analysis, field calculator, convert to grid,	1
8.	Interpolation, reclassification, image classification, band math and interpretation of analysis.	1

S.No.	Topic	No. of Lectures
9.	Farm management information systems, and crop intelligence.	1
10.	Introduction about Yield monitors and its components	1
11.	Mass flow and impact plate sensors, measuring volume with a photoelectric sensor. Lecture 12: Microwave radiation and Gamma rays to estimate volume,	1
12.	Different types of grain moisture sens	1
13.	Fan speed sensor, elevator speed sensor, header position, yield monitor data,	1
14.	Yield monitors for non-grain crops	1
15.	Sources of soil variability, general soil sampling basics, systematic variability Lecture 17: Selecting a soil sampling strategy.	1
16.	Proximal and remote sensing based soil sensors	1
17.	Electromagnetic based sensors for soil electrical conductivity measurement	1
18.	Sensing mechanical impedance based sensors for soil compaction	1
19.	Spectroscopy for determination of soil properties	1
20.	Introduction about proximal plant sensing systems	1
21.	Remote sensing platforms: Aircraft or satellite.	1
22.	Type of plant sensors: Imaging or non imaging, active or passive.	1
23.	Use of reflected or emitted energy for vegetation detection	1
24.	The spectral signature of vegetation, vegetation indices, application to agriculture	1
25.	Sensing system for nutrient management,	1
26.	Crops canopy reflectance and fluorescence.	1
27.	Machine vision thermal sensors, mechanical sensors, acoustic sensors	1
28.	Sensors for weed detection and management	1
29.	Sensing Techniques for disease and insect management,	1
30.	Different type of sensors/devices for water management.	1
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Simple programming for automating precision farming calculations	1
2.	Mathematics of longitude and latitude	1
3.	Spatial and temporal statistics using GIS	1
4.	Soil sampling strategies, understanding and results for precision farming	1
5.	Creation of management zones	1
6.	Measurement of yield variability in the field	1
7.	Measurement of soil Compaction in the field	1
8.	Measurement of soil EC in the field	1
9.	Measurement of soil pH in the field	1
10.	Developing and understanding prescriptive soil nutrient maps	1
11.	Measurement of essential plant nutrients in the field	1
12.	Fertilizer sources, and application rates calculations	1
13.	Deriving and using an equation to calculate economic optimum fertilizer	1
14.	Calculation of optimum seeding rates for optimized returns	1
15.	Cost of crop production using precision technologies.	1
	Total	**15**

I. Course Title : Mechanics of Tillage in Relation to Soil and Crop

II. Course Code : FMPE 604

III. Credit Hours : 2+1

IV. Aim of the course

To have deeper understanding of the tillage process in terms of crop requirement, soil characteristics and machinery function.

V. Theory

Unit I

Soil condition and soil strength determining factors. General aspects of mechanical behavior of soil elements. Soil compaction, conditions for its occurrence. Methods of estimation of soil compaction by experimental stress distribution. Concept of soil distortion, deformation at constant volume. Expansion of soil at breaking.

Unit II

Occurrence of soil breaking fundamentals. Measures of resistance against breaking. Shear failure and Coulomb's law. Compaction v/s shear failure. Tensile failure of soil, idealized brittle failure, Griffith's Model. Loading rate and repeated loading effects. Draft calculation using mechanism of rigid soil bodies.

Unit III

Crop requirements: Root structure, Soil conditions and purpose of tillage, looseness of soil and depth of loosening. Structure of seed bed. Soil properties, properties affected by tillage and those not affected by tillage. Soil compaction, formation of clods and dust. Effect of tillage on erosion and water logging. Impact of climate factors on soil. Tillage requirement for various types of soils.

Unit IV

Tillage operations for special tasks. Preparation of soil for cropping and stubble management. Primary and secondary tillage. Ploughing and its effect on soil. Disc tillage: Appropriate conditions and effect. Requirement of seed bed and techniques of creating proper seed bed. Quality of sowing and sowing methods. Modern trends and objectives of soil tillage.

Unit V

Plough bodies: Generalized representation, intake main flow and output process. Main flow under different surface curvatures. Kinetic aspects of plough bodies with different shapes. Draft of plough bodies as affected by moisture, speed and attachments.

VI. Practical

Characterization of soil condition before and after tillage. Cone penetrometer resistance, bulk density, moisture content. Measurement of forces on tillage tools under soil bin condition/ field condition. Measurement of soil manipulation by different tillage tools: Pulverization, furrow profile, inversion and mixing. Measurement of energy required for soil breakup by different methods. Field study of crop root development in relation to soil compaction and hard pan. Measurement of moisture movement in different surface configuration: Ridges, furrows, raised bed and flat bed. Field evaluation of plant establishment in relation to planting parameters.

VII. Learning outcome

Ability to design tillage machinery based on engineering principles as applied tom tillage science.

I. Course Title : Mechanics of Traction and its Application

II. Course Code : FMPE 611

III. Credit Hours : 2+1

IV. Aim of the course

Learning techniques of modelling soil traction device interaction under different states of wheel and under different soil conditions by analytical and empirical method.

V. Theory

Unit I

Tractor performance in soft soils, operational states of wheel: Wismer and Luth. Path traced by point on tyre periphery. Rolling resistance, conditions of wheel soil interaction, theoretical prediction, work on soil deformation, Bekke's model, derivation of resistance offered by flat rigid plate on soft soil. Measurement of sinkage parameters. Soft wheel on soft surface and rigid wheel on soft surface. Empirical prediction of tractive force: Bekker's model, stress deformation relation in soil, analysis of tractive performance of tracks.

Unit II

Empirical modelling of tractor performance, tractive performance modelling and mobility number. Empirical models for rolling resistance and traction by Gee-Clough. Derivation of equations for drawbar pull and drawbar power.

Unit III

Rigid wheel systems. Rigid wheel at rest: Soil bearing capacity, contact pressure and sinkage. Rigid wheel at driving state: Ground reaction on rigid wheel during driving action, force balance in soil reaction to driving wheel, determination of driving force, compaction resistance and effective driving force. Energy equilibrium under driving wheel.

Unit IV

Wheel under braking state: Slip velocity and amount of slippage under braked wheel. Soil deformation under braked wheel. Distribution of shear stresses and normal stress under driving wheel.

Unit V

Tyre wheel system-deformation of tyre and area of contact. Deformation of tyre and its measurement. Tyre deformation as function of inflation pressure. Ground reaction during pure rolling of tyre on hard surface. Trafficability in soft terrain, concept of wheel mobility number-cornering characteristic of wheel forces on a steered wheel under driving and braking conditions. Relation between cornering force and self-aligning torque.

VI. Practical

Measurement of soil parameters for modelling traction-simulation of the different traction models to obtain the tractive performance. Calculating the performance of tractor drive wheels, Braking performance of trailer wheels on road, Planter metering drive wheels, Tractor front wheel. Measurement of performance of tyres under soil bin condition/field condition for driving and braking. Measurement of variation in contact patch of tractor tyres under different inflation pressures. Design of lugged wheels for wet puddle soil condition. Field experiment with tractive performance of tractor.

VII. Learning outcome

Ability to model vehicle traction mechanics and provide insight into behavior of vehicles under different soil conditions.

I. Course Title : Farm Machinery Management and Systems Engineering

II. Course Code : FMPE 612

III. Credit Hours : 2+1

IV. Aim of the course

Understanding Farm Machinery from systems approach and ability to model the Farm machinery system.

V. Theory

Unit I

Mathematical models of field machinery systems: Operational constrains, power constrains, weather constrains. Systems approach to field operations and models of: Tillage, seeding, chemical application, harvesting, storage and irrigation systems.

Unit II

Engineering economics: Concept of incremental and differential cost, economic efficiency, time value of money. Equipment investment cost: Operational cost, production cost, income cost and uncertainty cost. B.C. ratio, payback period, IRR machinery replacement policies.

Unit III

Uncertainty: Concepts of probability, probability functions, distributions, sampling. Statistics, confidence limits, significance, contingency tables, analysis of variance. Regression and correlation. Monte Carlo methods and applications to farm machinery.

Unit IV

System modeling in farm machinery: Numerical methods, analogs, models with uncertainty stochastic service system. Feasibility system design-stability. Deterministic systems and stochastic systems.

Unit V

Optimum Design: Trial and error, differential calculus, calculus of variations. Allocations: Linear programming, simplex technique. Transportation and assignment technique. Critical path scheduling, dynamic programming, game and its applications to farm machinery management.

VI. Practical

Solving problems of mathematical models of field machinery, constraints, power constraints, weather constraints. Problems relates to tillage seeding chemical application harvesting and storage and irrigation systems. Problem solving in Economics of Engineering, calculation of investment cost, operational cost, and uncertainty cost. Case studies in machine performance modelling, Economics of machine selection, Analog components, Analog modelling stochastic system modelling and critical path scheduling.

VII. Learning outcome

Ability to understand and develop model of any farm machinery system to help in selection, management and optimization.

VIII. Lecture Schedule

I. Course Title : Machinery for Special Farm Operations

II. Course Code : FMPE 613

III. Credit Hours : 2+0

IV. Aim of the course

To bring to focus special farm operations that are not covered under conventional operations and the machinery used for such operations.

V. Theory

Unit I

Machinery for land development. Tractor operated and self-propelled machines for laying drainage system, sub surface drip laying machines, subsoiler, trenchers, laser levelers.

Unit II

Machines for plant protection, pneumatic, thermal type sprayers, aero/drone spraying and other methods of spraying, electrostatic charging, air sleeve boom sprayer, disinfection of seed beds by micro waves and other methods. Safety aids for operator and advances in plant protection method.

Unit III

Field plot machinery and its importance. Fertilizer and manure spreader.

Unit IV

Machines for residue management. Silage and hay making machines.

Unit V

Machinery for horticultural crops. Crop specific machines for cotton, sugarcane, forage/fodder. Machines for processing and handling of agricultural products.

VI. Learning outcome

Understanding of the broad horizon of agricultural machinery used for specialized agricultural operations.

VII. Lecture Schedule

S.No.	Topic	No of Lectures
1.	Machinery for land development	1
2.	Tractor operated and self-propelled machines for laying drainage system, sub surface drip laying machines, subsoiler, trenchers	2
3.	Laser levelers	2
4.	Machines for plant protection	1
5.	Pneumatic, thermal type sprayers	2
6.	Aero/drone spraying and other methods of spraying,	2
7.	Electrostatic charging, air sleeve boom sprayer	2

I. **Course Title** : **Ergonomics in Working Environment**
II. **Course Code** : **FMPE 614**
III. **Credit Hours** : **2+1**

IV. **Aim of the course**

To enable the student to understand the concept of designing the working environment and designing farm machinery and equipment to ensure operators comfort and safety.

V. **Theory**

Unit I

Musculoskeletal problems in sitting and standing postures-behavioral aspects of posture, body mechanics. Workspace design for standing and seated workers. Display units, controls and human-machine interaction, design of static work.

Unit II

Noise and noise control. Measurement of noise and safe limits. Protection from noise. Vibration and health. Vibrations generated by agricultural machines. Types of vibrations: Whole body vibrations and hand transmitted vibrations. Methods of measurements of vibrations, hazards of vibrations. Vibration White Fingers (VWF). Vibration reductions in agricultural machines.

Unit III

Working environment-heat and cold stress conditions. Thermal balance of human body. Measurement of thermal environment. Heat and cold stress condition. Thermoregulatory system of human body. Heat and cold acclimatization. Effect of climate on human performance. Environmental dust and its measurement: Organic and inorganic dust. Types of dust and their hazards: Respirable, thoracic and inhalable dust. Personal protection from dust.

Unit IV

Time motion study and its purpose. Application of Time motion study in agricultural and processing operations. Recent research works related to ergonomics in agriculture.

VI. **Practical**

Design of workspace for static work in standing and sitting positions. Study of body mechanics and postures in design of agricultural machinery. Human energy expenditure, calibration of subjects, Human work load and its assessment. Study of work and rest schedule. Measurement of visibility of tractors. Measurement and control of noise in tractors and self-propelled machines. Measurement of human vibrations in farm tractors and agricultural machines. Study of dust generated in agricultural operations.

VII. **Learning outcome**

Ability to design working environment of different agricultural machinery for efficient and safe operations.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Basics of body mechanics, stability and support	1
2.	Control of muscle function, fatigue and discomfort	1
3.	Musculoskeletal problems in sitting and standing posture	2
4.	Behavioural aspects of posture, risk factors for musculoskeletal disorders	1
5.	Importance of ergonomics in workspace design	1
6.	Workspace design for standing workers	1
7.	Workspace design for seated workers	1
8.	First hourly examination	1
9.	Visual display units, controls and human- machine interaction	1
10.	Design of static work	1
11.	Importance of noise control and safe limits for human	1
12.	Measurement of noise, reduction and protection	1
13.	Machine vibrations, human vibrations and health hazards	1
14.	Whole body vibrations and hand transmitted vibrations	1
15.	Methods of measurements of vibrations and health hazards	1
16.	Vibration reduction techniques for agricultural machines	1
17.	Mid-semester examination	1
18.	Working environment- heat and cold stress conditions, thermal balance of human body	1
19.	Measurement of thermal environment	1
20.	Thermo-regulatory system of human body, heat and cold acclimatization, effect of climate on human performance	2
21.	Environmental dust and its measurement, type of dust - organic and inorganic dust, dust health hazard	1
22.	Respirable, thoracic and inhalable dust, protection from dust	1
23.	Time motion study and its purpose	1
24.	Application of time motion study in agricultural and processing operations	1
25.	Recent research work related to physiological parameters of ergonomics in agriculture	1
26.	Recent research work related to tractor space layout and design of controls	1
27.	Recent research work related to noise studies on farm machines	1
28.	Recent research work related to vibrations studies on farm machines	1
29.	Recent research work related to accidents and safety studies on farm machines	1
30.	Revision and discussion	1
	Total	32

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Design of workspace for static work in standing or sitting posture	1
2.	Study of body mechanics and posture in design of agricultural machinery	2
3.	Study of displays and controls in tractors	1
4.	Calibration of subjects on ergometer and treadmill	2
5.	Human workload and its assessment	1

S.No.	Topic	No of Practicals
6.	Study of work and rest schedule	1
7.	Measurement of visibility to tractor operators	1
8.	Measurement of noise in tractors and self-propelled machines	1
9.	Measurement of machine component vibration	1
10.	Measurement of hand arm vibrations	1
11.	Measurement of whole body vibrations	1
12.	Study of dust generated in agricultural operations	1
13.	Case study of design improvement in agricultural machine/ tool through ergonomic concept	1
14.	Practical examination	1
	Total	**16**

Vol. 4

Agricultural Engineering
– Processing and Food Engineering

Preamble

(Processing and Food Engineering)

Three major points were kept in mind while preparing course curricula related to Processing and Food Engineering (1) the syllabus and courses taught at UG level as recommended by 6th Dean committee (2) preparing students to keep pace with future requirement of the human resource in institutions and industry (3) to align the syllabus with ARS/NET examination.

Course curricula and course outlines in Processing and Food Engineering have been designed keeping in view the courses offered by the faculties from associated/ closely related disciplines, viz. Mechanical Engineering, Mathematics, Renewable Energy Engineering, Electrical, Electronics and Computer Engineering, Farm Machinery and Power Engineering, Civil Engineering etc.

It becomes more important for the post graduate students to not only learn the recent advances but have also to be trained/ hands on experience in the modern and latest techniques in their major disciplines so that they can participate and contribute in the development and advancement in their related fields. Further, the shrinking job opportunities in the National Agricultural Research System (ICAR/SAUs) have put additional pressure on our education system to prepare students in tune with the demands of the corporate sector.

All courses are designed to cover all basic topics and by taking into consideration demands of corporate sector harnessing commercial aspects, modern research tools and their applications, supplementary skills required and enhancing the global competitiveness and employability of students. To meet these objectives new courses were added which covers areas: Instrumentation and Sensors in Food Processing, Agri-Project Planning and Management, Dairy Product Processing, Design of Aquacultural Structures and Thermal Environmental Engineering for Agricultural Processing.

Further, existing courses were suitably modified and restructured by deleting topics already covered in UG, removing overlapping topics in different courses, adding topics/ courses to cover ARS/NET exam syllabus and topic important to the food industry and emerging trends in Processing and Food Engineering. The modified/revised courses cover the areas: Transport Phenomena in Food Processing, Unit Operations in Food Process Engineering, Field Crops Process Engineering, Horticultural Crops Process Engineering, Storage Engineering and Handling of Agricultural Produce, Food Package Engineering, Application of Engineering Properties in Food Processing, Food Quality and Safety, Food Processing Technologies, Food Processing Equipment and Plant Design, Seed Process Engineering, Farm Structures and Environmental Control, Processing of Meat, Poultry and Fish, Advances in Food Process Engineering, Drying and Dehydration of Food Materials, Textural and Rheological Characteristics of Food Materials, Agricultural Waste and By-Products Utilization, Mathematical Modeling in Food Processing and Bioprocess Engineering.

The course content and syllabus upgraded make it more of practical oriented and as per ARS/NET Syllabus.

The ICAR recommendations for PG courses have been taken into consideration in framing these courses. It is hoped that these will prove very useful to the future students.

Course Title with Credit Load
M.Tech. in Processing and Food Engineering

Major Courses (Requirement: 20 Credits)

Course Code	Course Title	Credit Hours
*PFE 501	Transport Phenomena in Food Processing	2+1
*PFE 502	Unit Operations in Food Process Engineering	2+1
*PFE 503	Field Crops Process Engineering	2+1
*PFE 504	Horticultural Crops Process Engineering	2+1
PFE 505	Storage Engineering and Handling of Agricultural Produce	2+1
PFE 506	Food Package Engineering	1+1
PFE 507	Instrumentation and Sensors in Food Processing	2+1
PFE 508	Application of Engineering Properties in Food Processing	2+1
PFE 509	Food Quality and Safety	2+1
PFE 510	Food Processing Technologies	2+1
PFE 511	Food Processing Equipment and Plant Design	1+1
PFE 512	Seed Process Engineering	1+1
PFE 513	Agri-Project Planning and Management	2+1
PFE 514	Farm Structures and Environmental Control	2+1
PFE 515	Dairy Product Processing	2+1
PFE 516	Processing of Meat, Poultry and Fish	2+1
PFE 517	Design of Aquacultural Structures	2+1
PFE 518	Thermal Environmental Engineering for Agricultural Processing	2+1
	Total	**33+18**

*Compulsory Courses

Minor Courses (Requirement: 08 Credits)

Course Code	Course Title	Credits
ME 501	Mechatronics and Robotics in Agriculture	2+0
ME 502	Refrigeration Systems	2+1
REE 513	Energy, Ecology and Environment	3+0
REE 518	Energy Management in Food Processing Industries	1+1
FMPE 502	Testing and Evaluation of Agricultural Equipment	1+1
FMPE 514	System Simulation and Computer Aided Problem Solving in Engineering	1+1

Course Code	Course Title	Credit Hours
FMPE 515	Computer Aided Design of Machinery	0+2
CSE 501	Big Data Analytics	2+0
CSE 502	Artificial Intelligence	2+0
MATHS 501	Finite Elements Method	1+1
MATHS 502	Numerical Methods for Engineers	2+1
CE 501	Dimensional Analysis and Similitude	1+1
	Any other course (s) of other department other than course(s) from major can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
*STAT 501	Statistical Methods for Research Works	2+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Compulsory Course

Common Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*PGS 501	Library and Information Services	0+1
*PGS 502	Technical Writing and Communications Skills	0+1
*PGS 503	Intellectual Property and its management in Agriculture	0+1
*PGS 504	Basic Concepts in Laboratory Techniques	0+1
*PGS 505	Agricultural Research, Research Ethics and Rural Development Programmes	0+1

*Detailed course outline to be developed by designated BSMA

List of Other Essential Requirements

Course Code	Course Title	Credit Hours
PFE 591	Seminar	0+1
PFE 599	Thesis Research	0+30

Course Contents
M.Tech. in Processing and Food Engineering

I. Course Title : Transport Phenomena in Food Processing

II. Course Code : PFE 501

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the principles of heat, mass and momentum transfer and its applications in food processing

V. Theory

Unit I

Introduction to heat and mass transfer and their analogy. Steady and unsteady state heat transfer. Analytical and numerical solutions of unsteady state heat conduction equations. Use of Gurnie-Lurie and Heisler Charts in solving heat conduction problems: Applications in food processing including freezing and thawing of foods.

Unit II

Convective heat transfer in food processing systems involving laminar and turbulent flow. Heat transfer in boiling liquids. Heat transfer between fluids and solid foods. Functional design of heat exchangers: shell and tube, plate and scraped surface heat exchangers. Radiation heat transfer: governing laws, shape factors, applications in food processing.

Unit III

Momentum transfer.Mass flow and balance. Steady and unsteady flow.Theory and equation of continuity.Bernoulli's theorem and application. Flow through immerged bodies, Measurement of flow, pressure and other parameters. Flow driving mechanism.

Unit IV

Molecular diffusion in gases, liquids and solids.Molecular diffusion in biological solutions and suspensions.Molecular diffusion in solids. Unsteady state mass transfer and mass transfer coefficients.Molecular diffusion with convection and chemical reaction.Diffusion of gases in porous solids and capillaries. Mass transfer applications in food processing.

VI. Practical

Solving problems on steady and unsteady state conduction with or without heat generation.Numerical analysis.Problems in natural and forced convection, radiation.Design of heat exchangers. Experiments on heat conduction, convection and radiation heat transfer.

VII. Learning outcome

The course will impart requisite knowledge about transport phenomenon with respect to heat, mass and momentum transfer which is necessary to understand the food processing operations. After going through the course, students will be able to understand, analyse and solve numerically the food processing operations where heat/mass/momentum transfer is involved.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to basic heat and mass transfer and their analogy	2
2.	Steady and unsteady state heat transfer.	2
3.	Use of Gurnie-Lurie and Heisler Charts in solving heat conduction problems	1
4.	Applications in food processing including freezing and thawing of foods.	1
5.	Convective heat transfer in food processing systems involving laminar and turbulent flow	2
6.	Heat transfer in boiling liquids, Heat transfer between fluids and solid foods.	2
7.	Functional design of heat exchangers; Shell and tube, plate and scraped surface heat exchangers.	2
8.	Radiation heat transfer: governing laws, shape factors, applications in food processing.	2
9.	Classification of Flow Phenomena, Momentum Flow and Momentum Equation for Laminar Flow, Momentum transfer. Mass flow and balance.	2
10.	Steady and unsteady flow, Fluid Element Trajectories, Stream Function and Velocity Potential	1
11.	Theory and equation of continuity. Bernoulli's theorem and application.	1
12.	Flow through immerged bodies, Measurement of flow; Measurement of flow pressure and other parameters. Flow driving mechanism.	2
13.	Mass Transfer (Diffusion),Diffusion: Phenomenological Description, Diffusion Coefficient and Fick's Law	2
14.	Driving Force for Diffusion, Microscopic Picture of Diffusion	1
15.	Molecular diffusion in biological solutions and suspensions.	1
16.	Unsteady state mass transfer and mass transfer coefficients.	2
17.	Molecular diffusion with convection and chemical reaction	1
18.	Diffusion of gases in porous solids and capillaries	1
19.	Mass transfer applications in food processing.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Solving problems on steady conduction	1
2.	Solving problems on steady conductionwith or without heat generation	1
3.	Solving problems on steady and unsteady state conduction	2
4.	Steady and unsteady state conduction with or without heat generation	1
5.	Numerical analysis in heat transfer	1
6.	Problems in natural and forced convection	2
7.	Solving problems of heat transfer by radiation	2
8.	Design of heat exchangers.	2
9.	Experiments on heat conduction, convection	2
10.	Experiments on radiation heat transfer	1
	Total	**15**

I. Course Title : Unit Operations in Food Process Engineering

II. Course Code : PFE 502

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with different unit operations applicable in food industries.

V. Theory

Unit I

Review of basic engineering mathematics. Units and dimensions. Mass and energy balance. Principles of fluid flow. Heat transfer: Conduction, convection and radiation.Heat exchangers and their designs.

Unit II

Drying and dehydration: Psychrometry, theories of drying, EMC, equipment for drying of solid, pastes and liquid foods. Evaporation: Components, heat and mass balance in single and multiple effect evaporators, equipment and applications, steam economy. Thermal processing: Blanching, pasteurization and sterilization, death rate kinetics, process time calculations, sterilization equipment.

Unit III

Refrigeration and freezing: Principles, freezing curve, freezing time calculation, freezing equipment, cold chain.

Unit IV

Mechanical separation: Principle and equipment involved in sieving, filtration, sedimentation and centrifugation, cyclone separation. Material handling: Conveyors and elevators, components and design considerations for belt, chain, bucket and screw conveyors.

Unit V

Size reduction: Principles of size reduction, size reduction laws. Size reduction equipment: Jaw crusher, gyratory crusher, roller mill, hammer mill.

VI. Practical

Study of fluid flow properties. Study of heat exchangers, functional design of heat exchangers.Application of psychometric chart.Determination of EMC.Study of driers. Solving problems on single and multiple effect evaporator. Elevating and conveying equipments. Size reduction equipments. Cleaning and sorting equipment. Sieve analysis. Kinetics of fruits and vegetables dehydration.Calculation of refrigeration load, solving of numerical problems. Visit to related food industry.

VII. Learning outcome

The students will get knowledge on various unit operations, backbone of all food processes. Knowledge on basic principles of thermal food processes, size reduction and separation operations involved in food processing and related equipment will prepare students to solve problems related with food processing. This will help students to solve problems of post-production processes and will also enhance employability in food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Calculations of material balance related to various food processes	3
2.	Study of energy balance for processing operation and related parameters	3
3.	Study of fluid statics, fluid dynamics, flow characteristics	2
4.	Introduction to heat transfer, modes of heat transfer, heat conduction	2
5.	Introduction to Psychometrics basics	2
6.	Study of Dehydration, EMC, Mechanism of drying constant rate period, Falling rate period	2
7.	Study of drying equipments	2
8.	Evaporation, types of evaporators, Flow arrangements Mass and energy balance, Steam economy	2
9.	Thermal processing: Blanching, pasteurization and sterilization, death rate kinetics, process time calculations, sterilization equipment.	3
10.	Refrigeration and freezing: Principles, freezing curve, freezing time calculation, freezing equipment, cold chain.	2
11.	Mechanical separation: Principle and equipment involved in sieving, filtration, sedimentation and centrifugation, cyclone separation.	2
12.	Material handling: Conveyors and elevators, components and design considerations for belt, chain, bucket and screw conveyors.	2
13.	Study of principles involved in the size reduction and separation. Equipment used	3
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Use of units, dimensions and basic mathematical applications	1
2.	To judge the students ability for solving mass balance problems	2
3.	To judge the students ability for solving Energy balance problems	2
4.	To assess the flow rate of fluids through pipes and channels	1
5.	To verify the Bernoulli's Equation	1
6.	To Study heat exchangers and calculation of log mean temperature difference	1
7.	To solve the heat transfer problems	2
8.	To study different dryers used in drying of biological materials	1
9.	To study single effect and multi effect evaporators	1
10.	To calculate the thermal process time using trapezoidal/ Simpson's formulae	1

S.No.	Topic	No. of Practicals
11.	To find the graphical solution for calculation of thermal process time	1
12.	To study different separation equipments	1
13.	To study the size reduction equipments	1
	Total	**16**

I. Course Title : Field Crops Process Engineering

II. Course Code : PFE 503

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the post harvest technology of cereals, pulses and oilseeds with special emphasis on equipment used in the milling and processing.

V. Theory

Unit I

Production and utilization of cereals and pulses, grain structure of major cereals, pulses and oilseeds and their milling fractions. Grain quality standards and physico-chemical methods for evaluation of quality of flours.

Unit II

Pre-milling treatments and their effects on milling quality. Parboiling and drying, conventional, modern and integrated rice milling operations. Wheat roller flour milling. Processes for milling of corn, oats, barley, gram, pulses, paddy and flour milling equipment.Layout of milling plants.

Unit III

Dal mills, handling and storage of by-products and their utilization. Storage of milled products.Expeller and solvent extraction processing.Assessment of processed product quality.

Unit IV

Packaging of processed products. Design characteristics of milling equipment, selection, installation and their performance. Quality standards for various processed products. Value added products of cereals, pulses and oilseeds.

VI. Practical

Physical properties of cereals and pulses, raw and milled products quality evaluations:Parboiling and drying, terminal velocities of grains and their fractions, study of paddy, wheat, pulses and oilseeds milling equipments, planning and layout of various milling plants. Development of value added products for cereals, pulses and oilseeds, visit to related agro processing industry.

VII. Learning outcome

Student's capability to mill and process (value added products) all kinds of field crops as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Production and utilization of cereals and pulses, grain structure of major cereals, pulses and oilseeds and their milling fractions.	2
2.	Conventional, modern and integrated rice milling process, pre-milling treatments, rice parboiling, rice milling equipment and layout of rice milling plant.	5
3.	Conventional and roller wheat flour milling process, pre-milling treatments, milling equipment and layout of wheat milling plant.	4
4.	Preparation of oilseeds and pre- treatments, conventional and modern oil extraction methods viz expeller, solvent extraction and super critical fluid extraction. Milling equipment and layout of oil milling plant.	4
5.	Processes for milling of pulses, pretreatments, milling equipment and layout of pulse milling plant.	4
6.	Processes for milling of corn, oats and barley, pretreatments and milling equipments. Layout of milling plant.	3
7.	Handling, packaging and storage of milled products, by-products and their utilization.	2
8.	Assessment of processed product quality. Quality standards for various grains, processed products. Physico-chemical methods for evaluation of quality Value added products of cereals, pulses and oilseeds.	3
9.	Design characteristics of milling equipment, selection, installation and their performance.	3
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Engineering properties of grains, raw and milled products	2
2.	Physical, milling and cooking quality of grains	2
3.	Study of paddy milling process and equipments.	1
4.	Study of wheat milling process and equipments,	1
5.	Study of oil extraction process and equipments,	1
6.	Study of pulse milling process and equipments,	1
7.	Planning and layout of various milling plants.	3
8.	Development of value added products for cereals, pulses and oilseeds	2
9.	Visit to various agro processing industry.	2
	Total	**15**

I. Course Title : Horticultural Crops Process Engineering

II. Course Code : PFE 504

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with processing of fruits and vegetables and the design features of the equipment used for their processing.

V. Theory

Unit I

Importance of postharvest technology of fruits and vegetables, structure, cellular components, composition and nutritive value of fruits and vegetables, fruit ripening, spoilage of fruits and vegetables.

Unit II

Harvesting and washing, pre-cooling, blanching, preservation of fruits and vegetables, commercial canning of fruits and vegetables, minimal processing of fruits and vegetables.

Unit III

Cold storage of fruits and vegetables, controlled atmosphere and modified atmosphere packaging of fruits and vegetables, quality deterioration and storage.

Unit IV

Dehydration of fruits and vegetables, methods, osmotic dehydration, foam mat drying, freeze drying, microwave heating, applications, radiation preservation of fruits and vegetables, irradiation sources.

Unit V

Intermediate moisture foods, ohmic heating principle, high pressure processing of fruits and vegetables, applications, sensory evaluation of fruit and vegetable products, packaging technology for fruits and vegetables, general principles of quality standards and control, FPO, quality attributes.

VI. Practical

Determination of size, shape, density, area-volume-mass relationship of fruits and vegetables, sugar-acid ratio of fruits, evaluation of washer, grader and packaging methods, experiments on drying of fruits and vegetables, controlled atmosphere storage and quality evaluation.

VII. Learning outcome

Student's capability to mill and process (value added products) all kinds of horticultural crops as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Importance of postharvest technology of fruits and vegetables, structure, cellular components, composition and nutritive value of fruits and vegetables.	1
2.	Techniques for harvesting and washing of fruits and vegetables. Fruit ripening and spoilage.	2
3.	Pre-cooling of fruits and vegetables.	1
4.	Blanching: importance and objectives, blanching methods, effects on food (nutrition, colour, pigment, and texture).	1
5.	Different preservation techniques for fruits and vegetables.	1
6.	Commercial canning of fruits and vegetables.	1
7.	Minimal processing of fruits and vegetables.	1
8.	Modified and CA storage of fruits and vegetables, Cold storage, heat load calculations and design.	5
9.	Quality deterioration in fruits and vegetables.	1
10.	Different storage techniques for fruits and vegetables.	1
11.	Dehydration techniques of fruits and vegetables: osmotic dehydration, foam mat drying, freeze drying, microwave heating, applications, radiation preservation of fruits and vegetables, irradiation sources.	4
12.	Intermediate moisture foods.	1
13.	Ohmic heating and high pressure processing principle for fruits and vegetables.	2
14.	Applications of different processing techniques for fruits and vegetables.	1
15.	Sensory evaluation of fruit and vegetable products.	1
16.	Packaging technology for fruits and vegetables.	2
17.	General principles of quality standards and control.	2
18.	FPO, quality attributes for fruits and vegetables.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Determination of size of fruits and vegetables	1
2.	Determination of shape of fruits and vegetables	1
3.	Determination of bulk density and true density of fruits and vegetables	1
4.	Determination of area-volume-mass relationship of fruits and vegetables	1
5.	Determination of sugar-acid ratio of fruits	1
6.	Evaluation of different types of washers for fruits and vegetables	1
7.	Evaluation of different types of graders for fruits and vegetables	1
8.	Different types of packaging methods for fruits and vegetables	1
9.	Determination of the water vapor permeability of packaging materials	1
10.	Different types of drying methods for fruits and vegetables	1
11.	Comparative evaluation of different dryers for fruits and vegetables	1

S.No.	Topic	No. of Practicals
12.	Determination of solid gain and moisture loss during osmotic dehydration in fruits	1
13.	Study of components and design of controlled atmosphere storage	1
14.	Study of quality evaluation of fruits and vegetables	2
	Total	**15**

I. Course Title : Storage Engineering and Handling of Agricultural Produce

II. Course Code : PFE 505

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the safe storage of food materials, design of storage structures and the design of different material handling equipment used in the industries.

V. Theory

Unit I

Storage of grains, biochemical changes during storage, production, distribution and storage capacity estimate models, storage capacity models, ecology, storage factors affecting losses, storage requirements.

Unit II

Bag and bulk storage, godowns, bins and silos, rat proof godowns and rodent control, method of stacking, preventive method, bio-engineering properties of stored products, function, structural and thermal design of structures, aeration system.

Unit III

Grain markets, cold storage, controlled and modified atmosphere storage, effects of nitrogen, oxygen, and carbon dioxide on storage of durable and perishable commodities, irradiation, storage of dehydrated products, food spoilage and preservation, BIS standards.

Unit IV

Physical factors influencing flow characteristics, mechanics of bulk solids, flow through hoppers, openings and ducts; design of belt, chain, screw, roller, pneumatic conveyors and bucket elevators,principles of fluidization, recent advances in handling of food materials.

VI. Practical

Physical factors influencing flow characteristics, mechanics of bulk solids, flow through hoppers, openings and ducts, design of belt, chain, screw, roller, pneumatic conveyors and bucket elevators; principles of fluidization; recent advances in handling of food materials.

VII. Learning outcome

Student's capability to understand and undertake mechanical handling of food as per requirement of food industries as well as storage devices and systems for safe storage of food for longer period of time.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Importance of storage, Types of losses, Principle of storage, Aeration of grains, Factors causing deterioration of grains, Sources of infestation	3
2.	Biochemical changes during storage, Grain storage capacity estimation models	2
3.	Factors affecting losses, Storage requirements	2
4.	Bag and bulk storage, godowns, bins and silos, Selection of storage type, Deep and shallow bins	3
5.	Rat proof godowns and rodent control, method of stacking, preventive method, bio-engineering properties of stored products	2
6.	Functional, structural and thermal design of structures, aeration system.	2
7.	Grain markets- Recent reforms, Continued constraints to grain market integration, Rice and wheat marketing channels in India, Import, export and food policy, Food grains management system	2
8.	Cold storage,Controlled and modified atmosphere storage, Effects of nitrogen, oxygen, and carbon dioxide on storage of durable and perishable commodities.	3
9.	Food irradiation, Storage of dehydrated products, Food spoilage and preservation, BIS standards.	2
10.	Physical factors influencing flow characteristics, Rolling resistance, Mechanics of bulk solids - Shear apparatus for determination of flow properties, Yield locus, Time yield locus and effective yield locus.	3
11.	Flow through hoppers, openings and ducts – Types of flow along bins or hopper wall, Flow function and Critical flow factor, Critical dimensions of hopper openings;	2
12.	Material handling equipment, Design of belt, chain, screw, roller, pneumatic conveyors and bucket elevators.	4
13.	Principles of fluidization, recent advances in handling of food materials.	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Determination of angle of repose	1
2.	Determination of coefficient of internal friction	1
3.	Determination of coefficient of external friction	1
4.	Physical factors influencing flow characteristics	1

S. No	Topic	No. of Practicals
5.	Determination of flow properties using Shear apparatus	1
6.	Determination of Yield locus, Time yield locus and effective yield locus from Mohr's circle	1
7.	Flow through hoppers, openings and ducts	1
8.	Design of belt conveyors	1
9.	Design of chain conveyors	1
10.	Design of screw conveyors	1
11.	Design of bucket elevators	1
12.	Design of roller conveyors	1
13.	Design of pneumatic conveyors	1
14.	Principles of fluidization	1
15.	Recent advances in handling of food materials	2
	Total	16

I. Course Title : Food Package Engineering

II. Course Code : PFE 506

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint and equip the students with packaging methods, packaging materials, packaging machineries, modern packaging techniques etc.

V. Theory

Unit I

Introduction of packaging: Package, functions and design. Principle in the development of protective packaging. Deteriorative changes in foodstuff and packaging methods of prevention.

Unit II

Food containers: Rigid containers, glass, wooden boxes, crates, plywood and wire bound boxes, corrugated and fibre board boxes, textile and paper sacks, corrosion of containers (tin plate).Flexible packaging materials and their properties.Aluminum as packaging material.Evaluation of packaging material and package performance.

Unit III

Packaging equipment: Food packages, bags, types of pouches, wrappers, carton and other traditional package.Retortable pouches: Shelf life of packaged foodstuff.

Unit IV

Methods to extend shelf life.Packaging of perishables and processed foods. Special problems in packaging of food stuff.

Unit V

Package standards and regulation: Shrink packaging, aseptic packaging, CA and MAP. Biodegradable packaging: Recent advances in packaging, active packaging, smart packaging, antioxidant and antimicrobial packaging, edible films and biodegradable packaging, microencapsulation and nano encapsulation.

VI. Practical

Thickness, substance weight, water absorption capability of flexible packaging materials,strength properties of packaging materials,water vapour and gas transmission rate of flexible packaging materials,identification and chemical resistance of plastic films. Packaging of fruits/vegetables: Estimation of shelf-life of packaged food stuff, familiarization of types of packaging material.

VII. Learning outcome

Student's capability to develop packages for all kinds of food products as per requirement of food industries and thereby adding value to the food products.

VIII. Lectures Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to food packaging, Definition, importance, package, functions of packaging, design.	1
2.	Principle in the development of protective packaging	1
3.	Deteriorative changes in foodstuff, Factors affecting shelf life of foods during storage, interactions of spoilage agents with environmental factors (water, oxygen, light and pH), packaging methods of prevention	1
4.	Food containers: Rigid containers, glass, wooden boxes, crates, plywood and wire bound boxes, corrugated and fibre board boxes, textile and paper sacks, corrosion of containers (tin plate).	1
5.	Flexible packaging materials and their properties. Aluminum as packaging material.	1
6.	Evaluation of packaging material and package performance: Testing methods for flexible, rigid and semi rigid materials. Paper and paper board:thickness, bursting strength, breaking length, stiffness, tear resistance, folding endurance, ply bond and surface oil absorption, Plastic film and laminates: thickness, tensile strength, gloss, haze and burning test to identify polymer, aluminium foil: thickness and pin holes, Glass containers: visual defects, colour, dimensions and impact strength and metal containers: pressure test and product compatibility	3
7.	Packaging equipment for food packages, bags, types of pouches, wrappers, carton and other traditional packages	1
8.	Retortable pouches: Shelf life of packaged foodstuff.	1
9.	Methods to extend shelf life. Packaging of perishables and processed foods	1
10.	Special problems in packaging of food stuff	1
11.	Package standards and regulation: Shrink packaging, aseptic packaging, CA and MAP	2

S.No.	Topic	No. of Lectures
12.	Recent advances in packaging, active packaging, smart packaging, antioxidant and antimicrobial packaging, edible films and biodegradable packaging, microencapsulation and nano encapsulation	2
	Total	**16**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Familiarization of types of packaging material	1
2.	Determination of thickness of different types of packaging materials	1
3.	To determinewater absorption capability of flexible packaging materials	1
4.	Determination of tensile strength of packaging material	1
5.	Determination of compressive strength of packaging material	1
6.	Determination of water vapour transmission rate of packaging material	1
7.	Determination of gas transmission rate of packaging material	1
8.	Identification of different types of plastic films	1
9.	Testing of chemical and grease resistance of packaging materials	1
10.	Determination of bursting strength of packages	1
11.	Drop test for food package strength	1
12.	Vacuum packaging of various food products	1
13.	Nitrogen packaging of food products	1
14.	To study the effect of shrink wrapping onshelf life of fruits and vegetables	1
15.	To study the effect of active modified atmosphere packaging onshelf life of fruits and vegetables	1
16.	Visit to relevant industries	1
	Total	**16**

I. Course Title : Instrumentation and Sensors in Food Processing

II. Course Code : PFE 507

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with instrumentation and use of sensors in food processing operations.

V. Theory

Unit I

Basic instrumentation systems and transducer principles. Displacement transducers, Potential meters, LDVT, Piezoelectric and capacitive transducers, Digital transducers, velocity transducers.

Unit II

Acceleration and absolute motion measurement, Force transducer, Strain gauge, Hydraulic load cell, Cantilever type and probing ring. Method of separation of force: Torque, power and energy measuring technique.

Unit III

Temperature measurement using bi-metals, thermisters, thermocouples, humidity measurement, manometers. Flow transducer, positive displacement, venturimeter, Rotameter, Drag force, hot wire anemometer.

Unit IV

Theory and classifications of chemical sensors, biosensors, fibre optic sensors, gas sensors etc. Biosensor: Concepts, types of biosensors, methods of immobilizing biosensors, application. Imaging methods: X-ray imaging, Computed tomography, MRI, Ultrasound, Hyperspectral imaging. Spectroscopy and chemometrics: UV and visual spectroscopy, NIR spectroscopy, FTIR spectroscopy.

VI. Practical

Identification of components of generalized measuring system: Calibration of instruments, experiment on LVDT, strain gauge transducer, force, torque, power and pressure, fluid flow rates, temperature, calorific value, vibration measurement.Use of data loggers and data storage devices, spectroscopy, imaging systems.

VII. Learning outcome

Student's capability to control the process operations through precise instrumentation and knowledge of sensors for precision analysis of food quality in food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Basic instrumentation systems	1
2.	Transducer principles	1
3.	Displacement transducers, Potential meters, LDVT, Piezoelectric and capacitive transducers, Digital transducers, velocity transducers.	3
4.	Acceleration and absolute motion measurement, Force transducer, Strain gauge, Hydraulic load cell, Cantilever type and probing ring.	3
5.	Different methods of separation of force: Torque, power and energy measuring technique	3
6.	Temperature measurement using bi-metals, thermistors, thermocouples, humidity measurement, manometers.	3
7.	Flow transducer, positive displacement, venturi meter, Rotameter, Drag force, hot wire anemometer.	2
8.	Theory and classification of chemical sensors, biosensors, fibre optic sensors, gas sensors etc.	4
9.	Biosensor: Concepts, types of biosensors, methods of immobilizing biosensors, application.	3
10.	Imaging methods for foods, Principles, equipment, food applications- X-ray imaging, Computed tomography, MRI, Ultrasound, Hyperspectral imaging.	4
11.	Various methods of spectroscopy and chemometrics, principles, equipment, food applications- UV and visual spectroscopy, NIR spectroscopy, FTIR spectroscopy.	3
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Identification of components of generalized measuring system for temperature, pressure, relative humidity, moisture etc.	1
2.	Calibration of moisture measuring equipment	1
3.	Calibration of temperature control and measuring devices	1
4.	To study the working of Bourdon Pressure Gauge and to check the calibration of the gauge in a deadweight pressure gauge calibration set up.	1
5.	To study various temperature measuring instruments e.g. Mercury-in-glass thermometer, Thermocouple, Electrical resistance thermometer, laser thermometer and to estimate their response times	1
6.	To determine the calorific value of different food products using a bomb calorimeter having temperature sensing device	1
7.	To study a Linear Variable Differential Transformer (LVDT) and use it in a simple experimental set up to measure a small displacement	1
8.	To measure torque of a rotating shaft using torsion meter/strain gauge torque transducer	1
9.	To measure the speed of a motor shaft with the help of non-contact type pick-ups (magnetic or photoelectric)	1
10.	To measure static/dynamic pressure of fluid in pipe/tube using pressure transducer/pressure cell	1
11.	To determine the hardness/firmness of food samples using a texture analyzer	1
12.	To study the effect of vibrations during transportation on the quality of food (damage/ bruising/ texture etc) using a simulated vibration test	1
13.	To study and use the data logging and data storage devices	1
14.	To study and understand the working principle of UV and visual spectroscopy for measurement of food properties	1
15.	To study and understand the working principle of NIR and FTIR spectroscopy for measurement of food properties	1
16.	To study the working principle of X-ray imaging, Computed tomography, MRI, Ultrasound and Hyperspectral imaging for measurement of food quality	1
	Total	**16**

I. Course Title : Application of Engineering Properties in Food Processing

II. Course Code : PFE 508

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint the students with different techniques of measurement of engineering properties and their application in the design of processing equipment.

V. Theory

Unit I

Physical characteristics of different food grains, fruits and vegetables: Shape and size, description of shape and size, volume and density, porosity, surface area. Rheology: ASTM standard, terms, physical states of materials, classical ideal material, rheological models and equations, viscoelasticity, creep-stress relaxation, non-Newtonian fluid and viscometry, rheological properties, force, deformation, stress, strain, elastic, plastic behaviour.

Unit II

Contact stresses between bodies, Hertz problems, firmness and hardness, mechanical damage, dead load and impact damage, vibration damage, friction, effect of load, sliding velocity, temperature, water film and surface roughness. Friction in agricultural materials, rolling resistance, angle of internal friction, angle of repose, flow of bulk granular materials, aero dynamics of agricultural products, drag coefficients, terminal velocity.

Unit III

Thermal properties: Specific heat, thermal conductivity, thermal diffusivity, methods of determination, steady state and transient heat flow. Electrical properties: Dielectric loss factor, loss tangent, A.C. conductivity and dielectric constant, method of determination, energy absorption from high frequency electric field.

Unit IV

Application of engineering properties in design and operation of agricultural equipment and structures.

VI. Practical

Experiments for the determination of physical properties like length, breadth, thickness, surface area, bulk density, porosity, true density, coefficient of friction, angle of repose and colour for various food grains, fruits, vegetables, spices and processed foods, aerodynamic properties like terminal velocity, lift and drag force for food grains, thermal properties like thermal conductivity, thermal diffusivity and specific heat. Rheological properties: firmness and hardness of grain, fruits and stalk, electrical properties like dielectric constant, dielectric loss factor, loss tangent and A.C. conductivity of various food materials.

VII. Learning outcome

Student’s capability to apply properties of food for design of equipment and structures.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Physical characteristics of different food grains, fruits and vegetables: Shape and size, description of shape and size.	3
2.	Volume and density, porosity, surface area.	1
3.	Rheology: ASTM standard, terms, physical states of materials, classical ideal material.	2
4.	Rheological models and equations, visco elasticity.	2
5.	Creep-stress relaxation, non-Newtonian fluid and viscometry.	1
6.	Rheological properties, force, deformation, stress, strain, elastic, plastic behavior.	1
7.	Contact stresses between bodies, Hertz problems, firmness and hardness	1
8.	Mechanical damage, dead load and impact damage.	2
9.	Vibration damage, friction, effect of load, sliding velocity.	1
10.	Temperature, water film and surface roughness.	1
11.	Friction in agricultural materials, rolling resistance, angle of internal friction, angle of repose.	2
12.	Flow of bulk granular materials.	1
13.	Aero dynamics of agricultural products, drag coefficients, terminal velocity.	3
14.	Thermal properties: Specific heat, thermal conductivity, thermal diffusivity.	1
15.	Methods of determination, steady state and transient heat flow	1
16.	Electrical properties: Dielectric loss factor, loss tangent.	1
17.	A.C. conductivity and dielectric constant, method of determination.	2
18.	Energy absorption from high frequency electric field.	1
19.	Application of engineering properties in design and operation of agricultural equipment and structures.	3
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To determine the size of grains, pulses, oil seeds, spices, fruits and vegetables.	1
2.	To determine the shape of various food grains and fruits and vegetables.	1
3.	To determine the bulk density of food grains and fruits and vegetables.	1
4.	To determine the particle density/true density and porosity of solid grains.	1
5.	To study the comparison pycnometer for finding the particle density of food grains.	1
6.	To determine the angle of repose of grains, oilseeds etc.	1
7.	To find the coefficient of external friction for different food grains.	1
8.	To determine the coefficient of internal friction of different food grains.	1
9.	To plot the normal stress vs. sheet stress curves for different food grains.	1
10.	To study the separating behaviour of a grain sample in a vertical wind tunnel (Aspirator column).	1
11.	To study the thermal properties (thermal conductivity, thermal diffusivity and specific heat) of food grains.	2

S.No.	Topic	No. of Practicals
12.	To determine the Rheological properties: firmness and hardness of grain, fruits, stalk and vegetables.	1
13.	To study the electrical properties (dielectric constant, dielectric loss factor) of various food materials.	1
14.	To study the electrical properties (loss tangent and A.C. conductivity) of various food materials.	1
	Total	**15**

I. Course Title : Food Quality and Safety

II. Course Code : PFE 509

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the latest standards to maintain food quality and safety.

V. Theory

Unit I

Food safety:Need for quality control and safety, strategy and criteria, microbiological criteria for safety and quality, scope of food toxicology, toxic potential and food toxicants, biological and chemical contaminants.

Unit II

Food additives and derived substances, factors affecting toxicity, designing safety in products and processes, intrinsic factors, establishing a safe raw material supply, safe and achievable shelf life.

Unit III

Process equipment and machinery auditing, consideration of risk, environmental consideration, mechanical quality control.

Unit IV

Personnel hygienic standards, preventative pest control, cleaning and disinfesting system, biological factors underlying food safety.

Unit V

Preservation and stability, contaminants of processed foods, adulteration, prevention and control, FSSAI, ISO, Codex, GMP, BIS and HACCP.Practices, principles, standards, specifications, application establishment and implementation, HACCP and quality management system.Food Safety Management Systems (FSMS), Traceability.

VI. Practical

Microbiological examination of food, hazard analysis, premises design, HACCP project plan, CCP, CCP Decision tree, HACCP control chart. HACCP case studies: Survey, BIS, FPO, Codex standards and specifications. Visits to food industries to study the various quality and safety aspects adopted.

VII. Learning outcome:

Student's capability to measure food quality as well as ensure food safety in food supply chain.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Food safety: Need for quality control and safety, strategy and criteria.	2
2.	Microbiological criteria for safety and quality.	1
3.	Scope of food toxicology, toxic potential and food toxicants.	2
4.	Biological and chemical contaminants.	1
5.	Food additives and derived substances, factors affecting toxicity.	2
6.	Designing safety in products and processes, intrinsic factors.	2
7.	Establishing a safe raw material supply, safe and achievable shelf life.	2
8.	Process equipment and machinery auditing.	1
9.	Consideration of risk, environmental consideration. Biological factors underlying food safety.	2
10.	Personnel hygienic standards, preventative pest control. Cleaning and disinfesting system.	2
11.	Preservation and stability, contaminants of processed foods, adulteration, prevention and control	3
12.	FSSAI-Practices, principles, standards, specifications, application establishment and implementation	2
13.	ISO-Practices, principles, standards, specifications, application establishment and implementation.	2
14.	Codex, GMP and BIS - Practices, principles, standards, specifications, application establishment and implementation.	3
15.	HACCP and quality management system.	1
16.	Food Safety Management Systems (FSMS), Traceability.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To test microbiological contamination of food.	1
2.	To conduct hazard analysis.	2
3.	To study the premises design for food safety and quality.	2
4.	To study the HACCP project plan.	1
5.	To prepare CCP and CCP Decision tree.	2

S.No.	Topic	No. of Lectures
6.	To prepare HACCP control chart.	2
7.	To conduct the Survey and study BIS- standards and specifications.	2
8.	To study the FPO standards and specifications.	1
9.	To study the codex standards and specifications.	1
10.	Visits to food industries to study the various quality and safety aspects adopted.	2

I. Course Title : Food Processing Technologies

II. Course Code : PFE 510

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with different unit operations to be performed in food industries and related equipment.

V. Theory

Unit I

Mixing and homogenization; Principles of solid and liquid mixing, types of mixers for solids, liquid and pastes homogenization. Emulsification: Principles and equipments.

Unit II

Novel dehydration technologies; Osmotic dehydration, foam mat drying, puff drying, freeze drying, microwave drying, dehumidified air drying. Extrusion: Theory, equipment, applications.

Unit III

Non-thermal processing; Principles and equipment involved in ohmic heating, pulsed electric field preservation, hydrostatic pressure technique (vacuum processing, high pressure processing of Foods), ultrasonic technology, irradiation, quality changes and effects on microorganisms, nanotechnology in food processing.

Unit IV

Distillation, leaching and extraction: Principles and equipment for distillation, crystallization, phase equilibria, multistage calculations, leaching principles and equipment, solvent extraction, super-critical fluid extraction, near critical fluid extraction: Equipment and experimental techniques used in NCF extraction and industrial application, advanced methods for extraction of food components and aroma recovery.

Unit V

Food plant hygiene; Cleaning, sterilizing, waste disposal methods, Food processing plant utilities, steam requirements in food processing, HACCP in food processing industries.

VI. Practical

Conducting experiments and solving problems on mixing and mixing indices, homogenization, distillation, crystallisation, extraction, leaching, membrane separation, reverse osmosis and ultrafiltration, design of plate and packed tower, visit to related food industry.

VII. Learning outcome

Student's capability to develop food products using recent techniques as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Mixing and homogenization: Principles of solid and liquid mixing.	1
2.	Types of mixers for solids, liquid and pastes homogenization.	2
3.	Emulsification: Principles and equipments.	1
4.	Novel dehydration technologies: Osmotic dehydration, foam mat drying, puff drying.	2
5.	Freeze drying, microwave drying, and dehumidified air drying.	2
6.	Extrusion: Theory, equipment, applications.	2
7.	Non-thermal processing: Principles and equipment involved in ohmic heating, pulsed electric field preservation.	2
8.	Hydrostatic pressure technique (vacuum processing, high pressure processing of Foods), ultrasonic technology.	2
9.	Irradiation, quality changes and effects on microorganisms, nanotechnology in food processing.	2
10.	Distillation; Principles and equipment for distillation.	2
11.	Leaching; Principles and equipment.	2
12.	Extraction; Solvent extraction, crystallization, phase equilibria, multistage calculations.	3
13.	Super-critical fluid extraction, near critical fluid extraction: Equipment and experimental techniques used in NCF extraction and industrial application.	3
14.	Advanced methods for extraction of food components and aroma recovery.	1
15.	Food plant hygiene; Cleaning, sterilizing, waste disposal methods. Food processing plant utilities, steam requirements in food processing.	2
16.	HACCP in food processing industries.	1
	Total	**30**

I. Course Title : Food Processing Equipment and Plant Design

II. Course Code : PFE 511

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint and equip the students with the design features of different food processing equipment being used in the industries along with the layout, planning of different food processing plants.

V. Theory

Unit I

Design considerations of processing agricultural and food products.

Unit II

Design of machinery for drying, milling, separation, grinding, mixing, evaporation, condensation, membrane separation.

Unit III

Human factors in design, selection of materials of construction and standard component, design standards and testing standards. Plant design concepts and general design considerations: Plant location, location factors and their interaction with plant location, location theory models, and computer aided selection of the location.

Unit IV

Feasibility analysis and preparation of feasibility report; Plant size, factors affecting plant size and their interactions, estimation of break-even and economic plant size. Product and process design, process selection, process flow charts, computer aided development of flow charts.

Unit V

Hygienic design aspects and worker's safety, functional design of plant building and selection of building materials, estimation of capital investment, analysis of plant costs and profitability's, management techniques in plant design including applications of network analysis, preparation of project report and its appraisal.

VI. Practical

Detailed design and drawing of mechanical dryers, milling equipment, separators, evaporators, mixers and separators. Each individual student will be asked to select a food processing plant system and develop a plant design report which shall include product identification and selection, site selection, estimation of plant size, process and equipment selection, process flow-sheeting, plant layout, and its evaluation and profitability analysis.

VII. Learning outcome

Student's capability to deal with food processing equipment and plant, techno-economic feasibility analysis of the project as needed in food industries.

VIII. Lecture Schedule

S.No.	Toic	No. of Lectures
1.	Design considerations of processing agricultural and food products. Plant design concepts - situations giving rise to plant design problems.	2
2.	General design considerations, Food Processing Unit Operations, Design of machinery for drying, milling and grinding	2
3.	Design principles of separation, mixing machines	1
4.	Design of evaporation, condensation, membrane separation machines	2
5.	Human factors in design, selection of materials of construction and standard component	1
6.	Design standards and testing standards	1
7.	Plant location, location factors and their interaction with plant location, location theory models, and computer aided selection of the location.	2
8.	Pre Selection/ Pre feasibility stage, Analysis Stage: Market Analysis, Situational analysis related to market	1
9.	Technical analysis, Financial Analysis, Sensitivity and risk analysis, Feasibility cost estimates	1
10.	Break Even Analysis: Introduction, Break-Even Chart, Fixed Costs, Variable costs, Breakeven point calculation	1
11.	Product and process design, process selection, process flow charts, computer aided development of flow charts.	1
12.	Hygienic design aspects and worker's safety, functional design of plant building and selection of building materials	1
13.	Estimation of capital investment, analysis of plant costs and profitability's. Management techniques in plant design including applications of network analysis. Project report and its appraisal.	2
	Total	**18**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Detailed design and drawing of mechanical dryers	2
2.	Detailed design and drawing of milling equipment	2
3.	Design of separators	2
4.	Design of evaporators	2
5.	Design of mixers and separators	2
6.	Project report preparation by students. (Individual student will select a processing plant, develop design report include product identification, site selection, estimation of plant size, process and equipment, process flow-sheeting, plant layout, its evaluation and profitability analysis	5

I. Course Title : Seed Process Engineering

II. Course Code : PFE 512

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint and equip the students with seed processing along with the design features of the equipment used in their processing.

V. Theory

Unit I

Processing of different seeds and their engineering properties, principles and importance of seed processing.

Unit II

Performance characteristics of different unit operations such as precleaning, grading, conveying, elevating, drying, treating, blending, packaging and storage, seed processing machines like scalper, debreader, huller, velvet separator, spiral separator, cleaner-cum-grader, specific gravity separator, indent cylinder, disc separator, and colour sorter, seed treater, weighing and bagging machines, their operation and maintenance, installation and determination of their capacity, seed quality maintenance during processing, plant design and layout, economy and safety consideration in plant design.

Unit III

Seed drying principles and methods, theory of seed drying, introduction to different types of heated air dryers, significance of moisture equilibrium, method of maintaining safe seed moisture, thumb rule and its relevance.

Unit IV

Importance of scientific seed storage, types of storage structures to reduce temperature and humidity, management and operation/cleanliness of seed stores, packaging-principles, practices, materials and hermetic packaging, seed treatment methods and machines used, method of stacking and their impact, design features of medium and long term seed storage building.

VI. Practical

Study of various seed processing equipments such as pre-cleaners, scalpers, air screen cleaners, graders, spiral and pneumatic separators, seed treating equipment, bag closures, scale etc. and their performance evaluation, design and layout of seed processing plant and its economics, analysis of cost of operation and unit cost of processed product, effect of drying temperature and duration of seed germination and storability.

VII. Learning outcome

Student's capability to understand processing and storage requirement of seed maintaining its vigor and viability, suitable equipment for seed processing as per requirement of seed industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Processing of different seeds and their engineering properties.	1
2.	Principles and importance of seed processing.	1
3.	Performance characteristics of different unit operations such as pre-cleaning, grading, conveying, elevating, drying.	1
4.	Treating, blending, packaging and storage, seed processing machines like scalper, de-breeder, huller.	1
5.	Velvet separator, spiral separator, cleaner-cum-grader, specific gravity separator, indent cylinder, disc separator, and colour sorter.	1
6.	Seed treater, weighing and bagging machines, their operation and maintenance, installation and determination of their capacity.	1
7.	Seed quality maintenance during processing.	1
8.	Plant design and layout, economy and safety consideration in plant design.	2
9.	Seed drying principles and methods, theory of seed drying.	1
10.	Introduction to different types of heated air dryers.	1
11.	Significance of moisture equilibrium, method of maintaining safe seed moisture, thumb rule and its relevance.	1
12.	Importance of scientific seed storage, types of storage structures to reduce temperature and humidity.	1
13.	Management and operation/cleanliness of seed stores, packaging-principles, practices, materials and hermetic packaging.	1
14.	Seed treatment methods and machines used, method of stacking and their impact.	1
15.	Design features of medium and long term seed storage building.	1
	Total	**16**

IX. List of Practical

S.No.	Topic	No. of Practicals
1.	To study seed processing equipment such as pre-cleaners, scalpers and their performance evaluation.	2
2.	To study graders and their performance evaluation.	2
3.	To study air screen cleaners and their performance evaluation.	1
4.	To study spiral and pneumatic separators and their performance evaluation.	2
5.	To study seed treating equipment, bag closures, scale and their performance evaluation.	2
6.	To study design and layout of seed processing plant and its economics.	2
7.	To analyze the cost of operation and unit cost of processed product.	2
8.	To study the effect of drying temperature and duration of seed germination and storability.	2
	Total	**15**

I. Course Title : Agri-Project Planning and Management

II. Course Code : PFE 513

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the techniques of project development and evaluation along with different standards.

V. Theory

Unit I

Project development, market survey and time motion analysis.

Unit II

Selection of equipment, technology option, techno-economic feasibility and processing in production catchment.

Unit III

Product and process design, PERT, CPM, transport model, simplex, linear and dynamic programming, operation log book. Material balance and efficiency analysis, performance testing, performance indices, energy requirement and consumption. Marketing of agricultural products, market positioning.

Unit IV

BIS/FSSAI/ISO standards/ guidelines on best practices, equipment and their design and operation for handling, processing and storage of food/feed.

VI. Practical

Preparation of project and feasibility report. Salient features, design and layout of different food processing units; MSME, large processing unit. Record keeping related to production, finance and marketing. Techno-economic feasibility and SWOT analysis for Start-ups.

VII. Learning outcome

Student's capability to plan, scheduling of activities and manage a food related project as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Project development.	2
2.	Market survey and time motion analysis.	2
3.	Selection of equipment for agro project planning.	2
4.	Technology option.	2
5.	Techno-economic feasibility and processing in production catchment.	2
6.	Product and process design.	2
7.	PERT, CPM.	2
8.	Transport model, simplex, linear and dynamic programming, operation log book.	3
9.	Material balance and efficiency analysis.	3
10.	Performance testing, performance indices, energy requirement and consumption.	3
11.	Marketing of agricultural products, market positioning.	2
12.	BIS/FSSAI/ISO standards/ guidelines on best practices.	2
13.	Equipment and their design and operation for handling, processing and storage of food/feed.	3
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To study the preparation of project and feasibility report.	2
2.	To design salient features, design and layout of MSME.	2
3.	Design and layout of different food processing units: MSME, large processing unit.	2
4.	To study record keeping related to production.	2
5.	To study record keeping related to finance and marketing.	2
6.	To conduct experiment on agro project management and design techno-economic feasibility.	2
7.	To conduct SWOT analysis for different Start-ups.	3
	Total	**15**

I. Course Title : Farm Structures and Environmental Control

II. Course Code : PFE 514

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the different types of farm structures and techniques, to control atmospheric parameters and to create favourable environment in the agricultural structures.

V. Theory

Unit I

Farmstead planning, survey and data collection for information bank. Analysis of data, Lay outs. Cost estimation and appraisal. Project development; Time, motion and input analysis, flow charts and drawings andcase studies.

Unit II

Farm structures (farmstead, livestock, poultry, storage godowns, farm machinery storage, biogas, green house, net house etc), their design, constructional details and design of low cost structures. Heating, ventilating and exhaust systems, air distribution and air cleaning, combustion of fuels and equipment.

Unit III

Drying and dehumidification system, air-water contact operations and evaporation, process and product air conditioning, energy efficient environmental control practices. Rural electrification, households electric wiring, rural water supply and sanitation.

Unit IV

Instruments and measurements:Codes and standards.

VI. Practical

Calculation of heating and cooling load,design calculation of moisture condensation in agricultural buildings, study of moisture migration behaviour in storage bins, design aspect of green house, net house, septic tank, grain storage structures, cold storage.

VII. Learning outcome

Student's capability to design new farm structures and create suitable atmosphere within it.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Farmstead Planning, types and objectives. Planning principles and layout, design and construction of farmstead.	2
2.	Survey and data collection for information bank. Analysis of data, Lay outs. Cost estimation and appraisal.	2
3.	Project development: Time, motion and input analysis, flow charts and drawings and case studies.	2
4.	Farm structure, layout and structural design of shelters for dairy animals (cow, buffaloes, calves, bulls etc).	3
5.	Layout and structure design of modern poultry houses (cage type) along with other associated structures.	2

S.No.	Topic	No. of Lectures
6.	Familiarization with various rural grain storage structures. Layout, design and constructional detail of grain and feed storage structures like bins and silos.	3
7.	Layout and structural design of storage structures for farm inputs like farm machinery, seeds, weedicides, insecticides and fertilizers.	1
8.	Ventilation utility in farm buildings; principles of natural ventilation; psychometric processes; heat and mass balance equation for ventilation; ventilation rates for temperature moisture and odour control.	3
9.	Rural electrification, households electric wiring, rural water supply and sanitation.	2
10.	General design considerations, operational and maintenance of biogas plant.	2
11.	Drying and dehumidification system, air-water contact operations and evaporation, process and product air conditioning, energy efficient environmental control practices.	3
12.	Environmental indices like THI; wet bulb depression, daily range, degree days, effective temperature, black globe temperature; mean radiant temperature, etc. Basic solar-earth angles and sol-air temperature.	3
13.	Instruments and measurements; Codes and standards.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Planning and layout of a farmstead.	1
2.	Instruments for measurements of environmental parameters.	1
3.	Design of a farm fencing system.	1
4.	Study of moisture migration behaviour in storage bins.	1
5.	Design aspect of Septic tank.	1
6.	Design aspect of Net house.	1
7.	Design aspect of Grain storage structures.	1
8.	Design aspect of Green house.	1
9.	Design aspect of Cold storage.	1
10.	Design of a feed/fodder storage structures.	1
11.	Design of a biogas plant.	1
12.	Calculation of heating and cooling load.	1
13.	Design calculation of moisture condensation in agricultural buildings.	1
14.	Design of ventilation system for dairy and poultry house.	1
15.	Visit to Green/ Net house and cold storage.	2
	Total	**16**

I. Course Title : Dairy Product Processing

II. Course Code : PFE 515

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the various dairy products, processing methods and related equipment.

V. Theory

Unit I

Procurement, transportation and processing of market milk, cleaning and sanitization of dairy equipment. Special milks such as flavoured, sterilized, recombined and reconstituted toned and double toned.

Unit II

Condensed milk: Methods of manufacture and related equipment, evaluation of condensed and evaporated milk. Dried milk: Definition, methods of manufacture of skim and whole milk powder, instantiation, physiochemical properties, evaluation, defects in dried milk powder. Cream: Cream separation, neutralization, sterilization, pasteurization and cooling of cream, defects in cream, Butter: methods of manufacture, defects in butter.

Unit III

Ice cream: Methods of manufacture and related equipment, defects in ice cream, technology of softy manufacture. Cheese: Methods of manufacture, cheddar, Gouda, cottage and processed cheese, defects in cheese.

Unit IV

Indigenous milk products: Method of manufacture of *yoghurt, dahi, khoa, burfi, kalakand, gulabjamun, rosogolla, srikhand, chhana, paneer, ghee, lassi*etc.Probiotic milk product.

VI. Practical

Estimation and fat and SNF in milk.Operation of LTLT and HTST Pasteurization. Preparation of special milks.Cream separation and standardization of milk. Preparation and evaluation of table butter, ice-cream, cheese and indigenous milk product such as *khoa, chhana, paneer, ghee, rosogolla, gulabjamun, shrikhand, lassi, burfi,* etc. Visit to dairy plants.

VII. Learning outcome

Student's capability to mechanize processing operations in dairy industries for manufacturing of dairy products.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Collection and transportation of milk; Practices for collection of milk, preservation at farm, refrigeration, natural microbial inhibitors, lactoperoxidase system.	1
2.	Reception and treatment of milk: Reception, chilling, clarification and storage. General practices. Homogenization: pretreatments, theories, synchronization of homogenizer with operation of pasteurizer (HTST),	

S.No.	Topic	No. of Practicals
	effect of homogenization on physical properties of milk. Bactofugation: Theory and microbiology.	**3**
3.	Principles of thermal processing; kinetics of microbial destruction, thermal death curve, arrhenius equation, D value, Z value, F0 value, Q10 value. Factors affecting thermal destruction of micro organisms. Definition and description of processes; Pasteurization, thermisation, sterilization, UHT Processing.	**2**
4.	Cleaning and sanitization of dairy equipment	**1**
5.	Manufacture of special milks: flavoured, sterilized milk, recombined and reconstituted toned and doubled toned.	**2**
6.	Condensed milk, sweetened condensed milk and evaporated milk. Manufacture of evaporated milk, sweetened condensed milk and Recombined sweetened condensed milk and related equipment	**2**
7.	Physico chemical changes taking place during manufacture of condensed milk, Heat stability of milk and condensed milk, Physico chemical properties of condensed milk, Chemical defects in condensed milk, their causes and prevention.	**2**
8.	Dried Milks; Definition, grading and quality of raw milk for dried milks, Manufacture of skim milk powder (SMP), whole milk powders and heat classified powders,	**2**
9.	Physico chemical changes taking place during manufacture of dried milks, Physical properties of dried milks, Defects in dried milk during manufacture and storage, their causes and prevention.	**2**
10.	Cream: Definition, Efficiency of cream separation and factors affecting it; Neutralization, standardization, pasteurization and cooling of cream; Defects in cream	**2**
11.	Butter; Definition, Introduction to the butter making process; theory of churning, Technology of Butter manufacture, Batch and continuous methods, Defects in butter.	**2**
12.	History of ice cream industry, composition of ice cream, stabilizers and emulsifiers, properties and role in quality of ice cream Ice cream:	**1**
13.	Manufacturing, Ice cream plant components, Types of freezers, refrigeration control/ instrumentation, Technology of softy manufacture.	**2**
14.	Defects in ice cream, their causes and prevention	**1**
15.	Cheese; Manufacture of different varieties of cheese; Cheddar, Gouda, Cottage and processed cheese. Microbiological defects in cheese; their causes and prevention.	**3**
17.	Indigenous milk products: Product description, methods of manufacture of *yoghurt, dahi, khoa, burfi, kalakand, gulabjamun, rosogolla, srikhand, chhana, paneer, ghee, lassi*etc. Probiotic milk product.	**2**
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Estimation of fat and SNF in milk.	1
2.	Operation of LTLT and HTST Pasteurizer.	1
3.	Standardization of milk.	1
4.	Preparation of special milks.	1
5.	Cream separation: parts of separator and the process.	1
6.	Preparation of table butter using the power driven churn.	1
7.	Preparation of plain and fruit flavoured ice cream.	1

S.No.	Topic	No. of Practicals
8.	Preparation and analysis of *khoa* from cow and buffalo milk.	1
9.	Preparation and analysis of *chhana* from cow and buffalo milk.	1
10.	Preparation and analysis of *paneer* from cow and buffalo milk.	1
11.	Preparation and analysis of*lassi*from cow and buffalo milk.	1
12.	Preparation of *ghee* from cream and butter.	1
13.	Preparation of *rosogolla* and *gulabjamun*.	1
14.	Preparation of srikhand and burfi.	1
15.	Visit to dairy plant.	1
	Total	**15**

I. Course Title : Processing of Meat, Poultry and Fish

II. Course Code : PFE 516

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with processing of meat, fish and poultry and the design features of the equipment used for their processing.

V. Theory

Unit I

Meat: Genetic engineering of farm animals for better meat quality, automation for the modern slaughterhouse, hot-boning of meat, new spectroscopic techniques for online monitoring of meat quality, real-time PCR for the detection of pathogens in meat, new developments in decontaminating raw meat, automated meat processing, developments in chilling and freezing of meat, high pressure processing of meat, approaches for the development of functional meat products, new techniques for analyzing raw meat, modified atmosphere packaging, perspectives for the active packaging of meat products.

Unit II

Poultry: Breeding and quality of poultry, stunning and slaughter of poultry, processing and packaging of poultry, new techniques of preservation of poultry, production of turkeys, geese, ducks and game birds, microbial hazards in poultry production and processing, latest trends in measuring quality of poultry and poultry products, treatment and disposal of poultry processing waste.

Unit III

Fish and seafood: Fresh fish handling and chill storage, modified atmospheric packaging of seafoods, fish odours and flavours, assessment of freshness of fish and seafoods, traditional dried and salted fish products, proteolysed fish products, minced fish technology, retort pouch processing technology, irradiation and microwave in fish handling and processing, advanced freezing technology for fish storage, high pressure processing of seafoods, value addition of freshwater and aqua cultured fish products, application of enzymes in fish processing and quality control, toxins, pollutants and contaminants in fish and seafoods.

Unit IV

Milk: Physical, chemical and nutritional properties of milk components, improvements in the pasteurization and sterilization of milk. Flavour generation in dairy products, controlling texture of fermented dairy products, functional dairy products, on-line measurement of product quality in dairy processing, high pressure processing of milk products, novel separation technologies to produce dairy ingredients, new technologies to increase shelf-life of dairy products, genetic engineering of milk proteins, production and utilization of functional milk proteins, methods of improving nutritional quality of milk, significance of milk fat in dairy products, chromatographic, spectrometric, ultrasound and other techniques for analysis of milk lipids.

VI. Practical

Analysis of fresh and processed meat, fish, poultry and milk products, preservation of fresh meat and fish, processing and production of different products from fresh meat, fish and milk, shelflife studies on different meat, fish and milk products. Visit to processing plants.

VII. Learning outcome

Student's capability to process meat, fish and poultry and manufacture value added products as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Genetic engineering of farm animals for better meat quality.	1
2.	Developments in automation of the modern slaughterhouse, hot-boning process of meat, benefits of hot boning.	1
3.	New spectroscopic techniques for online monitoring of meat quality, Real-time PCR for the detection of pathogens in meat.	2
4.	Automated meat processing, developments in chilling and freezing of meat, High pressure processing of meat, approaches for the development of functional meat products.	3
5.	New techniques for analyzing raw meat, modified atmosphere and active packaging of meat products.	2
6.	Breeding and quality of poultry, Stunning and slaughter of poultry, Processing and packaging and new techniques of preservation of poultry.	2
7.	Production of turkeys, geese, ducks and game birds.	1
8.	Microbial hazards in poultry production and processing, treatment and disposal of poultry processing waste, Latest trends in measuring quality of poultry and poultry products. Treatment and disposal of poultry processing waste.	3

S No	Topic	No. of Lectures
9.	Fish and seafood: Fresh fish handling and chill storage, modified atmospheric packaging, Assessment of freshness of fish and seafoods, different traditional and proteolysed fish products, minced fish technology.	3
10.	Retort pouch processing technology, irradiation and microwave in fish processing, Advanced freezing technology for fish storage, Value addition of freshwater and aqua cultured fish products, application of enzymes in fish processing.	3
11.	Quality control: toxins, pollutants and contaminants in fish and sea foods.	1
12.	Physical, chemical and nutritional properties of milk components, improvements in the pasteurization and sterilization of milk.	2
13.	Flavour generation in dairy products, controlling of texture in fermented dairy products.	1
14.	Functional dairy products, on-line measurement of product quality, high pressure processing, Novel separation technologies to produce dairy ingredients, new technologies to increase shelf-life of dairy products.	2
15.	Genetic engineering of milk proteins, production and utilization of functional milk proteins.	1
16.	Methods of improving nutritional quality of milk, significance of milk fat in dairy products and different techniques for analysis of milk lipids.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Analysis of fresh and processed meat products	1
2.	Analysis of fresh and processed fish products	1
3.	Analysis of fresh and processed poultry products	1
4.	Analysis of fresh and processed milk products	1
5.	Preservation of fresh meat and fish	1
6.	Processing and production of different products from fresh meat	2
7.	Processing and production of different products from fresh fish	2
8.	Processing and production of different products from fresh poultry	2
9.	Processing and production of different products from fresh milk	1
10.	Shelf life studies on different meat, fish and milk products	2
11.	Visit to processing plants	1
	Total	**15**

I. Course Title : Design of Aquacultural Structures

II. Course Code : PFE 517

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with aquaculture structures and their design features.

V. Theory

Unit I

Inland fish farming and associated considerations.

Unit II

Fish physiology and micro-climatic considerations.Site selection for aquaculture structures.

Unit III

Design of dykes, sluice, channels etc. Aeration and feeding systems: Design of fish rearing structures, hatcheries, containers for live fish, fingerlings, fish seeds.

Unit IV

Aquaculture in recirculatory systems, oxygen and aeration, sterilization and disinfection. Recirculation of water:Reuse systems, water exchange, design of re-use systems, Inlet and outlet structures and water treatment plants.

VI. Practical

Aeration and feeding systems of fish ponds, fish farming structures, water treatment plants, containers for live fish.Design of re-use systems.Inlet and outlet structures.

VII. Learning outcome

Student's capability to design suitable aquaculture structures.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Inland fish farming.	1
2.	Considerations in site selection for designing inland fish farms.	2
3.	Preparatory work for designing inland fish farms: technological requirements, general technical, hydrological and meteorological data.	3
4.	Fish physiology.	2
5.	Micro-climatic considerations for fish farms.	1
6.	Design of dykes, sluice, channels etc.	3
7.	Aeration and feeding systems.	1
8.	Design of fish rearing structures.	1
9.	Hatcheries.	2
10.	Containers for live fish, fingerlings, fish seeds.	1
11.	Fish pond arrangements: Barrage Ponds, Contour Ponds, Paddy Ponds.	2
12.	Earth structures in fish farms: Dams and Dikes, Feeder Canals, Drainage canals, Drain Ditch, Internal Pond Drains, Borrow Pits and Internal Harvesting Pits.	3
13.	Aquaculture in recirculatory systems.	2
14.	Oxygen and aeration in fish farms. Sterilization and disinfection in fish farms.	2

S.No.	Topic	No. of Lectures
15.	Recirculation of water; Reuse systems, water exchange, design of re-use systems, Inlet and outlet structures.	3
16.	Water treatment plants in fish farms.	1
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of aeration systems of fish ponds.	1
2.	Study of feeding systems of fish ponds.	1
3.	Design of dykes in fish farming structures.	1
4.	Design of feeder canals in fish farming structures.	2
5.	Design of drainage canals in fish farming structures.	1
6.	Design of drain ditch in fish farming structures.	1
7.	Design of internal pond drains in fish farming structures.	1
8.	Design of borrow pits in fish farming structures.	1
9.	Design of internal harvesting pits in fish farming structures.	1
10.	Study of waste water management through aquaculture.	1
11.	Design of recirculatory ponds for waste water treatment in fish farms.	1
12.	Different types of containers for live fish.	1
13.	Design of re-use systems in fish farms.	1
14.	Different types of inlet and outlet structures in fish farms.	1
	Total	**15**

- FAO. 1983. *Inland Aquaculture Engineering*. ISBN 92-5-102168-6.

I. Course Title : Thermal Environmental Engineering for Agricultural Processing

II. Course Code : PFE 518

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint and equip the students with the concept of thermodynamic properties of air and its application in food processing.

V. Theory

Unit I

Requirements of temperature and moisture in food preservation, processing, storage, animal and plant production systems, human comfort etc.

Unit II

Thermodynamic properties of moist air, psychrometric chart, psychrometric processes and applications. Mass transfer and evaporation of water from free surfaces, theory of psychrometer, direct contact transfer processes between moist air and water-air washer, cooling tower, heating and cooling of moist air by extended surface coils, dehumidification using moisture absorbing materials. Solar irradiations on structures, calculation of heating and cooling loads in buildings/ storage structures.

Unit III

Design of air conditioning systems, air distribution and duct design, air flow pattern and control, equipment, components and controls.Instruments for measurement and control of temperature and moisture.

Unit IV

Thermal insulation materials for environmental control systems, applications of environmental control in green house, dairy industry, potato storage etc.

VI. Learning outcome

Student's capability to design environmental control systems related to different unit operation in food processing industry.

VII. Schedule of Lectures

S.No.	Topic	No. of Lectures
1.	Requirements of temperature and moisture in food preservation, processing, storage, animal and plant production systems, human comfort etc. Various thermal indices.	5
2.	To study the different temperature, moisture and relative humidity measuring instruments.	3
3.	Thermodynamic properties of moist air.	3
4.	Psychrometric chart, psychrometric processes and applications. Mass transfer and evaporation of water from free surfaces, theory of psychrometer.	5
5.	Direct contact transfer processes between moist air and water-air washer, cooling tower, heating and cooling of moist air by extended surface coils, dehumidification using moisture absorbing materials.	4
6.	Solar irradiations on structures, calculation of heating and cooling loads in buildings/ storage structures.	5
7.	Introduction to air conditioning systems and design considerations.	4
8.	air distribution and duct design, air flow pattern and control, equipment, components and controls. Instruments for measurement and control of temperature and moisture.	4
9.	Thermal insulation materials for environmental control systems. Comparative performance of these materials.	4
10.	Applications of environmental control in farm buildings, farmstead, green house, dairy industry, poultry shed, potato storage etc.	5
	Total	**42**

Course Title with Credit Load
Ph.D. in Processing and Food Engineering

Major Courses

Course Code	Course Title	Credit Hours
*PFE 601	Advances in Food Process Engineering	2+1
*PFE 602	Drying and Dehydration of Food Materials	2+1
PFE 603	Textural and Rheological Characteristics of Food Materials	2+1
PFE 604	Agricultural Waste and By-Products Utilization	2+1
PFE 605	Mathematical Modeling in Food Processing	3+0
PFE 606	Bioprocess Engineering	2+1
	Total	**13+5**

Minor Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
CSE 506	Digital Image Processing	2+1
CSE 507	Process Control System	2+1
REE 616	Renewable Energy for Industrial Application	2+1
ME 501	Mechatronics and Robotics in Agriculture	2+0
CE 501	Dimensional Analysis and Similitude	1+1
	Any other course (s) of other department other than course(s) from major can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*CPE-RPE	Research and Publication Ethics	1+1
STAT 502	Theory of Designs and Analysis of Experiments	1+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Course has been made compulsory by UGC for PhD students. Course code and its detailed course outline to be adopted in toto as recommended by UGC.

List of Other Essential Requirements

Course Code	Course Title	Credits
PFE 691	Seminar-I	0+1
PFE 692	Seminar-II	0+1
PFE 699	Thesis Research	0+75

Course Contents
Ph.D. in Processing and Food Engineering

I. Course Title : Advances in Food Process Engineering

II. Course Code : PFE 601

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the modern andlatest techniques offood engineering.

V. Theory

Unit I

Preservation of foods: Physical and chemical methods, microbiological aspects, thermo bacteriology, process calculation and selection. Thermal processing of canned foods: Introduction, commercial sterilization systems, thermal inactivation, kinetics of bacterial spores, heat transfer in canned foods, process calculations, numerical computer simulation of heat transfer, aseptic processing.

Unit II

Low temperature preservation; Cooling and cold storage. Hurdle technology: Principles and applications. Food irradiation: Advantages and applications, beneficial chemical and biological effects on foods, mechanisms of food irradiation, sources of food irradiation, criteria for judging the efficacy, dosimetry, radiation tolerance of foods, upper irradiation dose for foods, safety of irradiated foods. Microwave processing: Interaction with food materials, microwave equipment. Hydrostatic pressure treatment of food: Equipment, processing and effect on microorganisms. High pressure processing: Introduction, equipment and operation principles. Chemical and thermodynamic principles.Applications of HP to foods.Commercial high pressure equipment and applications. Membrane concentration of liquid foods: Principles, thermodynamics and osmotic pressure, mechanisms of membrane transport, membrane transport models.

Unit III

Application of heat energy and ultrasound; Effects of different environmental factors on microbial ultrasonic resistance, effects of treatment parameters on lethal effect of ultrasound, mechanism of action of inactivation of microorganisms and enzymes, cavitation. Electrical resistance heating of food: Heat generation. Ohmic heating and moderate electric field: Introduction, microbial death kinetics, electrolytic effects, applications, ohmic heater, heating models. Pulsed electric field preservation: Principles and application, microbial inactivation mechanism, determinant factors in PFE technology, influence on food ingredients, pulsed electric field treatment unit, modeling PFE microbial inactivation, alternative applications of PFE technology, decontamination of microorganisms by surface treatment.

Unit IV

Extrusion cooking: Rheology of extrudates, newtonian models of single-screw extruder performance, non-newtonian models of single-screw extruder performance, single-screw extruder leakage flows, extruder die and its interaction with extruder behaviour, screw power demand, non-isothermal screw operation, feed zone, behavior of more complex single-screw designs, multiple-screw extruders, partially filled screws, analysis of complex screws, heat transfer in extruders, extruder residence-time distributions, recent developments, methods, equipment, design criteria of extruders.

VI. Practical

Thermal processing of foods, sterilization, irradiation, membrane concentration, ultrasound, ohmic heating, pulsed electric field preservation, extrusion cooking, product quality determination. Visit of related food industries.

VII. Learning outcome

Student's capability to process and preserve food products using advance techniques as per requirement of food industries.

VIII. Lecture Schedule

S.No.	Toic	No. of Lectures
1.	Preservation of foods; Physical and chemical methods, microbiological aspects, thermo bacteriology, process calculation and selection.	3
2.	Thermal processing of canned foods: Introduction, commercial sterilization systems, thermal inactivation, kinetics of bacterial spores, heat transfer in canned foods, process calculations, Numerical computer simulation of heat transfer, aseptic processing.	4
3.	Low temperature preservation: Cooling, cold storage and CA storage.	3
4.	Hurdle technology; Principles and applications.	2
5.	Food irradiation: Advantages and applications, beneficial chemical and biological effects on foods, mechanisms of food irradiation, sources of food irradiation, criteria for judging the efficacy, dosimetry, radiation tolerance of foods, upper irradiation dose for foods, safety of irradiated foods.	2
6.	Microwave processing; Interaction with food materials, microwave equipment.	2
7.	Hydrostatic pressure treatment of food; Equipment, processing and effect on microorganisms. High pressure processing: Introduction, equipment and operation principles. Chemical and thermodynamic principles. Applications of HP to foods. Commercial high pressure equipment and applications.	2
8.	Membrane concentration of liquid foods; Principles, thermodynamics and osmotic pressure, mechanisms of membrane transport, membrane transport models.	2
9.	Application of heat energy and ultrasound; Effects of different environmental factors on microbial ultrasonic resistance, effects of treatment parameters on lethal effect of ultrasound, mechanism of action of inactivation of microorganisms and enzymes, cavitation	2
10.	Electrical resistance heating of food: Heat generation. Ohmic heating and moderate electric field: Introduction, microbial death kinetics, electrolytic effects, applications, ohmic heater, heating models.	2

S.No.	Topic	No. of Lectures
11.	Pulsed electric field preservation; Principles and application, microbial inactivation mechanism, determinant factors in PFE technology, influence on food ingredients, pulsed electric field treatment unit, modeling PFE microbial inactivation, alternative applications of PEF technology, decontamination of microorganisms by surface treatment.	2
12.	Extrusion cooking; Rheology of extrudates, Newtonian and non-Newtonian models of single-screw extruder performance, extruder leakage flows, extruder die and its interaction with extruder behaviour, screw power demand, non-isothermal screw operation, single-screw designs, multiple-screw extruders, partially filled screws, analysis of complex screws, heat transfer in extruders, extruder residence-time distributions, recent developments, design criteria of extruders.	4
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of thermal processing of foods and equipment, viz. pasteurization and sterilization and tutorials.	2
2.	Study of different irradiation processes and equipments.	1
3.	Study of different membrane separation processes and equipments.	1
4.	Study of different ultrasound processes and equipments	1
5.	Study of different ohmic heating method and equipments.	1
6.	Study of different pulsed electric field preservation processes and equipments.	1
7.	Study of different extrusion cooking method and equipments.	2
8.	Product quality determination	2
9.	Visit of various food industries.	3
10.	Development of experimental setup by students	1
	Total	**15**

I. Course Title : Drying and Dehydration of Food Materials

II. Course Code : PFE 602

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the latest technologies of dehydration of food products and the design features of different dryers.

V. Theory

Unit I

Importance of drying, principles of drying, moisture determination, equilibrium moisture content, determination of EMC, methods and isotherm models. Psychrometry; Psychrometric terms, construction and use of psychrometric charts.

Unit II

Air flow and resistance, principles and equipment for air movement and heating, drying methods and theory of drying, dryers, classification and other allied equipment, thin layer drying of cereal grains, deep bed and continuous flow drying, drying models.

Unit III

Heat requirements and thermal efficiency of drying system, aeration, tempering and dehydration, operation of dryers and their controls, selection of dryers, performance testing of grain dryers, drying characteristics of cereals, pulses and oilseeds, microwave drying, radio frequency drying and tunnel drying, principles and equipment.

Unit IV

Drying of liquid foods, spray drying, drum drying, freeze drying, foam mat drying, heat pump drying, refractance window drying, infrared drying osmotic dehydration. Principles, methods, construction and adjustments,selection of dryers, heat utilization factor and thermal efficiency.

VI. Practical

Experiments on batch type thin layer dryer, fluidized bed dryer, continuous flow mixing type dryer, continuous flow non mixing type dryer, sand medium dryer (conduction type drying), agricultural waste fired furnace dryer, spray dryer, drum dryer, foam mat drying and osmotic dehydration to evaluate the thermal efficiency and heat utilization factor.

VII. Learning outcome

Student's capability to develop dehydrated food products with higher retention of nutrients using different drying techniques and equipments.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Importance of drying, principles of drying, moisture content determination, equilibrium moisture content, determination of EMC.	2
2.	Basic concepts associated with drying – Intermolecular forces, Water activity, Molecular mobility, Glass transition temperature, Isotherm models – Langmuir, BET Isotherm	3
3.	Psychrometry; Psychrometric terms, construction and use of psychrometric charts.	3
4.	Air flow and resistance, principles and equipment for air movement and heating	3
5.	Theory of drying, Dryers, Classification and other allied equipment,	2
6.	Thin layer drying of cereal grains, deep bed and continuous flow drying, drying models.	3
7.	Heat requirements and thermal efficiency of drying system, aeration, tempering and dehydration.	3

S.No.	Topic	No. of Lectures
8.	Operation of dryers and their controls, selection of dryers, performance testing of grain dryers Drying characteristics of cereals, pulses and oilseeds,	3
9.	Microwave drying, radio frequency drying and tunnel drying, principles and equipment.	2
10.	Drying of liquid foods, spray drying, drum drying. Principles, methods, construction and adjustments.	2
11.	Freeze drying, foam mat drying, heat pump drying, refractance window drying, infrared drying, and osmotic dehydration. Principles, methods, construction and adjustments.	3
12.	Selection of dryers, heat utilization factor and thermal efficiency.	1
	Total	30

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Determination of moisture content with Oven method.	1
2.	Determination of moisture content (w.b.) with Universal/Digital moisture meter.	1
3.	Determination of moisture content (w b) with Infrared moisture meter.	1
4.	Determination of Equilibrium moisture content of grains.	1
5.	Drying of grains in a batch type thin layer dryer to evaluate the thermal efficiency and heat utilization factor.	1
6.	To evaluate the performance of fluidized bed dryer in terms of thermal efficiency and heat utilization factor.	1
7.	To draw a drying rate curve for wet grains in Satake test dryer i.e. Compartment type dryer.	1
8.	Drying of food materials in a solar assisted mechanical tray drying system.	1
9.	To dry grains in continuous flow mixing type dryer.	1
10.	To evaluate the performance of conduction type dryer.	1
11.	To determine the drying efficiency of agricultural waste fired furnace dryer.	1
12.	Drying of liquid food material in a spray dryer and evaluate its thermal efficiency and heat utilization factor.	1
13.	To evaluate the performance of a drum dryer.	1
14.	Experimentation on foam mat drying process.	1
15.	Experiment on osmotic dehydration of grapes.	1
	Total	**15**

I. Course Title : Textural and Rheological Characteristics of Food Materials

II. Course Code : PFE 603

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with advances in measurement of textural and rheological characteristics affecting the food quality.

V. Theory

Unit I

Rheological properties of foods; Food rheology, physical states of materials, classical ideal material, rheological models, elements in the models, electrical equivalence, maxwell model, Kelvin model and four element burger's model, stress-strain behavior. Elastic–plastic behavior, visco-elastic behavior, creep behavior, dynamic visco-elastic behavior, flow behavior of fluids, creep, stress relaxation.

Unit II

Viscometry; Capillary viscometry, casson model, flow rate equation, friction losses in pumping, turbulent flow, newtonian fluid, power law fluid, cone and plate viscometry, parallel plate viscometry, mixer viscometry. Flow through a converging die, cogswell's equations, gibson's equations, empirical method. Applications of stress and strain, shear modulus and shear loss modulus, storage compliance and loss compliance, comparison of moduli and compliances.

Unit III

Objective and subjective measurements of texture; Texture classification, relation of food texture with structure and rheology, principles and practices of objective or instrumental texture measurements, fundamental rheological tests, physiological aspects, mechanical aspects and viscosity measurements and relationship between fundamental tests and sensory evaluation. Imitative and empirical measurements of texture; Tenderometer, brabenderfarinograph, firmness meter, texture profile method, dynamic methods for evaluation of food texture, dimensional analysis of food texture, firmness and hardness measurement.

Unit IV

Mathematical models and their application along with pipe line design and pump selection for non-newtonian fluids. Recent advances in textural, rheological and viscoelastic characteristics of foods and their associated mathematical models.

VI. Practical

Determination of viscosity of liquid foods, gumminess, chewiness, springiness and hardness of various fruits, vegetables and processed foods using texture profile analysis.Determination of force-distance relationship.Sensory evaluation/ subjective measurement and correlation between subjective and objective measurements of foods.

VII. Learning outcome

Student's capability to determine textural and rheological properties of food materials and their application in control of food processing operations.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Objective and subjective measurements of texture: Texture classification, relation of food texture with structure and rheology.	3
2.	Principles of Objective Texture Measurement.	2
3.	Practices of objective or instrumental texture measurements.	2
4.	Fundamental rheological tests, physiological aspects, mechanical aspects and viscosity measurements and relationship between fundamental tests and sensory evaluation.	2
5.	Imitative and empirical measurements of texture: Tenderometer, brabender farinograph, firmness meter, texture profile method, dynamic methods for evaluation of food texture, dimensional analysis of food texture, firmness and hardness measurement.	2
6.	Rheological properties of foods: Food rheology, physical states of materials, classical ideal material.	2
7.	Elastic–plastic behavior, visco-elastic behavior, creep behavior, dynamic visco-elastic behavior, flow behavior of fluids, creep, stress relaxation.	2
8.	Rheological models, elements in the models, electrical equivalence, maxwell model, Kelvin model and four element burger's model, stress-strain behavior.	2
9.	Viscometry; Capillary viscometry, casson model, flow rate equation, friction losses in pumping, turbulent flow, newtonian fluid, power law fluid, cone and plate viscometry, parallel plate viscometry, mixer viscometry.	2
10.	Flow through a converging die, cogswell's equations, gibson's equations, and empirical method.	2
11.	Applications of stress and strain, shear modulus and shear loss modulus, storage compliance and loss compliance, comparison of moduli and compliances.	2
12.	Correlation between physical measurements and sensory assessments of texture and viscosity.	2
13.	Mathematical models and their application along with pipe line design and pump selection for non-newtonian fluids.	2
14.	Recent advances in textural, rheological and viscoelastic characteristics of foods and their associated mathematical models.	2
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Introduction to Texture analyzer	1
2.	Study of different attachments of texture analyzer used in texture analysis of various agricultural commodities.	1
3.	To study the texture profile curve for food material	1
4.	To study the textural profile kinetics of various fruits	2
5.	To study the textural profile kinetics of various vegetables	2
6.	To study the textural profile kinetics of various processed foods	2
7.	To study the textural properties of liquid food	1
8.	To study the Compression, puncture, elongation and bending tests for food materials	3
9.	Introduction to Rapid Visco analyser	2
10.	Subjective measurement and correlation between subjective and objective measurements of foods.	1
	Total	**16**

I. Course Title : Agricultural Waste and By-Products Utilization

II. Course Code : PFE 604

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the techniques of utilization of agricultural waste and by-products and also about development of value added products from wastes.

V. Theory

Unit I

Conversion processes: Thermo-chemical conversions, densification, combustion and gasification, extraction, biological conversions, anaerobic digestion, biochemical digestion process, digestion systems, energy from anaerobic digestion, cellulose degradation, fermentation process. Agricultural wastes as paper, boards and fuel.

Unit II

Briquetting: Briquetted fuel from husk, hull and other wastes selection, design of briquetting machines. Utilization of shell, stem and stalk:Production of activated carbon. By-products of agro-industries:Rice mill, oil mill, cattle feed mill, valuable constituents and composition. Utilization of rice husk: Production of silica and cement from rice husk.Stabilization and storage of rice bran, extraction of rice bran oil.

Unit III

By-products of oil refining: Fatty acids/soap stock, wax and gum, characteristics and utilization. Rice germ and broken rice. Production of starch and infant food, industrial uses of starch. By-products of oil milling:Oil cake and defatted oil cake, cattle feed and industrial uses. Utilization of starch and other industrial wastes: Microcrystalline cellulose, production of ethanol, wastes of tapioca starch industries,thippi-utilization as fuel, extraction of starch by hydrolysis, utilization of starch for food, adhesives and feed purposes.

Unit IV

By-products of sugar industry: Sugarcane tops, bagasse, molasses and pressmud, utilization as animal feed. By-products of fruits and vegetables based agro-industries: Mango seed kernel and pineapple waste.

VI. Practical

Exercises on stepped grate and fixed grate rice husk furnaces, waste fired furnace, briquette machine, production of alcohol from waste materials, production and testing of paperboards and particleboards from agricultural wastes.

VII. Learning outcome

Student's capability to develop processes for effective utilization of wastes generated through milling and processing of food materials.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to by-products and waste generation in agricultural production and processing system. Generation of agricultural and agro industrial by-products/ wastes, their properties, on site handling, storage and processing.	2
2.	Thermo-chemical conversions, biological conversions, anaerobic digestion, biochemical digestion process, digestion systems, energy from anaerobic digestion, cellulose degradation, fermentation process.	3
3.	Combustion and its types, theory, basic requirements for combustion, extraction.	2
4.	Gasification process, gasifiers- types and their functioning, factors affecting gasification process.	2
5.	Densification process, methods to densify mateials, factors to be considered.	1
6.	Utilization of wastes for paper production, production of particle board.	1
7.	Briquetting process, methods, design of machinery used for briquette formation, basic requirements, factors affecting briquetting from husk, hull and other wastes selection.	2
8.	Utilization of rice husk: Production of silica and cement from rice husk, Stabilization and storage of rice bran, extraction of rice bran oil.	2
9.	Utilization of shell, stem and stalk: Production of activated carbon.	1
10.	By-products from rice milling operations, rice husk, rice bran, utilization in different materials.	3
11.	Waste from oil mill, cattle feed mill, their valuable constituents and composition, utilization.	2
12.	By-products of oil refining: Fatty acids/soap stock, wax and gum, characteristics and utilization.	1
13.	Rice germ and broken rice. Production of starch and infant food, industrial uses of starch.	1
14.	By-products of oil milling: Oil cake and defatted oil cake, cattle feed and industrial uses.	1
15.	Utilization of starch and other industrial wastes: Microcrystalline cellulose, production of ethanol, wastes of tapioca starch industries.	2
16.	Thippi-utilization as fuel, extraction of starch by hydrolysis, utilization of starch for food, adhesives and feed purposes.	2
17.	By-products of sugar industry: Sugarcane tops, bagasse, molasses and press mud, utilization as animal feed.	2
18.	By-products of fruits and vegetables based agro-industries: Mango seed kernel and pineapple waste.	2
	Total	32

IX. List of Practicals

S.No.	Experiment	No. of Practicals
1.	To Determine of moisture content of biomass.	1
2.	To Determine of ash content of biomass.	1
3.	To determine Proximate analysis of biomass/waste/residue.	2
4.	Exercises on stepped grate and fixed grate rice husk furnaces.	2
5.	Exercises on waste fired furnaces.	1
6.	Exercises on combustion calculation.	1
7.	To study the briquetting machine.	1

S.No.	Topic	No. of Lectures
8.	To study the various quality parameters of briquettes.	1
9.	To study the production of alcohol from waste materials.	1
10.	To study the production of paper boards and particle boards from agricultural wastes.	2
11.	To determine the properties of paper boards and particle boards from agricultural wastes.	2
	Total	**15**

I. Course Title : Mathematical Modeling in Food Processing

II. Course Code : PFE 605

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint and equip the students with the mathematical modeling techniques and their applications in food processing

V. Theory

Unit I

An overview of the modeling process.Introduction to mathematical, correlative and explanatory models.Formulation, idealization and simplification of the problems.

Unit II

Probability models, series and linear mathematical approximation, dynamic and interacting dynamic processes.

Unit III

Applications of mathematical modelling techniques to food processing operations like parboiling, convective drying, pasteurization, dehydration, shelf-life prediction, fermentaiton, aseptic processing, moisture diffusion, deep fat drying, microwave processing, infrared heating and ohmic heating.

Unit IV

Stochastic finite element analysis of thermal food processes. Neural networks approach to modelling food processing operations.

VI. Learning outcome

Student's capability to develop models for food processing operations for prediction and control of operations.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	An overview of the modeling process.	2
2.	Introduction to mathematical, correlative and explanatory models. Formulation, idealization and simplification of the problems.	3
3.	Probability models, series and linear mathematical approximation	3
4.	Dynamic Mathematical Model, Analysis of Dynamic Mathematical Models, dynamic and interacting dynamic processes.	3
5.	Basic Concepts of Systems Analysis and Simulation.	2
6.	Common Heat and Mass Transfer Models Dimensional Analysis.	3
7.	Model-based techniques in food processing.	2
8.	Applications of mathematical modelling techniques to parboiling of rice, convective drying/ dehydration, deep fat drying etc.	4
9.	Applications of mathematical modelling techniques to pasteurization of milk and juices.	4
10.	Applications of mathematical modelling techniques to fermentation, aseptic processing, moisture diffusion.	4
11.	Applications of mathematical modelling techniques in shelf-life prediction of agricultural commodities.	3
12.	Applications of mathematical modelling techniques to microwave heating, infrared heating and ohmic heating.	3
13.	Stochastic finite element analysis of thermal food processes.	3
14.	Probability models, series and linear mathematical approximation	3
15.	Neural networks approach to modelling food processing operations.	3
	Total	**45**

I. Course Title : Bioprocess Engineering

II. Course Code : PFE 606

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip the students with the basic principles of biochemical process engineering.

V. Theory

Unit I

Applications of engineering principles: Mass and energy balance, fluid flow principles, Unit operations of process engineering.

Unit II

Fundamentals of growth kinetics, maintenance energy and yield concepts, principles of media sterilization, media formulations of industrial fermentation.

Unit III

Aerobic and agitated rheology of fermentative fluids, design and scale-up of bioreactors, enzyme reactors.

Unit IV

Principles of recovery of fermented products in bio-processing, instrumentation, transport phenomenon.

VI. Practical

Kinetics of one substitute reactions, kinetics of growth in batch cultures, design consideration for bioreactors, media preparation and sterilization, microprocessor based monitoring of bioprocess parameters.

VII. Learning outcome

Student's capability to calculate the mass and energy balances in ant process operations, understanding growth kinetics and design bioreactors as per requirement of food industries.

VIII. Lectures Schedule

S.No.	Topic	No. of Lectures
1.	Basic engineering principles and their applications. Use of units and dimensions.	3
2.	Mass balance: steady and unsteady. Problem solving involving blending, separation, drying, growth, recycling etc.	3
3.	Energy balance in food processing operations. Use of steam tables in calculation of heat requirements etc.	3
4.	Fluid flow principles: Static and dynamic. Concept of viscosity. Types of flow. Flow through pipes. Mass and energy balance in fluid flow. Calculation of pressure drop in pipes.	4
5.	Fundamentals of growth kinetics, maintenance energy and yield concepts.	3
6.	Principles of media sterilization, media formulations of industrial fermentation.	3
7.	Aerobic and agitated rheology of fermentative fluids.	3
8.	Design and scale-up of bioreactors, enzyme reactors.	3
9.	Principles of recovery of fermented products in bio-processing, instrumentation, transport phenomenon.	5
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To study the instruments used for measurement of temperature, relative humidity, flow rate, pressure, wind velocity, solar radiation etc.	1
2.	Use of units, dimensions and basic mathematical applications.	1
3.	To judge the students ability for solving mass balance problems.	2
4.	To judge the students ability for solving Energy balance problems.	2
5.	To study the kinetics of one substitute reactions.	1

S.No.	Topic	No. of Practicals
6.	To assess the kinetics of growth in batch cultures.	1
7.	To study the order of reactions involving single/multiple reactants/products.	1
8.	To study the various thermal and structural parameters affecting the design of bioreactors.	1
9.	To assess the student's ability for design of bioreactors by solving related numerical problems.	2
10.	To prepare various media cultures and assess their effectiveness with time.	1
11.	To study the mechanism of sterilization of cultures.	1
12.	To study the various electronic gadgets for continuous monitoring of bioprocess parameters.	1
	Total	**15**

Agricultural Engineering
– Irrigation and Drainage Engineering

Preamble

(Irrigation and Drainage Engineering)

Course curricula and course outlines in Irrigation and Drainage Engineering are designed in view of the fact that courses are offered by students from disciplines of faculties of Soil Science, Agronomy and Agricultural Meteorology.

At the post graduate level it becomes more important where they have not only to learn the recent advances in their subjects but have also to be trained in the modern and latest techniques in their disciplines so that they can participate and contribute in the development and advancement in their related fields. Further, the shrinking job opportunities in the National Agricultural Research System (ICAR/SAUs) have put additional pressure on our education system to prepare students in tune with the demands of the private sector.

All courses are designed to cover all basic topics and have been designed by taking into consideration demands of private sector harnessing commercial aspects, modern research tools and their applications, supplementary skills required, and enhancing the global competitiveness and employability of students. The emphasis has been given on precision irrigation and modeling management and accordingly new courses “Water and nutrient management under protected cultivation, Waste water management and utilization in agriculture, Sensing and automation in irrigation systems, Climate change and water resources, Multi criteria decision making system” are framed in view of the recent developments in the subject.

The courses have been revised, updated and restructured in view of current developments and emerging trends in Irrigation and Drainage Engineering. The revised courses cover the areas: Design of farm drainage systems, Command area management, Design of surface irrigation systems, Design of drip and sprinkler irrigation systems, Ground water engineering, Remote sensing and GIS for land and water resource management, Water conveyance and distribution, Minor irrigation, Design of pumps for irrigation and drainage, Water resources systems engineering, Irrigation economics, Planning and management, Watershed management and modeling, Flow through porous media, Dryland water management technologies, Recent developments in irrigation engineering, Advances in drainage engineering, Hydro-Mechanics and ground water modeling, Soil-Water-Plant-Atmospheric modeling, Plant growth modeling and simulation, Applied watershed hydrology, Reservoir operation and river basin modeling and Modeling soil erosion processes and sedimentation.

The course content and syllabus upgraded with more of practical orientation and as per ARS Syllabus.

The ICAR recommendations for PG courses have been taken into consideration in framing these courses. It is hoped that these will prove very useful to the future students.

Course Title with Credit Load
M.Tech. in Irrigation and Drainage Engineering

Major Courses (Requirement: 20 Credits)

Course Code	Course Title	Credits
IDE 501	Design of Surface Irrigation Systems	1+1
*IDE 502	Design of Farm Drainage Systems	2+1
IDE 503	Command Area Management	2+1
IDE 504	Water and Nutrient Management Under Protected Cultivation	2+1
*IDE 505	Design of Drip and Sprinkler Irrigation Systems	2+1
*IDE 506	Ground Water Engineering	2+1
SWCE 507/IDE 507	Remote Sensing and GIS for Land and Water Resource Management	2+1
IDE 508	Waste Water Management and Utilization in Agriculture	2+1
IDE 509	Water Conveyance and Distribution	2+1
IDE 510	Minor Irrigation	2+1
IDE 511	Design of Pumps for Irrigation and Drainage	2+0
IDE 512	Crop Environmental Engineering	2+0
IDE 513	Water Resources Systems Engineering	2+1
IDE 514	Irrigation Economics, Planning and Management	2+0
IDE 515	Sensing and Automation in Irrigation Systems	3+0
	Total	30+11

*Compulsory course

Minor Courses (Requirement: 08 Credits)

Course Code	Course Title	Credits
SWCE 505	Watershed Management and Modeling	2+1
SWCE 506	Flow Through Porous Media	2+0
SWCE 508	Climate Change and Water Resources	3+0
SWCE 510	Dryland Water Management Technologies	2+0
FMPE 517	Machinery for Precision Agriculture	2+1
REE 513	Energy, Ecology and Environment	3+0
CE 501	Dimensional Analysis and Similitude	2+0
CSE 501	Big Data Analytics	2+0
CSE 502	Artificial Intelligence	2+0
CSE 504	Soft Computing Techniques in Engineering	2+1

Course Code	Course Title	Credits
MATH 501	Finite Element Methods	2+0
MATH 502	Numerical Methods for Engineers	2+0
ME 501	Mechatronics and Robotics in Agriculture	2+0
	Any other course(s) of other department can be taken as per recommendationsof the student’s advisory committee.	

Supporting Courses (Requirement: 06 Credits)

Course Code	Course Title	Credits
*STAT 501	Statistical Methods for Research Works	2+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student’s advisory committee.	

*Compulsory Course

Common Courses (Requirement: 05 Credits)

Course Code	Course Title	Credits
*PGS 501	Library and Information Services	1+0
*PGS 502	Technical Writing and Communication Skills	1+0
*PGS 503	Intellectual Property and its management in Agriculture	1+0
*PGS 504	Basic Concepts in Laboratory Techniques	1+0
*PGS 505	Agricultural Research, Research Ethics and Rural Development Programmes	1+0

*Detailed course outline to be developed by designated BSMA

List of Other Essential Requirements

Course Code	Course Title	Credits
IDE 591	Seminar	0+1
IDE 599	Thesis Research	0+30

Course Contents
M.Tech. in Irrigation and Drainage Engineering

I. Course Title : Design of Surface Irrigation Systems

II. Course Code : IDE 501

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint students for design and evaluation of various surface irrigation methods, design optimum layout, conveyance network for efficient use of water in surface irrigation system.

V. Theory

Unit I

Climate and irrigation water requirement. Irrigation principles, losses, conveyance, distribution, application and water budgeting. Estimation techniques of effective rainfall. Irrigation softwares: CROPWAT, AQUACROP.

Unit II

Farm irrigation systems. Irrigation efficiencies. Economic feasibility. Irrigation water quality and salinity management techniques. Design of water conveyance, control and distribution systems.

Unit III

Hydraulics: Design and operation of border, check basin, furrow, sprinkler and trickle irrigation systems. Flow dynamics, drop size distribution and spray losses in sprinklers. Cablegation, surge and bubbler irrigation. Automation of irrigation system.

Unit IV

Basic water management concepts and objectives. Alternative irrigation scheduling techniques. Integrated approach to irrigation water management.

VI. Practical

Design and evaluation of border, furrow, check basin, sprinkler and micro-irrigation. Computation of frictional losses. Design of underground water conveyance systems. Economics of irrigation methods. Visit to mechanized farms.

VII. Learning outcome

The students will be able to plan and design various surface irrigation systems and irrigation scheduling techniques for efficient use of water. They will also be exposed to irrigation softwares used for design purpose.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Climate and irrigation water requirement	1
2.	Irrigation principles, losses, conveyance, distribution, application and water budgeting	2

S.No.	Topic	No. of Lectures
3.	Estimation techniques of effective rainfall	2
4.	Irrigation softwares; CROPWAT, AQUACROP	2
5.	Farm irrigation systems. Irrigation efficiencies, Economic feasibility	2
6.	Irrigation water quality and salinity management techniques	2
7.	Design of water conveyance, control and distribution systems	2
8.	Hydraulics; Design and operation of border, check basin and furrow irrigation systems.	5
9.	Hydraulics: Design and operation of sprinkler and trickle irrigation systems	4
10.	Flow dynamics, drop size distribution and spray losses in sprinklers	2
11.	Cablegation, surge and bubbler irrigation	3
12.	Automation of irrigation system	2
13.	Basic water management concepts and objectives	2
14.	Alternative irrigation scheduling techniques	1
15.	Integrated approach to irrigation water management	2
	Total	**34**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Estimation of different techniques of effective rainfall	1
2.	Design of irrigation methods using irrigation software's: CROPWAT, AQUACROP	3
3.	Design of water conveyance, control and distribution systems.	1
4.	Design and evaluation of border irrigation method	1
5.	Design and evaluation of furrow irrigation method	1
6.	Design and evaluation of check basin method	1
7.	Design and evaluation of sprinkler irrigation method	1
8.	Design and evaluation of trickle irrigation method	1
9.	Study of automation of irrigation system	1
10.	Design of underground water conveyance systems	1
11.	Study of economics of irrigation methods	2
12.	Visit to mechanized farms	1
	Total	**15**

I. Course Title : Design of Farm Drainage Systems

II. Course Code : IDE 502

III. Credit Hours : 2+1

IV. Aim of the course

To provide in depth knowledge of water logging and salt affected areas, surface and sub-surface drainage systems, design and reclamation of salt affected waterlogged areas.

V. Theory

Unit I

Salt affected waterlogged areas in India. Water quality criteria and brackish water use for agriculture. Drainage requirements and crop growth under salt affected waterlogged soil.

Unit II

Concept of critical water table depth for waterlogged soil and crop growth. Drainage investigations and drainage characteristics of various soils. Methods of drainage system and drainage coefficient.

Unit III

Theories and applications of surface and subsurface drainage. Planning, design and installation of surface and subsurface drainage systems for waterlogged and saline soils. Theories and design of vertical drainage, horizontal subsurface drainage and multiple well point system. Drainage materials.

Unit IV

Steady and unsteady state drainage equations for layered and non-layered soils. Principle and applications of Hooghoudt, Kirkham, Earnst, Glover Dumm, Kraijenhoff-van-de-leur equations. Drainage for salinity control.

Unit V

Salt balance, leaching requirement and management practices under drained conditions. Disposal of drainage effluents. Case study for reclamation of salt affected waterlogged areas.

VI. Practical

Measurement of in-situ hydraulic conductivity. Estimation of drainage coefficient and leaching requirements. Delineation of waterlogged areas through isobar, isobath and topographic maps. Design of surface and subsurface drainage systems. Design of filter and envelop materials.

VII. Learning outcome

The students will able to develop surface as well as subsurface drainage network in the agriculture field, install and laying of the drainage pipe with fitting of all accessories at their place and derive equation for different flow in drainage system and their approaches.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Waterlogging, causes of waterlogging, salt built up in waterlogged soil, solute transport in salt affected soil. Recent salt affected areas in different states and country as whole	2

S.No.	Topic	No. of Lectures
2.	Technology and approach for reclamation of salt affect waterlogged areas	2
3.	Drainage requirement and crop growth under salt affected waterlogged soil. Drainage water/ brackish water quality and it's criteria for use in agriculture	2
4.	Concept of critical water table depth for waterlogged soil and crop growth	1
5.	Drainage investigations and drainage characteristics of various soils.	2
6.	Methods of drainage system: surface, sub surface, well drainage and bio-drainage and drainage coefficient	1
7.	Theories and applications of surface and sub surface drainage	3
8.	Planning, design and installation of surface and subsurface drainage systems for waterlogged and saline soils	3
9.	Theories of vertical and horizontal subsurface drainage systems	2
10.	Theory, design and application of multiple well point system	1
11.	Drainage materials. Design of filter and envelop for drainage system with different materials	2
12.	Steady state drainage equations for layered and non layer soils	2
13.	Unsteady state drainage equations for layered and non layer soils	3
14.	Principle and application, Hooghoudt and Khirkham equation	3
15.	Principles and application of Ernst, Glover Dumm, Karigenth off–van-de-law eaquation	2
16.	Drainage for salinity control, salt balance equation, leaching requirement and management practices under drained conditions, Disposal of drainage effluents	3
17.	Case study: Integrated planning, design and installation of drainage system for reclamation of salt affected waterlogged areas	2
	Total	**36**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Delineation of waterlogged areas through isobar, isobath and topographic maps	3
2.	Measurement of in-situ hydraulic conductivity	1
3.	Estimation of drainage coefficient from rainfall data	2
4.	Determination of leaching requirements for reclamation of salt affected land	2
5.	Design of surface drainage systems	2
6.	Design of subsurface drainage systems	2
7.	Design of filter and envelop materials	2
8.	Visit to drainage installation site/Institute	2
	Total	**16**

I. Course Title : Command Area Management

II. Course Code : IDE 503

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the concept of command area management, assessment and appraisal of water availability in command areas, water management problems in command areas and their possible remedies including socio-economic aspects of irrigation command.

V. Theory

Unit I

Concept of command area development as an integrated approach. Command area project formulation, major, medium and minor projects. Command areas in India, command area activities and their prioritization. Source of budget for CAD works. Structure of command area development, organization, role and responsibilities of CADA.

Unit II

Laser based land grading survey and levelling in command areas. Design of lined and unlined canals. Diversion head works and canal head regulators, cross drainage works, canal falls, canal breaches. Design of On Farm Water Distribution Network, operation and maintenance of canal.

Unit III

Assessment and appraisal of water availability in command areas. Water management problems in command areas and their possible remedies. Duty of water, its determination and factors affecting it. Methods of improving duty of canal water. Feasibility of drip irrigation in irrigated command areas.

Unit IV

Single and multi-objective command area planning for the better management and allocation of irrigation water. Conjunctive use of canal water and groundwater. Real time canal irrigation scheduling.

Unit IV

Canal performance indices. Diagnostic analysis and perform appraisal of command area projects. Water user's association–functions, problems encountered during formation of WUA and strategy and overcome the problems. Participatory irrigation management efforts and strategy for preparing PIM. Socio economic aspects of irrigation management in command areas.

VI. Practical

Study of canal, tank and tube well in a command area. Study of design and operational parameters of a command area. Study of water balance in a command. Study the impact of command area project on crop yield and environment. Conflict resolution through PRA exercise. Diagnostic analysis of the problems of command area through PRA and field observations. Analysis of equity in water distribution. Considerations for preparation of roistering schedules. Study of the functioning of irrigation cooperatives/water user's associations. Preparation of command area development plan.

VII. Learning outcome

The students will be able to understand the concept of command area and its management, to analyze problem diagnostics and remedies of command area and able to understand the performance evaluation procedure of command area.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Concept of command area development as an integrated approach	1
2.	Command area project formulation, major, medium and minor projects	2
3.	Command areas in India	1
4.	Command area activities and their prioritization	1
5.	Source of budget for CAD works	1
6.	Structure of command area development	1
7.	Organization, role and responsibilities of CADA	1
8.	Laser based land grading survey and levelling in command areas	1
9.	Design of lined and unlined canals	2
10.	Diversion head works and canal head regulators, cross drainage works, canal falls, canal breaches	2
11.	Design of On Farm Water Distribution	1
12.	Network, operation and maintenance of canal	1
13.	Assessment and appraisal of water availability in command areas	1
14.	Water management problems in command areas and their possible remedies	2
15.	Duty of water, its determination and factors affecting it. Methods of improving duty of canal water	2
16.	Feasibility of drip irrigation in irrigated command areas	1
17.	Single and multi-objective command area planning for the better management and allocation of irrigation water	1
18.	Conjunctive use of canal water and groundwater	1
19.	Real time canal irrigation scheduling	1
20.	Canal performance indices	1
21.	Diagnostic analysis and perform appraisal of command area projects	1
22.	Water user's association–functions, problems encountered during formation of WUA and strategy and overcome the problems	2
23.	Participatory irrigation management efforts and strategy for preparing PIM	2
24.	Socio economic aspects of irrigation management in command areas	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of canal, tank and tube well in a command area	1
2.	Study of design and operational parameters of a command area	2
3.	Study of water balance in a command	1
4.	Study the impact of command area project on crop yield and environment	2
5.	Study about conflict resolution through PRA exercise	2
6.	Diagnostic analysis of the problems of command area through PRA and field observations	2
7.	Analysis of equity in water distribution	1

S.No.	Topic	No. of Lectures
8.	Considerations for preparation of roistering schedules	1
9.	Study of the functioning of irrigation cooperatives/water user's associations	2
10.	Preparation of command area development plan	2
	Total	**16**

I. Course Title : Water and Nutrient Management under Protected Cultivation

II. Course Code : IDE 504

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the concept of soilless culture in agriculture, water and nutrient management, water potential in soilless media and automation for climate control under protected cultivation.

V. Theory

Unit I

Significance of soilless culture in agriculture. Functions of the root system. Response of root growth to local nutrient concentrations. Interactions between environmental conditions and form of N nutrition.

Unit II

Roots as source and sink for organic compounds and plant hormones. Physical and chemical properties of soilless media.

Unit III

Water content and water potential in soilless media. Water movement in soilless media. Uptake of water by plants in soilless media and water availability.

Unit IV

Production technology for vegetables under protected conditions in soil and soilless media. Automation for climate control in protected structures. Thermal modeling of greenhouse environment for protected cultivation.

VI. Practical

Filter types and its selection criteria. Design and installation of drip irrigation system for vegetables and orchards. Irrigation and fertigation scheduling for vegetables and horticultural. Study of different types of sensors, relay and control mechanism for controlled irrigation and fertigation. Design of automated system for irrigation and fertigation. Design and installation of different protected structures as per the guidelines of NHM. Design and fabrication of soilless medium for crop/flower production. Economical evaluation of automated irrigation system and soilless medium for crop/flower production.

VII. Learning outcome

The students will able to understand the concept of soilless farming including nutrient management, water content and water potential in soilless media along with automation for climate control under protected cultivation.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Significance of soilless culture in agriculture	1
2.	Functions of the root systems	1
3.	Response of root growth to local nutrient concentrations	2
4.	Interactions between environmental conditions and form of N nutrition	2
5.	Roots as source and sink for organic compounds and plant hormones	2
6.	Physical and chemical properties of soilless media	2
7.	Water content and water potential in soilless media	2
8.	Water movement in soilless media: water retained, drainage, plant use, etc	2
9.	Uptake of water by plants in soilless media and water availability	3
10.	Production technology for vegetables under protected conditions in soil and soilless media	4
11.	Automation for climate control in protected structures	3
12.	Thermal modeling of greenhouse environment using multiple regressions	2
13.	Thermal modeling of greenhouse environment using energy and mass balance approaches	4
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To study the filter types and their selection criteria	1
2.	Design and installation of drip irrigation system for vegetables	1
3.	Design and installation of drip irrigation system for orchards	1
4.	Irrigation and fertigation scheduling for vegetables and horticultural crops	1
5.	Study of different types of sensors, relay and control mechanism for controlled irrigation and fertigation	1
6.	Design of automated system for irrigation and fertigation	1
7.	Design and installation of different protected structures as per guidelines of NHM	6
8.	Design and fabrication of soilless medium for vegetable crops	1
9.	Design and fabrication of soilless medium for flower production	1
10.	Economical evaluation of automated irrigation system and soilless medium for crop/flower production	1
	Total	**15**

X. Suggested Reading

- Howard M Resh. *Hydroponic Food Production*. CRC Press, New York.

I. Course Title : Design of Drip and Sprinkler Irrigation Systems

II. Course Code : IDE 505

III. Credit Hours : 2+1

IV. Aim of the course

To provide exposure of new cutting-edge technologies to the students in design of drip and sprinkler irrigation systems including selection of pipe and fertigation techniques.

V. Theory

Unit I

Suitability of sprinkler and drip irrigation systems under Indian conditions. Basic hydraulics of sprinkler and micro irrigation system.

Unit II

Pipe flow analysis. Friction losses and pressure variation. Flow in nozzles and emitters.

Unit III

Design and evaluation of sprinkler and micro irrigation systems in relation to source, soil, climate and topographical conditions.

Unit IV

Selection of pipe size, pumps and power units. Layout, distribution, efficiency and economics.

Unit V

Fertigation through sprinkler and micro irrigation systems. Fertigation techniques involved in drip and sprinkler irrigation system.

VI. Practical

Design of drip and sprinkler irrigation system. Calculation of total head. Determination of uniformity of sprinkler discharge at field. Numerical on hydraulics of dripper. Calculation of different types of efficiencies of installed drip system. Calculation of cost benefits of drip and sprinkler irrigation system.

VII. Learning outcome

Students will understand design aspects of various drip and sprinkler irrigation systems including friction losses and flow variations. They may also expose to various fertigation techniques involved in the system.

VIII. Lecture Schedule

S.No.	Topic	No. of lectures
1	Plant-soil-atmosphere relationships	3
2	Evapotranspiration, methods for estimation of evapotranspiration, Irrigation water requirements, Irrigation principles, Numerical Problems	2
3	Drip irrigation, adaptability, limitations, components and classification of systems	2
4	Pipe flow analysis, types of friction losses in main, sub-main and lateral, pressure variation in drip irrigation system and their calculations	2

S.No.	Topic	No. of Lectures
5	Design of drip irrigation system based on source of irrigation, soil, climate and topographical conditions and hydraulics of drip components with numerical problems	3
6	Selection of pipe, pump and power unit	2
7	Fertigation: advantages, limitations, methods, fertilizers solubility and their compatibility, precautions, frequency, duration and injection rate, Emitter clogging and prevention	2
8	Performance evaluation of drip irrigation system	1
9	Sprinkler irrigation, adaptability, limitations, components and classification of systems	2
10	Pipe flow analysis, types of friction losses, pressure variation in sprinkler irrigation system and their calculations	2
11	Flow in nozzles, drop size distribution, spray evaporation	1
12	Hydraulic and engineering design of sprinkler irrigation system on source of irrigation, soil, climate and topographical conditions, numerical problems	3
13	Fertigation techniques in sprinkler irrigation	1
14	Selection of pipe, pump and power unit	2
15	Performance evaluation of sprinkler irrigation system	1
16	Irrigation scheduling techniques and automation in drip and sprinkler irrigation system	2
17	Benefit cost ratio of drip and sprinkler irrigation system	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of different components of drip and sprinkler irrigation system	1
2.	Determination of physical properties of soil	1
3.	Design of drip irrigation system for orchards	1
4.	Design of micro-irrigation system for row crops	1
5.	Design of sprinkler irrigation system for vegetable crops	1
6.	Design of sprinkler irrigation system for field crops	1
7.	Estimation of total head in drip and sprinkler irrigation system	1
8.	Determination of filtration efficiency of different filters	1
9.	Evaluation of drip irrigation system	1
10.	Determination of uniformity of sprinkler discharge at field	1
11.	Study of hydraulics of drippers	1
12.	Estimation of fertigation rate in drip irrigation system	1
13.	Calculation of different types of efficiencies of installed drip system	1
14.	Study of Automation in micro-irrigation system	1
15.	Calculation of cost benefits of drip irrigation system	1
16.	Calculation of cost benefits of sprinkler irrigation system	1
	Total	**16**

I. Course Title : Ground Water Engineering

II. Course Code : IDE 506

III. Credit Hours : 2+1

IV. Aim of the course

To provide comprehensive knowledge to the students in aquifers, groundwater flow, artificial groundwater recharge techniques, well hydraulics and groundwater models.

V. Theory

Unit I

Water resources of India. Occurrence, storage and movement of groundwater in alluvial and hard rock formations. Principles of groundwater flow. Interaction between surface water and groundwater.

Unit II

Natural and artificial groundwater recharge. Conjunctive use of surface and groundwater. Groundwater balance. Fluctuation of water table beneath a recharge site. Delineation of groundwater potential zones using RS and GIS, MODFLOW equation.

Unit III

Derivation of hydraulics of fully and partially penetrating wells in confined, leaky and unconfined aquifers. Flow net analysis.

Unit IV

Analysis of multi aquifers. Flow analysis in interfering wells. Pumping tests for estimation of aquifer parameters. Wells near recharge and impermeable boundaries. Skimming well technology.

Unit V

Design of well field. Salt water intrusion in inland and coastal aquifers. Application of groundwater models for groundwater management. Calibration and validation of models.

VI. Practical

Water table contour maps and determination of groundwater flow. Estimation of aquifer characteristics. Problems on non-leaky and leaky aquifers. Analysis of pumping test data. Computation of interference of wells. Groundwater computer simulation models.

VII. Learning outcome

The student will be able to analyze storage, movement and flow characteristics of different aquifers and also model ground water and plan for ground water recharge including delineation of potential groundwater recharge zones.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Water Resources of India. Occurrence, movement of groundwater and storage of groundwater in geological formation	2
2.	Study of hydro geological formation in India	1
3.	Principal of Groundwater flow. Interaction between surface water and groundwater.	
4.	Natural and artificial groundwater recharge. Conjunctive use of surface and groundwater	1
5.	Groundwater balance and fluctuation of water table beneath recharge sites	2
6.	Delineation of groundwater potential zones using RS and GIS	2
7.	Study of MODFLOW and its application	2
8.	Hydraulics of wells	1
9.	Steady state flow to fully penetrating well in unconfined, confined and leaky aquifer	2
10.	Unsteady state flow to fully penetrating wells in unconfined, confined and leaky aquifer	3
11.	Steady state flow to partially penetrating well in unconfined, confined and leaky aquifer	2
12.	Unsteady state flow to partially penetrating wells in unconfined, confined and leaky aquifer	3
13.	Flow net analysis for groundwater flow	1
14.	Steady and Unsteady flow in Multi aquifers	2
15.	Flow analysis in interfering multiple wells	2
16.	Pumping tests for estimation of aquifer parameters	1
17.	Flow to wells near recharge and impermeable boundaries	2
18.	Design of well field and skimming well technology (multiple well point system)	2
19.	Salt water intrusion in inland and coastal aquifers	2
20.	Groundwater modelling approaches	1
21.	Study of various groundwater models	2
22.	Application of groundwater models for groundwater management	2
23.	Calibration and validation of models	2
	Total	**40**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Delineation of water table contour maps.	2
2.	Determination of groundwater flow using contour maps	1
3.	Estimation of aquifer characteristics by Theis and Cooper-Jacob method	2
4.	Estimation of aquifer characteristics by Chow's and Theis recovery method	2
5.	Hand on exercise for analysis groundwater flow through well in leaky aquifers.	2
6.	Hand on exercise for analysis groundwater flow through well in non-leaky aquifers.	2
7.	Analysis of pumping test data for estimation of aquifer parameters.	1
8.	Computation of drawdown and discharge under interference of wells.	2
9.	Simulation of groundwater flow using various computer models (MODFLOW, etc)	2
	Total	**16**

I. Course Title : GIS and Remote Sensing for Land and Water Resource Management

II. Course Code : IDE 507/SWCE 507

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students with recent technology of RS and GIS including satellite data analysis, digital image processing and thematic mapping of land use, surface and ground water.

V. Theory

Unit I

Physics of remote sensing. Electromagnetic radiation (EMR), interaction of EMR with atmosphere, earth surface, soil, water and vegetation. Remote sensing platforms: Monitoring atmosphere, land and water resources: LANDSAT, SPOT, ERS, IKONOS and others. Indian Space Programme.

Unit II

Satellite data analysis. Visual interpretation. Digital image processing. Image pre-processing. Image enhancement. Image classification. Data merging.

Unit III

Basic components of GIS. Map projections and co-ordinate system. Spatial data structure: Raster, vector. Spatial relationship. Topology. Geodatabase models: Hierarchical, network, relational, object-oriented models. Integrated GIS database. Common sources of error. Data quality: Macro, micro and Usage level components, Meta data. Spatial data transfer standards.

Unit IV

Thematic mapping. Measurement in GIS: Length, perimeter and areas. Query analysis. Reclassification, Buffering and Neighbourhood functions. Map overlay: Vector and raster overlay. Interpolation and network analysis. Digital elevation modelling. Analytical Hierarchy Process. Object oriented GIS, AM/FM/GIS and Web Based GIS.

Unit V

Spatial data sources. 4M GIS approach water resources system. Thematic maps. Rainfall runoff modelling, groundwater modelling and water quality modelling. Flood inundation mapping and modelling. Drought monitoring. Cropping pattern change analysis. Performance evaluation of irrigation commands. Site selection for artificial recharge. Reservoir sedimentation.

VI. Practical

Familiarization with the remote sensing instruments and satellite imagery. Aerial Photograph and scale determination with stereoscope. Interpretation of satellite imagery and aerial photograph. Determination of Parallaxes in images. Introduction to digital image processing software and GIS software and their working principles. Generation of digital elevation model (DEM) for land and water resource management. Case studies on mapping, monitoring and management of natural resources using remote sensing and GIS.

VII. Learning outcome

The student will be able to use satellite remote sensing to perform image analysis and classification for developing thematic maps and also able to integrate satellite data with GIS to undertake recourse mapping and lanning studies.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction and brief history of RS and GIS, applications of RS and GIS	1
2.	Physics of remote sensing. Electromagnetic radiation (EMR), interaction of EMR with atmosphere, earth surface, soil, water and vegetation.	1
3.	Remote sensing platforms: Monitoring atmosphere, land and water resources: LANDSAT, SPOT, ERS, IKONOS and others. Indian Space Programme	2
4.	Satellite data analysis. Visual interpretation.	1
5.	Digital image processing- Image pre-processing, Image enhancement, Image classification, data merging.	3
6.	Basic components of GIS- Map projections and co-ordinate system.	2
7.	Spatial data sources,Thematic maps.	1
7.	Spatial data structure: Raster, vector data, Spatial relationship-Topology	1
8.	Geodatabase models: Hierarchical, network, relational, object-oriented models. Integrated GIS database	3
9.	Data quality, Common sources of error, Macro, micro and Usage level components, Meta data and Spatial data transfer standards	2
10.	Measurement in GIS- Length, perimeter and areas.	1
10.	Query analysis. Reclassification, Buffering and Neighbourhood functions.	1
11.	Map overlay: Vector and raster overlay	1
12.	Interpolation and network analysis	1
13.	Digital elevation modelling. Analytical Hierarchy Process. Object oriented GIS, AM/FM/GIS and Web Based GIS.	3
14.	GIS approach to Rainfall runoff modelling, Flood inundation mapping and modelling.	2
15.	GIS approach to Groundwater modelling and water quality modelling,	2
16.	Site selection for artificial recharge. Reservoir sedimentation	1
17.	Drought monitoring	1
18.	Performance evaluation of irrigation commands	1
19.	Cropping pattern change analysis	1
	Total	**32**

7 IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Familiarization with the remote sensing instruments and satellite imagery	1

S.No.	Topic	No. of Practicals
2.	Methods of establishing ground truth survey and Comparison between ground truth and remotely sensed data	2
3.	Aerial Photograph and scale determination with stereoscope	1
4.	Interpretation of satellite imagery and aerial photograph	1
5.	Determination of Parallaxes in images	1
6.	Demonstration on GPS; Provision of Ground Control by GPS in different mode	1
7.	Introduction to digital image processing software	1
8.	Introduction to GIS software	1
9.	Data input; Data editing and Topology creation -Digitization of point, line and polygon features	
10.	SRTM and CARTO DEM download from web and Georeferencing of an image	1
11.	Delineation of Watershed, DEM generation: slope, Aspect, flow direction, Flow accumulation, Drainage, network and morphometric analysis	2
12.	LULC by supervised classification and LULC by unsupervised classification	1
13.	Application of Remote Sensing data and GIS for water quality parameters	
14.	Temporal satellite data analysis for vegetation condition, crop water requirement calculation	1
15.	Erosion mapping using aerial and satellite Data	1
	Total	**17**

I. Course Title : Waste Water Management and Utilization in Agriculture

II. Course Code : IDE 508

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about status of waste water and water quality requirements, standards both for domestic and irrigation purposes and also to provide in depth knowledge of waste water treatment methods and utilization in agriculture.

V. Theory

Unit I

Status of wastewater in India. Sources of contamination and characterization of urban and rural wastewater for irrigation. Water quality: Physical, chemical and biological parameters of wastewater.

Unit II

Water quality requirement: Potable water standards, wastewater effluent standards, water quality indices. Irrigation water quality standards and guidelines for their restricted and unrestricted uses. Selection of appropriate forestry trees, fruits, vegetables, oilseeds and food grain crop for wastewater utilization.

Unit III

Control measures for preventing soil and other surface/groundwater source contamination. Different types of wastewater, pollutants and contaminants. Impact of wastewater on ecosystem, eutrophication, biomagnification, water borne diseases.

Unit IV

Wastewater treatment methods: Physical, chemical and biological. General water treatments: Wastewater recycling, constructed wetlands, reed bed system. Carbon foot prints of wastewater reuse. Environmental standards.

Unit V

Regulation and environmental impact assessment (EIA): Environmental standards-CPCB Norms for discharging industrial effluents to public sewers. Stages of EIA-Monitoring and Auditing. Environmental clearance procedure in India.

VI. Practical

Measurement of water quality indices in the lab. Field demonstration of impact of waste water on eco-system and human health. Waste water treatment methods and effect of waste water in contamination of ground water. Visit of waste water treatment plant near by area.

VII. Learning outcome

The students will be able to understand sources and treatment methods of waste water quality with standard norms of water quality for domestic and irrigation purposes and also be exposed to waste water recycling and environmental standards.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Status of wastewater in India, Sources of contamination and characterization of urban and rural wastewater for irrigation	2
2.	Water quality: Physical, chemical and biological parameters of wastewater	2
3.	Wastewater quality requirement: Potable water standards, wastewater effluent standards, water quality indices. Irrigation water quality standards both national and global and guidelines for their restricted and unrestricted uses.	2
4.	Different types of wastewater, pollutants and contaminants.	1
5.	Impact of wastewater on ecosystem, eutrophication, biomagnification, water borne diseases.	2
6.	Key drivers of wastewater use in agriculture and existing approaches for regulating wastewater reuse in agriculture	2
7.	Selection of appropriate forestry trees, fruits, vegetables, oilseeds and food grain crop for wastewater utilization and practices used for irrigation	3
8.	Health Risks Associated with the Use of Wastewater for Irrigation	1
9.	Wastewater treatment methods: Physical, chemical and biological.	3

S.No.	Topic	No. of Lectures
10.	Choice of (Cost-Effective) Wastewater Treatment Systems for Irrigation	2
11.	General water treatments: Wastewater recycling, constructed wetlands, reed bed system.	2
12.	Carbon foot prints of wastewater reuse. Environmental standards.	2
13.	Management of health and environmental risks of wastewater irrigation	1
14.	Regulation and environmental impact assessment (EIA): Environmental standards-CPCB Norms for discharging industrial effluents to public sewers. Valuation of environmental impacts.	3
15.	Impact on groundwater resources and soil health, EIA process, Stages of EIA-monitoring and auditing. Environmental clearance procedure in India	3
16.	Economics of wastewater irrigation	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study on physical, chemical and biological parameters of wastewater	1
2.	Determination of EC and pH of wastewater	1
3.	Determination of BOD of wastewater	1
4.	Determination of COD of wastewater	1
5.	Determination of TSS and TDS of wastewater	1
6.	Determination RSC of wastewater	1
7.	Determination of e-coli in the wastewater	1
8.	On field demonstration of wastewater use for the irrigation	1
9.	Determination of nutrient (N, P and K) concentration in wastewater	2
10.	Field demonstration of impact of waste water on eco-system and human health.	1
11.	Study on various wastewater treatment methods	2
12.	Study on effect of wastewater on contamination of ground water	1
13.	Visit of village pond treatment nearby area	1
14.	Visit of sewerage treatment plant nearby area	1
	Total	**16**

I. Course Title : Water Conveyance and Distribution

II. Course Code : IDE 509

III. Credit Hours : 2+1

IV. Aim of the course

To develop the common understanding of different conveyance structure in irrigation network and provide knowledge of various flow and their computations including sediment transport in channels.

V. Theory

Unit I

Channel characteristics. Prismatic and non-prismatic channel. Steady, unsteady, uniform and non-uniform flow. Open channel and their properties. Energy and momentum, critical flow computation and application. Basic Concepts of free surface flow, classification of flow, velocity and pressure distribution.

Unit II

Uniform flow, conservation laws and specific energy. Application of momentum and energy equation. Channel transition. Study of critical flow, uniform flow, gradually varied flow, rapid varied flow, spatially varied flow and unsteady flow and their computations.

Unit III

Energy dissipation. Flow control structures and flow measurement. Theories and methods of open channel design.

Unit IV

Sediment transport in channels. Regime flow theories. Tractive force theory. Design of stable channels.

Unit V

Basic principles of pipe flow, pipe flow problems and equivalent pipe. Principles of network synthesis. Pipe network analysis. Water transmission lines. Cost considerations: Single-Input source. Branched systems: Single-Input source. Looped Systems: Multi-Input source. Branched systems: Multi-Input source, Looped systems. Decomposition of a large water system and optimal zone size.

VI. Practical

Computation and use of geometrical and hydraulic elements of open channel. Use of flow measuring devices and methods and their limitations. Examination of velocity distribution and calculation of energy and momentum coefficients. Solution of channel design problems. Appraisal of flow control and distribution structures. Analysis and computation of flow profiles.

VII. Learning outcome

The student will be able to infuse the knowledge about different types of channel flow and their behavior and also able to gain the knowledge of appraisal of flow control and distribution structures including design of stable channel.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Channel characteristics. Prismatic and non-prismatic channel	1
2.	Steady, unsteady, uniform and non-uniform flow	1
3.	Open channel and their properties	2
4.	Energy and momentum, critical flow computation and application	2
5.	Basic Concepts of free surface flow, classification of flow, velocity and pressure distribution	2
6.	Uniform flow, conservation laws and specific energy	2
7.	Application of momentum and energy equation	1
8.	Channel transition	1
9.	Study of critical flow, uniform flow, gradually varied flow, rapid varied flow	2
10.	Spatially varied flow and unsteady flow and their computations	2
11.	Energy dissipation	1
12.	Flow control structures and flow measurement	1
13.	Theories and methods of open channel design	2
14.	Sediment transport in channels	1
15.	Regime flow theories	1
16.	Tractive force theory	1
17.	Design of stable channels	1
18.	Basic principles of pipe flow, pipe flow problems and equivalent pipe	1
19.	Principles of network synthesis. Pipe network analysis	1
20.	Water transmission lines. Cost considerations: Single-Input source. Branched systems: Single-Input source	2
21.	Looped Systems: Multi-Input source. Branched systems: Multi-Input source, Looped systems	2
22.	Analysis and computation of flow profiles	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Computation and use of geometrical and hydraulic elements of open channel	2
2.	Study of Flow measuring devices,methods and their limitations	2
3.	Examination of velocity distribution	2
4.	Calculation of energy and momentum coefficients	2
5.	Channel design: problems and its solution	3
6.	Appraisal of flow control and distribution structures	2
7.	Analysis and computation of flow profiles	3
	Total	**16**

I. Course Title : Minor Irrigation

II. Course Code : IDE 510

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the need and scope of minor irrigation in India. To provide in-depth knowledge in design and operation of surface and groundwater-based irrigation practices.

Unit I

Definition, scope, historical background and progress in minor irrigation works in India, Assessment of surface water resource. Design and operation of surface water storage structures.

Unit II

Evaporation and seepage control. Groundwater development methods and their scope. Groundwater extraction devices and methods. Aquifer characteristic and their evaluation. Wells in alluvial and rocky aquifers.

Unit III

Well interference, spacing and multiple well point system for controlled groundwater pumping. Safe yield from wells. Augmentation of well yield through pumping and recovery time management.

Unit IV

Well design, drilling and construction. Tube well strainers, gravel packing and resistance to flow. Pumps and prime movers for groundwater lifting. Diagnosis of sick and failed wells and their remediation.

Unit V

Conjunctive use of surface and groundwater. Legislation for groundwater development and management. Groundwater recharge and its use.

V. Practical

Measurement of seepage loss from reservoirs. Estimation of inflow to surface reservoir. Measurement of evaporation loss from surface reservoirs. Pumping test and determination of aquifer parameters. Establishment of draw down-discharge characteristic. Well log analysis and deciding on length and placement of strainers. Computation of well interference and deciding on well spacing. Estimation of irrigation for given discharge from well. Estimating pumping cost for irrigation. Analysis of ground water quality. Problems on well design.

VI. Learning outcome

The students will be able to understand minor irrigation practices and their importance in Indian agriculture. They will also expose to conjunctive use of surface and groundwater and able to perform groundwater development legislation, recharge and utilization practices.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Definition and scope of minor irrigation works in India	1
2.	Historical background and progress in minor irrigation works in India	2

S.No.	Topic	No. of Lectures
3.	Assessment of surface water resource	1
4.	Design and operation of surface water storage structures	2
5.	Evaporation and seepage control	1
6.	Groundwater development methods and their scope	2
7.	Groundwater extraction devices and methods	1
8.	Aquifer characteristic and their evaluation	2
9.	Wells in alluvial and rocky aquifers	1
10.	Well interference	2
11.	Spacing and multiple well point system for controlled groundwater pumping	2
12.	Safe yield from wells	1
13.	Augmentation of well yield through pumping and recovery time management	2
14.	Well design, drilling and construction	2
15.	Tube well strainers	1
16.	Gravel packing and resistance to flow	2
17.	Pumps and prime movers for groundwater lifting	2
18.	Diagnosis of sick and failed wells and their remediation	1
19.	Conjunctive use of surface and groundwater	1
20.	Legislation for groundwater development and management	1
21.	Groundwater recharge and its use	2
	Total	**32**

I. Course Title : Design of Pumps for Irrigation and Drainage

II. Course Code : IDE 511

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint students about basic hydraulic design of various pumps, energy requirement in pumping, solar photovoltaic system and solar pump including design of pumping station.

V. Theory

Unit I

Basic hydraulic design of centrifugal pump. Net positive suction head and cavitation, vapour pressure, water hammering problem in centrifugal pump.

Unit II

Principles and design of pumping systems for agricultural drainage. Selection and performance of characteristics of vertical turbine pump, submersible pump and axial flow pump.

Unit III

Multiple well point system and their design. Energy requirement in groundwater pumping.

Unit IV

Non-conventional energy sources for pumping, wind mills, micro turbines, solar pumps. Hydraulic ram: Selection and design criteria. Solar photovoltaic system.

Unit V

Design of pumping station. Techno-economic evaluation. Efficient pumping system operation, flow control strategies and conservation measures for pumping systems.

VI. Learning outcome

The students will be able to select the pump for desired discharge to be pumped from particular water source by developing pump characteristics curve, able to analyze the flow in different types of pump and also able to design the pumping station for managing the irrigation and drainage system.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Different types of pumps used under different conditions	1
2.	Principal and working of centrifugal pump	1
3.	Basic hydraulic design of centrifugal pump	1
4.	Net positive suction head and cavitation, vapour pressure, water hammering problem in centrifugal pump	3
5.	Use of pumpsets for agricultural drainage under different conditions.	1
6.	Principles and design of pumping systems for agricultural drainage.	2
7.	Selection and performance of characteristics of vertical turbine pump	2
8.	Flow pattern in turbine pumps	1
9.	Selection and performance of characteristics of vertical submersible pump	2
10.	Flow pattern in submersible pumps	1
11.	Visit to Pumping Industry	5
12.	Use of Multiple well point/skimming well point system under different conditions and its design	1
13.	Energy requirement and efficiency for Multiple well point/skimming well point system	1
14.	Introduction and use of Non-conventional energy sources for pumping	1
15.	Selection and design criteria for Solar photovoltaic system	2
16.	Selection and design criteria for wind mills, micro turbines, solar pumps. Hydraulic ram	3

S.No.	Topic	No. of Lectures
17.	Introduction to pumping station and its components & design	1
18.	Techno-economic design evaluation in pumping sets	1
19.	Energy conservation measures under different pumping units under different flow conditions	2
	Total	**32**

VIII. Suggested Reading

I. Course Title : Crop Environmental Engineering

II. Course Code : IDE 512

III. Credit Hours : 2+0

IV. Aim of the course

To develop the common understanding aerial and edaphic environments for plant growth, energy and mass transfer which help to maximizing the crop yield. To understand the basic interface of soil and root and its characteristics.

V. Theory

Unit I

Principles of heat, mass and momentum transport. Transport of radiant energy, radiation environment, micro climatology of radiation. Micrometeorology: Turbulent transfer profiles and fluxes. Interpretation of flux measurement. Laws of electromagnetic radiation, its measurement and estimation.

Unit II

Profile balance of heat, mass and momentum in and above crop communities. Climatic changes and plant response to environmental stresses. Measurement and estimation of potential evapotranspiration on point and regional scale.

Unit III

Root anatomy, water flow in roots and root density models (microscopic and macroscopic). Stem anatomy and pressure volume curves. Methods of measuring water status in plants. Estimating ET using three temperature model and MODIS algorithm. Soil–Plant–Atmosphere system: Basic properties. Dynamics of water movement. ET-yield relations.

Unit IV

Principles of optimal scheduling of irrigation and seasonal allocation of limiting water supplies using LP and DP. Seasonal and dated production functions. Crop yield modelling and condition assessment. Instrumentation and techniques for monitoring plant environments.

Unit V

Design and operation of controlled environment facilities and their instrumentation. Climatic changes and plant response to environmental stresses. Evapotranspiration models.

VI. Learning outcome

The students will be able to identify climatic changes on plant and how plant responds to environmental stresses and evapotranspiration. The students will be exposed for design and operation of controlled environment facilities and crop yield modeling.

VII. Lecture Schedule

S.No.	Topic	No. of lectures
1.	Principles of heat, mass and momentum transport	2
2.	Transport of radiant energyradiation environment, micro climatology of radiation	2
3.	Micrometeorology: Turbulent transfer profiles and fluxes. Interpretation of flux measurement	1

I. Course Title : Water Resources Systems Engineering

II. Course Code : IDE 513

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the concept of optimization and its application in water resources management, mathematical programming techniques and multi objective water resources planning.

V. Theory

Unit I

Concepts and significance of optimization in water resources management. Model development in water management. Objective functions, deterministic and stochastic inputs.

Unit II

Soil plant atmosphere system. Problem formulation. Mathematical programming techniques: Linear programming, simplex method.

Unit III

Non-linear programming, quadratic programming, integer programming. Transportation problem and solution procedure. Geometric programming and dynamic programming.

Unit IV

Application of optimization techniques for water resources planning. Conjunctive use of water resources. Crop production functions and irrigation optimization.

Unit V

Multi objective water resources planning. Critical path method. Programme evaluation and review technique. Economic models. Project evaluation and discounting methods.

VI. Practical

Assessment of water resources. Problems related to water allocation in agriculture under single and multiple cropping system. Use of computer software for linear and dynamic programming. Introduction to the use of other programming methods. Sensitivity analysis of different alternatives of water resources development and allocation. Analysis of water demand and supply. Analysis of Competitive demands for water by various sectors of development. Benefits and cost of water resources development.

VII. Learning outcome

The students will be able to identify objective function and components in water resource planning problems and also able to formulate and solve various mathematical programming models of water resource system as well as to develop conjunctive use and crop production function optimization models.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Concepts and significance of optimization in water resources management	1
2.	Model development in water management	1

S.No.	Topic	No. of Lectures
3.	Objective functions, deterministic and stochastic input	1
4.	Soil plant atmosphere system. Problem formulation. Mathematical programming techniques	1

8.	Geometric programming	3
9.	Dynamic programming	4
10.	Application of optimization techniques for water resources planning	2
11.	Conjunctive use of water resources	1
12.	Crop production functions and irrigation optimization	2
13.	Multi objective water resources planning. Critical path method	2
14.	Programme evaluation and review technique	1
15.	Economic models	2
16.	Project evaluation and discounting methods	1
	Total	**35**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Assessment of water resources of the region	1
2.	Problems on water allocation in agriculture under single and multiple cropping system	2
3.	Familiarization with computer software for linear programming	3
4.	Hands on exercise for non-linear programming on computer	3
5.	Hands on exercise for dynamic programming on computer	3
6.	Sensitivity analysis of different alternatives of water resources development and allocation	2
7.	Analysis of water demand and supply	2
8.	Benefits and cost of water resources development	1
	Total	**17**

I. Course Title : Irrigation Economics Planning and Management

II. Course Code : IDE 514

III. Credit Hours : 2+0

IV. Aim of the course

To impart knowledge of various public and government policy on regulation and allocation of irrigation water, cost and benefit analysis including project evaluation, decision making process and risk analysis.

V. Theory

Unit I

Economic analysis. Problems in project selection. Methods and approaches to water pricing. Criteria for investment and pricing in irrigation projects. Social benefits, problems and causes of under-utilization. Mathematics of economic analysis. Cost allocation, separable and non-separable costs. Discounting factors and techniques. Determination of benefits, cost and benefit analysis. Project evaluation. Limitations of benefit-cost analysis. Dynamics of project analysis.

Unit II

Role of financial analysis. Distinctions from economic analysis. Financial feasibility and analysis. Impact of public policies on regulation and allocation of irrigation water. Relative economic efficiency of alternative irrigation water management models. Irrigation system improvement by simulation and optimization to enhance irrigation water use efficiency.

Unit III

Indian agriculture, main problems, population, government policies, systems, organizing agriculture production. Farm Management: Definition, importance, scope, relation with other sciences and its characteristics.

Unit IV

Socio-economic survey. Importance of such survey in planning, implementation and evaluation of project performance. Planning of socio-economic survey, types of data sets to be collected, preparing the questionnaires form, schedules sampling, editing and scrutinizing of secondary data, classification and analysis of data.

Unit V

Role of farm management principles in decision making for irrigated agriculture. Decision making process, assessing risk and uncertainty in planning.

VI. Learning outcome

The students will be able to estimate the cost benefit analysis, pricing and investment criteria on irrigation project evaluation and finding their problems. The students will also expose to conduct socio-economic survey and analyse secondary data.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Economic analysis, problems in project selection	1
2.	Methods and approaches to water pricing	1
3.	Criteria for investment and pricing in irrigation projects	1
4.	Social benefits, problems and causes of under-utilization	1
5.	Mathematics of economic analysis	1
6.	Cost allocation, separable and non-separable costs	1
7.	Discounting factors and techniques	1
8.	Determination of benefits and limitations of cost-benefit analysis	1
9.	Project evaluation	1
10.	Dynamics of project analysis	1
11.	Role of financial analysis	1
12.	Distinctions from economic analysis	1
13.	Financial feasibility and analysis	1
14.	Impact of public policies on regulation and allocation of irrigation water	1
15.	Relative economic efficiency of alternative irrigation water management models	2

S.No.	Topic	No. of Lectures
16.	Irrigation system improvement by simulation and optimization to enhance irrigation water use efficiency	2
17.	Indian agriculture, main problems, population, government policies, systems, organizing agriculture production	2
18.	Farm Management: Definition, importance, scope, relation with other sciences and its characteristics	2
19.	Socio-economic survey: Importance of survey in planning, implementation and evaluation of project performance	2
20.	Planning of socio-economic survey, types of data sets to be collected, preparing the questionnaires form, schedules sampling, editing and scrutinizing of secondary data	2.
21.	Classification and analysis of data	1
22.	Role of farm management principles in decision making for irrigated agriculture	2
23.	Decision making process	1
24.	Assessing risk and uncertainty in planning	2
	Total	**32**

I. Course Title : Sensing and Automation in Irrigation Systems

II. Course Code : IDE 515

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint students about the concept of sensing and automation in irrigation system, wireless sensor network and digital signal processor. To provide knowledge of surface irrigation automation.

V. Theory

Unit I

Sensing and sensors. Sensor classifications. Wireless sensor networks. History of wireless sensor networks (WSN). Communication in a WSN. Important design constraints of a WSN like Energy, self management, wireless networking, decentralized management, design constraints, security etc.

Unit II

Node architecture. Sensing subsystem. Analog-to-Digital converter. The processor subsystem, architectural overview, microcontroller, digital signal processor, application-specific integrated circuit, field programmable gate array (FPGA).

Unit III

Communication interfaces, serial peripheral interface, inter-integrated circuit, the IMote node architecture, The XYZ node architecture, the Hogthrob node architecture.

Unit -IV

Applications in surface irrigation automation, automation based on volume, time, fertigation scheduling, water logging, salinity, oxygen diffusion systems, etc.

VI. Learning outcome

The students will be able to understand concept of automation in irrigation system which is quite important to enhance water use efficiency and also able to understand Node architecture and other routing protocols.

VII. Lecture Schedule

S.No.	Topics	No. of Lectures
1.	Sensing and sensors	2
2.	Sensor classifications	2
3.	History of wireless sensor networks (WSN) and Wireless sensor networks	3
4.	Communication in a WSN	1
5.	Important design constraints of a WSN like Energy, self-management, wireless networking, decentralized management, design constraints, security etc	3
6.	Node architecture	1

Course Title with Credit Load
Ph.D. in Irrigation and Drainage Engineering

Major Courses (Requirement: 12 Credits)

Course Code	Course Title	Credit Hours
IDE 601*	Recent Developments in Irrigation Engineering	2+1
IDE 602*	Advances in Drainage Engineering	2+1
IDE 603	Hydro-Mechanics and Ground Water Modeling	3+0
IDE 604	Soil-Water-Plant-Atmospheric Modeling	2+1
IDE 605	Plant Growth Modeling and Simulation	2+0
IDE 606	Multi Criteria Decision Making System	2+0
	Total	**13+3**

Minor Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
SWCE 502	Applied Watershed Hydrology	2+1
SWCE 603	Reservoir Operation and River Basin Modeling	2+1
SWCE 604	Modeling Soil Erosion Processes and Sedimentation	2+1
CSE 503	Neuro-Fuzzy Application in Engineering	2+1
CSE 506	Digital Image Processing	2+1
FMPE 602	Advances in Machinery for Precision Agriculture	2+1
REE 615	Energy Planning, Management and Economics	3+0
	Any other course(s) of other department can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
CPE-RPE*	Research and Publication Ethics	1+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

***Course has been made compulsory by UGC for PhD students. Course code and its detailed course outline to be adopted in toto as recommended by UGC.

List of other Essential Requirements

Course Code	Course Title	Credit Hours
IDE 691	Seminar-I	0+1
IDE 692	Seminar-II	0+1
IDE 699	Thesis Research	0+75

Course Contents
Ph.D. in Irrigation and Drainage Engineering

I. Course Title : Recent Developments in Irrigation Engineering

II. Course Code : IDE 601

III. Credit Hours : 2+1

IV. Aim of the course

To focus the students for the recent designs progressed in surface irrigation systems, surface and subsurface drip irrigation systems and for utilizing good and poor-quality waters for sustaining crop productivity.

V. Theory

Unit I

Geospatial analysis of hydraulic properties of the soil. Surge flow irrigation systems. One dimensional and two-dimensional zero inertia modelling of border irrigation, surge irrigation and furrow irrigation. Integral equation solutions to surface irrigation. Design of irrigation runoff recovery systems. Cablegation: Automated supply for surface irrigation. Analyzing wind distortion in sprinkler irrigation systems uniformity.

Unit II

Design of sub-surface drip irrigation systems. Modeling soil water regimes and solute distribution emanating from surface and sub-surface drip irrigation systems. Recent developments in designs of surface and sub-surface drip irrigation systems. Effects of emitter variability and plant and soil variability on soil moisture distribution uniformity. Irrigation scheduling through partial root zone irrigation. Low energy drip irrigation systems.

Unit III

Drip irrigation for poor quality water. Drip automation for time and volume. Drip irrigation system modification for waste water utilization. Modeling deficit irrigation and crop yield in response to hydraulic variation of the system and distribution uniformity of the soil-crop water fertilizer response function. Crop water salinity response function.

Unit IV

Drip irrigation in command area development. Mulching and its effect on crop productivity. Analyzing moisture and temperature profiles with time and depth. Effect of shading and mulching on crop productivity, vapour phase movement.

VI. Practical

Designing border irrigation using zero inertia model, volume balance approaches, evaluating surge flow irrigation systems, operation of segmented border irrigation systems for enhancing water use efficiency, geospatial analysis of soil properties, design and planning of surface drip irrigation systems using various designs, design of subsurface drip irrigation, analyzing three dimensional moisture movement under subsurface drip irrigation using simple empirical models, design and planning of surface and subsurface drainage systems, developing the irrigation schedules using partial root zone irrigation, seasonal and dated production functions for forecasting crop yield

VII. Learning outcome

The students will be able to design, operate and maintain surface irrigation systems, surface and sub-surface pressurized irrigation systems and managing crop productivity with poor quality of waters without deteriorating soil conditions.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Geospatial analysis of hydraulic properties of soil: Geospatial analysis, Spatial interpolation, Data quality assessment, Vegetation analysis, Correlation analysis	3
2.	Surge flow: Effect of surging on infiltration and surface flow hydraulics, surge flow systems	2
3.	Zero inertia modeling of border irrigation	2
4.	Integral equation solutions to surface irrigation: Border and furrow irrigation method	2
5.	Design of irrigation runoff recovery systems: Border and furrow irrigation method	3
6.	Cablegation: Automated supply for surface irrigation	2
7.	Wind effects on sprinkler irrigation performance: Analyzing wind distortion in sprinkler irrigation system uniformity	2
8.	Design of sub-surface drip irrigation systems, Modeling soil water regimes and solute distribution emanating from sub-surface drip irrigation systems	3
9.	Effects of emitter variability and plant and soil variability on soil moisture distribution uniformity	2
10.	Irrigation scheduling through partial root zone irrigation.	2
11.	Low energy drip irrigation systems	2
12.	Drip irrigation for poor quality water, Drip automation for time and volume, Drip irrigation system modification for waste water utilization	2
13.	Modeling deficit irrigation and crop yield in response to hydraulic variation of the system and distribution uniformity of the soil-crop water fertilizer response function, Crop water salinity response function	3
14.	Drip irrigation in command area development	2
15.	Mulching and its effect on crop productivity, Analyzing moisture and temperature profiles with time and depth, Effect of shading and mulching on crop productivity, vapour phase movement	3
	Total	**35**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of geospatial analysis of soil properties	
2.	Design of border irrigation using zero inertia model	1
3.	Design of border irrigation using volume balance approach	1
4.	Design and evaluation of surge flow irrigation system	1
5.	Design of irrigation runoff recovery system for border irrigation method	1

S.No.	Topic	No. of Practicals
6.	Design of irrigation runoff recovery system for furrow irrigation method	1
7.	Design and planning of cablegation system	1
8.	Analysis of wind distortion in sprinkler irrigation system uniformity	1
9.	Design and planning of subsurface drip irrigation system	1
10.	Analysis of three dimensional moisture movement under subsurface drip irrigation using simple empirical models	2
11.	Development of irrigation schedules using partial root zone irrigation	1
12.	Modeling deficit irrigation and crop yield in response to hydraulic variation of the system and distribution uniformity of the soil-crop water fertilizer response function	1
13.	Analysis of moisture and temperature profiles with time and depth	1
14.	Development of seasonal and dated production functions for forecasting crop yield	
	Total	**15**

I. Course Title : Advances in Drainage Engineering

II. Course Code : IDE 602

III. Credit Hours : 2+1

IV. Aim of the course

To provide comprehensive knowledge of advances in land drainage, synthetic materials for drainage systems, linear flow laws and environmental issues related to drainage.

V. Theory

Unit I

Physics of land drainage. Forces, surface tension and energy effects water. Energy of soil water. Capillary potential.

Unit II

Devices to measure capillary potential. Hystersis, Darcy's law. Synthetic materials for drainage systems. Environmental issues related to drainage. Socio-economic impacts of drainage systems.

Unit III

Laplace equation its derivation and solution in various forms. Boundary value problems, Liner flow laws.

Unit IV

Drainage criteria saturated flow theory, steady flow and non steady flow. Controlled drainage for reducing agricultural non-point pollution. Application of simulation models for drainage systems.

Unit V

Flow equations in general and the approach. Flow problem and physical boundary conditions.

VI. Practical

Steady state and non steady state flow problems. Measurement of capillary potential. Use of various synthetic materials under the field condition. Use of simulated models for drainage system.

VII. Learning outcome

The student will be familiar about energy of soil water, capillary potential, drainage material and various sources of agricultural pollution and also able to develop and apply simulation model for management of drainage system for particular area.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Physics of land drainage: Forces acting on movement of water through soil profile, surface tension, capillary forces and energy effects movement of water, Energy of soil water	5
2.	Capillary potential: Effect of capillary potential on movement of water through porous media, devices to measure capillary potential. Hystersis effect in drainage of soil, Darcy's law	3
3.	Synthetic materials for drainage systems: Design of filter and envelop for drainage system with synthetic materials	2
4.	Environmental issues related to drainage. Socio-economic impacts of drainage systems	2
5.	Drainage Flow Equation: Laplace equation its derivation and solution in various forms, Liner flow laws	4
6.	Boundary value problems: Initial and boundary condition and its solution	3
7.	Drainage criteria: Drainage criteria for different type of soils and crops, guidelines for design and installation of drainage system	2
8.	Saturated flow theory: steady flow and non steady saturated flow	3
9.	Controlled drainage for raising crop and reducing agricultural non-point pollution	2
10.	Application of simulation models for drainage systems (DRAINMOD, SALTMOD, etc)	4
11.	Flow equations: general drainage flow equations and the approach, drainage flow problems and solutions with physical boundary conditions	3
	Total	**34**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Steady state drainage flow problems	3
2.	Unsteady state drainage flow problems	3
3.	Measurement of capillary potential	2

S.No.	Topic	No. of Practicals
4.	Use of various synthetic materials for drainage filter under the field condition	2
5.	Design of filter and envelop with synthetic materials	2
6.	Use of simulated models for drainage system	4
	Total	**16**

I. Course Title : Hydro-Mechanics and Groundwater Modeling

II. Course Code : IDE 603

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint students about the concept of soil aquifer system, unsaturated flow models, numerical modeling of groundwater flow, theory of krigging and movement of groundwater in fractured and swelling porous media.

V. Theory

Unit I

Concept of soil aquifer system, flow of water in partially saturated soils. Partial differential equation of flow, pressure under curved water films, moisture characteristic functions.

Unit II

Physical models, Analog models, Mathematical modelling, Unsaturated flow models, Numerical modelling of groundwater flow, Finite difference equations and solutions. Successive over relaxation. Alternating direction implicit procedure. Crank Nicolson equation. Iterative methods. Direct methods. Inverse problem. Finite element method.

Unit III

Determination of unsaturated hydraulic conductivity and model for its estimation. Diffusivity and its measurement. Infiltration and exfiltration from soils in absence and presence of water table.

Unit IV

Fence diagram and aquifer mapping. Movement of groundwater in fractured and swelling porous media. Spatial variability, theory of krigging.

Unit V

Data requirements. Conceptual model design: Conceptualization of aquifer system. Parameters, Input-output stresses, Initial and Boundary conditions. Model design and execution: Grid design, Setting boundaries, Time discretization and transient simulation. Model calibration: Steady state and unsteady state. Sensitivity analysis. Model validation and prediction. Uncertainty in the model prediction.

VI. Learning outcome

The students will be able to understand complex mechanics movement of water in soil systems and also able to estimate the statistical parameters for better understanding of soil aquifer system, model validation and prediction.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Concept of soil aquifer system	1
2.	Flow of water in partially saturated soils	1
3.	Partial differential equation of flow	1
4.	pressure under curved water films, moisture characteristic functions	1
5.	Different types of Models used in hydrology and Groundwater	1
6.	Unsaturated flow models	1
7.	Numerical modelling of groundwater flow	1
8.	Finite difference equations and solutions, Finite difference equations and solutions, Alternating direction implicit procedure	4
9.	Crank Nicolson equation. Iterative methods	2
10.	Inverse problem. Finite element method	1
11.	Determination of unsaturated hydraulic conductivity and model for its estimation	2
12.	Diffusivity and its measurement	1
13.	Infiltration and exfiltration from soils in absence and presence of water table	2
14.	Fence diagram and aquifer mapping	2
15.	Movement of groundwater in fractured and swelling porous media, Spatial variability, theory of krigging	4
16.	Data requirements. Conceptual model design: Conceptualization of aquifer system. Parameters, Input-output stresses, Initial and Boundary conditions	4
17.	Model design and execution: Grid design, Setting boundaries, Time discretization and transient simulation	4
18.	Model calibration: Steady state and unsteady state. Sensitivity analysis. Model validation and prediction. Uncertainty in the model prediction	6
19.	Course Seminar	4
	Total	**43**

I. Course Title : Soil-Water-Plant-Atmospheric Modeling

II. Course Code : IDE 604

III. Credit Hours : 2+1

IV. Aim of the course

To impart the knowledge of measurement of radiation within plant cover, thermodynamics of flow through plant cells, heat transfer and radiation exchange under plant cover.

V. Theory

Unit I

Radiation balance of earth's surface. Turbulent transport of heat and momentum. Radiation exchange and heat transfer in a low plant cover.

Unit II

Measurement of radiation, leaf and air temperature, humidity and wind profiles within plant cover. Predicting potential evapotranspiration.

Unit III

Thermodynamics of flow through plant cells. Dynamics of water movement through soil plant atmosphere system. Stomatal aperture, photosynthesis and actual evapotranspiration relationship.

Unit IV

Production functions of evapotranspiration. Evapo-transpiration in mathematical modelling and optimization of design and regulation of irrigation systems and for utilization of limited water resources in agriculture.

Unit V

Crop water requirement under protected cultivation and remote sensing-based modeling.

VI. Practical

Estimation of potential evapotranspiration. Measurement of ET parameters under open and protected cultivation and development of stochastic and deterministic models of ET. Use of software for estimation of crop water requirement and ET.

VII. Learning outcome

The students will be able to understand the measurement of radiation, photosynthesis and actual evapotranspiration relationship along with modeling of evapotranspiration.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Radiation balance of earth's surface	1
2.	Turbulent transport of heat and momentum	2
3.	Radiation exchange and heat transfer in a low plant cover	2
4.	Measurement of radiation, leaf and air temperature, humidity and wind profiles within plant cover	2
5.	Predicting potential evapotranspiration	2
6.	Thermodynamics of flow through plant cells	2
7.	Dynamics of water movement through soil plant atmosphere system	2

S.No.	Topic	No. of Lectures
8.	Stomatal aperture, photosynthesis and actual evapotranspiration relationship	1
9.	Production functions of evapotranspiration	3
10.	Evapo-transpiration in mathematical modelling and optimization of design and regulation of irrigation systems and for utilization of limited water resources in agriculture	4
11.	Crop water requirement under protected cultivation and remote sensing-based modeling	4
	Total	**29**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Estimation of potential evapotranspiration using FAO 56 Penman Monteith equation	1
2.	Estimation of potential evapotranspiration using FAO Cropwat model	1
3.	Estimation of potential evapotranspiration using FAO ETo calculator	2
4.	Measurement of ET parameters under open condition	1
5.	Measurement of ET parameters under protected cultivation	1
6.	Development of stochastic models of ET	3
7.	Development of deterministic models of ET	3
8.	Use of software for estimation of crop water requirement and ET	2
	Total	**14**

X. Suggested Reading

I. Course Title : Plant Growth Modeling and Simulation

II. Course Code : IDE 605

III. Credit Hours : 2+0

IV. Aim of the course

To impart the in-depth knowledge of plant growth modeling, type of modeling approach, quantitative analysis of photosynthesis and remote sensing-based modeling.

V. Theory

Unit I

Introduction to plant growth modeling. Simulation and simulation language. Types of models and modeling approaches.

Unit II

Relational diagram of principle process. Structure of a generalized agricultural simulator. Input environment and techniques for monitoring plant environment.

Unit III

Process and aspects of growth and development. Input yield models. Quantitative analysis of photosynthesis, respiration, growth, water and nutrient uptake. Yield functions.

Unit IV

Remote sensing-based modeling and field variability of growth influencing factors.

VI. Learning outcome

The students will be able to know various plant growth models and their application based on input environmental parameters. Student will be acquainted with generalized agricultural simulator.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to plant growth modelling	4
2.	Simulation and simulation language	4
3.	Types of models and modeling approaches	4
4.	Relational diagram of principle process	2
5.	Structure of a generalized agricultural simulator	2
6.	Input environment and techniques for monitoring plant environment	4
7.	Process and aspects of growth and development. Input yield models	4
8.	Quantitative analysis of photosynthesis, respiration, growth, water and nutrient uptake. Yield functions	3
9.	Remote sensing-based modelling	3
10.	Field variability of growth influencing factors	2
	Total	**32**

I. Course Title : Multi Criteria Decision Making Systems

II. Course Code : IDE 606

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint students about multi criteria decision making system which include multi-attribute decision making and multi-objective decision making.

V. Theory

Unit I

Introduction: MCDM overview, basic foundations and Pareto optimality elementary decision analysis. Decision trees and influence diagrams.

Unit II

Multi–attribute decision making (MADM): Deterministic utility theory, value decomposition, additive value decomposition, Multi–facility location analysis, expected utility theory, single attribute utility functions, multi–attribute overview, two–attribute utility models, multi–attribute computer programs, multi–attribute assessment.

Unit III

Multi-objective decision making (MODM): Vector optimization theory, weighting methods, weighting example. Linear vector optimization (LVOP), parametric decomposition, LVOP algorithm, LVOP example.

Unit IV

Non interactive and interactive methods: Geoffrion's Bi-criterion method, linear goal programming, nonlinear and integer goal programming.

Unit V

Interactive trade-off methods: Zionts–Wallenius, Surrogate worth, Group decision making methods.

VI. Learning outcome

The students will be able to understand and learn to apply various techniques for the best solutions of real-life command area and other hydrological problems.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	MCDM overview	1
2.	Basic foundations and Pareto optimality elementary decision analysis	2
3.	Decision trees and influence diagrams	1
4.	Multi-attribute decision making (MADM): Deterministic utility theory, value decomposition, additive value decomposition	2
5.	Multi-facility location analysis	1
6.	Expected utility theory	1
7.	Single attribute utility functions	1
8.	Multi-attribute overview	1
9.	Two-attribute utility models	1
10.	Multi-attribute computer programs and multi–attribute assessment	2
11.	Multi-objective decision making (MODM)	1

Vol. 4

Agricultural Engineering
– Renewable Energy Engineering

Preamble

(Renewable Energy Engineering)

Course curricula and course outlines in Renewable EnergyEngineering are designed in view of the fact that courses are offered by students from disciplines of faculties of Farm Machinery and Power Engineering, Irrigation and Drainage Engineering, Process and Food Engineering.

At the post graduate level it becomes more important where they have not only to learn the recent advances in their subjects but have also to be trained in the modern and latest techniques in their disciplines so that they can participate and contribute in the development and advancement in their related fields.Further, the shrinking job opportunities in the National Agricultural Research System (ICAR/SAUs) have put additional pressure on our education system to prepare students in tune with the demands of the private sector.

All courses are designed to cover all basic topics andhave been designed by taking into consideration demands of private sector harnessing commercial aspects, modern research tools and their applications, supplementary skills required, and enhancing the global competitiveness and employability of students.The emphasis has been given on precision irrigation and modeling management and accordingly new courses “Wind energy, solid waste management, new alternate energy system, advances in renewable energy systemsand Energy generation from agricultural waste and byproducts”are framed in view of the recent developments in the subject.

The courses have been revised, updated and restructured in view of current developments and emerging trends in Renewable Energy Engineering.The revised courses cover the areas:Energy auditing, conversion and management, Solar photovoltaic system design and analysis, Renewable energy policy, planning and economics, Advances in renewable energy systems, New alternate energy systems, Fuel and combustion, Advances in biogas technology, Solid waste and waste water management, Advanced photovoltaic power generation, Renewable energy for industrial application, Bio-fuel technologies and application and Energy modeling and simulation.

The course content and syllabus upgraded with more of practical orientation and as per ARS Syllabus.

The ICAR recommendations for PG courses have been taken into consideration in framing these courses. It is hoped that these will prove very useful to the future students.

REE 512	Energy Generation from Agricultural Waste and Byproducts	2+1
REE 513	Agro Energy Audit and Management	2+1
REE 514	Green House Energetic and Passive Architecture	1+1
REE 515	Energy Management in Food Processing Industries	1+1
	Total	**28+13**

*Compulsory Course

Minor Courses (Requirement: 08 Credits)

Course Code	Course Title	Credit Hours
FMPE 517	Machinery for Precision Agriculture	2+1
FMPE 518	Machinery for Horticulture and Protected Agriculture	2+0
PFE 511	Application of Engineering Properties in Food Processing	2+1
PFE 519	Bioprocess Engineering	2+1
IDE 511	Design of Pumps for Irrigation and Drainage	2+0
CE 501	Dimensional Analysis and Similitude	2+0
FMPE 515	Computer Aided System Design	0+2
CSE 501	Big Data Analytics	2+1
CSE 502	Artificial Intelligence	2+1
CSE 504	Soft Computing Techniques in Engineering	2+1
MATH 501	Finite Element Methods	1+1

Course Code	Course Title	Credits
MATH 502	Numerical Methods for Engineers	2+1
ME 501	Mechatronics and Robotics in Agriculture	2+0
	Any other course(s) of other department other than courses from major can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 06 Credits)

Course Code	Course Title	Credits
*STAT 501	Statistical Methods for Research Works	2+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Compulsory Course

Common Courses (Requirement: 05 Credits)

Course Code	Course Title	Credits
*PGS 501	Library and Information Services	1+0
*PGS 502	Technical Writing and Communication Skills	1+0
*PGS 503	Intellectual Property and its management in Agriculture	1+0
*PGS 504	Basic Concepts in Laboratory Techniques	1+0
*PGS 505	Agricultural Research, Research Ethics and Rural Development Programmes	1+0

*Detailed course outline to be developed by designated BSMA

List of Other Essential Requirements

Course Code	Course Title	Credits
IDE 591	Seminar	0+1
IDE 599	Thesis Research	0+30

Course Contents
M.Tech. in Renewable Energy Engineering

I. Course Title : Renewable Energy Technologies

II. Course Code : REE 501

III. Credit Hours : 2+1

IV. Aim of the course

To provide knowledge, understanding and application oriented skills on renewable energy sources and relevant technologies towards their effective utilization for meeting energy demand.

V. Theory

Unit I

Solar Energy: Heat transfer, estimation and physical conversion, Instruments for measurement. Energy collection and analysis: FPC, ETC, concentrating collectors. Solar energy application: Direct and indirect. Solar photovoltaic technology: Conversion, Systems components, integrations and applications.

Unit II

Energy from biomass and wastes: Production, distribution, characterization, treatments, recycling. Biomass conversion technologies: Thermo-chemical, bio-chemical and agro-chemical technology. Raw materials, process parameters, end products and utilization.

Unit III

Wind energy: Resource estimation, technologies, performance curves, power and torque characteristics. Airfoils and rotors: Wind mill parameters, wind farms design and considerations.

Unit IV

Alternate Energy Technologies: Ocean Thermal Energy Conversion, Geothermal, Tidal, Hydro. Energy conversion systems: Resources, systems integrations and analysis, applications. Energy storage: Types, materials, characteristics and application.

VI. Practical

Analysis of solar collectors.Solar Photovoltaic cell characteristics, analysis of SPV systems.Characterization of biomass. Design and benefit analysis of energy systems. Design and efficiency testing of wind energy conversion devices.

VII. Learning outcome

The students is acquainted the skill to understand technical aspects and principles of renewable energy characteristics of the resource base (solar radiation, wind energy, bio energy, etc.) In a further steps an economic analysis of supply technologies.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Solar energy: introduction. Solar radiations measuring Instruments	1
2.	Passive Flat plate solar collectors, types. Passive solar water heaters. Performance of solar water heater. Effect of various parameters on performance	2
3.	Solar passive concentrators: Brief introduction to main types of solar concentrators, solar cookers	1
4.	Solar passive crop dryers: Description of various types of solar crop dryers, Applications of solar crop dryers	2
5.	Solar photovoltaic technology: Conversion, Systems components, integrations and applications	2
6.	Biomass Production, distribution, characterization, treatments, recycling.	1
7.	Review of gasifiers basics; Selection criteria for type and capacity of gasifier; Performance parameters for gasifiers e.g. SGR, turn down ratio etc;	1
8.	Basic design of small scale Imbert type downdraft gasifier (without use of Tables) and Basic features of throatless and inverted downdraft gasifiers (No designing)	1
9.	Baling for densification of biomass and briquetting machines for densification of biomass	1
10.	Bio-chemical and agro-chemical technologies for biomass conversion	2
11.	Raw materials, process parameters, end products and utilization for bio-chemical and agro-chemical technologies	2
12.	Resource estimation of wind energy, technologies and performance curves	2
13.	Power and torque characteristics	2
14.	Wind mill parameters	2
15.	Wind farms design and considerations	2
16.	Ocean Thermal Energy Conversion	2
17.	Geothermal, Tidal and Hydro Energy conversion systems	2
18.	Energy storage: Types, materials, characteristics and application	4
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Analysis of solar collectors	3
2.	Solar Photovoltaic cell characteristics, analysis of SPV systems	3
3.	Characterization of biomass	4
4.	Design and benefit analysis of energy systems	3
5.	Design and efficiency testing of wind energy conversion devices	3
	Total	**16**

X. Suggested Reading

I. Course Title : Solar Thermal Energy Conversion Technologies

II. Course Code : REE 502

III. Credit Hours : 2+1

IV. Aim of the course

To provide in-depth knowledge, understanding and application oriented skills on solar thermal conversion technologies and their effective utilization for meeting energy demand.

V. Theory

Unit I

Characteristics of solar radiation: Attenuation, absorption, scattering and air mass. Solar earth geometry.

Unit II

Solar flux and weather data. Solar radiation data and estimation: Radiation estimation models and applications. Heat and mass transfer in solar energy utilization: Gray surface, sky radiation, radiation heat transfer coefficient, reflectivity, transitivity, transmittance absorption product. Selective surfaces and materials.

Unit III

Solar thermal energy collectors (track and untrack): Heat capacity effect, time constant measurement, design and efficiency calculations, F chart method utility.

Unit IV

Techno-economic feasibility of solar thermal energy applications: Cooking, air heating for drying, steam generation, space heating and cooling, refrigeration, architecture, absorption cooling, thermal power generation.

VI. Practical

Solar radiation measurement, estimation model applications, design of collectors, study of materials used in solar system. Energy balance and efficiency calculation of collectors.

VII. Learning outcome

The student is able to understand the detail knowledge about working and design of various solar thermal devices able to design different solar thermal devices.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to characteristics of solar radiation and Solar earth geometry	2
2.	Solar flux and weather data measurement and interpretation	2
3.	Estimation of Solar radiation data using models and estimation	3
4.	Heat and mass transfer in solar energy utilization	2

S.No.	Topic	No. of Lectures
5.	Gray surface, sky radiation, radiation heat transfer coefficient	2
6.	Reflectivity, Transitivity, Transmittance Absorption	2
7.	Selective surfaces and materials as solar energy collectors	2
8.	Heat capacity effect, time constant measurement of solar energy	2
9.	Design and efficiency calculations of Solar thermal energy collectors	4
10.	F chart method utility for Designing Solar Thermal Water Heating Systems	2
11.	Techno-economic feasibility of solar thermal energy in cooking, drying of food products, space heating and cooling.	4
12.	Economic feasibility of solar thermal energy in refrigeration, architecture, absorption cooling, thermal power generation.	4
	Total	**30**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Measurement of Solar radiation	1
2.	Estimation of solar energy by model applications	2
3.	Design of solar energy collectors	2
4.	Study of materials used in solar system	1
5.	Energy balance in solar energy collectors	2
6.	Efficiency calculation of collectors	2
	Total	**10**

I. Course Title : Biomass Energy Conversion Technologies

II. Course Code : REE 503

III. Credit Hours : 2+1

IV. Aim of the course

To understand the bio-conversion technologies and fuels system, types of biomass derived fuels and energy, thermo-chemical conversion of biomass to heat and power, value adding of agro-residues.

V. Theory

Unit I

Biomass characterization: Types and resources, sustainability issues, assessment tools and methodologies, biomass fuel characterization, Biomass supply chain concept. Direct use of biomass: Size reduction, baling, pelletization, briquetting technologies.

Unit II

Biochemical conversion of biomass: Feedstock, process design, operation, optimized process parameters and utilization for biogas and bioethanol production.

Unit III

Biomass combustion: Stoichiometric air requirement, chemistry of combustion, design of combustion system, combustion zones, flame structure, stability, emissions. Co-firing of biomass.

Unit IV

Thermo-chemical conversion of biomass: Feedstock, chemistry, reactor design, operation, optimized process parameters and utilization for gasification, carbonization, torrefaction and pyrolysis.

Unit V

Cogeneration technologies: Cycles, topping, bottoming, selection, problems, applications. Waste heat recovery: Estimation, systems, design and application.

VI. Practical

Biomass characterization.Design of bioreactors.Study of techno-economical feasibility of bio-chemical conversion process.Performance evaluation of combustion gadgets, gasifiers and pyrolytic converters.Design of waste heat recovery system.

VII. Learning outcome

The students is enable to extract the energy from biomass and acquainted the skill to know how to choose the suitable biomass fuels for different industrial applications with design and economics of the system.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Biomass characterization: Types and resources, sustainability issues, assessment tools and methodologies, biomass fuel characterization, Biomass supply chain concept.	3
2.	Direct use of biomass	1
3.	Size reduction, baling, pelletization, briquetting technologies.	2
4.	Biochemical conversion of biomass	1
5.	Feedstock, process design, operation, optimized process parameters.	2
6.	Utilization for biogas and bioethanol production.	1
7.	Biomass combustion	1
8.	Stoichiometric air requirement, chemistry of combustion.	3
9.	Design of combustion system.	2
10.	Combustion zones, flame structure, stability, emissions.	2
11.	Co-firing of biomass.	1
12.	Thermo-chemical conversion of biomass: Feedstock, chemistry.	2
13.	Reactor design.	1

S.No.	Topic	No. of Lectures
14.	Operation, optimized process parameters and utilization for gasification, carbonization, torrefaction and pyrolysis.	2
15.	Cogeneration technologies: Cycles, topping, bottoming, selection.	2
16.	Cogeneration Problems and applications.	2
17.	Waste heat recovery	2
18.	Estimation, systems, design and application.	2
	Total	**32**

IX. List of Practicals

S.No.	Topics	No. of Practicals
1.	Characterization of biomass	2
2.	Design of bio-reactors	1
3.	Determination of techno-economical feasibility of bio-chemical conversion process.	2
4.	Performance evaluation of combustion gadgets	1
5.	Performance evaluation of gasifiers	1
6.	Performance evaluation of pyrolytic converters	1
7.	Design of waste heat recovery system	2
	Total	**10**

I. Course Title : Energy Auditing, Conservation and Management

II. Course Code : REE 504

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip about the sources of energy, conservation of energy and its management. Study of energy efficiency, energy planning, forecasting and energy economics.

V. Theory

Unit I

Energy conservation: Concepts, energy classification, equivalents, scenario, energy pricing, importance. Energy conservation act.

Unit II

Energy auditing and economics: Energy management, energy audit strategy, types. Energy performance: Bench marking, fuel substitutions, energy audit instruments, material and energy balance. Energy conversion: Energy index, cost index. Financial management.

Unit III

Thermal energy audit: Performance evaluation, energy conservation opportunities in boilers, steam system and furnaces, insulation, refractory's and other thermal utilities.

Unit IV

Electrical Energy audit: Electrical systems, electricity billing, load management, power factor. Performance evaluation and energy conservation opportunities in motors, compressed air system, HVAC and refrigeration system, fans and blowers, pumps and lighting system.

Unit V

Energy auditing and reporting in industries, Replacement of renewable energy technology option, case study in agro-industries.

VI. Practical

Problems on energy index, cost index. Problems on material balance and energy balance. Financial management.Energy audit and conservation opportunities in thermal and electrical utilities. Case studies on energy audit and conservation.

VII. Learning outcome

Able to understand the concept of energy auditing, conservation and management. The in-depth knowledge about the quantification, conservation opportunity and retrofitting of energy efficient system integration is expected from the course.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Energy conservation: Introduction, Concepts, Scenario	2
2.	Classification of Energy	1
3.	Energy equivalents, energy pricing, importance.	2
4.	Energy conservation act.	2
5.	Introduction to energy management, energy audit strategy and types.	2
6.	Energy performance: Bench marking, fuel substitutions.	1
7.	Energy audit instruments, material and energy balance.	2
8.	Energy conversion: Energy index, cost index. Financial management.	2
9.	Performance evaluation and energy conservation opportunities in boilers.	1
10.	Insulation, refractory's and other thermal utilities.	2
11.	Performance evaluation and energy conservation opportunities in steam system and furnaces.	2
12.	Electrical Energy audit: Electrical systems, electricity billing, load management, power factor.	2
13.	Performance evaluation and energy conservation opportunities in motors, compressed air system.	2
14.	Performance evaluation and energy conservation opportunities in HVAC and refrigeration system.	2
15.	Performance evaluation and energy conservation opportunities in fans and blowers, pumps and lighting system.	2
16.	Energy auditing and reporting in industries.	1
17.	Replacement of renewable energy technology option.	2
18.	Case study in agro-industries.	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Problems on energy index.	2
2.	Problems on cost index.	2
3.	Problems on material balance.	2
4.	Problems on energy balance.	2
5.	Financial management.	2
6.	Energy audit and conservation opportunities in thermal utilities.	2
7.	Energy audit and conservation opportunities in electrical utilities.	2
8.	Case studies on energy audit and conservation.	2
	Total	**16**

I. Course Title : Wind Energy Conversion and Utilization

II. Course Code : REE 505

III. Credit Hours : 2+1

IV. Aim of the course

To acquire the in-depth knowledge of wind energy conversion systems, wind potential mapping, estimation and analysis of wind data.

V. Theory

Unit I

Wind mapping and assessment: Wind energy potential, nature of wind, Weibull and Rayleigh analysis, instruments, history and taxonomy of wind mills, wind power laws.

Unit II

Wind turbine aerodynamics: Momentum theories, basic aerodynamics, airfoils and their characteristics. Horizontal Axis Wind Turbine (HAWT): Blade element theory, wake analysis. Vertical Axis Wind Turbine (VAWT): Aerodynamics, rotor design, power regulation, yaw system.

Unit III

Selection of site.Mechanical and electrical applications. Wind farms: Interfacing, maintenance. Management of power generated by wind mill: Instruments and controls. Stand alone and grid connected systems. Wind energy storage. Wheeling and banking. Cost economics. Testing and certification procedures.

Unit IV

Wind turbine loads: Aerodynamic loads in steady operation, wind turbulence, static. Wind energy control system (WECS). Synchronous and asynchronous generators. Annual Energy Output (AEO). Testing of WECS.

VI. Practical

Visit to meteorological observatory. Wind velocity mapping and curve analysis. Wind energy instruments and resource assessment. Design of wind mills, water pumping wind mills.Performance evaluation of wind aero-generator. Wind turbine loads. Economics of wind energy systems.

VII. Learning outcome

The students will acquire knowledge regarding mechanism of wind energy and different types of wind machines available to harness wind power and also able to design wind turbine for irrigation as well as for power generation.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Mapping of Wind energy and its assessment, nature of wind, Wind energy potential	2
2.	Weibull and Rayleigh analysis	2
3.	Instruments, history and taxonomy of wind mills, wind power laws	2
4.	Aerodynamics of Wind turbine, Momentum theories, airfoils and their characteristics	3
5.	Elemental theory of Horizontal and Vertical Axis Wind Turbine (HAWT)	2
6.	Aerodynamics of wind turbines, rotor design, power regulation, yaw system	2
7.	Selection of site for wind mill installation, Mechanical and electrical applications of wind mills	2
8.	Wind farms: Interfacing and maintenance, Instruments and controls for management of power generated by wind mill	3
9.	Stand alone and grid connected systems, Wind energy storage, Wheeling and banking.	2
10.	Economics of wind mills	2
11.	Testing and certification procedures for wind mills	3
12.	Wind turbine Aerodynamic loads in steady operation, wind turbulence, static.	2
13.	Wind energy control system (WECS), Synchronous and asynchronous generators	2
14.	Annual Energy Output (AEO), Testing of Wind energy control system	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Visit to meteorological observatory	1
2.	Wind velocity mapping and curve analysis	2
3.	Wind energy instruments and resource assessment	1
4.	Design of wind mills	1

S.No.	Topic	No. of Practicals
5.	Water pumping wind mills	1
6.	Performance evaluation of wind aero-generator	2
7.	Study of Wind turbine loads	2
8.	Economics of wind energy systems.	2
	Total	**12**

I. Course Title : Solar Photovoltaic System Design and Analysis

II. Course Code : REE 506

III. Credit Hours : 1+1

IV. Aim of the course

To provide detail knowledge about working and design of various solar photovoltaic systems for power generation.

V. Theory

Unit I

Physics of solar cells: Crystal structure, band theory, semiconductor, p-n junctions, absorption of radiation, generation, recombination and carrier separation. Standard solar cell structure: I,V characteristics, conversion efficiency, losses in solar cell, impact of radiation and temperature.

Unit II

Solar PV module technologies, First generation: Silicon wafer based technology, Second generation: Thin film technologies, Third generation/emerging PV technologies: Organic PV, Dye sensitized PV, Quantum-dot, Hot-carrier, up conversion and down conversion. Latest benchmark efficiencies: Laboratory and manufacturing. Fabrication technologies.

Unit III

Solar PV systems: Balance of System (BoS), SPV system design guideline and methodologies, introduction to PVSyst, designing of standalone/grid connected PV systems for domestic/commercial use. Rooftop business models: CAPEX and RESCO, canal top, floating PV system design.

Unit IV

Materials and devices for energy storage: Batteries, Carbon Nano-Tubes (CNT), fabrication of CNTs, CNT-polymer composites, ultra-capacitors etc.

VI. Practical

Solar cell efficiency testing.SPV fabrication technologies.System integration and BoS matching studies.PV software's operation and utilization.Design and estimation of SPV systems components for agrobased industrial applications.Batteries performance testing.

VII. Learning outcome

Student is able to design different solar photovoltaic system for power generation with system integration and economic analysis.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Physics of solar cells: Crystal structure, band theory, semiconductor, p-n junctions	1
2.	Absorption of radiation, generation, recombination and carrier separation.	2
3.	Standard solar cell structure: I,V characteristics, conversion efficiency, losses in solar cell, impact of radiation and temperature.	2
4.	Solar PV module technologies, First generation: Silicon wafer based technology, Second generation: Thin film technologies.	1
5.	Third generation/emerging PV technologies: Organic PV, Dye sensitized PV, Quantum-dot, Hot-carrier, up conversion and down conversion.	1
6.	Latest benchmark efficiencies: Laboratory and manufacturing. Fabrication technologies.	2
7.	Solar PV systems: Balance of System (BoS), SPV system design guideline and methodologies,	1
8.	Introduction to PVSyst, designing of standalone/grid connected PV systems for domestic/commercial use.	2
9.	Rooftop business models: CAPEX and RESCO, canal top, floating PV system design.	2
10.	Materials and devices for energy storage: Batteries, Carbon Nano-Tubes (CNT), Fabrication of CNTs, CNT-polymer composites, ultra-capacitors etc.	2
	Total	**16**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	To demonstrate the I-V and P-V characteristics of PV module with varying radiation and temperature level and efficiency determination.	1
2.	To demonstrate the I-V and P-V characteristics of series combination of PV modules and efficiency determination.	1
3.	To demonstrate the I-V and P-V characteristics of parallel combination of PV modules and efficiency determination.	1
4.	To show the effect of variation in tilt angle on PV module power.	1
5.	To demonstrate the effect of shading on module output power and efficiency determination.	1
6.	Study on SPV fabrication technologies.	1
7.	Study on system integration and BoS matching.	1

S.No.	Topic	No. of Practicals
8.	PV software's operation and utilization.	1
9.	Design and estimation of SPV systems components for agrobased industrial applications.	1
10.	Battery performance testing.	1
	Total	**10**

I. Course Title : Renewable Energy Policy, Planning and Economics

II. Course Code : REE 507

III. Credit Hours : 3+0

IV. Aim of the course

To provide the in-depth knowledge about the current energy policy and planning, environmental economics, policy and ecology.

V. Theory

Unit I

Introduction to policy parameters, regulatory bodies.Introduction to overall policy environment on energy sector, policy formulation parameters. Entities: Consumers and their tariffs, generator, DISCOM, Regulators: CERC and SERC, Statutory bodies. Typical issues of Indian power sector.

Unit II

Indian energy Policy: Introduction, Electricity Act, National Policy on Tariff, Climate Change, RE, Solar Missions, Wind Power and Regulatory Commissions. Concept of Grid Code, Green Corridor, Solar and Hybrid Parks. Electricity Trading: Open Access, RPO Distributed Generation Regional Grid Region. International Energy Policies and Treaties.

Unit III

Policy and planning: Energy, environment interaction, clean development mechanism, financing of energy systems, software for energy planning, socio-economical approach. Project management in energy: Cost economics-sensitivity and risk analysis.

Unit IV

Energy economics: economic evaluation of renewable energy systems, life cycle costing, components of energy investment and risk and uncertainties in energy investment.

VI. Learning outcome

A student is be able to develop an interdisciplinary knowledge base that will enable them to understand and solve contemporary energy policy, planning and environmental problems.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to policy parameters and regulatory bodies in Energy	2
2.	Introduction to overall policy environment on energy sector, policy formulation parameters	3
3.	Entities: Consumers and their tariffs	2
4.	Generator, DISCOM, Regulators: CERC and SERC, Statutory bodies.	3

III. Credit Hours : 2+1

IV. Aim of the course

To get acquainted with various alternate fuels, their applications and also to learn safety factors of alternate fuel, efficiency, economics and commercial considerations.

V. Theory

Unit I

Introduction to alternate fuels: Methanol, ethanol, biogas, producer gas, hydrogen and fuel cell. Production composition and properties, combustion characteristics, comparison with conventional fuels, potential, possibilities and problems.

Unit II

Fuel cell: Principle, classification, system efficiency. Life cycle assessment of fuel cell systems.

Unit III

Hydrogen fuel: Production, gas cleanup, challenges and opportunities. Hydrogen storage and energy economy.

Unit IV

Utilization: Thermal and mechanical applications. Environmental impact and safety factors of alternate fuel, efficiency, economics and commercial considerations.

VI. Practical

Performance of I.C. engines on alternate fuels, measurement of flue gas parameters, thermal applications of alternate fuels. Hydrogen production. Biomass based fuel cell. Integrated biomass based gasifier for power generation.

VII. Learning outcome

Students will understand various properties of alternate fuels like methanol, ethanol, fuel cells, hydrogen fuel for energy efficient utilization.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to alternate fuels: methanol, ethanol, biogas, producer gas, and hydrogen fuel cell.	3
2.	Alternate fuels: potential, possibilities and problems.	2
3.	Production, composition and properties of methanol.	2
4.	Production, composition and properties of ethanol.	2
5.	Production, composition and properties of biogas.	2
6.	Production, composition and properties of producer gas.	2
7.	Production and properties of hydrogen fuel cell.	2
8.	Combustion characteristics of alternate fuels, comparison of with conventional fuels.	3
9.	Fuel cell: Principle, classification, system efficiency.	2
10.	Life cycle assessment of fuel cell systems.	2
11.	Hydrogen fuel: gas cleanup.	2
12.	Hydrogen fuel: challenges and opportunities	2

S.No.	Topic	No. of Lectures
13.	Hydrogen storage and energy economy.	1
14.	Thermal and mechanical applications alternate fuel.	2
15.	Environmental impact and safety factors of alternate fuels, efficiency, economics and commercial considerations.	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Performance of I.C. engines on alternate fuels (biogas, producer gas and bio diesel)	3
2.	Measurement of flue gas parameters.	1
3.	Thermal applications of alternate fuels (biogas, producer gas and bio diesel)	3
4.	Hydrogen production.	1
5.	Biomass based fuel cell.	1
6.	Integrated biomass-based gasifier for power generation.	1
	Total	**10**

I. Course Title : Biogas Technology and Mechanism

II. Course Code : REE 509

III. Credit Hours : 1+1

IV. Aim of the course

To provide the in-depth knowledge about biogas technology and its mechanism in detail to use the biogas as domestic as well as commercial fuel.

V. Theory

Unit I

Biogas Technology: Potential and status, chemistry, physical conditions and utilization of alternate feedstock materials.

Unit II

Types of reactors: Single phase, two phase processes. High rate biomethanation process, selection of model and size, construction technique, material requirement. Design concept of night soil, kitchen waste, solid state cold condition biogas plants.

Unit III

Biogas distribution and utilization: Properties and uses of biogas, design of gas distribution system. Biogas utilization devices: Biogas scrubbing and compressing, dual fuel engines and its limitations, generation of power. Testing of biogas appliances.

Unit IV

Effluent: Handling of effluent biogas plant, effluent treatment and management, BDS applications and enrichment. Cost and financial viability of biogas plants.Repair and maintenance of biogas plants.

VI. Practical

Design of biogas plant for solid and liquid wastes, cost estimation, analysis of biogas, purification of biogas.Performance evaluation of biogas appliances.Testing of biogas burner for heat transfer, thermal and cooking efficiency. Bio digested slurry analysis, use of biogas spent slurry. Carbon credits.

VII. Learning outcome

Students are able to design, select, estimate and analyzed the biogas technology, chemical and physical conditions and get acquainted with various biogas appliances.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Biogas Technology potential and status	1
2.	Chemistry, physical conditions and utilization of alternate feedstock materials	1
3.	Types of reactors: Single phase, two phase processes.	1
4.	High rate bio-methanation process, selection of model and size, construction technique, material requirement	2
5.	Design concept of night soil, kitchen waste, solid state cold condition biogas plants	1
6.	Properties and uses of biogas, design of gas distribution system	1
7.	Biogas scrubbing and compressing, dual fuel engines and its limitations, generation of power	2
8.	Testing of biogas appliances	2
9.	Handling of biogas plant effluents, effluent treatment and management	1
10.	Bio digested Slurry applications and enrichment	2
11.	Cost and financial viability of biogas plants	1
12.	Repair and maintenance of biogas plants	1
	Total	**16**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Design of biogas plant for solid and liquid wastes	1
2.	Cost estimation of different biogas plants: KVIC, Janta, Deenbandhu, type	2

S.No.	Topic	No. of Lectures
3.	Analysis of biogas	1
4.	Experiment on purification of biogas	1
5.	Performance evaluation of biogas appliances	1
6.	Testing of biogas burner for heat transfer, thermal and cooking efficiency	2
7.	Analysis of Bio-digested slurry	2
8.	Study on use of biogas spent slurry	1
9.	Study and analysis of Carbon credits.	1
	Total	**12**

I. Course Title : Energy, Ecology and Environment

II. Course Code : REE 510

III. Credit Hours : 3+0

IV. Aim of the course

To provide detail knowledge of carbon cycle, ecosystem, climate change and global environmental change and inter linkages of renewable energy sources.

V. Theory

Unit I

Global carbon cycle.Carbon reservoirs flow and human interventions. Global warming and climate change. Energy efficient technology: Efficiency hierarchy, energy dependent activities, energy policies, linkage between energy use and economic growth and environment.

Unit II

Ecosystem: Kinds, transfection, components of ecosystem, ecosystem development of evaluation, major ecosystem of the world, physical environment and metrology.

Unit III

Climate change: Impact and models. Energy for sustainable development: Development indices, pillars, subsystems, principles and dimensions. Low carbon technologies: Energy efficiency projects, carbon trading.

Unit IV

Environment, Environmental degradation: Thermal and chemical pollution, primary and secondary pollutant, air pollution, water pollution, unclear energy hazard, radioactive hazards, mining hazards, land use, oil spills and gas leaks.

Unit V

Global environmental changes: United Nations Framework Convention on Climate Change (UNFCC), Kyoto protocol and clean development mechanism: Overview, administration, participation, institutions, procedures, project design and formulation.

VI. Learning outcome

Students will able to understand the relationship between carbon cycle, energy policies, energy use and economic growth and factors affecting environment.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Global carbon cycle.	1
2.	Carbon reservoirs flow and human interventions.	2
3.	Global warming and climate change.	2
	Energy efficient technology: Efficiency hierarchy, energy dependent activities, energy policies, linkage between energy use and economic growth and environment.	4
4.	Ecosystem: Kinds, transfection, components of ecosystem,	3
5.	Ecosystem development of evaluation, major ecosystem of the world, physical environment and metrology.	3
6.	Climate change: Impact and models.	3
	Energy for sustainable development: Development indices, pillars, subsystems, principles and dimensions.	2
7.	Low carbon technologies: Energy efficiency projects, carbon trading.	3
8.	Environment, Environmental degradation	1
9.	Thermal and chemical pollution, primary and secondary pollutant, air pollution,	3
10.	Water pollution	1
11.	unclear energy hazard	1
12.	Radioactive hazards, mining hazards, land use, oil spills and gas leaks.	3
13.	Global environmental changes: United Nations Framework Convention on Climate Change (UNFCC)	4
14.	Kyoto protocol and clean development mechanism: Overview, administration, participation, institutions, procedures, project design and formulation.	4
	Total	**40**

I. Course Title : Design and Analysis of Renewable Energy Conversion Systems

II. Course Code : REE 511

III. Credit Hours : 2+1

IV. Aim of the course

To design and analyze renewable energy conversion systems, thermodynamics involved in it and performance of renewable energy systems.

V. Theory

Unit I

Energy cycle of the earth. Estimation and assessment of renewable energy sources: Water flow and storage, ocean currents and tides, biomass energy, solar energy, wind energy and other renewable energy sources.

Unit II

Thermodynamics of renewable energy conversion: Energy and exergy analysis of renewable energy power systems. Optimum design of hybrid renewable energy systems: Concept, considerations and methodologies.

Unit III

Design of renewable energy systems: Design concept, operational parameters, consideration and rational values for agro industrial applications.

Unit IV

Performance analysis of renewable energy systems: Standards and test codes, optimum performance records, evaluation and maintenance aspects, uses of HOMER (Hybrid Optimization Model for Electric Renewable) software.

VI. Practical

Estimation and assessment of renewable energy sources in India.Thermodynamic principles of energy conversion.Design and operational parameters of renewable energy systems. Study on standards and test codes of renewable energy systems.

VII. Learning outcome

Students will able to design of various energy conversion systems, standards and test codes of renewable energy systems and their performance analysis.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Energy cycle of the earth	1
2.	Estimation and assessment of renewable energy sources: Water flow and storage, ocean currents and tides	2

S.No.	Topic	No. of Lectures
3.	Estimation and assessment of renewable energy sources: biomass energy, solar energy, wind energy	3
4.	Estimation and assessment of renewable energy sources: other renewable energy sources.	2
5.	Thermodynamics of renewable energy conversion: Energy and energy analysis of renewable energy power systems.	4
6.	Optimum design of hybrid renewable energy systems: Concept, considerations and methodologies.	4
7.	Design of renewable energy systems: Design concept, operational parameters,	4
8.	Design of renewable energy systems: Consideration and rational values for agro industrial applications.	4
9.	Performance analysis of renewable energy systems: Standards and test codes, optimum performance records	3
10.	Performance analysis of renewable energy systems: Evaluation and maintenance aspects	3
11.	Uses of HOMER (Hybrid Optimization Model for Electric Renewable) software.	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Estimation and assessment of renewable energy sources in India	1
2.	Thermodynamic principles of energy conversion	2
3.	Design and operational parameters of biogas plant	2
4.	Design of a updraft gasifier using solid biomass	2
5.	Design of solar photovoltaic plant for a hostel/building	2
6.	Life cycle assessment and financial assessment of a photovoltaic plant for a hostel/building	1
7.	Study on standards of renewable energy systems	1
8.	Study on test codes of renewable energy systems	2
	Total	**13**

I. Course Title : Energy Generation from Agricultural Waste and Byproducts

II. Course Code : REE 512

III. Credit Hours : 2+1

IV. Aim of the course

To focus on agricultural wastes and by products for its utilization for energy generation.

V. Theory

Unit I

By Products: Generation, estimation and utilization. Agricultural and agro industrial by-products/wastes: Properties, characterization, on site handling, storage and processing. Concept, scope and maintenance of waste management and effluent treatment

Unit II

Waste as fuel: Utilization pattern, pretreatments, secondary treatments, mechanism, construction, efficiency and suitability.

Unit III

Utilization of agro based industrial wastes for paper production, production of particle board, fertilizer through vermi-composting and fuel.

Unit IV

Thermo-chemical and biochemical conversion of agricultural waste and byproducts: Densification, combustion, gasification, extraction, pyrolysis, carbonization, torrefaction, liquefaction, anaerobic digestion and fermentation process.

VI. Practical

Estimation and characterization of agricultural waste and byproducts, production of fuel from agricultural wastes and by products, techno-economic feasibility of waste to fuel systems.

VII. Learning outcome

Student will be able to understand the estimation, characterization, storage and handling of agricultural wastes and by products to generate the energy.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to Agricultural and agro industrial by-products/wastes:.	1
2.	Generation, estimation and utilization of Agricultural and agro-industrial by-products/wastes	2
3.	Properties, characterization, of Agricultural and agro industrial by-products/wastes	1
4.	On site handling, storage and processing Agricultural and agro industrial by-products/wastes	2
5.	Concept, scope and maintenance of waste management and effluent treatment	2
6.	Introduction to Waste as fuel:.	1
7.	Utilization pattern of waste as Fuel in India and world	1

S.No.	Topic	No. of Lectures
8.	Pretreatments and secondary treatments for waste for conversion to Fuel	2
9.	Mechanism, construction, efficiency and suitability of treatments	2
10.	Utilization of agro based industrial wastes for paper production	2
11.	Production of particle board,	1
12.	Fertilizer through vermi-composting and fuel	1
13.	Introduction to Thermo-chemical of agricultural waste and by-products	1
14.	Introduction to biochemical conversion of agricultural waste and by-products	1
15.	Densification	1
16.	Combustion	1
17.	Gasification	1
18.	Extraction	1
19.	Pyrolysis	1
20.	Carbonization	1
21.	Torrefaction	1
22.	Liquefaction	1
23.	Anaerobic digestion	2
24.	Fermentation process	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Estimation of agricultural waste by remote sensing and field Method	2
2.	Characterization of agricultural waste and by products	1
3.	Determination of moisture content of biomass	1
4.	Determination of Volatile solids	1
5.	Determination of Fixed carbon content of biomass	1
6.	Determination of ash content of biomass	1
7.	Estimation of calorific value of biomass	1
8.	Estimation of calorific value of biogas	1
9.	Estimation of calorific value of producer gas	1
10.	Determination of Lignin Cellulose Hemicellose in Biomass	1
11.	Production of fuel from agricultural wastes and by products,	1
12.	Production of Biogas, Producer gas and Biodiesel from Agricultural waste	2
13.	Techno-economic feasibility of waste to fuel systems	2
	Total	**16**

I. Course Title : Agro Energy Audit and Management

II. Course Code : REE 513

III. Credit Hours : 2+1

IV. Aim of the course

To emphasize the energy audit and its management in agriculture production system and agro based industries.

V. Theory

Unit I

Energy resources on the farm: Conventional and non-conventional forms of energy and their use. Heat equivalents and energy coefficients for different agricultural inputs and products.Pattern of energy consumption and their constraints in production of agriculture.

Unit II

Direct and indirect energy, energy audit of production agriculture, rural living and scope of conservation.

Unit III

Energy requirement in different agro-based industries: Energy analysis, energy ratio and specific energy value. Identification of energy efficient machinery systems: energy losses and their management.

Unit IV

Energy analysis techniques and methods: Energy balance, output and input ratio, resource utilization, conservation of energy sources. Energy conservation planning and practices.

VI. Practical

Study of energy audit techniques, energy use pattern and management strategies in various agro-industries, assessment of overall energy consumption, production and its cost in selected agro- industries. Estimation of energy requirement in different agriculture production system, study of energy input/output ratio of different agriculture production system.

VII. Learning outcome

Students will learn detail energy audit, energy balance techniques, energy management strategies, energy conservation planning and practices in agriculture production system.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Energy resources on the farm.	2
2.	Conventional and non-conventional forms of energy and their use.	2
3.	Heat equivalents and energy coefficients for different agricultural inputs and products.	3
4.	Pattern of energy consumption and their constraints in production of agriculture.	3
5.	Direct and indirect energy	2
6.	Energy audit of production agriculture, rural living and scope of conservation.	3

I. Course Title : Green house Energetic and Passive Architecture

II. Course Code : REE 514

III. Credit Hours : 1+1

IV. Aim of the course

To provide the in-depth knowledge about greenhouse design, energetics, production technique, passive heating concept and evaporative cooling etc.

V. Theory

Unit I

Green House: Environmental requirement, analysis of thermal energy flows, analysis of a greenhouse as solar collector. Instrumentation and control in green house.

Unit II

Passive concepts and components: Passive heating concepts, direct gain, indirect grain, isolated gains and sunspace passive cooling concepts,

Unit III

Evaporative cooling: Evaporative air and water coolers, application of wind, water and earth for cooling, use of isolation, shading, paint sand cavity walls for cooling.

Unit IV

Passive heating and cooling: Concepts, roof pond/sky therm, roof radiation trap, vary thermo wall, earth sheltered or earth based structures and earth air tunnels, ventilation, components, windows and thermal storage.

VI. Practical

Design of passive structures for animals, rural housing, study of evaporative cooling, air and light flows in house, survey of green houses, green house energetic.

VII. Learning outcome

Students get knowledge of thermal energy flows, analysis of green house, instrumentation and control in green house.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Green House: Environmental requirement, analysis of thermal energy flows, analysis of a greenhouse as solar collector.	3
2.	Instrumentation and control in green house.	2
3.	Passive concepts and components	1
4.	Passive heating concepts	1
5.	Direct gain, indirect grain, isolated gains and sunspace passive cooling concepts	3
6.	Evaporative cooling: Evaporative air and water coolers, application of wind, water and earth for cooling	2
7.	Use of isolation, shading, paint sand cavity walls for cooling.	1
8.	Passive heating and cooling	1
9.	Concepts, roof pond/sky theorem, roof radiation trap, vary thermo wall, earth sheltered or earth based structures and earth air tunnels, ventilation, components, windows and thermal storage.	2
	Total	**16**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Design of passive structures for animals.	2
2.	Design of passive structures for rural housing	2
3.	Study of evaporative cooling	1
4.	Study of air and light flows in house	1
5.	Survey of green houses	8
6.	Green house energetic	2
	Total	**16**

I. Course Title : Energy Management in Food Processing Industries

II. Course Code : REE 515

III. Credit Hours : 1+1

IV. Aim of the course

To acquaint and equip the students with different energy management techniques including energy auditing of food industries.

V. Theory

Unit I

Energy forms and units, energy perspective, norms and scenario, energy auditing, data collection and analysis for energy conservation in food processing industries.

Unit II

Sources of energy, its audit and management in various operational units of the agro-processing units, passive heating, passive cooling, sun drying and use of solar energy, biomass energy and other non-conventional energy sources in agro-processing industries.

Unit III

Reuse and calculation of used steam, hot water, chimney gases and cascading of energy sources. Energy accounting methods, measurement of energy, design of computer-based energy management systems, economics of energy use.

VI. Practical

Study of energy use pattern in various processing units i.e., rice mills, sugar mills, dal mills, oil mills, cotton-ginning units, milk plants, food industries etc. Energy audit study and management strategies in food processing plants.Identification of energy efficient processing machines.Assessment of overall energy consumption, production and its cost in food processing plants, visit to related food processing industry.

VII. Learning outcome

Student's capability to understand energy sources, analyze energy requirement in food processing operations and to economize it in food industries.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Energy forms and units, energy perspective, norms and scenario	2
2.	Energy auditing: definition, types of energy audit, planning	2
3.	Data collection and analysis for energy conservation in food processing industries.	2
4.	Sources of energy, its audit and management in various operational units of the agro-processing units	2
5.	Passive heating, passive cooling, sun drying and use of solar energy in agro-processing industries.	1
6.	Use of biomass energy and other non-conventional energy sources in agro-processing industries.	2
7.	Reuse and calculation of used steam, hot water, chimney gases and cascading of energy sources.	2
8.	Energy accounting methods, measurement of energy	1

REE 612	Energy Modelling and Simulation	1+1
	Total	**22+11**

*****Course has been made compulsory by UGC for PhD students. Course code and its detailed course outline to be adopted in toto as recommended by UGC.

Minor Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
FMPE 612	Farm Machinery Management and System Engineering	2+1
ME 501	Mechatronics and Robotics in Agriculture	2+0
PFE 614	Agri- Project Planning and Management	1+1
	Any other course(s) of other department other than course(s) from major can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*CPE-RPE	Research and Publication Ethics	1+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

***Course has been made compulsory by UGC for PhD students. Course code and its detailed course outline to be adopted in toto as recommended by UGC.**

List of other Essential Requirements

Course Code	Course Title	Credit Hours
IDE 691	Doctoral Seminar-I	0+1
IDE 692	Doctoral Seminar-II	0+1
IDE 699	Doctoral Research	0+75

Course Contents
Ph.D. in Renewable Energy Engineering

I. Course Title : Biochemical Conversion of Biomass

II. Course Code : REE 601

III. Credit Hours : 2+1

IV. Aim of the course

To impart the advanced knowledge about biochemical conversion technologies of biomass, engineering design and kinetic of bio-energy systems.

V. Theory

Unit I

Biomass formation: Energy recovery and recycling. Biochemical conversion of organic wastes: Methane production, vertical through digesters, high solid digestion, sludge treatment.

Unit II

Lagoons: Composting, contact and filter digestion, reactors, physical and chemical removal of dissolved materials. Activated sludge and other suspended culture process parameters. Waste waters, biological film flow processes, sanitation land fill, pre-digestion of waste.

Unit III

Engineering design of biogas units: Biogas boosters, structural behaviour, alternate construction materials, multi-criteria optimization, immobilization, modular biogas for tropical areas, kinetic models.

Unit IV

Bioconversion of biomass to alcohol: Types and pre-treatment of biomass, production process. Fermenter design and process parameters.Economics of bio-alcohol production, reaction kinetics, gasohol.Bio-hydrogen from algae/biomass.

VI. Practical

Lagoons and compositing. Biogas plant: Analysis of biogas system. Determination of methane production rate and parameters, biogas storage, purification, utilization and kinetic equations.Alcohol production, optimization of process parameters, fermenter designing and evaluation.Economic calculations of biogas and alcohol.

VII. Learning outcome

The student will able to design, analyze and evaluate the various biomass conversion technologies and parameters related to biomass for utilization of it for fuel extraction.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Biomass formation.	1
2.	Energy recovery and recycling.	1

S.No.	Topic	No. of Lectures
3.	Biochemical conversion of organic wastes.	1
4.	Methane production, vertical through digesters, high solid digestion.	2
5.	Sludge treatment.	1
6.	Lagoons: Composting, contact and filter digestion, reactors.	2
7.	Physical and chemical removal of dissolved materials.	2
8.	Activated sludge and other suspended culture process parameters.	2
9.	Waste waters	1
10.	Biological film flow processes, sanitation land fill, pre-digestion of waste.	2
11.	Engineering design of biogas units	2
12.	Biogas boosters, structural behaviour.	1
13.	Alternate construction materials.	1
14.	Multi-criteria optimization, immobilization.	2
15.	Modular biogas for tropical areas. Kinetic models	2
16.	Bioconversion of biomass to alcohol	1
17.	Types and pre-treatment of biomass production process.	2
18.	Fermenter design and process parameters.	2
19.	Economics of bio-alcohol production.	1
20.	Reaction kinetics, Gasohol.	1
21.	Bio-hydrogen from algae/biomass.	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Lagoons and compositing.	1
2.	Analysis of biogas systems.	2
3.	Determination of methane production rate and parameters.	1
4.	Biogas storage, purification.	1
5.	Biogas storage utilization and kinetic equations.	1
6.	Alcohol production, optimization of process parameters.	1
7.	Fermenter designing and evaluation.	1
8.	Economic calculations of biogas and alcohol.	2
	Total	**10**

X. Suggested Reading

- Culp AW. 1979. *Principles of Energy Conversion*. McGraw Hill Book Company, New York, USA.
- Kiang YH. 1981. *Waste Energy Utilization Technology*. Marcel Dekkar, New York, USA.
- Klan E. 1985. *Energy from Biomass and Wastes*. Institute of Gas Technology, Chicago.
- Wilson DG and Reinhold VN. 1977. *Hand Book of Solid Waste Management*. McGraw Hill Book Company, New York, USA.

I. Course Title : Thermo-Chemical Conversion of Biomass

II. Course Code : REE 602

III. Credit Hours : 2+1

IV. Aim of the course

To help students to understand in depth knowledge of thermo-chemical conversion of organic waste, combustion chemistry and different heat based conversion technologies for fuel and power generation.

V. Theory

Unit I

Biomass: Characterization, resources and energy recovery. Thermo-chemical conversion of organic wastes.Chemical thermodynamics, stoichiometry and thermodynamics.

Unit -II

Combustion of fuels: Solid fuels, stoker, types, fluidised bed. Liquid fuels: Atomization, vapour concentration, combustion phenomena. Gaseous fuel: Flame characteristics, inflammability limits, submerged combustion, combustion with explosion flame, pulsating combustion.

Unit III

Biomass Gasification: Gasifier configurations, classification, entrained flow, fluidized bed, moving bed, plasma gasification. Coal gasification technologies.Syngas characteristics.Tar and particulates in gasification.Integrated coal gasification.Gas turbine technologies.

Unit IV

Pyrolysis: Models, regimes, kinetics and effect of process parameters. Radiant heat flux, heterogeneous reactions, wall heat transfer.Fluidised bed reactors: Heat transfer circulating beds, moving bed reactor.

Unit V

Torrefaction and charcoal production: Carbonization parameters, temperature zone, input output, energy density ratios and characterization of finished products.

VI. Practical

Combustion thermodynamics and phenomenon in solid, liquid and gaseous fuels.TGA studies. Liquid and gaseous burners, flame studies, flue gas, heat budgeting. Kinetic study on gasifiers. Producer gas based power generation systems. Kinetic and model studies for torrefaction, char coal and bio oil production.

VII. Learning outcome

Students will enable to critical analysis of combustion of fuel and system design for thermos chemical conversion technologies for domestic and industrial applications.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Biomass: Characterization, resources and energy recovery.	2
2.	Thermo-chemical conversion of organic wastes.	1
3.	Chemical thermodynamics and stoichiometry.	3
4.	Combustion of solid fuels: stoker, types, fluidized bed.	2
5.	Combustion of liquid fuels: Atomization, vapour concentration, combustion phenomena.	2
6.	Combustion of gaseous fuel: Flame characteristics, inflammability limits, submerged combustion, combustion with explosion flame, pulsating combustion.	2
7.	Biomass Gasification: Gasifier configurations, classification, entrained flow, fluidized bed, moving bed, plasma gasification.	3
8.	Coal gasification technologies, Integrated coal gasification.	2

S.No.	Topic	No. of Lectures
9.	Syngas characteristics, Tar and particulates in gasification.	2
10.	Gas turbine technologies.	2
11.	Pyrolysis: Models, regimes, kinetics and effect of process parameters.	2
12.	Radiant heat flux, heterogeneous reactions, wall heat transfer.	2
13.	Fluidized bed reactors: Heat transfer circulating beds, moving bed reactor.	2
14.	Torrefaction and charcoal production: Carbonization parameters, temperature zone, input output	2
15.	Energy density ratios and characterization of finished products.	2
	Total	**31**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Combustion thermodynamics and phenomenon in solid, liquid and gaseous fuels	2
2.	Determination of efficiency of improved chulha through water boiling test procedure.	1
3.	Thermo-gravimetric analysis of biomass sample	1
4.	Study of liquid burners	1
5.	Study of gaseous burners	1
6.	Flame studies and flue gases	1
7.	Study on heat budgeting	1
8.	Study on kinetics of fluidized bed gasifier	1
9.	Producer gas based power generation systems	1
10.	Kinetic and model studies for Torrefaction	2
11.	Kinetic and model studies for charcoal production.	2
12.	Kinetic and model studies for bio oil production.	2
	Total	16

X. Suggested Reading

I. Course Title : Advances in Renewable Energy Systems

II. Course Code : REE 603

III. Credit Hours : 2+1

IV. Aim of the course

To provide in depth knowledge, understanding and application oriented skills on advanced renewable energy systems and relevant technologies towards their effective utilization for meeting energy demand.

V. Theory

Unit I

Solar thermal energy systems: Kinetics and heat transfer analysis, modelling studies. Design and performance of solar thermal systems, mathematical models, power plants, design and performance.

Unit II

Photovoltaics: Thermodynamic limitations of photocells. Semiconductors: P-n and n-p junctions, module design, sizing, power control and storage, space charge control, low pressure diode, cesium converter. Photo electro chemical cells, photo electrolysis cell.

Unit III

Wind power: Rotor design procedure, betz limit, ideal horizontal axis wind turbine, wake rotation, momentum theory and blade element theory, blade shape for ideal rotor without wake rotation, performance prediction wind turbine rotor dynamics and dynamic models.

Unit IV

Designing of water pumping wind mills: Electric power, power transformers, electrical machines, ancillary electrical equipment, wind power to consumer/grid. Wind turbine: Sitting, installation and operation issues, offshore wind farms, operation in severe climates.

VI. Practical

Design parameters of air collectors. Thermal analysis and heat loss, regularity models of heliostatic fields, power plant design. Photovoltaic cells characteristic curves. Water pumping.Power control system, grid control devices.Design of wind mills, rotor design procedure, momentum theory and blade element theory. Wind mill installation and operation issues.

VII. Learning outcome

The student is able to design and analyzed the renewable energy systems and relevant technologies critically with economic feasibility.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Solar thermal energy systems.	1
2.	Kinetics and heat transfer analysis, modelling studies.	3
3.	Design and performance of solar thermal systems	2
4.	Mathematical models, power plants, design and performance.	2
5.	Solar thermal energy systems: Kinetics and heat transfer analysis, modelling studies.	2
6.	Design and performance of solar thermal systems, mathematical models, power plants, design and performance.	3
7.	Photo-voltaic	1
8.	Thermodynamic limitations of photocells.	2
9.	Semiconductors: P-n and n-p junctions, module design, sizing, power control and storage, space charge control, low pressure diode, cesium converter.	2
10.	Photo electro chemical cells, photo electrolysis cell	1

S.No.	Topic	No. of Lectures
11.	Wind power	1
12.	Design procedure of rotor, betz limit, ideal horizontal axis wind turbine, wake rotation, momentum theory and blade element theory, blade shape for ideal rotor without wake rotation,	3
13.	Performance prediction wind turbine rotor dynamics and dynamic models.	1
14.	Designing of water pumping wind mills.	1
15.	Electric power, power transformers.	1
16.	Electrical machines, ancillary electrical equipment, wind power to consumer/grid.	2
17.	Wind turbine: Sitting, installation and operation issues,	2
18.	Offshore wind farms, operation in severe climates	2
	Total	**32**

IX. Practical

S.No.	Topic	No. of Practicals
1.	Design parameters of air collectors.	1
2.	Thermal analysis and heat loss,	1
3.	Regularity models of heliostatic fields	1
4.	Design of power plant.	2
5.	Photovoltaic cells characteristic curves.	1
6.	Analysis of water pumping with photovoltaic cells.	1
7.	Power control systems.	1
8.	Grid control devices.	1
9.	Design of wind mills.	2
10.	Rotor design procedure	1
11.	Momentum theory and blade element theory	2
12.	Installation of wind mill.	1
13.	Wind mill operation issues.	1
	Total	16

I. Course Title : New Alternate Energy Systems

II. Course Code : REE 604

III. Credit Hours : 2+1

IV. Aim of the course

To get acquainted with various recent and emerging alternate fuels and their various applications for power generation.

V. Theory

Unit I

Hydrogen production: Water splitting, electrolytic meth-ods, chemical cycle, photo splitting, photo galvanic, photo chemical. Hydrogen storage and utilization. Fuel cells: Reactions, types, design, applications, conversion and problems. Thermoelectric convertor and thermionic convertors.Magneto hydra dynamic system (MHD). Electro gas dynamics (EGD): Principles, types.

Unit II

Tidal energy: Operating mode, energy content. Estimation of wave power, tidal power sites and ocean thermal energy cycle (OTEC): Baseline design, heat design, power cycle design, plant working.

Unit III

Geo-thermal energy system: Classification, binary cycle conversion, waterfed heat pumps, electric generation, steam generation, steam field. Heat mining, Darcy's law, volcano related heat resources, sedimentary basins, hot dry rocks.

Unit IV

Power generation through alternative sources. Environmental pollution: Measurements and control methods, instrumentation, pollution standards, social cost estimates, CO_2 reduction potential, CO_2 sequestration.

VI. Practical

Testing of electrolysis plant, photo electric plant, photo plant, design criteria of fuel cell. Design considerations for alternative energy systems.

VII. Learning outcome

Students are able to understand the various recent and emerging alternate energy sources and their utilization for meeting the increasing energy demand.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Hydrogen production: Water splitting, electrolytic meth-ods, chemical cycle, photo splitting, photo galvanic, photo chemical.	2
2.	Hydrogen storage and utilization.	1
3.	Fuel cells: Reactions, types, design, applications, conversion and problems.	2
4.	Thermoelectric convertor and thermionic convertors.	2
5.	Magneto hydra dynamic system (MHD). Electro gas dynamics (EGD): Principles, types.	2

I. Course Title : Fuel and Combustion

II. Course Code : REE 605

III. Credit Hours : 2+1

IV. Aim of the course

To get acquainted with in depth knowledge about solid, liquid and gaseous fuels and their combustion kinematics. Understand of different combustion technologies.

V. Theory

Unit I

Solid and liquid fuels: Type and availability, oxidation, hydrogenation of solid fuel and processing of solid fuels. Liquid Fuels: Processing, properties testing of liquid fuels and refining. Liquid fuels from other sources: Preparation and storage. Production technologies for solid and liquid fuel.

Unit II

Gaseous Fuels: Types, processing and testing of gaseous fuels, gases from biomass refinery gases, LPG, oil gasification, cleaning and purification of gaseous fuels. Gaseous fuel production technologies.

Unit III

Combustion Stoichiometry: Thermodynamics and kinetics, solid, liquid and gaseous fuels. Combustion of solid fuels. Biomass combustion, stages of wood combustion, industrial biomass combustion concepts, types of combustion system.

Unit IV

Combustion of liquid fuels: Atomization, vapor concentration, droplet and ignition. Liquid fuel burners: Atomizing air burners, pressure jet atomizing burners, thin fluid burners, rotary atomizing burners.

Unit V

Combustion of gaseous fuel: Character, shape and size of the flame. Flame stabilization of bluff bodies.Effect of equivalence on reaction rate and extinction velocity, submerged combustion, combustion with explosion flame, pulsating combustion.

VI. Practical

Determination of fuel properties of solid, liquid and gaseous fuels.Determination of efficiency of combustion system using solid, liquid and gaseous fuel.Standard testing of burners for thermal efficiency for solid, liquid and gaseous fuel.

VII. Learning outcome

Students will able to design, estimate and critical analysis of various combustion techniques for efficient utilization of fuels.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Type and availability of solid and liquid fuels.	1
2.	Oxidation and hydrogenation of solid fuel.	1
3.	Processing of solid fuels.	1
4.	Processing of liquid fuel, properties and testing of liquid fuels.	2
5.	Refining of liquid fuel.	1
6.	Liquid fuels from other sources: Preparation and storage.	1
7.	Production technologies for solid and liquid fuel.	2
8.	Gaseous fuel production technologies.	1
9.	Gases from biomass, refinery gases and LPG.	2
10.	Oil gasification.	1
11.	Types, processing and testing of gaseous fuels.	2
12.	Cleaning and purification of gaseous fuels.	1
13.	Combustion Stoichiometry: thermodynamics and kinetics.	1
14.	Solid, liquid and gaseous fuels.	2
15.	Combustion of solid fuels, biomass combustion, stages of wood combustion.	2
16.	Industrial biomass combustion concepts.	1
17.	Types of combustion systems.	1
18.	Combustion of liquid fuels: Atomization, vapor concentration, droplet and ignition.	2

S.No.	Topic	No. of Lectures
19.	Liquid fuel burners: Atomizing air burners, pressure jet atomizing burners, thin fluid burners, rotary atomizing burners.	2
20.	Combustion of gaseous fuel: Character, shape and size of the flame.	2
21.	Flame stabilization of bluff bodies.	1
22.	Effect of equivalence on reaction rate and extinction velocity.	1
23.	Submerged combustion, Combustion with explosion flame, Pulsating combustion.	1
	Total	**32**

IX. Practical

S.No	Topic	No. of Practicals
1.	Determination of fuel properties of solid fuels.	1
2.	Determination of fuel properties of liquid fuels.	1
3.	Determination of fuel properties of gaseous fuels.	1
4.	Determination of efficiency of combustion system using solid fuels.	1
5.	Determination of efficiency of combustion system using liquid fuels.	1
6.	Determination of efficiency of combustion system using gaseous fuels.	1
7.	Standard testing of burners for thermal efficiency for solid.	1
8.	Standard testing of burners for thermal efficiency for liquid fuel.	1
9.	Standard testing of burners for thermal efficiency for gaseous fuel.	1
	Total	**09**

I. Course Title : Advances in Biogas Technology

II. Course Code : REE 606

III. Credit Hours : 2+1

IV. Aim of the course

The students will understand advances in biogas technology and its mechanism in detail. To analyze the case studies for understanding success and failures. To facilitate the students in developing skills in the decision making process.

V. Theory

Unit I

Worldwide review of anaerobic digesters, realistic potential- of biogas, analysis of biogas system and proposed means for their prospects.Engineering design of biogas units for biogas production from solid and liquid wastes.

Unit II

Design parameters: Affecting and failure of biogas systems, structural behaviour and conditions of fixed dome digesters, alternate construction- materials, gas holders for gas production in colder regions, heating, stirring etc.

Unit III

Multi-criteria optimization design of fermentation systems, immobilization, modular biogas for tropical rural areas.Toxicity effect of pesticides herbicides on the anaerobic digestion process. Kinetic models, design equa-tions, contact and anaerobic filter digesters, high rate digesters.

Unit IV

Scrubbing, purification and compression of biogas. Scaling-up and standardization of biogas plant for power generation and heating. Advanced biofuels: Bio-CNG/ renewable natural gas (RNG) as vehicle fuel.Liquefaction of biogas.

VI. Practical

Engineering design and analysis of biogas system.Development of kinetic equations.Biogas purification, compression and liquefaction.Industrial applications of biogas.

VII. Learning outcome

The student is able to analyse the various aspects of biogas energy management systems, Carry out techno-economic feasibility for biogas plant, to apply the knowledge in planning and operations of biogas energy system.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Review of anaerobic digesters	1
2.	Realistic potential- of biogas	1
3.	Analysis of biogas system	2
4.	Proposed means for prospects of biogas systems	1
5.	Engineering design of biogas units for biogas production from solid and liquid wastes	3
6.	Design parameters: Affecting and failure of biogas systems	2
7.	Structural behavior and conditions of fixed dome digesters	2
8.	Alternate construction- materials for biogas plants	1
9.	Design of biogas plants for colder regions	1
10.	Heating and stirring systems for biogas plants	2

I. Course Title : Solid Waste and Waste Water Management

II. Course Code : REE 607

III. Credit Hours : 2+1

IV. Aim of the course

To provide in depth knowledge, understanding and application oriented skills on sources, quality, classification and characteristics of solid waste along with municipal and compost treatment and remote sensing technologies for waste management.

V. Theory

Unit I

Solid waste: Sources, quality, classification and characteristics, collection and reduction at source, handling, storage, transportation and disposal methods.

Unit II

Reactor for anaerobic digestion: Contact and filter digestion, homogenous and non-homogeneous reactors. Energetic and kinetics of anaerobic treatment.

Unit III

Gas transfer, mass models, bubble aeration, film flow oxygen transfer, stripping, solids removal. Activated sludge and other suspended culture processes parameters. Biosorption of contact stabilization.

Unit IV

Sanitation land fill, munici-pal and compost treatment. Predigestion of waste.Sensors, ICT and remote sensing technologies for waste management.

VI. Practical

Design principles in waste treatment, equipment specifica-tion and instrumentation.

Mathematical modelling of BOD and COD reduction rate, recovery by batch distillation.

VII. Learning outcome

The student is able to estimate, characterize and design of solid waste conversion system and also able to understand the energetic and kinetics of anaerobic treatment, sanitation land fill, pre-digestion of waste etc.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to Solid waste	1
2.	Sources, classification and characteristic and quality	2
3.	Collection and handling and Transportation	2
4.	Disposal methods, reduction at source	3
5.	Reactor for anaerobic digestion	2
6.	Contact and filter digestion	2
7.	homogenous and non-homogeneous reactors	2
8.	Energetic and kinetics of anaerobic treatment.	2
9.	Gas transfer, mass models,	3
10.	Bubble aeration, film flow oxygen transfer, stripping, solids removal.	2
11.	Activated sludge and other suspended culture processes parameters.	2
12.	Biosorption of contact stabilization	1
13.	Sanitation land fill,	2
14.	Municipal and compost treatment	2
15.	Predigestion of waste.	1
16.	Sensors, ICT and remote sensing technologies for waste management	3
	Total	**32**

IX. List of Practicals

I. Course Title : Advanced Photovoltaic Power Generation

II. Course Code : REE 608

III. Credit Hours : 1+1

IV. Aim of the course

To develop a comprehensive technological understanding in solar PV system components. To provide in depth understanding of design parameters to help design and simulate the performance of a solar PV power plant. To pertain knowledge about planning, project implementation and operation of solar PV power generation.

V. Theory

Unit I

Semiconductors: Transport properties, junctions, dark and illumination characteristics. Single junction and multi junction films. Solar PV concentrator cells and systems. Thin film solar cells: Nano, micro, and polycrystalline solar cells.

Unit II

Systems for remote applications and large solar PV power plants: System integrations, roof top system, sizing methodology, power control, storage, tracking and control. PCID simulation of industrial solar cell structure, software's in solar cell simulation.

Unit III

Space charge control, low pressure diode, MMPT, cesium converter, system considerations. Photo electro chemical cells and materials.Photogalvanic cells: Recent development.

Unit IV

Conjunctive use of photo conversion systems: Photo-agriculture system, components, integration and economics. Software's for PV system integration and designing. PV system for ground mounted and rooftop plants with shadow analysis.

VI. Practical

PV systems for typical applications, water pumping, solar PV tracking and mechanical clock tracking. Testing of power control system for output regulation, charging and discharging characteristics of storage by PV panels.

VII. Learning outcome

Student will able to design different solar photovoltaic system for power generation. Design and simulate a PV power plant using software tool, Plan, project implementation, operation and maintenance. Carry out techno-economic-environmental performance evaluation of a solar PV power plant.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Semiconductors: Transport properties, junctions, dark and illumination characteristics.	1
2.	Single junction and multi junction films, Solar PV concentrator cells and systems.	1
3.	Thin film solar cells: Nano, micro, and polycrystalline solar cells.	1
4.	Systems for remote applications, Large solar Photovoltaic power plants: System integrations, roof top system and sizing methodology	2

S.No.	Topic	No. of Lectures
5.	Power control, storage, tracking and control in Photovoltaic power plants.	1
6.	PCID simulation of industrial solar cell structure, software's in solar cell simulation	2
7.	System considerations for Space charge control, low pressure diode, MMPT and cesium converter	2
8.	Photo electro chemical cells and materials	1
9.	Recent development in Photogalvanic cells	1
10.	Conjunctive use of photo conversion systems: Photo-agriculture system, components, integration and economics	1
11.	Softwares for PV system integration and designing.	2
12.	PV system for ground mounted and rooftop plants with shadow analysis	1
	Total	16

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Typical applications of Photovoltaic (PV) systems	1
2.	Applications of Photovoltaic systems in water pumping	2
3.	Study of Solar PV tracking and mechanical clock tracking	2
4.	Testing of power control system for output regulation	3
5.	Charging and discharging characteristics of storage by PV panels.	2
	Total	**10**

I. Course Title : Energy Planning, Management and Economics

II. Course Code : REE 609

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint and equip with energy planning, management and economical evaluation for agricultural production system.

V. Theory

Unit I

Energy resources on the farm: Conventional and non-conventional forms of energy and their use. Heat equivalents and energy coefficients for different agricultural inputs and products.Pattern of energy consumption and their constraints in production of agriculture.Direct and indirect energy.

Unit II

Energy audit of production agriculture and rural living and scope of conservation. Identification of energy efficient machinery systems, energy losses and their management.

Unit III

Energy analysis techniques and methods: Energy balance, output and input ratio, resource utilization, conservation of energy sources. Energy conservation planning and practices.

Unit IV

Energy forecasting, energy economics, energy pricing and incentives for energy conservation, factors effecting energy economics. Techno-economic evaluation of RET's, computation of programme for efficient energy management.

VI. Learning outcome

The student will be able to quantify, analyze and forecast the demand and supply of different energy for agriculture production system.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Energy resources on the farm: Conventional and non-conventional forms of energy and their use.	3
2.	Heat equivalents and energy coefficients for different agricultural inputs and products.	3
3.	Pattern of energy consumption and their constraints in production agriculture. Direct and indirect energy.	3

I. Course Title : Renewable Energy for Industrial Application

II. Course Code : REE 610

III. Credit Hours : 2+1

IV. Aim of the course

To provide the knowledge regarding the energy consumption pattern in agro based industries, quantification techniques and identification of opportunities for renewable energy sources.

V. Theory

Unit I

Elucidation of unit operations in industry.Energy quantification techniques, system boundary, estimation of productivity, plant capacity utilization, energy density ratio and energy consumption pattern.Energy flow diagram conservation opportunities identification.

Unit II

Solar energy for industrial application: Solar water heating, steam solar cooking system, industrial solar dryer and solar process heat, solar cooling system (refrigeration, air conditioning and solar architecture technology), solar furnace and solar green house technology for high-tech cultivation. Solar photovoltaic technology for industrial power.

Unit III

Bio energy for industrial application: Quantification of industrial bio-waste, characterization, power generation through bio-methanation, gasification and dendro thermal power plant.

Unit IV

Wind energy: Aero generator of new era and national and international state of art in wind power generation. Other renewable energy sources: Magneto hydro dynamics, fuel cells technology and micro-hydro energy technology.

VI. Practical

Elucidation and energy consumption for unit operations in industry. Study of energy quantification and identification of opportunities for RET's. Design of solar dryers.Design of solar photovoltaic system.Design of gasifiers for thermal energy and power generation. Design of combuster (gasifier stove). Study of solar greenhouse.Study of biogas engine generator set.Case study of agro-industrial energy estimation and visit to RSE power generation site.

VII. Learning outcome

Students will be acquainted with energy quantification techniques, design of system, economic evaluation and utilization of renewable energy sources for agro-industrial applications.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Elucidation of unit operations in industry.	1
2.	Energy quantification techniques, system boundary,	2
3.	Estimation of productivity, plant capacity utilization,	2
4.	Energy density ratio and energy consumption pattern.	2
5.	Energy flow diagram conservation opportunities identification.	1
6.	Solar energy for industrial application.	1
7.	Solar water heating.	1
8.	Steam solar cooking system.	1
9.	Industrial solar dryer and solar process heat.	2
10.	Solar cooling system (refrigeration, air conditioning and solar architecture technology).	2
11.	Solar furnace.	1
12.	Solar greenhouse technology for high-tech cultivation.	2
13.	Solar photovoltaic technology for industrial power.	1
14.	Bio energy for industrial application	1
15.	Quantification of industrial bio-waste, its characterization	2
16.	Power generation through bio-methanation,	2
17.	Gasification and dendro thermal power plant.	2
18.	Wind energy: Aero generator of new era.	1
19.	National and international state of art in wind power generation.	2
20.	Other renewable energy sources: Magneto hydro dynamics, fuel cells technology and micro-hydro energy technology.	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Elucidation and energy consumption for unit operations in industry.	1
2.	Study of energy quantification and identification of opportunities for RET's	1
3.	Design of solar dryers.	2
4.	Design of solar photovoltaic system.	2
5.	Design of gasifiers for thermal energy and power generation.	2
6.	Design of combuster (gasifier stove).	2
7.	Study of solar greenhouse.	1
8.	Study of biogas engine generator set.	1
9.	Case study of agro-industrial energy estimation	2

I. Course Title : Biofuel Technologies and Applications

II. Course Code : REE 611

III. Credit Hours : 1+1

IV. Aim of the course

To get acquainted with recent biofuel production technologies and their applications.To perform financial estimations of the biofuel projects.To get insight of the various biofuel technologies.

V. Theory

Unit I

Liquid biofuels: Non-edible oilseeds, oil extraction, pre-processing, characterization. World scenario: Liquid fuel challenges and some solutions. Liquid bio-fuel applications.

Unit II

Bioethanol: First and second generation ethanol production technologies. Production of syngas from biomass, production of methanol from syngas, production of ethanol from lingo-cellulosic biomass. Syngas and poly-generation, chemical conversion of syngas to methanol and ethanol and some advanced fuels like bio butanol, bio-propanol.

Unit III

BioCNG: Biogas to green vehicle fuel, anaerobic digestion. Bio gas opportunities: Landfill gas, agricultural and industrial wastewater and additional sources of methane.

Unit IV

Biodiesel: Feedstock for biodiesel, manufacturing processes for biodiesel, value addition by utilization of by-products, environmental impacts of biodiesel, biodiesel from algae, biodiesel engines.

Unit V

Pyrolysis oil: Fast pyrolysis technologies, composition and issues of bio oil. Bio oil upgradation technologies.

VI. Practical

Evaluation of liquid fuel system for heat and power generation and characterization of liquid fuel, transesterification process.Engine performance on biodiesel.Biogas-engine system for transport vehicle.Bio oil production by pyrolysis.

VII. Learning outcome

Student will able to understand the bio-fuel production technologies with financial viability and applications of bio-fuel in different sector of development.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Liquid biofuels: Non-edible oilseeds, oil extraction, pre-processing, characterization.	1
2.	World scenario: Liquid fuel challenges and some solutions. Liquid bio-fuel applications.	1
3.	Bioethanol: First- and second-generation ethanol production technologies.	1
4.	Production of syngas from biomass.	1

I. Course Title : Energy Modelling and Simulation

II. Course Code : REE 612

III. Credit Hours : 1+1

IV. Aim of the course

The objective of this course is to provide in depth knowledge about various mathematical models, interdependence of energy, ecology and environment, energy modelling in the context of climate change.

V. Theory

Unit I

Model: Basics, system, boundary, interaction, types of models, physical, analogy models and applications. Mathematical models: Concepts, input, output model, stochastic, deterministic, empirical models, linear, non-linear models, interdependence of energy, economy, environment, modelling concept and application.

Unit II

Energy Modelling: Review of various energy sector models, energy demand analysis and forecasting, energy supply assessment and evaluation, energy demand, supply balancing, energy modelling in the context of climate change.

Unit III

Model studies in gasification, pyrolysis, biogas, fermentation, biodiesel, solar, wind technologies and heat transfer applications. Moving boundary models.

Unit -IV

Energy economics of energy sources: Investment and cost management in various energy technologies. Economics of energy generation, energy conservation economics, financial analysis, sensitivity and risk analysis.

VI. Practical

Formulating dimensionless numbers, applications, types of models, mathematical model formulation and types, Software's and model evaluation. Development of models in thermo-chemical and biochemical conversion processes. Studies on model development in solar and wind technologies, economics of energy generation and conservation, financial analysis.

VII. Learning outcome

Students will get thorough knowledge about energy modelling of gasification, pyrolysis, biogas system, fermentation, biodiesel production system, solar and wind technologies etc.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction to Model	1
2.	Basics, system, boundary, interaction, types of models, physical, analogy models.	2
3.	Model applications.	1
4.	Mathematical models: Concepts, input, output model, stochastic, deterministic, empirical models, linear, non-linear models, interdependence of energy, economy, environment.	3

Agricultural Engineering
– Soil and Water Conservation Engineering

Preamble
(Soil and Water Conservation Engineering)

Course curricula and course outlines in Soil and Water Conservation Engineering are designed in view of the fact that courses are offered by students from disciplines of faculties of Soil Science, Agronomy and Agricultural Meteorology.

At the post graduate level it becomes more important where they have not only to learn the recent advances in their subjects but have also to be trained in the modern and latest techniques in their disciplines so that they can participate and contribute in the development and advancement in their related fields. Further, the shrinking job opportunities in the National Agricultural Research System (ICAR/SAUs) have put additional pressure on our education system to prepare students in tune with the demands of the private sector.

All courses are designed to cover all basic topics and have been designed by taking into consideration demands of private sector harnessing commercial aspects, modern research tools and their applications, supplementary skills required, and enhancing the global competitiveness and employability of students. The emphasis has been given on advanced watershed hydrology and modeling management and accordingly new courses "Stochastic hydrology, Climate change and water resources, Waste water treatment and utilization, Multi criteria decision making system" are framed in view of the recent developments in the subject.

The courses have been revised, updated and restructured in view of current developments and emerging trends in Soil and Water Conservation Engineering. The revised courses cover the areas: Advanced Soil and Water Conservation Engineering, Applied Watershed Hydrology, Soil and Water Conservation Structures, Watershed Management and Modeling, Flow Through Porous Media, Remote sensing and GIS for land and water resource management, Dryland Water Management Technologies, Minor irrigation, Design of Drip and Sprinkler Irrigation Systems, Groundwater engineering, Water Resources Systems Engineering, Advances in Hydrology, Soil and Water Systems Simulation and Modeling, Reservoir Operation and River Basin Modeling, Modeling Soil Erosion Processes and Sedimentation.

The course content and syllabus upgraded with more of practical orientation and as per ARS Syllabus.

The ICAR recommendations for PG courses have been taken into consideration in framing these courses. It is hoped that these will prove very useful to the future students.

Course Title with Credit Load
M.Tech. in Soil and Water Conservation Engineering

Major Courses (Requirement: 20 Credits)

Course Code	Course Title	Credit Hours
*SWCE 501	Advanced Soil and Water Conservation Engineering	2+1
*SWCE 502	Applied Watershed Hydrology	2+1
SWCE 503	Soil and Water Conservation Structures	2+1
SWCE 504	Stochastic Hydrology	2+1
*SWCE 505	Watershed Management and Modeling	2+1
SWCE 506	Flow Through Porous Media	2+0
SWCE 507/IDE 507	Remote Sensing and GIS for Land and Water Resource Management	2+1
SWCE 508	Climate Change and Water Resources	3+0
SWCE 509	Numerical Methods in Hydrology	2+0
SWCE 510	Dryland Water Management Technologies	2+0
	Total	**19+6**

*Compulsory course

Minor Courses (Requirement: 08 Credits)

Course Code	Course Title	Credit Hours
IDE 505	Design of Drip and Sprinkler Irrigation Systems	2+1
IDE 506	Groundwater Engineering	2+1
IDE 510	Minor Irrigation	2+1
IDE 513	Water Resources Systems Engineering	2+1
CE 501	Dimensional Analysis and Similitude	2+0
CE 502	Water Quality and Pollution Control	2+1
FMPE 517	Machinery for Precision Agriculture	2+1
REE 513	Energy, Ecology and Environment	3+0
CSE 501	Big Data Analytics	2+0
CSE 502	Artificial Intelligence	2+0
CSE 504	Soft Computing Techniques in Engineering	2+1
MATH 501	Finite Element Methods	2+0
MATH 502	Numerical Methods for Engineers	2+0
ME 501	Mechatronics and Robotics in Agriculture	2+0
	Any other course(s) of other department can be taken as per recommendations of the student's advisory committee.	

Supporting Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
*STAT 501	Statistical Methods for Research Works	2+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Compulsory Course

Common Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*PGS 501	Library and Information Services	1+0
*PGS 502	Technical Writing and Communication Skills	1+0
*PGS 503	Intellectual Property and its management in Agriculture	1+0
*PGS 504	Basic Concepts in Laboratory Techniques	1+0
*PGS 505	Agricultural Research, Research Ethics and Rural Development Programmes	1+0

*Detailed course outline to be developed by designated BSMA

List of other Essential Requirements

Course Code	Course Title	Credit Hours
SWCE 591	Seminar	0+1
SWCE 599	Thesis Research	0+30

Course Contents
M.Tech. in Soil and Water Conservation Engineering

I. Course Title : Advanced Soil and Water Conservation Engineering
II. Course Code : SWCE 501
III. Credit Hours : 2+1

IV. Aim of the course

To acquaint and equip students with the advances in soil and water conservation measures, use of RS and GIS and Software's for design of soil and water conservation structures.

V. Theory

Unit I

Concept of probability in design of soil and water conservation structures. Probability and continuous frequency distribution. Fitting empirical distributions.

Unit II

Relevance of soil and water conservation in agriculture and in the river valley projects. Layout and planning of soil and water conservation measures. Software's for design of conservation structures.

Unit III

Productivity loss due to soil erosion. Water stress and water excess. Types and mechanics of soil erosion. Software's for soil loss estimation, WEAP, EPIC

Unit IV

Theories of sediment transport. Control of runoff and sediment loss. Sediment deposition process. Estimation of sediment load.

Unit V

Design of soil and water conservation structures: Check dams, gully plugs, gabion structures, earth dams, silt detention dams, farm ponds, etc., and the alternate use of the stored water for agriculture. Application of Remote Sensing and GIS in Soil and Water Conservation.

VI. Practical

Assessment of erosive status of a watershed through field measurement or analysis of morphometric properties. Estimation of erosivity index of rainfall. Determination of soil physical properties: Texture, grain size distribution, Atterberg's limits, various moisture percentages. Locating best possible sites of soil and water conservation structures on the basis of map features and erosivity status. Estimation of costs of soil and water conservation measures.

VII. Learning outcome

The students will able to plan and design soil and water conservation measures in particular watershed using RS and GIS techniques. They can estimate the sedimentation and capacity losses, design of gully control structures and earthen dams usingsoftware's.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Concept of probability in design of soil and water conservation structures	2
2.	Probability and continuous frequency distribution	2
	Fitting empirical distributions	2
3.	Relevance of soil and water conservation in agriculture and in the river valley projects	2
4.	Layout and planning of soil and water conservation measures	2
5.	Software's for design of conservation structures	1
6.	Productivity loss due to soil erosion	1
7.	Water stress and water excess	1
8.	Types and mechanics of soil erosion	1
9.	Software's for soil loss estimation, WEAP, EPIC	3
10.	Theories of sediment transport	2
11.	Control of runoff and sediment loss	1
12.	Sediment deposition process and estimation of sediment load	2
13.	Design of soil and water conservation structures: Check dams, gully plugs, gabion structures, earth dams, silt detention dams, farm ponds, etc., and the alternate use of the stored water for agriculture	6
14.	Application of Remote Sensing and GIS in Soil and Water Conservation	3
	Total	**31**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Assessment of erosive status of a watershed through field measurement	2
2.	Morphometric analysis of a watershed	2
3.	Estimation of erosivity index of rainfall	1
4.	Determination of soil texture	1
5.	Determination of soil grain size distribution	1
6.	Determination of Atterberg's limits of soil	1
7.	Determination of various soilmoisture percentages	1
8.	Locating best possible sites of soil and water conservation structures on the basis of map features and erosivity status	2
9.	Design of Check dams, gully plugs, gabion structures, earth dams, silt detention dams and farm ponds	4
10.	Estimation of costs of soil and water conservation measures	2
	Total	**17**

X. Suggested Reading

- Garg SK. 1987. *Irrigation Engineering and Hydraulic Structures*. Khanna Publishers, New Delhi.

I. Course Title : Applied Watershed Hydrology

II. Course Code : SWCE 502

III. Credit Hours : 2+1

IV. Aim of the course

To provide in depth knowledge of surface and sub-surface hydrology of watershed including stream flow measurement and computer simulation of hydrological processes in small watersheds.

V. Theory

Unit I

Hydrology in water resources planning, rainfall, surface runoff and sub-surface runoff as components of hydrologic cycle. Runoff phenomena, relationship between precipitation and runoff. Stream flow measurement and analysis of data in detail.

Unit II

Synthetic unit hydrograph. Recent advances in analysis of hydrologic data and flow from small watersheds. Methods of runoff estimation from small watersheds. Use of IUH and various methods of estimation. Runoff estimation models: SCS, CN software.

Unit III

Micro climate, estimation methods of evaporation. Advances and improvements in rational approach. SCS approach criticism and improvements.

Unit IV

Hydrological hazard functions. Methods of estimation of hydrologic parameters. Data transformation.

Unit V

Calibration and evaluation of hydrologic models. Computer simulation of hydrological process in small watersheds.

VI. Practical

Delineation of watershed and study of watershed characteristics. Measurement of rainfall and runoff in a watershed and data analysis. Estimation of infiltration and runoff from a watershed. Analysis and derivation of various types of hydrographs. Flood routing. Reservoir sedimentation. Watershed model components. Visit to a watershed.

VII. Learning outcome

The students will be able to understand and analyze the process and the effect of various climatic parameters on rainfall-runoff relationship. They can also be able to develop the competency for calibration and evaluation of hydrologic models and computer simulation.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Hydrology in water resources planning, rainfall, surface runoff and sub-surface runoff as components of hydrologic cycle	2
2.	Basics of watershed hydrology and processes, global and watershed perspectives	2

S.No.	Topic	No. of Lectures
3.	Runoff phenomena, relationship between precipitation and runoff	1
4.	Synthetic unit hydrograph, Unit hydrograph and its derivation including for complex storm,	3
5.	S-hydrograph and derivation, Use of IUH and various methods of estimation.	3
6.	Runoff estimation models: SCS, CN software	3
7.	Flood routing principles	2
8.	Recent advances in analysis of hydrologic data and flow from small watersheds. Methods of runoff estimation from small watersheds.	3
9.	Micro climate, estimation methods of evaporation. Advances and improvements in rational approach. SCS approach criticism and improvements	3
10.	Process of sedimentation of reservoirs	2
11.	Hydrological hazard functions, Methods of estimation of hydrologic parameters, Data transformation,	3
12.	Hydrologic modeling approaches, component conceptualization, types of watershed hydrologic models and choice of model.	3
13.	Calibration and evaluation of hydrologic models. Computer simulation of hydrological process in small watersheds	2
	Total	**32**

VIII. List of Practicals

S.No.	Topic	No. of Practicals
1.	Delineation of watershed and study of watershed characteristics	1
2.	Measurement of rainfall and runoff in a watershed	1
3.	Analysis of hydrologic data and flow from small watersheds	1
4.	Estimation of infiltration and runoff from a watershed	1
5.	Measurement and analysis of stream flow data	1
6.	Analysis of synthetic unit hydrograph for complex storm	1
7.	Analysis of S-hydrograph for complex storm	1
8.	Use of runoff estimation models: SCS, CN software	2
9.	Study of different types of flood routing methods	2
10.	Computer simulation of hydrological process in small watersheds	1
11.	Study of reservoir sedimentation	1
12.	Study of watershed model components	1
13.	Visit to a watershed	1
	Total	**16**

II. Course Code : SWCE 503

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students with the planning and design of soil and water conservation structures, their stability checks and mechanized soil conservation techniques.

V. Theory

Unit I

Design, planning and layout of soil and water conservation structures. Criteria of selection of appropriate structures as per soil, land use and climatic conditions.

Unit II

Design and construction of earthen dam, stability analysis of land slopes and soil mass including landslides.

Unit III

Hydrological and structural design including stress analysis. Hydraulic jump and energy dissipaters for soil conservation structures.

Unit IV

Seepage through dams, flow net and determination of uplift pressure in drop structures, design of energy dissipaters.

Unit V

Design of water harvesting structures, construction, maintenance and utilization of stored water. Mechanized construction techniques for soil and water conservation structures.

VI. Practical

Numerical approach on probability distribution functions. Stability analysis and structural design of masonry water harvesting structures. Design of earthen dams and other energy dissipating structures. Cost analysis of water harvesting structures. Field visit to already constructed water harvesting structures in the nearby area/ watershed.

VII. Learning outcome

The student will be able to design the soil and water conservation structures as well as permanent gully control structures and water harvesting structures. They can have understanding of mechanized construction of soil and water conservation structures.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Introduction and need of Soil and Water Conservation in agricultural watershed	1
2	Runoff process and factors affecting it and estimation of runoff using various methods	3
3	Analysis of rainfall data, Probability concepts in the design of structures	3
4	Introduction, classification and functional requirement of soil and water conservation structures-Straight Drop spillway, chute spillway and drop inlet spillway	1
5	Specific energy and specific force	2
6	Hydraulic jump and its application, type of hydraulic jump, energy dissipation due to jump, jump efficiency, relative loss of energy	2
7	Straight drop spillway- Components and their functions, hydrologic, hydraulic and structural design	4

S.No.	Topic	No. of Lectures
8	Drop inlet spillway- Components and their functions, hydrologic, hydraulic and structural design	2
9	Chute Spillway- Components and their functions, hydrologic, hydraulic and structural design	3
10	Criteria of selection of appropriate structures as per soil, land use and climatic conditions	1
11	Design of energy dissipaters in soil and water conservation structures	1
12	Introduction, types, design, criteria and construction of earthen dam, causes of failure of earthen dam, retaining wall and its design	3
13	Stability analysis of land slopes and soil mass including landslides, seepage control in earthen dams, flow net in earthen dams	2
14	Water harvesting: principles, importance and issues. Water harvesting techniques: classification based on source, storage and use. Runoff harvesting: short-term and long-term harvesting techniques, purpose and design criteria.	3
15	Mechanized construction techniques for soil and water conservation structures	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of various probability distribution function for rainfall analysis	1
2.	Construction of specific energy and specific force diagram	2
3.	Measurement of hydraulic jump parameters and amount of energy dissipation	1
4.	Hydrologic and hydraulic design of a straight drop spillway	1
5.	Determination of uplift force and construction of uplift pressure diagram	1
6.	Determination of loads on headwall and construction of triangular load diagram	1
7.	Stability analysis of a straight drop spillway	1
8.	Hydraulic design of a chute spillway	1
9.	Design of drop inlet spillway	1
10.	Design of energy dissipating structures	1
11.	Design of earthen dam	1
12.	Seepage analysis in earthen embankment	1
13.	Design of water harvesting structures	1
14.	Economic analysis of water harvesting structures	1
15.	Field visit to already constructed water harvesting structures in the nearby area/watershed.	1
	Total	**16**

I. Course Title : Stochastic Hydrology

II. Course Code : SWCE 504

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the stochastic processes in hydrology including statistical characteristics of hydrological time series data, modeling hydrologic uncertainty and analysis of multivariate hydrologic series,

V. Theory

Unit I

Hydrologic cycle, Systems concept, Hydrologic systems model. Classification of hydrologic models, Statistical, stochastic and deterministic approaches. Statistical characteristics of hydrological data, probability distribution of hydrologic variables. Deterministic and stochastic hydrology, Cause and effect analysis. Hydrologic time series analysis – nature, stationarity and ergodicity, components of time series, trend, periodicity and stochastic parts, parameter estimation of probability distributions. Analysis of hydrologic extremes.

Unit II

Multivariate regression analysis, correlation analysis, correlation coefficient and its significance in regional analysis. Developing prediction equation by simple and multiple linear regression. Reliability of the Model.

Unit III

Stochastic Process: Classification, stationary process. Time series: Classification, component of time series. Methods of investigation: Auto correlation coefficient, moving average process, auto regressive process, auto regressive moving average process, auto regressive integrated moving average process. Spectral analysis, analysis of multivariate hydrologic series.

Unit IV

Thomas Fiering model, Box Jenkins model. Model formulation: Parameter estimation, calibration and validation. Application to hydrologic data. Generation and forecasting. Regional flood frequency analysis. Transformations, Hypothesis testing.

Unit V

Modeling hydrologic uncertainty. First order Markov process, Markov chain, Data generation, Hydrologic time series analysis, Modelling of hydrologic time series.

VI. Practical

To estimate various statistical parameters of the hydrologic variables, estimating missing data in historical series, various parameter estimation methods like method of moments, method of maximum likelihood, method of mixed moments, probability of weighted moments fitting discrete and continuous distribution functions to variables, application of transformation techniques to historical data for estimating variables at different return periods, determining correlation and regression coefficients, analyzing multivariate regression, autocorrelation coefficient for independent and correlated events, fitting ARMA models, fitting Markov models of first and second order, regional frequency analysis, time series analysis of the historical data, estimating and fitting Thomas Fiering Model.

VII. Learning outcome

The students are enabled to understand the stochastic process of hydrology including statistical based analysis of hydrological time series data. They are exposed to stochastic and deterministic modeling of small watersheds.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Hydrologic cycle, Systems concept, Hydrologic systems model	1
2.	Hydrological models, processes and systems - Physical Characterization of watersheds; Rainfall measurements	1
3.	Classification of hydrologic models, Statistical, stochastic and deterministic approaches	1
4.	Statistics and probabilities in hydrology – Basic concepts – Experiment, Sample space, element, event, complement, intersection, disjoint, union, statistical parameters; Uncertainty in hydrological event; Statistical homogeneity, Permutation, combination, probability, conditional probability; Independent events, random variables, discrete and continuous sample space, Probability and Return period	3
5.	Statistics and probabilities in hydrology- Frequency Analysis – Mean, Median, Mode, Variance, Frequency Analysis - Standard deviation, Coefficient of Variance, Skewness, Kurtosis Theorems on Probability; Total probability theorem and Baye's theorem	3
5.	Statistics and probabilities in hydrology- Discrete and Continuous probability - Random Variable and Variate; Probability Distribution of hydrological variables; Co-relation and regression analysis.	3
6.	Introduction and examples of stochastic processes; Specification of stochastic process- nature, stationarity and ergodicity, components of time series,	2
7.	Hydrologic time series analysis –trend, periodicity	1
8.	Stochastic time series analysis- Methods of analysis -Auto correlation coefficient,	1
9.	Stochastic time series analysis- moving average process, auto regressive process,	2
10.	Stochastic time series analysis- auto regressive moving average process,	2
10.	Stochastic time series analysis- auto regressive integrated moving average process.	2
11.	Spectral analysis, analysis of multivariate hydrologic series	2
12.	Thomas Fiering model, Box Jenkins model	2
13.	Model formulation: Parameter estimation, calibration and validation.	2
14.	Application to hydrologic data	2
15.	Generation and forecasting- Regional flood frequency analysis Transformations,	1
16.	Hypothesis testing	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Development of regression models	1
2.	Estimation of missing data in historical series	1
3.	Parameter estimation-Method of Moments	1
4.	Parameter estimation-method of maximum likelihood	1
5.	Parameter estimation- method of mixed moments, Probability of weighted moments	1
6.	Fitting discrete and continuous distribution functions to variables	1
7.	Transformation techniques to historical data for estimating variables at different return periods	1
8.	Regression analysis, Correlation analysis,	1
9.	Analyzing multivariate regression,	1
10.	Autocorrelation coefficient for independent and correlated events,	1
11.	Fitting ARMA models to rainfall runoff data	1
12.	Fitting Markov models of first and second order,	1
13.	Regional frequency analysis,	1
14.	Estimating parameters of Thomas Fiering Model	1
15.	Fitting of Thomas Fiering Model	1
	Total	**15**

I. Course Title : Watershed Management and Modeling

II. Course Code : SWCE 505

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students with watershed management concept and its benefit for sustainable rural development through participatory approach, including environmental impact as well as policy frame work.

V. Theory

Unit I

Concept of watershed, its hydrological and geomorphological characteristics. Status of watershed management programs in India. Problems of desertification and degradation.

Unit II

Concept of watershed management and sustainability, participatory approach and operational watershed. Surveys, monitoring, reclamation and conservation of agricultural and forest watersheds, hill slopes and ravines.

Unit III

Watershed management research instrumentation and measurement, problem identification, simulation and synthesis. Rainfed farming and drought management. Modeling of flood and drought phenomenon.

Unit IV

Use of Remote Sensing and GIS in watershed management and modeling. Watershed modeling approaches, mathematical bases and structure of existing watershed models.

Unit V

Environmental impact assessment of watersheds. Quantitative evaluation of management techniques. National land use policy, legal and social aspects. Case studies of watershed management.

VI. Practical

Selection and delineation of a watershed. Benchmark surveys. Preparation of watershed land use map. Preparation of watershed development proposal. Preparation of watershed evaluation and impact assessment report. Application of watershed models for evaluation of conservation treatments. Use of Remote Sensing and GIS in watershed management and modeling.

VII. Learning outcome

The students will be able to understand different conservation practices and their effect on watershed behavior. They can also estimate the geomorphologic parameters of particular watershed which is quite useful for watershed planning and development of watershed models.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Concept of watershed, its hydrological and geomorphological characteristics	2
2	Status of watershed management programs in India	2
3	Problems of desertification and degradation	2
4	Concept of watershed management and sustainability, participatory approach and operational watershed	3
5	Surveys, monitoring, reclamation and conservation of agricultural and forest watersheds, hill slopes and ravines	3
6	Watershed management research instrumentation and measurement, problem identification, simulation and synthesis	2
7	Rainfed farming and drought management	2
8	Modeling of flood and drought phenomenon	2
9	Use of Remote Sensing and GIS in watershed management and modeling	2
10	Watershed modeling approaches, mathematical bases and structure of existing watershed models	3
11	Environmental impact assessment of watersheds	2
12	Quantitative evaluation of management techniques	2
13	National land use policy, legal and social aspects	2
14	Case studies of watershed management	3
	Total	**32**

IX. List of Practicals

S.No.	Topic	No of Practicals
1	Selection and delineation of a watershed	3
2	Benchmark surveys	2
3	Preparation of watershed land use map	2
4	Preparation of watershed development proposal	3
5	Preparation of watershed evaluation and impact assessment report	2
6	Application of watershed models for evaluation of conservation treatments	2
7	Use of Remote Sensing and GIS in watershed management and modelling	2
	Total	**16**

I. Course Title : Flow Through Porous Media

II. Course Code : SWCE 506

III. Credit Hours : 2+0

IV. Aim of the course

To provide comprehensive knowledge to the students in aquifer and fluid properties, unsaturated flow theory and movement of groundwater in fractured and swelling porous media.

V. Theory

Unit I

Aquifer and fluid properties, forces holding water in soils, hydrodynamics in porous media and limitations of governing laws.

Unit II

Differential equations of saturated flow, initial and boundary conditions. Dupuit and Business approximations and linearization techniques.

Unit III

Stream functions, potential functions and flow net theory. Analysis of seepage from canals and ditches.

Unit IV

Unsaturated flow theory, Infiltration and capillary rise flux dynamics. Movement of groundwater in fractured and swelling porous media.

Unit V

Hydro-dynamic dispersion in soil-aquifer system. Velocity hydrograph, flow characteristics at singular points, examples of velocity hydrograph, solution by complex velocity, solution of triangular dam, drainage in retaining structures, influence of seepage on stability of slopes, drainage methods for stability of slopes.

VI. Learning outcome

The students will be able to understand physical properties of flow through porous media. Competence on various laws governing dynamics of flow through porous media. Understanding of hydrodynamics in porous media, governing laws and boundary conditions.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Aquifer and its classification, properties of aquifers and fluids	1
2.	Forces responsible for holding water in soil and movement, hydrostatic pressure distribution	1
3.	Porosity, permeability and hydraulic conductivity: its importance in fluids flow	1
4.	Hydrodynamics in porous media: Continuum approach to porous media, Representative Elementary Volume (REV), linear and aerial porosity, velocity and specific discharge relationship in porous medium	3
5.	Generalization of Darcy Law in isotropic and anisotropic layered porous medium, deviation from Darcy Law and limitations of governing laws in flow through porous media	3
6.	Saturated flow: Differential equations for flow through saturated medium, initial and boundary conditions, types of boundary conditions, boundary and initial value problems	3
7.	Dupuit and Boussinesq approximations and linearization: Dupuit assumption and equation, Boussinesq linearization Techniques and solutions	3
8.	Unsaturated flow theory: Continuity and conservation equations for a homogeneous fluid in non-deforming medium and deforming medium, continuity equation for compressible fluid and moveable solid matrix	6
9.	Infiltration and capillary rise flux dynamics, movement of groundwater in fractured and swelling porous media	2
10.	Stream and potential functions: Stream functions in two and three dimensional flow, potential functions and flow net theory	3
11.	Analysis of seepage from canals and ditches	2
12.	Hydro-dynamic dispersion in soil-aquifer system: Hydro-dynamic dispersion, derivation of dispersion and diffusion equation	3
13.	Velocity hydrograph: Flow characteristics at singular points, examples of velocity hydrograph, solution by complex velocity, solution of triangular dam, drainage in retaining structures, influence of seepage on stability of slopes, drainage methods for stability of slopes	3
	Total	**34**

I. Course Title : GIS and Remote Sensing for Land and Water Resource Management

II. Course Code : SWCE 507/IDE 507

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students with recent technology of RS and GIS including satellite data analysis, digital image processing and thematic mapping of land use, surface and ground water.

V. Theory

Unit I

Physics of remote sensing, electromagnetic radiation (EMR), interaction of EMR with atmosphere, earth surface, soil, water and vegetation. Remote sensing platform, monitoring atmosphere, land and water resources: LANDSAT, SPOT, ERS, IKONOS and others, Indian Space Programme.

Unit II

Satellite Data analysis: Visual interpretation, digital image processing, image pre-processing, image enhancement, image classification and data merging.

Unit III

Definition: Basic components of GIS, map projections and co-ordinate system, spatial data structure-raster, vector, spatial relationship, topology, geodatabase models, hierarchical network, relational, object-oriented models, integrated GIS database-common sources of error–data quality: Macro, micro and usage level components, meta data, Spatial data transfer standards.

Unit IV

Thematic mapping, measurements in GIS: Length, perimeter and areas. Query analysis, reclassification: Buffering, neighbourhood functions, map overlay: Vector and raster overlay: Interpolation, network analysis, digital elevation modelling. Analytical Hierarchy Process, Object oriented GIS–AM/FM/GIS, Web Based GIS.

Unit V

Spatial data sources: 4M GIS approach water resources system, Thematic maps, rainfall runoff modelling, groundwater modelling, water quality modelling and flood inundation mapping and modelling. Drought monitoring, cropping pattern change analysis, performance evaluation of irrigation commands. Site selection for artificial recharge, reservoir sedimentation.

VI. Practical

Familiarization with the Remote sensing instruments and satellite imagery. Aerial

Photograph and scale determination with stereoscope. Interpretation of satellite imageries and aerial photographs. Determination of Parallaxes in images. Introduction to digital image processing software and GIS software and their working principles. Generation of digital elevation model (DEM) for land and water resource management. Case studies on mapping, monitoring and management of natural resources using remote sensing and GIS.

VII. Learning outcome

Students will be able to use satellite remote sensing to perform image analysis and classification for developing thematic maps. Able to integrate satellite data with GIS to undertake recourse mapping and planning studies.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction and brief history of RS and GIS, applications of RS and GIS	1
2.	Physics of remote sensing. Electromagnetic radiation (EMR), interaction of EMR with atmosphere, earth surface, soil, water and vegetation	1
3.	Remote sensing platforms: Monitoring atmosphere, land and water resources: LANDSAT, SPOT, ERS, IKONOS and others. Indian Space Programme	2
4.	Satellite data analysis. Visual interpretation.	1
5.	Digital image processing- Image pre-processing, Image enhancement, Image classification, data merging.	3
6.	Basic components of GIS- Map projections and co-ordinate system.	2
7.	Spatial data sources,Thematic maps	1
7.	Spatial data structure: Raster, vector data, Spatial relationship-Topology	1
8.	Geodatabase models: Hierarchical, network, relational, object-oriented models. Integrated GIS database	3
9.	Data quality, Common sources of error, Macro, micro and Usage level components, Meta data and Spatial data transfer standards	2
10.	Measurement in GIS- Length, perimeter and areas	1
10.	Query analysis. Reclassification, Buffering and Neighbourhood functions	1
11.	Map overlay: Vector and raster overlay	1
12.	Interpolation and network analysis	1
13.	Digital elevation modelling. Analytical Hierarchy Process. Object oriented GIS, AM/FM/GIS and Web Based GIS	3
14.	GIS approach to Rainfall runoff modelling, Flood inundation mapping and modelling	2
15.	GIS approach to Groundwater modelling and water quality modelling	2
16.	Site selection for artificial recharge. Reservoir sedimentation	1
17.	Drought monitoring	1
18.	Performance evaluation of irrigation commands	1
19.	Cropping pattern change analysis	1
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Familiarization with the remote sensing instruments and satellite imagery	1
2.	Methods of establishing ground truth survey and Comparison between ground truth and remotely sensed data	2
3.	Aerial Photograph and scale determination with stereoscope	1
4.	Interpretation of satellite imagery and aerial photograph	1
5.	Determination of Parallaxes in images	1
6.	Demonstration on GPS; Provision of Ground Control by GPS in different mode	1
7.	Introduction to digital image processing software	1
8.	Introduction to GIS software	1
9.	Data input; Data editing and Topology creation -Digitization of point, line & polygon features	
10.	SRTM & CARTO DEM download from web and Georeferencing of an image	1
11.	Delineation of Watershed, DEM generation: slope, Aspect, flow direction, Flow accumulation, Drainage, network and morphometric analysis	2
12.	LULC by supervised classification and LULC by unsupervised classification	1
13.	Application of Remote Sensing data and GIS for water quality parameters	
14.	Temporal satellite data analysis for vegetation condition, crop water requirement calculation	1
15.	Erosion mapping using aerial and satellite Data	1
	Total	**17**

I. Course Title : Climate Change and Water Resources

II. Course Code : SWCE 508

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint students about the concept of climate change and its impact on surface and ground water resources. To understand adaptation and mitigation strategy under climate change scenario.

V. Theory

Unit I

The climate system: Definitions, climate, climate system, climate change. Drivers of climate change, characteristics of climate system components: Greenhouse effect, carbon cycle, wind systems. Trade winds and the Hadley Cell, ozone hole in the stratosphere, El Nino, La Nina– ENSO, teleconnections.

Unit II

Impacts of climate change: Observed and projected, global and Indian scenario, observed changes and projected changes of IPCC: Impacts on water resources, NATCOM Report, impacts on sectoral vulnerabilities, SRES, different scenarios, climate change impacts on ET and irrigation demand.

Unit III

Tools for vulnerability assessment: Need for vulnerability assessment, steps for assessment, approaches for assessment. Models: Quantitative models, Economic models, impact matrix approach, Box models, Zero-dimensional models, Radioactive-convective models, Higher-dimension models, EMICs (Earth-system models of intermediate complexity), GCMs (global climate models or general circulation models), Sectoral models.

Unit IV

Adaptation and mitigation water: Related adaptation to climate change in the fields of ecosystems and biodiversity, agriculture and food security, land use and forestry, human health, water supply and sanitation, infrastructure and economy (insurance, tourism, industry and transportation), Adaptation, vulnerability and sustainable development.

Unit V

Sector specific mitigation: Carbon dioxide capture and storage (CCS), bio-energy crops, biomass electricity, hydropower, geothermal energy, energy use in buildings, land-use change and management, cropland management, afforestation and reforestation. Potential water resource conflicts between adaptation and mitigation. Implications for policy and sustainable development.

Case studies: Water resources assessment case studies: Ganga Damodar Project, Himalayan glacier studies, Ganga valley project. Adaptation strategies in assessment of water resources. Hydrological design practices and dam safety, operation policies for water resources projects. Flood management strategies, drought management strategies, temporal and spatial assessment of water for irrigation, land use and cropping pattern, coastal zone management strategies.

VI. Learning outcome

The students will be able to understand climate change concept particularly on surface and ground water. Students can have in depth knowledge about adaptation and mitigation strategies in respect of climate change.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Definitions- climate, climate system, climate change; Drivers of climate change	3
2.	Climate system and its components; wind systems, carbon cycle, Greenhouse effect, Trade winds and the Hadley Cell, ozone hole in the stratosphere, El Nino, La Nina– ENSO, teleconnections	3
3.	Climate scenarios- SRES, RCP, Scenario based observed and projected climate changes in Indian and global context	3

S.No.	Topic	No. of Lectures
4.	IPCC projected climate change impacts on water resources, NATCOM Report-impacts on ET and irrigation demand	3
5.	Vulnerability assessment: Need, steps for assessment, approaches for assessment	2
6.	Models: Quantitative models, Economic models, impact matrix approach, Box models, Zero-dimensional models, Radioactive-convective models, Higher-dimension models, EMICs (Earth-system models of intermediate complexity), GCMs (global climate models or general circulation models), Sectoral models	4
7.	Adaptation to climate change in the fields of ecosystems and biodiversity, agriculture and food security, land use and forestry, human health, water supply and sanitation, infrastructure and economy (insurance, tourism, industry and transportation)	4
8.	Sector specific mitigation: Carbon dioxide capture and storage (CCS)	2
9.	Sector specific mitigation: bio-energy crops, biomass electricity, hydropower, geothermal energy, energy use in buildings	2
10.	Sector specific mitigation: land-use change and management, cropland management, afforestation and reforestation	2
11.	Potential water resource conflicts between adaptation and mitigation	2
12.	Implications for policy and sustainable development.	2
13.	Case studies- Ganga Damodar Project, Himalayan glacier studies, Ganga valley project	5
14.	Adaptation strategies in assessment of water resources- Temporal and spatial assessment of water for irrigation, land use and cropping pattern	2
15.	Adaptation strategies in assessment of water resources- Hydrological design practices and dam safety, operation policies for water resources projects	3
16.	Flood management strategies, coastal zone management strategies.	3

I. Course Title : Numerical Methods in Hydrology

II. Course Code : SWCE 509

III. Credit Hours : 2+0

IV. Aim of the course

To acquaint students about the concept of linear space, triangular and quadrilateral shape functions, isoparametric elements and transformation of coordinates.

V. Theory

Unit I

Review of finite difference operators. Concept of linear space and basis functions. Approximating from finite dimensional sub spaces.

Unit II

Variational and weighted residual methods. Langrange polynomials. Triangular and quadrilateral shape functions.

Unit III

Isoparametric elements and transformation of coordinates. Basis functions in three dimensions.

Unit IV

Galerkin finite element solution of Laplace, diffusion and dispersion-convection equations.

Unit V

Method of collocation, application in surface and sub surface hydrology.

VI. Learning outcome

The students are able to understand numerical methods in hydrology by having in-depth knowledge of linear space and finite element solution in surface and sub-surface hydrology.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Review of finite difference operators	2
2	Concept of linear space and basis functions	3
3	Approximating from finite dimensional sub spaces	3
4	Variational and weighted residual methods	2
5	Langrange polynomials	2
6	Triangular and quadrilateral shape functions	3
7	Isoparametric elements and transformation of coordinates.	3
8	Basis functions in three dimensions	3
9	Galerkin finite element solution of Laplace	3
10	Diffusion and dispersion-convection equations	3
11	Method of collocation	2
12	Application in surface and sub surface hydrology	3
	Total	**32**

I. Course Title : Dryland Water Management Technologies

II. Course Code : SWCE 510

III. Credit Hours : 2+0

IV. Aim of the course

To provide detail knowledge about analysis of severity of drought assessment and various dry land water management technologies suitable for conservation, harvesting and enhancing productivity of rainfed areas.

V. Theory

Unit I

Drought severity assessment: Meteorological, hydrological and agricultural methods. Drought indices. GIS based drought information system, drought vulnerability assessment and mapping using GIS. DPAP programme, drought monitoring constraints, limiting crop production in dry land areas. Types of drought, characterization of environment for water availability, crop planning for erratic and aberrant weather conditions.

Unit II

Stress physiology and crop resistance to drought, adaptation of crop plants to drought, drought management strategies. Preparation of appropriate crop plans for dry land areas. Mid contingent plan for aberrant weather conditions.

Unit III

Land shaping and land development for soil moisture conservation. Improvement of tillage and soil management by implements and engineering practices. Soil and moisture conservation for rainfed lands through improved implements and engineering practices. Gel technology.

Ex-situ measures: Water harvesting-micro catchments. Design of small water harvesting structures: Farm Ponds, percolation tanks their types and design, recycling of runoff water for crop productivity.

Unit IV

Crops and cropping practices related to soil and moisture conservation. Fertility management in dryland farming. Planning and development of watersheds from engineering view point. Case studies.

Unit V

Application of aerial photography in surveys and planning of watersheds for rainfed agriculture.

Use of Remote Sensing in soil moisture estimation.

VI. Learning outcome

The students will be able to understand drought severity assessment techniques alongwith new and appropriate methods of rainwater conservation and harvesting technologies for rainfed areas.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Drought severity assessment: Meteorological, hydrological and agricultural methods	2
2.	Drought indices	1
3.	GIS based drought information system, drought vulnerability assessment and mapping using GIS	2
4.	DPAP programme, drought monitoring constraints, limiting crop production in dry land areas	2
5.	Types of drought: characterization of environment for water availability	1
6.	Types of drought: crop planning for erratic and aberrant weather conditions	1
7.	Stress physiology and crop resistance to drought	1
8.	Adaptation of crop plants to drought and drought management strategies	1
9.	Preparation of appropriate crop plans for dry land areas	2
10.	Mid contingent plan for aberrant weather conditions	1
11.	Land shaping and land development for soil moisture conservation	1
12.	Improvement of tillage and soil management by implements and engineering practices	2
13.	Soil and moisture conservation for rainfed lands through improved implements and engineering practices	2
14.	Introduction of Gel technology for conservation measures	1
15.	*Ex-situ* measures: Water harvesting-micro catchments	1
16.	Design of small water harvesting structures: Farm Ponds	1
17.	Design of small water harvesting structures: percolation tanks their types and design	2
18.	Recycling of runoff water for crop productivity	1
19.	Crops and cropping practices related to soil and moisture conservation	1
20.	Fertility management in dryland farming	1
21.	Planning and development of watersheds from engineering view point	2
22.	Planning and development of watersheds - Case studies	1
23.	Application of aerial photography in surveys and planning of watersheds for rainfed agriculture	1
24.	Use of Remote Sensing in soil moisture estimation	1
	Total	**32**

Course Title with Credit Load
Ph.D. in Soil and Water Conservation Engineering

Major Courses (Requirement: 12 Credits)

Course Code	Course Title	Credit Hours
*SWCE 601	Advances in Hydrology	2+1
*SWCE 602	Soil and Water Systems Simulation and Modeling	2+1
SWCE 603	Reservoir Operation and River Basin Modeling	2+1
SWCE 604	Modeling Soil Erosion Processes and Sedimentation	2+1
SWCE 605	Waste Water Treatment and Utilization	3+0
SWCE 606	Hydro-Chemical Modeling	2+0
	Total	**13+4**

Minor Courses (Requirement: 06 Credits)

Course Code	Course Title	Credit Hours
IDE 603	Hydro-Mechanics and Ground Water Modeling	3+0
IDE 604	Soil-Water-Plant-Atmospheric Modeling	2+1
IDE 606	Multi Criteria Decision Making System	2+0
CSE 503	Neuro-Fuzzy Application in Engineering	2+1
CSE 506	Digital Image Processing	2+1
	Any other course(s) of other department can be taken as per recommendations of the students advisory committee	

Supporting Courses (Requirement: 05 Credits)

Course Code	Course Title	Credit Hours
*CPE-RPE	Research and Publication Ethics	1+1
	Courses from subject matter fields (other than Major and Minor) relating to area of special interest and research problem can be taken as per recommendations of the student's advisory committee.	

*Course has been made compulsory by UGC for PhD students. Course code and its detailed course outline to be adopted in toto as recommended by UGC.

List of other Essential Requirements

Course Code	Course Title	Credit Hours
SWCE 691	Seminar-I	0+1
SWCE 692	Seminar-II	0+1
SWCE 699	Thesis Research	0+75

Course Contents
Ph.D. in Soil and Water Conservation Engineering

I. Course Title : Advances in Hydrology
II. Course Code : SWCE 601
III. Credit Hours : 2+1

IV. Aim of the course

To provide comprehensive knowledge to the students about hydrologic models, flood frequency analysis and formulation of statistical models.

V. Theory

Unit I

Hydrologic models, processes and systems. Uncertainty in hydrological events. Statistical homogeneity.

Unit II

Probabilistic concept. Frequency analysis. Probability distribution of hydrological variables. Confidence intervals and hypothesis testing.

Unit III

Simple and multiple linear regressions, correlation, statistical optimization and reliability of linear regression models. Analysis of hydrologic time series and modeling. Auto–correlation, correlogram and cross-correlation analysis.

Unit IV

Markov processes, stochastic hydrologic models including Markov chain models. Generation of random variates. Hydrology of climate extremes. Area-duration-frequency curves. Regional flood frequency analysis.

Unit V

Formulation of various steps involved in formulation of statistical models and their application in hydrology.

VI. Practical

Parametric and non parametric test of time series data. Development of probabilistic and deterministic models for time series data of rainfall and runoff. Development of hydrologic models and frequency analysis for specified data set using SPSS and other software used in hydrologic modeling.

VII. Learning outcome

The students will be able to develop the hydrologic modeling and find out their trend as well as periodic component. To develop the stochastic and deterministic models for forecasting precipitation for prediction of floods and droughts.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Hydrologic models, processes and systems	1
2.	Uncertainty in hydrologic events risks, uncertainty	1
3.	Statistical homogeneity in hydrologic processes	1
4.	Probability, total probability theorem, Bayes theorem	2
5.	Moment generating function, statistical parameters	1
6.	Probability distribution of hydrologic variables	2
7.	Confidence interval one sided, two sided, Hypothesis testing test statistics	2
8.	Regression analysis, simple regression, confidence interval on regression coefficient, regression line, inference on regression	3
9.	Multiple linear regression	2
10.	Optimization of regression coefficients, Statistical optimization and reliability of linear regression models	3
11.	Time series analysis, components, stationarity, Auto correlation, correlograms, Cross correlation analysis	3
12.	Generating processes, Markov process- first order, higher order	2
13.	Statistical principles and techniques for time series modeling	2
14.	Markov chain models, Examples of Markov chain models in hydrology	2
15.	Autoregressive models, Autoregressive modeling of annual time series, Examples of autoregressive modeling	3
16.	Hydrology of climate extremes. Area-duration-frequency curves. Regional flood frequency analysis	2
17.	Formulation of various steps involved in formulation of statistical models and their application in hydrology	2
	Total	**34**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study of parametric and non parametric test of time series data	4
2.	Development of probabilistic models for time series data of rainfall and runoff	2
3.	Development of deterministic models for time series data of rainfall and runoff	2
4.	Development of hydrologic models for specified data set using SPSS and other software used in hydrologic modeling	2
5.	Development of frequency analysis for specified data set using SPSS and other software used in hydrologic modeling	2
6.	Development of the stochastic models for forecasting precipitation for prediction of floods and droughts	2
7.	Development of deterministic models for forecasting precipitation for prediction of floods and droughts	2
	Total	**16**

I. Course Title : Soil and Water Systems Simulation and Modeling

II. Course Code : SWCE 602

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the rainfall-runoff models, sediment model, overland and channel flow simulation and decision support systems using simulation models.

V. Theory

Unit I

Models and their classification, simulation procedure. Rainfall-runoff models. Infiltration models, evapo-transpiration models, structure of a water balance model.

Unit II

Overland and channel flow simulation. Modeling approaches and parameters. Stream flow statistics. Surface water storage requirements.

Unit III

Flood control storage capacity and total reservoir capacity. Surface water allocations. Palaeo-channels. Ground water models.

Unit IV

Design of nodal network. General systems frame work. Description of the model. Irregular boundaries. Decision support system using simulation models. Monte-Carlo approach to water management.

Unit V

Stanford watershed model and input data requirements of various hydrologic modeling systems. Soil water assessment tool (SWAT). Groundwater modeling and solute transport.

VI. Practical

Rainfall-runoff models. Infiltration models. Stanford watershed model (SWM). Channel flow simulation problems. Stream flow statistics. Model parameters and input data requirements of various software's of surface hydrology and groundwater. Hydrologic modeling system. Soil water management model. Soil water assessment tool (SWAT). Catchments simulation hydrology model. Stream flow model and use of dimensionless unit hydrograph. Generalized groundwater models.

VII. Learning outcome

The students will be able to develop the model for overland and channel flow simulation, which can be used for watershed management and planning and also able to simulate the ground water and surface water by developing the ground water model and runoff models.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1	Models and their classification, simulation procedure	2
2	Rainfall-runoff models	3
3	Infiltration models, evapo-transpiration models, structure of a water balance model	2

S.No.	Topic	No. of Lectures
4	Overland and channel flow simulation	2
5	Modeling approaches and parameters. Stream flow statistics	2
6	Surface water storage requirements	1
7	Flood control storage capacity and total reservoir capacity	2
8	Surface water allocations	1
9	Palaeo-channels	1
10	Ground water models	2
11	Design of nodal network	1
12	General systems frame work	1
13	Description of the model	1
14	Irregular boundaries	1
15	Decision support system using simulation models	2
16	Monte-Carlo approach to water management	2
17	Stanford watershed model and input data requirements of various hydrologic modeling systems	2
18	Soil water assessment tool (SWAT)	2
19	Groundwater modeling and solute transport	2
	Total	**32**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Rainfall-runoff models	2
2.	Infiltration models	1
3.	Stanford watershed model (SWM)	1
4.	Channel flow simulation problems	1
5.	Stream flow statistics	2
6.	Model parameters and input data requirements of various software's of surface hydrology and groundwater	2
7.	Hydrologic modeling system. Soil water management model	2
8.	Soil water assessment tool (SWAT). Catchments simulation hydrology model	2
9.	Stream flow model and use of dimensionless unit hydrograph	1
10.	Generalized groundwater models	2
	Total	**16**

I. Course Title : Reservoir Operation and River Basin Modeling

II. Course Code : SWCE 603

III. Credit Hours : 2+1

IV. Aim of the course

To provide comprehensive knowledge to the students about water management plans, demand analysis and water resources planning in river basins including stochastic and deterministic modeling.

V. Theory

Unit I

Water resources system analysis: Techniques, concept, objectives and applications.

Unit II

Identification and evaluation of water management plans. Demand analysis, policy formulation. Water resources planning objectives. Water resources planning under uncertainty.

Unit III

Definition of terminologies and basic concepts. Theories and principles of IRBM processes/phases in integrated river basin management. River basins, river functions. Human interventions and impacts. River basins in India, related case studies. Water resources planning in river basins. Operational management, tools and methods. Monitoring, acquisition and processing of water resource data.

Unit IV

Statistical methods. Decision support systems. Deterministic river basin modeling. Stream flow estimation, estimating reservoir storage, mass diagram analysis, sequent peak analysis, single and multi-reservoir operation models. Economics and finance.

Unit V

Stochastic river basin modeling: Single reservoir design and operation, multisite river basin models, stochastic linear programming operation models.

VI. Practical

Development of regression models, stochastic models and deterministic models for river basin based on stream flow data. Estimation of reservoir storage and preparation of operation models.

VII. Learning outcome

The students will be able to develop the model for effective water resources planning for river basins, identification and evaluation of water management plans as well as in-depth knowledge of stochastic and deterministic modeling.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Introduction–Concepts of Systems and Systems Analysis; Techniques, objectives and applications	2
	Applications of Water resources system analysis	1
2.	Identification and evaluation of water management plans-water demand analysis, Water resources planning objectives	2
3.	Water resource planning and management approaches-Top-Down Planning and Management; Bottom-Up Planning and Management Integrated Water Resources Management	1
4.	Water resource management policy formulation, Water resources planning under uncertainty	1

S.No.	Topic	No. of Lectures
5.	River basins, river functions, Theories and principles of IRBM processes/phases in integrated river basin management	1
6.	Human interventions and impacts in in integrated river basin management	1
7.	River basins in India- related case studies	1
8.	Water resources planning in river basins- Operational management, tools and methods	2
9.	Water resources planning in river basins - Monitoring, acquisition and processing of water resource data	2
10.	Economic Considerations in Water Resources Planning	1
10.	Deterministic river basin modeling-Stream flow estimation, estimating reservoir storage, mass diagram analysis, sequent peak analysis	2
11.	Deterministic river basin modeling- Reservoir Sizing; Reservoir Operation – standard operating policy, optimal operating policy; multi-reservoir systems,	6
12.	Concept of Reliability	1
13.	Stochastic river basin modeling: Basic probability theory,	2
14.	Single reservoir design and operation-Chance constrained Linear Programming for reservoir operation and design	3
15.	Stochastic river basin modeling: multisite river basin models,	1
	Model Formulations and Case Studies- Conjunctive use of ground and surface water; Crop yield optimization, Multi-basin and multi-reservoir systems	3
	Total	**33**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Development of regression models	1
2.	Regression analysis	1
3.	Correlation analysis	1
4.	Simple Linear Regression and coefficient of determination	1
5.	Discrete and Continuous probability - Random Variable and Variate	1
6.	Deterministic models for river basin based on stream flow data	1
7.	Stochastic models for river basin based on stream flow data	1
8.	Stochastic river basin modeling	1
9.	Stochastic linear programming operation models	1
10.	Single and multi-reservoir operation models	1
11.	Evaluation of water management plans	1
12.	Evaluation of demand analysis	1
13.	Stream flow estimation	1
14.	Estimation of reservoir storage	1
15.	Preparation of operation models	1
16.	Deterministic river basin planning model	1
	Total	**16**

I. Course Title : Modeling Soil Erosion Processes and Sedimentation

II. Course Code : SWCE 604

III. Credit Hours : 2+1

IV. Aim of the course

To acquaint students about the concept of modeling upland erosion, reservoir sedimentation and sediment yield models for estimation of soil erosion.

V. Theory

Unit I

Mechanics of soil erosion. Erosion-sedimentation systems of small watersheds. Overland flow theory and simulation. Basic theory of particle and sediment transport. Sediment deposition processes.

Unit II

Modeling upland erosion and component processes. Modes of transport and transport capacity concept and computation. Channel erosion. Erosion and sediment yield measurement and estimates.

Unit III

Reservoir sedimentation surveys and computation. Classification of models, structure and mathematical bases of sediment yield models. Nature and properties of sediment: Individual and group of particles. Critical tractive force, lift and drag forces. Shield's analysis.

Unit IV

Calibration and testing of models. Universal soil loss equation, its modification and revisions. Stochastic and dynamic sediment yield models.

Unit V

Evaluation of erosion control measures. Computer models used for hydrologic and/ or watershed modeling.

VI. Practical

Computation of soil erosion index. Estimation of soil erodibility factor. Design of erosion control structures. Computation of suspended load and sediment load using empirical formulae. Application of sediment yield models. Prediction of sediment loss. Computation of reservoir sedimentation, sounding method.

VII. Learning outcome

The students will be able to estimate the sediment from the particular watershed by using various instruments. Development of the common understanding of mechanics of sediment transportation process and remedies to reduce sedimentation of watersheds

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Mechanics of soil erosion	1
2.	Erosion-sedimentation systems of small watersheds	1
3.	Overland flow theory and simulation	2
4.	Basic theory of particle and sediment transport. Sediment deposition processes	2

S.No.	Topic	No. of Lectures
5.	Modeling upland erosion and component processes	2
6.	Modes of transport and transport capacity concept and computation	2
7.	Channel erosion	1
8.	Erosion and sediment yield measurement and estimates	1
9.	Reservoir sedimentation surveys and computation	2

I. Course Title : Waste Water Treatment and Utilization

II. Course Code : SWCE 605

III. Credit Hours : 3+0

IV. Aim of the course

To acquaint students about types of waste water and the various treatment measures alongwith the utilization of waste water in agriculture and other sectors.

V. Theory

Unit I

Types of waste water, causes of pollution, analysis of pollutants in the waste effluents, Biological wastewater treatment, biological sludge treatment. Biological systems: Fundamentals of microbiology and biochemistry, bioenergetics and metabolism, kinetics of biological growth. Process analysis: Reaction rates, effect of temperature on reaction rate, enzyme reaction and kinetics, effect of temperature on reaction rate. Reactor analysis, residence time distribution.

Unit II

Sewerage system: Domestic wastewater characteristics, flow equalization, population equivalent, treatment flow chart. Primary, secondary and tertiary treatment of domestic wastewater. Downstream wastewater treatment for reuse and recycle. Need for downstream processing. Guidelines for wastewater recycling. Small and package plants for wastewater treatment.

Unit III

Activated sludge process: Substrate utilization and biomass growth, Monod's kinetics, estimation of kinetic parameters. Process Description and its Modification, Process design, process performance evaluation, trouble shooting. Nitrogen removal-Biological nitrification and denitrification.

Unit IV

Activated sludge process design for nutrient removal. Process operation: (F/M), mean cell residence time, oxygen requirement. Biological and chemical phosphorus removal, Sedimentation of activated sludge. Advanced activated sludge process-Sequencing Batch reactor, Oxidation ditch and membrane bioreactors.

Unit V

Biofilm process: Trickling filter, biotower, rotational biological contactor, integrated activated sludge and biofilm processes. Stabilization ponds and aerated lagoons: Types and their description, design, operation and maintenance. Anaerobic processes: Process description, process design, operation and maintenance, sludge digestion. Sludge treatment-thickening, dewatering-mechanical and sludge drying beds. Utilization of waste water in agriculture and other sectors.

VI. Learning outcome

Students will be able to have in-depth knowledge about waste water treatment methods, sewerage system, activated sludge process, biofilm process. The student will also expose to use of waste water in agriculture and other sectors.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Status of wastewater in India, Sources of contamination and characterization of urban and rural wastewater for irrigation	2
2.	Water quality: Physical, chemical and biological parameters of wastewater	2
3.	Wastewater quality requirement: Potable water standards, wastewater effluent standards, water quality indices. Irrigation water quality standards both national and global and guidelines for their restricted and unrestricted uses.	2
4.	Different types of wastewater, pollutants and contaminants.	1
5.	Impact of wastewater on ecosystem, eutrophication, biomagnification, water borne diseases.	2
6.	Key drivers of wastewater use in agriculture and existing approaches for regulating wastewater reuse in agriculture	2

S.No.	Topic	No. of Lectures
7.	Selection of appropriate forestry trees, fruits, vegetables, oilseeds and food grain crop for wastewater utilization and practices used for irrigation	3
8.	Health Risks Associated with the Use of Wastewater for Irrigation	1
9.	Wastewater treatment methods: Physical, chemical and biological.	3
10.	Choice of (Cost-Effective) Wastewater Treatment Systems for Irrigation	2
11.	General water treatments: Wastewater recycling, constructed wetlands, reed bed system.	2
12.	Carbon foot prints of wastewater reuse. Environmental standards.	2
13.	Management of health and environmental risks of wastewater irrigation	1
14.	Regulation and environmental impact assessment (EIA): Environmental standards-CPCB Norms for discharging industrial effluents to public sewers. Valuation of environmental impacts.	3
15.	Impact on groundwater resources and soil health, EIA process, Stages of EIA-monitoring and auditing. Environmental clearance procedure in India	3
16.	Economics of wastewater irrigation	1
	Total	**32**

VIII. List of Practicals

S.No.	Topic	No. of Practicals
1.	Study on physical, chemical and biological parameters of wastewater	1
2.	Determination of EC and pH of wastewater	1
3.	Determination of BOD of wastewater	1
4.	Determination of COD of wastewater	1
5.	Determination of TSS and TDS of wastewater	1
6.	Determination RSC of wastewater	1
7.	Determination of e-coli in the wastewater	1
8.	On field demonstration of wastewater use for the irrigation	1
9.	Determination of nutrient (N, P and K) concentration in wastewater	2
10.	Field demonstration of impact of waste water on eco-system and human health.	1
11.	Study on various wastewater treatment methods	2
12.	Study on effect of wastewater on contamination of ground water	1
13.	Visit of village pond treatment nearby area	1
14.	Visit of sewerage treatment plant nearby area	1
	Total	**16**

IX. Suggested Reading

I. Course Title : Hydro-Chemical Modeling

II. Course Code : SWCE 606

III. Credit Hours : 2+0

IV. Aim of the course

To provide comprehensive knowledge to the students about hydrodynamics of flow through porous media and development of analytical, statistical and numerical models.

V. Theory

Unit I

Review of hydrodynamics in flow through porous media. Miscible displacement, physical processes.

Unit II

Breakthrough curves and mathematical models for miscible displacement. Hydrodynamic dispersion convection equations and its solutions.

Unit III

Statistical models for dispersion. Gaseous (CO_2 and O_2) diffusion equation.

Unit IV

Heat flow through soil by conduction. Concept of adsorption in solute transport.

Unit V

Analytical and numerical models of contaminant transport in unsaturated soil profile and groundwater aquifers.

VI. Learning outcome

Students will be able to demonstrate understanding of hydrodynamics of fluid transport through modeling and will be able to do water quality analysis of lakes and reservoir based physical and chemical characteristics. Develop water reclamation and water reuse plans for irrigation and industries.

VII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Review of hydrodynamics in flow through porous media	7
2.	Miscible displacement, physical processes, breakthrough curves	2
3.	Mathematical models for miscible displacement	5
4.	Hydrodynamic dispersion convection equation and its solutions	4
5.	Heat flow through soil by conduction	2
6.	Concept of adsorption in solute transport	2
7.	Analytical and numerical models of contaminant transport in unsaturated soil profile and groundwater aquifers.	6
8.	Statistical models for dispersion	3
9.	Gaseous (CO_2 and O_2) diffusion equation.	3
	Total	**34**

Details of Minor Courses
Department of Electrical Engineering and Information Technology

I. Course Title : Big Data Analytics

II. Course Code : CSE 501

III. Credit Hours : 2+1

IV. Aim of the course

To understand principles of analyzing and mining big data and to use simple tools to extract useful information from big data sets.

V. Theory

Unit I

Data analysis, data matrix attributes. Data: Algebraic and geometric view, probabilistic view.

Unit II

Basics of data mining and CRISP-DM, organizational and data understanding, purposes, Intents and limitations of data mining, database, data warehouse, data mart and data set, types of data, privacy and security, data preparation, collation and data scrubbing.

Unit III

Data mining models and methods, correlation, association rules, k-means, clustering understanding of concept, preparation and modelling.

Unit IV

Discriminant analysis, linear regression, logistic regression, understanding, preparation and modeling.

Unit V

Decision trees, neural networks, understanding, preparation and modeling.

VI. Practical

Introduction to OpenOffice and RapidMiner in data analytics and mining. Preparing RapidMiner, Importing data, handling missing data, data reduction, handling Inconsistent data, attribute reduction. Performing different analysis using RapidMiner or suitable software.

VII. Learning outcome

Capability to understand the principles behind analysis of big data and apply the same using simple tools.

VIII. Lecture Schedule

S.No.	Topic	No. of Lectures
1.	Data analysis, data matrix attributes	2
2.	Algebraic and geometric view, probabilistic view.	4

S.No.	Topic	No. of Lectures
3.	Basics of data mining and CRISP-DM	2
4.	Organizational and data understanding	3
5.	Intents and limitations of data mining, database, data warehouse, data mart and data set	4
6.	Types of data, privacy and security, data preparation, collation and data scrubbing.	4
7.	Data mining models and methods, correlation, association rules	6
8.	K-means, clustering understanding of concept, preparation and modelling.	5
9.	Discriminant analysis, linear regression, logistic regression, understanding, preparation and modeling.	5
10.	Decision trees, neural networks, understanding, preparation and modeling.	5
	Total	**40**

IX. List of Practicals

S.No.	Topic	No. of Practicals
1.	Working of OpenOffice and RapidMiner	3
2.	Preparing RapidMiner Dataset	3
3.	Handling the inconsistent data, missing data, attribute reduction	4
4.	Performing analysis on dataset using RapidMiner	3
	Total	**13**

I. Course Title : Artificial Intelligence

II. Course Code : CSE 502

III. Credit Hours : 2+1

IV. Aim of the course

To introduce students with techniques and capabilities of artificial intelligence (AI) and enable them to do simple exercises.

V. Theory

Unit I

Definitions of intelligence and artificial intelligence. What is involved in intelligence? Disciplines important to AI. History of development of AI. Different types of AI. Acting humanly, Turing test. AI systems in everyday life. Applications of AI.

Unit II

Classical AI, concept of expert system, conflict resolution, multiple rules, forward chaining, backward chaining. Advantages and disadvantages of expert system. Fuzzy logic and fuzzy rules. Fuzzy expert systems.

Unit III

Problem solving using AI, search techniques, breadth first search, depth first search, depth limited search, bidirectional search, heuristic search, problems and examples. Knowledge representation, frames, methods and demons, correlations, decision trees, fuzzy trees.

Unit IV

Philosophy of AI, Penrose's pitfall, weak AI, strong AI, rational AI, brain prosthesis experiment, the Chinese room problem, emergence of consciousness, technological singularity, Turing test.

Unit V

Modern AI, biological brain, basic neuron model, perceptrons and learning, self-organizing neural network, N-tuple network, evolutionary computing, genetic algorithms, agent methods, agents for problem solving, software agents, multi agents, hardware agents.

VI. Practical
